Attorneys.

DEPARTMENT OF THE INTERIOR,
OFFICE OF THE SECRETARY,
Washington, D. C., April 26, 1889.

SIR: The Secretary of the Interior has ordered that Daniel O'Driscoll, of Washington, D. C., be not recognized after this date as attorney or agent in the prosecution of any claim or other matter before this Department or any bureau thereof.

Very respectfully,

E. M. DAWSON,
Acting Chief Clerk.

The Commissioner of Patents.

The Official Gazette.

THE OFFICIAL GAZETTE is published every Tuesday, simultaneously with the weekly issue of patents. From January 1, 1872, (the commencement of its publication,) to June 30, 1883, it was published and bound in semi-annual volumes; since July 1, 1883, in quarterly volumes. All subscriptions must commence with the beginning of a volume; none taken for less than three months. Terms: To all subscribers within the United States and Canada, $5 per annum; to foreign subscribers, $7; single copies, 10 cents; bound semi-annual volumes, (prior to June 30, 1883,) full sheep, $4 per volume; bound quarterly volumes, (subsequent to July 1, 1883,) full sheep, $2.75 per volume. No club rates. *Payment in advance.* All orders should be addressed to "The Commissioner of Patents, Washington, D. C."

Indexes to Patents on Electricity.

Appendix No. 2 to the index to patents relating to electricity, covering the period of time from July 1, 1882, to June 30, 1883, has been issued, and is now for sale. These indexes, arranged alphabetically, numerically, and by classes, are completed to June 30, 1883, and comprise the following volumes:

Vol. 1. Index to patents relating to electricity granted by the United States prior to June 30, 1881, with an appendix, July 1, 1881, to June 30, 1882. One volume, 250 pages. In paper covers, $3; bound, $5.

Vol. 2. Appendix No. 2, July 1, 1882, to June 30, 1883. One volume, 50 pages. In paper covers, $1.50.

Vol. 3. Appendix No. 3, July 1, 1883, to June 30, 1884. One volume, 60 pages. In paper covers, $1.50.

Vol. 4. Appendix No. 4, July 1, 1884, to June 30, 1885. One volume, 60 pages. In paper covers, $1.50.

Vol. 5. Appendix No. 5, July 1, 1885, to June 30, 1886. One volume, 54 pages. In paper covers, $1.50.

Vol. 6. Appendix No. 6, July 1, 1886, to June 30, 1887. One volume, 52 pages. In paper covers, $1.50.

Issue of May 7, 1889.

DESIGNS.

19,076.—ORNAMENTATION OF GLASSWARE.—*William C. Anderson*, Toledo, Ohio, assignor to *The W. L. Libbey & Son Company*, same place. Application filed January 21, 1889. Serial No. 297,101. Term of patent 7 years.

19,077.—ORNAMENTATION OF BUILDERS' HARDWARE.—*George S. Barkentin*, New Britain, Conn., assignor to *P. & F. Corbin*, same place. Application filed April 12, 1889. Serial No. 307,066. Term of patent 7 years.

19,078.—KNITTED GARMENT.—*Swits Condé*, Oswego, N. Y. Application filed February 18, 1889. Serial No. 300,366. Term of patent 7 years.

19,079.—KNITTED GARMENT.—*Swits Condé*, Oswego, N. Y. Application filed March 18, 1889. Serial No. 303,779. Term of patent 7 years.

19,080.—BANJO.—*Edwin J. Cubley*, Ravenswood, Ill. Application filed June 8, 1888. Serial No. 276,534. Term of patent 7 years.

19,081.—TYPE.—*Rudolph Gnichwitz*, Ashbourne, Pa. Application filed February 27, 1889. Serial No. 301,425. Term of patent 7 years.

19,082.—INITIAL LETTER FOR HANDKERCHIEFS.—*Catharine Schiess*, New York, N. Y. Application filed February 7, 1889. Serial No. 299,210. Term of patent 7 years.

19,083 and 19,084.—FABRIC FOR CLOAKING, &c.—*Henry Topham*, Philadelphia, Pa., assignor to *Scheppers Brothers*, same place. Applications filed March 28, 1889. Serial Nos. 305,492 and 305,493. Term of patents 3½ years.

19,085.—WATCH-CHAIN BAR.—*Darius Whitford*, Providence, R. I. Application filed March 21, 1889. Serial No. 304,363. Term of patent 3½ years.

19,086.—SPOOL-THREAD CABINET.—*William Wilson*, Brooklyn, assignor to *George A. Clark & Bro.*, New York, N. Y. Application filed December 28, 1888. Serial No. 294,872. Term of patent 14 years.

19,087.—TEXTILE FABRIC.—*Joseph W. Woods*, Boston, Mass. Application filed April 4, 1889. Serial No. 306,018. Term of patent 7 years.

TRADE-MARKS.

[Certificates of registration of Trade-Marks numbered 8,191 and upward are registered under the act of March 3, 1881.]

16,547.—VELVETEENS.—*Louis Behrens & Sons*, New York, N. Y. Application filed January 14, 1889. Used since 1884.

"The words 'ROYAL FAMILY.'"

16,548.—SKINS DRESSED WITH THE FUR OR WOOL ON.—*Bevington & Morris*, London and Bermondsey, county of Surrey, England. Application filed February 26, 1889. Used since 1888.

"The words 'ROUEL DRESS' and the representation of an anchor."

16,549.—COTTON-SEED LARD.—*The Cotton Oil Product Company*, New York, N. Y. Application filed March 11, 1889. Used since June 1, 1888.

"The representation of a pig, a man cook, and the letters 'C. O. P.'"

16,550.—GAME IN WHICH MARBLES ARE EMPLOYED.—*James Fenton*, Buffalo, N. Y. Application filed April 3, 1889. Used since March 20, 1889.

"The legend 'THE THREE BLIND MICE.'"

16,551.—VELVET AND PLUSH.—*Goldschmidt, Buchrach & Co.*, New York, N. Y. Application filed March 8, 1889. Used since January 1, 1889.

"The words 'THE STAR BRAND' and the representation of a star."

16,552.—PLUG, TWIST, AND FANCY TOBACCO.—*P. H. Hanes & Co.*, Winston, N. C. Application filed December 6, 1888. Used since July, 1888.

"The words 'CROWNED HEADS.'"

16,553.—MEDICATED ARTICLES FOR TOILET AND VETERINARY PURPOSES.—*Ichthyol-Gesellschaft Cordes, Hermanni & Company*, Hamburg, Germany. Application filed February 13, 1889. Used since January 24, 1889.

"The word 'THIOL.'"

16,554.—[Withdrawn.]

16,555.—CERTAIN GAMING SET AND BOARD.—*George H. Monks*, Boston, Mass. Application filed February 1, 1889. Used since October 26, 1885.

"The word 'HALMA.'"

16,556.—SALT.—*Nash, Whiton & Co.*, New York, N. Y. Application filed March 8, 1889. Used since February 15, 1889.

"The representation of a banner."

16,557.—BOOTS, SHOES, AND SLIPPERS.—*Packard & Field*, Brockton, Mass. Application filed March 2, 1889. Used since February 11, 1889.

"The representation of a human foot visible through the upper of a boot or shoe, within which it is inclosed, and in connection therewith the words 'KORRECT SHAPE' inscribed on the remaining upper portion of the boot or shoe."

16,558.—WHEAT-FLOUR.—*St. Jacob Mill Company*, St. Jacob, Ill. Application filed April 10, 1889. Used since March, 1883.

"The word 'ENTERPRISE.'"

16,559.—PLUG AND FINE-CUT CHEWING-TOBACCO, CIGARS, CIGARETTES, AND SNUFF.—*Frank H. Woodbury*, Kansas City, Mo. Application filed March 28, 1889. Used since January 1, 1882.

"The words 'BED ROCK.'"

16,560.—LEATHER.—*L. Ziegel & Co.*, Newark, N. J. Application filed March 20, 1889. Used since February 1, 1889.

"The words 'RUDOLPH' and 'MANHATTAN LEATHER WORKS.'"

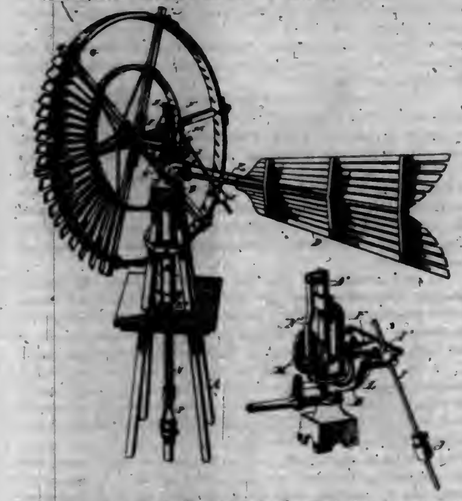
LABELS.

5,899.—Title: "CENTER'S PERMANENT CURE FOR MALARIA AND FEVER AND AGUE."—*Granville Center*, New York, N. Y. Application filed April 8, 1889.

5,900.—Title: "GERMAN MILLS—SINGAPORE PEPPER."—*The Consolidated Coffee Company*, Omaha, Nebr. Application filed March 30, 1889.

5,901.—Title: "GERMAN DRY HOP YEAST."—*The Consolidated Coffee Company*, Omaha, Nebr. Application filed March 30, 1889.

5,902.—Title: "PROFESSOR ZIMMERMAN'S REMARKABLE OIL," (FOR A MEDICINAL PREPARATION.)—*Lauer & Roulson*, Baltimore, Md. Application filed April 2, 1889.



5,903.—Title: "MEADOW MINT BALSAM."—*The Morgan Medicine Co.*, Bridgeton, N. J. Application filed January 25, 1889.

5,904.—Title: "PRUSSIAN SPAVIN CURE."—*George Phippe*, Green Bay, Wis. Application filed February 6, 1889.

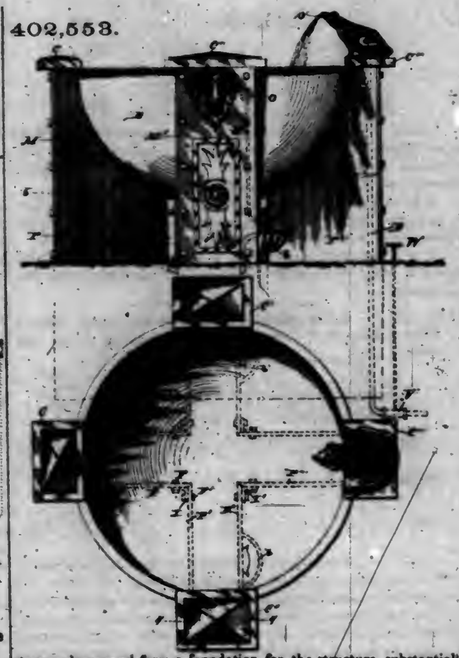
PATENTS

GRANTED MAY 7, 1889.

402,552. WINDMILL. JONAS H. ALDRICH, Butler, Ind. Filed Mar. 24, 1888. Serial No. 268,449. (No model.)

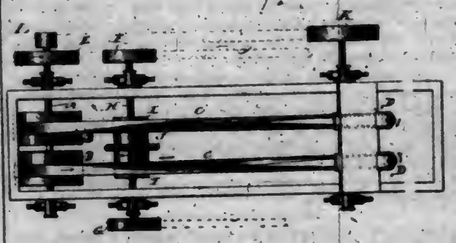
Claim.—In a windmill, a spring-brake attached to the vane-casting and projecting in the path of travel of the pitman-wheel and governor-rod, as and for the purpose set forth.

402,553. DRINKING-FOUNTAIN. STEPHEN R. BABCOCK, Little Falls, N. Y. Filed Aug. 15, 1888. Serial No. 282,767. (No model.)



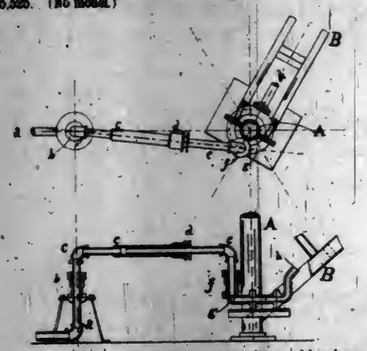
Claim.—1. In a drinking-fountain, the combination of the supporting-frame made in the form of a cross and cut away at its upper end, the bowl which fits into said cut-away portion, and the caps which are removably attached to the frame and which overlap the edges of the bowl, substantially as described.

2. In a drinking-fountain, the combination of the upright plates, each of which has a circular portion cut away from its upper inner corner, the angle-irons and end plates to which the first-mentioned plates are fastened in the form of a cross with all of their cut-away corners at the center, the bowl which fits into the cut-away space thus formed, and the caps which are bolted to the frame and which overlap the edges of the bowl, substantially as described.



3. In a drinking-fountain, the combination, with the bowl, of a number of upright plates which have a considerable portion of their upper ends cut away and which are set in the ground and bolted together in any suitable form, so that those portions of the plates above ground form a support for the bowl of the fountain, while those portions underground form a foundation for the structure, substantially as described.

402,553.

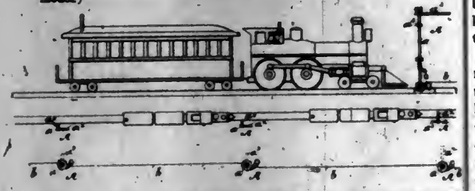


402,554. BELT-GUIDE WHEEL. EDWIN BENJAMIN, South Evanston, Ill., assignor to the Benjamin Machine Company, of Illinois. Filed Jan. 7, 1889. Serial No. 295,670. (No model.)

Claim.—1. The combination, with two belts whose adjacent edges run in the same direction and in close proximity with each other, of a guide-wheel projecting between said edges and presenting its sides to said belt-edges, substantially as shown and described.

2. The combination, with two belts whose adjacent edges run in the same direction and in close proximity with each other, of a guide-wheel projecting between said edges, presenting its sides to said belt-edges, and driven independently of its contact with the edges of the belts, as shown and described.

402,555. STEAM-PIPE JOINT FOR EXCAVATING-MACHINES. Lenox Birchhead, Toledo, Ohio. Filed Nov. 18, 1887. Serial No. 255,525. (No model.)

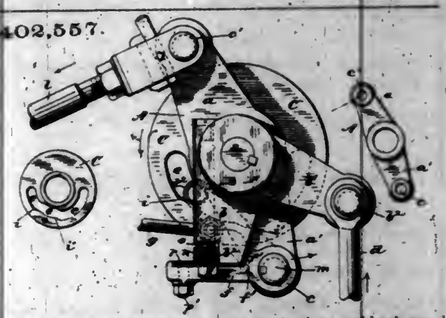


Claim.—1. In an excavating-machine, in combination with an engine mounted upon the crane thereof, pipes *c e*, provided with "telescope-joint" *d*, permitting longitudinal motion of pipe *e*, substantially as shown and described, for the purpose specified.

2. In an excavating-machine, in combination with the crane having an engine mounted thereon, pipes *c* and *e*, having joints *b*, *d*, and *f*, substantially as shown and described, for the purpose specified.

3. In combination with crane A B, pipes *a*, *c*, *e*, *g*, and *h*, having joints *b*, *d*, and *f*, substantially as shown and described, for the purpose specified.

402,556. BLOCK-SIGNAL SYSTEM FOR RAILWAYS. Edmund Blunt, Brooklyn, N. Y. Filed May 23, 1888. Serial No. 274,736. (No model.)



Claim.—1. A railway-signal comprising the rods extending upwardly at one side of the track, signal-arms thereon, one above the other and at substantially right angles to each other and adapted to contact with obstructions on a passing train, a ratchet on each vertical rod, a pivotal spring-controlled dog engaging a ratchet on each vertical rod, a wire having one end coiled around a vertical rod and engaging at the other end with the dog of the adjacent rod, and weights having flexible connection with the rods, said connections leading over a pulley, substantially as specified.

2. A railway-signal system having, in combination, the rods extending upwardly at one side of the track, the signal devices thereon, comprising arms, one above the other, adapted to contact, respectively, with obstructions on a passing train, pivotal dogs on said rods, the wires each connecting a rod and a dog on an adjacent rod, the ratchets on said rods, and devices for returning the signals to their normal positions, substantially as specified.

3. A railway-signal system comprising the vertical rods placed at the side of the track, the projecting signal devices thereon adapted to contact with projections or obstructions on a passing train, whereby the signal devices will be set in different positions and whereby an audible signal will be sounded on the locomotive, the wires connecting with a rod and a pivoted dog normally engaging a ratchet on a rod, and a weight having a flexible connection over a bearing with a rod, substantially as specified.

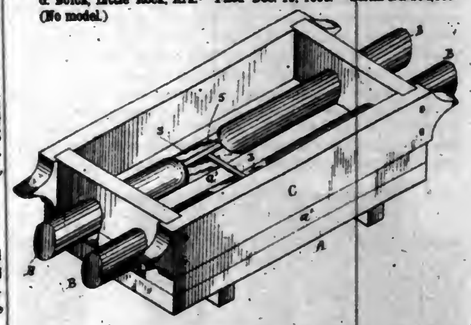
402,557. CUT-OFF-VALVE GEAR. Walter F. Brown, Providence, R. I. Filed Oct. 26, 1888. Serial No. 289,308. (No model.)

Claim.—1. The governor-actuated double-acting cam-grooved disk and the pivotally-mounted hook and tripping-lever connected with said cam, and a steam-arm having a latch-block adapted to engage said hook, substantially as hereinbefore described, and for the purpose set forth.

2. In a cut-off valve, the combination, with the governor-actuated double-acting cam-grooved disk, of a pivotally mounted tripping-lever and hook taking its axial movement from said cam, substantially as shown and hereinbefore described.

3. In a cut-off-valve gear, the combination, with the steam-arm and hook-lever, of a loosely-mounted tripping-lever and hook traveling in unison with said hook-lever, and a loosely-mounted double-acting cam-grooved disk actuated by the governor and having an arm of the said tripping-lever connected with and worked by said groove of the cam, substantially as hereinbefore described, and for the purpose specified.

4. In a releasing or cut-off-valve gear, the combination, with a steam-arm having a drop-rod and a loosely-mounted latch-block, as *n*, carried by said arm, of a pivotally-mounted hook arranged to engage said latch-block, a working or hook lever, as A, carrying the tripping-lever and hook and oscillated by the engine, and a positive-acting or cam-grooved disk, as C, actuated by the governor and having the tripping-lever engaging said cam, whereby the movements of the lever A and cam, individually or conjointly, act to oscillate the tripping-lever, substantially as hereinbefore described, and for the purpose specified.



5. In a cut-off-valve gear, the combination, with the loosely-mounted governor-actuated double-acting cam-grooved disk hereinbefore described, of a suitably-mounted hook, as *f*, axially vibrated by means of said cam and arranged to engage the steam-arm, &c., of the valve-gear, substantially as set forth, and for the purpose stated.

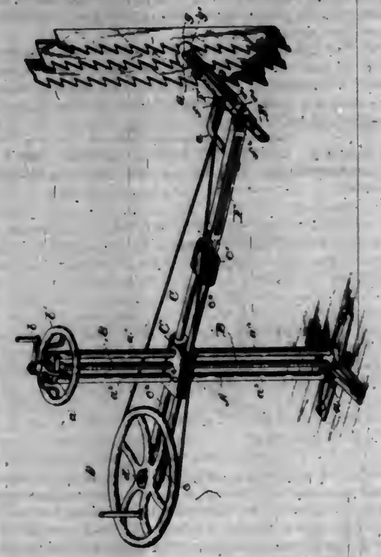
6. In a cut-off-valve gear, the combination, with the loosely-mounted governor-actuated cam-grooved disk, as C, of the pivotally-mounted tripping-lever *t*, vibrated by said cam, a loosely-mounted hook-lever, A, carrying the tripping-lever, a fixed steam-arm, B, provided with a drop-rod and latch-block, as *n*, mounted to move up and down in the arm, and a hook, *f*, secured to and moving in unison with the said tripping-lever and provided with a lug, as *f'*, to engage the steam-arm to positively close the steam-valve, the whole combined, arranged, and operating substantially as shown and described.

7. In a cut-off-valve gear, the arrangement of the axis of the tripping-lever and hook below the line of pressure of the contact-surface of the hook-plates, substantially as shown, whereby the resistance of work required to trip the valve is nearly balanced, thereby also relieving the governor and rendering it more sensitive in working, substantially as hereinbefore described.

8. In a cut-off-valve gear, the combination of a governor-actuated cam-grooved disk, C, and a pivotally-mounted tripping-lever and hook positively vibrated in each direction by being connected to the cam-groove, substantially as shown and set forth.

402,558. MOLD FOR CASTING WINDOW-WEIGHTS. Luther G. Buick, Little Rock, Ark. Filed Dec. 19, 1888. Serial No. 294,069. (No model.)

Claim.—1. The combination of the follow-board A, having recesses *a*, flasks C D, adjustable guides 3, having the concave ends 4, patterns B, stops 1, having the concave inner ends and cone-shaped points, cone-shaped chills 2, gate-pattern 5, and gate-pin 6, all substantially as shown and described, and for the purposes set forth.



2. The combination of the flask, a groove follow-board, patterns, and the guides 3, having concave ends 4, as set forth.

3. The combination of the follow-board A, having recesses *a*, flask C D, adjustable guides 3, having the concave ends 4, patterns B, stops 1, having the cone-shaped inner ends and points, cone-shaped chills 2, and suitable gate-patterns and pin, substantially as shown and described.

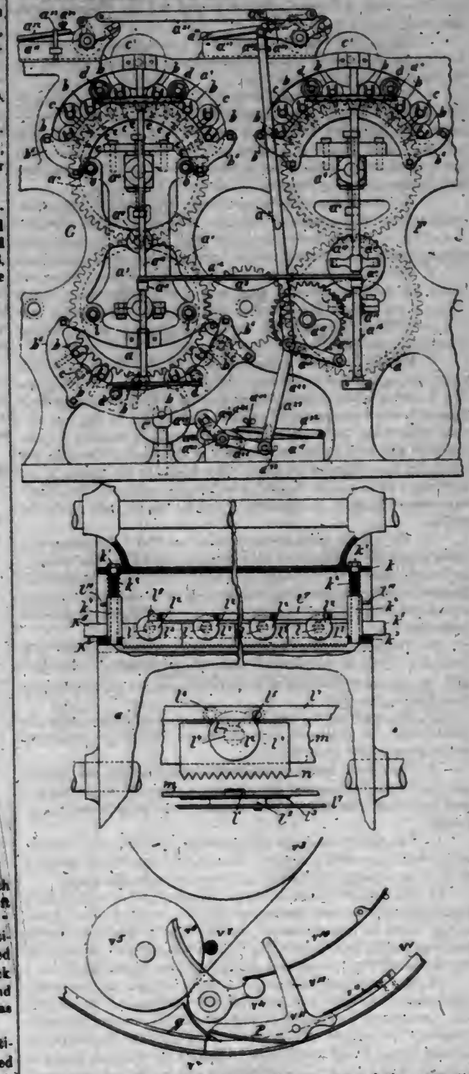
402,559. ROOFING MATERIAL. Philip Carey, Cincinnati, Ohio. Filed Dec. 22, 1888. Serial No. 294,573. (No specimens.)

Claim.—A roofing or paving material consisting of the above-described compound of distilled petroleum, lamp-black, and asphaltum, or its equivalent, combined substantially in the proportions and for the purpose described.

402,560. SAW-SHARPENING MACHINE. Gustav Carlson, Uleaborg, Finland, assignor to Holst & Fleischer, Christiania, Norway. Filed July 18, 1888. Serial No. 280,296. (No model.) Patented in Finland Sept. 23, 1887, No. 297, and June 8, 1888, No. 310; in Sweden Sept. 28, 1887, No. 1,209; in Norway May 26, 1888, No. 960, and in England June 20, 1888, No. 9,096.

Claim.—1. In a saw-sharpening machine, the combination, with the frame C and its cross-head C', of the stand A and its screw-shaft B, substantially as and for the purposes specified.

2. In a saw-sharpening machine, the combination, with a vertically-adjustable frame, C, a tool-stock, and a revoluble tool mounted in one end of said stock, of a connecting-arm hinged to the tool-stock and frame C, and a tool-rest, *c*, secured to said connecting-arm and projecting under the tool-stock to support the same, substantially as and for the purpose specified.



3. In a saw-sharpening machine, the combination, with a vertically-adjustable frame, C, a tool-stock, and a revoluble tool mounted in one end of said stock, of a connecting-arm hinged to the tool-stock and frame C, and a flexible or elastic tool-rest, *c*, secured to said connecting-arm and projecting under the tool-stock to support the same, substantially as and for the purpose specified.

4. The combination, with a stand, A, its screw-shaft B, the frame C, having cross-head C' and head *c'*, and the arm E, hinged to said head *c'*, of a tool-stock and a universal joint between said stock and arm, substantially as and for the purposes specified.

5. The combination, with the stand A, its screw-shaft B, the frame C, having cross-head C', and a driving-pulley mounted on said frame C, of a tool-stock, a revoluble tool mounted thereon, an intermediate arm hinged to said frame and tool-stock, and transmitting-pulleys connected with the driving-pulley and revoluble tool, substantially as and for the purposes specified.

6. The combination, with the stand A, its screw-shaft B, the frame C, having cross-head C' and heads *c c'*, the band-pulley, pulley D, mounted on head *c*, and the arm E, hinged to head *c'*, of the slotted tool-stock F, the emery-wheel G, the band-pulley *g'*, and the band and transmitting pulleys F' *f'*, said parts being arranged and co-operating substantially as described.

402,561. COMBINED PRINTING AND ADDRESSING MACHINERY. Stephen D. Carpenter, Carthage, Mo. Filed Apr. 26, 1886. Serial No. 272,142. (No model.)

Claim.—1. In a combined job and newspaper printing-press, the sets of printing-cylinders, (shown in Figs. 1 and 2,) as B D F, in combination with the alternate sets of reversible printing-cylinders C E G, connected with the intermediate gears, a^{s}, as and for the purposes herein described.

2. In a combined job and newspaper printing-press for plain or colored work on one or both sides of the web, a series of ink-fountains, as shown, placed above the printing-cylinders for each set and below each alternate set, provided with means, substantially as herein described, for quick and ready removal and substitution of other fountains containing different colors of ink, in combination with the sets of printing-cylinders, as and for the purposes herein described.

3. In a combined job and newspaper press, for use of different colors on one or both sides of the sheet, the ratchet-arm a^{35}, pivoted to the short connecting-rod a^{33}, which is hinged at a^{32}, in connection with the long connecting-rod a^{34}, that operates the ratchet-arms of the upper ink-fountains, giving reciprocal motion to the connecting-rod a^{31}, which operates the ratchet-arm of the ink-fountain over the reversible set of cylinders G, and also operates the transfer-rollers a^{39} for each of the three ink-fountains as and when the same may be

used, two at a time, all in combination, as and for the purposes herein described.

4. The removable roller-plates b^4, in combination with the outside frame and reversible cylinders, as and for the purposes herein described.

5. The inside reversible frames, a^7, in combination with the type and impression cylinders mounted thereon and the main frame, as and for the purposes herein described.

6. In a combined job and newspaper printing-press, the reversible inside frame, with its printing-cylinders and trunnions, in combination with the main frame, said frames being provided with bolts and corresponding screw-threaded and free holes made as to exact size and relative position to the center of motion both at top and bottom for interchanging purposes, as set forth.

7. In combination with the set of reversible type and impression cylinders, the ink-fountains for the same, one above and the other below, with the means for conveying ink from either to the type-cylinder, according to its position, as and for the purposes herein described.

8. The rock-shaft a^{16}, Fig. 5, provided with cross-arms above and below the reversible cylinder for actuating the reciprocating rollers either at top or bottom, as occasion may require, in combination with the reversible cylinders and the reciprocating rollers, as and for the purposes herein described.

9. The set of cut-off cylinders a and a^4, Fig. 5, provided with cutter-bars graduated in distance, as illustrated in Fig. 2 and diagram Fig. 3, having lancet-pointed knives divided in various cross-sections, graded to the minimum width of sheet intended to be slit, and also with other described means to secure cross-cuts in variable lengths, provided also with means, substantially as described, for locking and unlocking the cutter-blades, one or more blades in any section to act upon the web, as may be desired, or one or all save one of the cutting-bars suspended, all in combination, as and for the purposes herein described.

10. The outside shell of the cylinder a^4, Fig. 7, consisting of a series of cylindrical segments, k^3, projecting beyond the line of cross-cut knives, having slots or openings therein sufficient in number and length to admit the knives, in combination with a series of supporting-arms between each series of knives, as and for the purpose herein described.

11. The cylinder provided with projecting shell and annular projections k, Fig. 8, in combination with the guide-rods k', cutter-bar, with its removable section-knives, and roller-bar, as and for the purposes herein described.

12. The cutter of the cut-off cylinder, in combination with the spiral springs, the guide-rods, stop-off fork, and stop-off pin, as and for the purposes herein described.

13. The cut-off knives provided with spiral springs, the stop-off pins, the stop-off forks, and the supporting-arms, all in combination with the cut-off cylinders a and a^4, as and for the purposes herein described.

14. The guide-rods k', the spiral springs k^9, tilting rod j^7, cutter-bar, with its removable section-knives, and roller-bar k^3, and riser-cam k^7, all in combination, as and for the purposes herein described.

15. The series of cut-off knives provided with round holes in their longitudinal centers, with openings to the backs of the same, as shown in Figs. 9 and 10, in combination with the large headed bolts having cut-away shanks, as shown in Fig. 18, the cutter-bar m, and the slitting-shears a^{20}, Fig. 1, as and for the purposes herein described.

16. In a combined job and newspaper printing-press using cylindrical plates, a cylinder provided with disk and flange at its working end, containing a scroll-spool, v^3, Figs. 14 and 16, a perforated gum-cylinder, v^2, in contact with roller v^4, acting upon the scroll-web, the serrated knives P, and with means to operate the whole, as shown in views 14, 15, and 16, all in combination, as and for the purposes herein described.

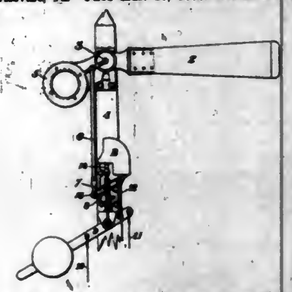
17. In a combined job, newspaper, and addressing printing-machine, the perforated gum-cylinder v^2, provided with cloth covering and with means of communicating with the reservoir v^{13}, and also provided with means (as the valve v^{15}) to regulate the supply of liquid gumming material, in combination with the gum-fountain v^{13}, the contact-roller v^4, arm v^5, and the trip-pin v^6, as and for the purposes herein described.

18. The revolving shear-cutters, Figs. 11, 12, 13, (a^{20} in Fig. 1), provided with semicircular shear-blades, Fig 13, removable at pleasure, and also provided with flanges or cheeks each side of the cutting-blade for friction-tension with the web on the line of cut, all in combination and in combination with the cut-off knives in the cut-off cylinder, as and for the purposes herein described.

19. The trip-pin v^6, Figs. 14 and 15, in combination with the frame f, the trip shear-arm v^{12} to cutting-blade p, and arm v^5, and roller v^4, operated thereby, as and for the purposes herein described.

20. The form and impression cylinders and the ink-fountains provided with adjustable means for printing one or both sides of the web in one or more colors at one operation, and jobs of various widths and lengths at one operation, substantially as herein described, in combination with the revolving shears and the cut-off knives, as and for the purposes herein described.

21. A series of stationary printing-cylinders in a web-feeding printing-press, in combination with a series of alternate sets of reversible form and impression cylinders, and in combination with changeable ink-fountains for change and proper distribution of colors, so constructed and fitted to the frame that any one of any color may be displaced and another of another color substituted therefor, as and for the purposes herein described.

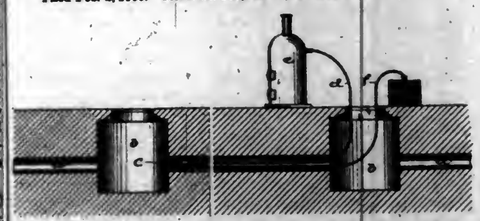


22. The type-cylinders provided with the longitudinal markings and numberings, in combination with the cut-off knives, as and for the purposes herein described.

23. The type-cylinders provided with the circumferential markings and numberings, in combination with the slitting-shears and the cut-off cutter-bars and series of cut-off knives, as and for the purposes herein described.

24. The cut-off cylinder a^4, Fig. 1, provided with a slotted shell bolted to a series of arms, k^3, corresponding in number to the series of cut-off knives projecting beyond the line of web and knives, in combination with the guide-rods and cross-cutting knives, as and for the purposes herein described.

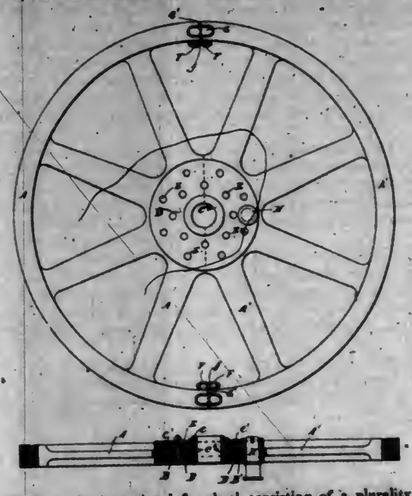
25. The cylinder a^4 in series A, provided with gum-fountain cylinder v^2, gum-reservoir v^{13}, Fig. 14, and connecting mechanism, substantially as described, for addressing subscribers' names on the margin of newspapers, in combination with cylinder a in series A, as and for the purposes herein described.



402,562. ELECTRIC SIGNALING APPARATUS. JOHN P. COLEMAN, Swissvale, Pa. Filed Mar. 10, 1888. Serial No. 266,806. (No model.)

Claim.—1. In an electric signaling apparatus, the combination, with the electro-magnet, its armature, and a rod, 18, which connects the armature with the mechanism of the apparatus, said rod being arranged to have a loose or yielding motion and provided with a spring for the purpose of seating the armature with safety, substantially as and for the purposes described.

2. In an electric signaling apparatus, the combination, with the signal, its operating-rod 6, and a lever whereby the rod is moved vertically, of a spring placed to receive the impact of dropping of the rod, substantially as and for the purposes described.



402,563. METHOD OF TREATING UNDERGROUND ELECTRICAL CONDUITS WITH CHEMICAL SUBSTANCES. ARTHUR E. COLLATZ, New York, N. Y., assignor to the Western Electric Company, Chicago, Ill. Filed Feb. 2, 1889. Serial No. 298,446. (No model.)

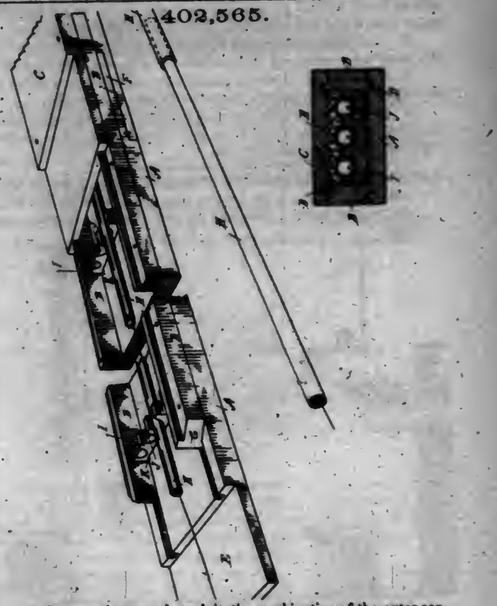
Claim.—1. The process of treating the electric conduits with a chemical substance, which consists in throwing the same against the interior of the conduit in the form of a spray, substantially as described.

2. The method of treating a conduit which consists in forcing the liquid through an atomizer and at the same time drawing the atomizer through the conduit and throwing the liquid substance against the interior walls of the conduit, substantially as and for the purpose specified.

402,564. SECTIONAL FLY-WHEEL. ROBERT B. COLLINS, Columbus, Ohio. Filed June 21, 1888. Serial No. 277,769. (No model.)

Claim.—1. A sectional fly-wheel consisting of a plurality of cast sections, A A', each comprising a portion of the rim and a corresponding portion of a sectional central web, B B', the abutting edges of said sections being carefully faced off to fit against each other, and the sides of the sectional central web being carefully and truly faced, a slotted hub, C, made of a single flanging or casting, and having an annular flange, C', faced off to fit truly on one side of the sectional central web, B B', and having a sleeve, C^3, turned to fit the central hole in web B B', and an annular plate, D, made of a single piece of metal, turned and faced to fit on the sleeve C^3 and against the sectional central web, B B', and a number of bolts, E E, arranged to fit in carefully-reamed perforations symmetrically arranged about the hub C and passing through the flange C', the sectional central web, B B', and the plate D.

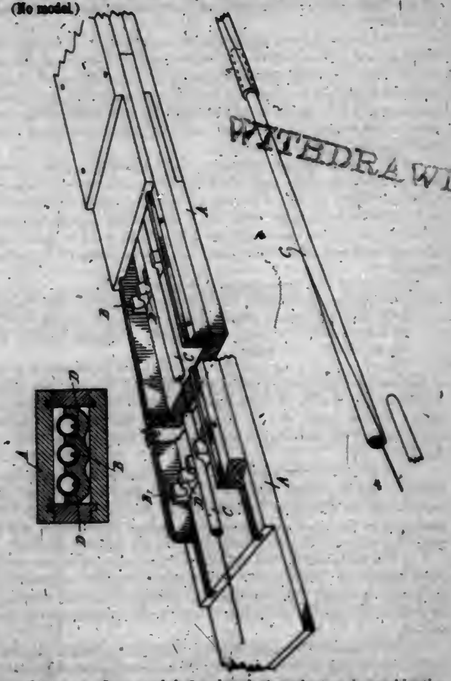
2. A sectional fly-wheel consisting of a plurality of cast sections, A A', having a sectional central web, B B', the abutting edges of said sections being carefully faced off to fit against each other, and the sides of the sectional central web being carefully and truly faced, a hub, C, having an annular flange, C', faced off to fit truly on one side of the sectional central web, B B', and having a sleeve, C^3, turned to fit the central hole in B B', an annular plate, D, turned and faced to fit on the sleeve C^3 and against the sectional central web, B B', a number of bolts, E E, arranged to fit in carefully-reamed perforations symmetrically arranged about the hub C and passing through the flange C', the sectional central web, B B', and the plate D, and a crank-pin, H, inserted in a reamed perforation passing through the flange C, section B, and plate D, all substantially as described.



402,565. CONDUIT FOR ELECTRIC WIRES. GEORGE W. COOK, Detroit, Mich., assignor of one-third to Charles C. Canny, same place. Filed Sept. 5, 1888. Serial No. 284,592. (No model.)

Claim.—1. In an underground conduit, the combination of the following elements: an outer casing or box, insulating-bridges placed therein at intervals, and an inner conduit or conduits formed of tapering paper tubes supported upon said cross-bridges, substantially as described.

2. In an underground conduit, the combination of the following elements: an outer casing or box of substantially rectangular shape, insulating cross-bridges placed therein at intervals, an inner conduit or conduits consisting of paraffined taper-jointed paper tubes supported upon said cross-bridges, and an insulating water-proof compound filled into the outer conduit, substantially as described.



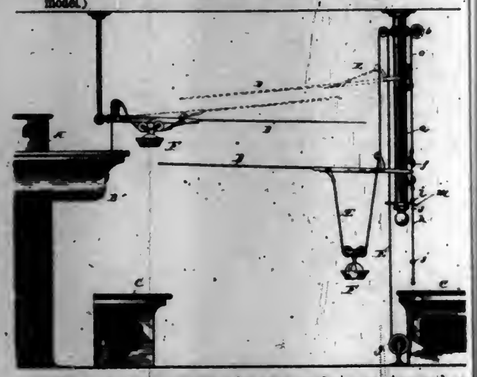
3. The outer conduit-sections, each consisting of bottom A and sides C, halved upon their ends and provided with longitudinal mortises upon their inner faces, and of the sides D, provided with beveled ends and with longitudinal tenons upon their inner edges engaging with the corresponding mortises in the bottom and top, said bottom, top, and sides being connected together to break the joint in connecting the sections, substantially as described.

4. The combination, with the outer conduit or box, substantially of rectangular shape, of the insulating cross-bridges provided with legs or similarly-reduced contact-faces upon their lower faces, and with circular bearings upon their upper faces, and of the paper tubes supported in said bearings, substantially as described.

5. In an underground conduit, the combination of the outer conduit consisting of bottom A, sides B, and top C, connected together by a mortise-and-tenon joint, having the tenon upon the inner corners of the sides, the insulating cross-bridges I, provided with legs K and bearings J, the inner conduit of taper-jointed paper tubes supported upon the cross-bridges, and the water-proof insulating compound filled into the outer conduit, substantially as described.

402,566. UNDERGROUND CONDUIT FOR ELECTRICAL CONDUCTORS. GEORGE W. COOK, Detroit, Mich., assignor of one-third to Charles C. Canny, same place. Filed Dec. 8, 1888. Serial No. 292,973. (No model.)

Claim.—1. In a conduit for electrical conductors, in combination



with an outer conduit, an inner conduit consisting of a series of like paper tubes fitted one within the other, substantially as described.

2. A conduit for electrical conductors, consisting of a series of like paper tubes saturated with paraffine and taper-jointed together.

3. A conduit for electrical conductors, consisting of a series of like tapering asbestus paper tubes, substantially as described.

4. An inner conduit for electrical conductors, consisting of tubes tapering from one end to the other and adapted to be taper-jointed together, substantially as described.

402,567. STORE-SERVICE APPARATUS. JAMES T. COWLEY, New York, N. Y., assignor to the Lamson Consolidated Store Service Company, of New Jersey. Filed Aug. 25, 1885. Serial No. 175,306. (No model.)

Claim.—1. In an apparatus for store-service, a receiver and restorer, one end of said restorer having a spring take-up mechanism for raising the car to the track, in combination with a spring elevating device for raising the sliding end of the track, as set forth.

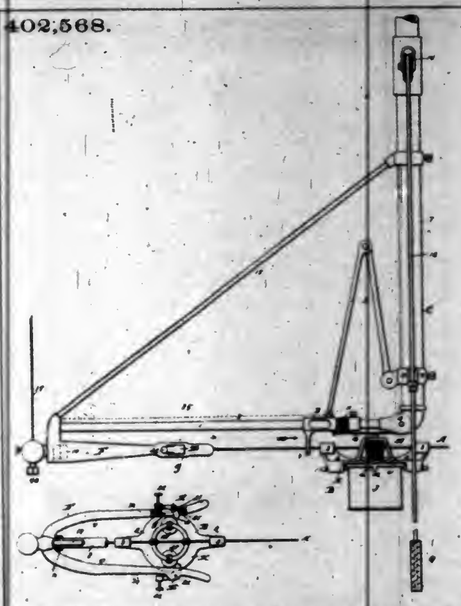
2. The combination, with the track of a store-service apparatus, of a yoke or bracket provided with anti-friction rollers, a pivoted arm, *m*, and a graduated rope or cord for raising and lowering said yoke and contacting with said arm, as set forth.

3. The combination, with a store-service apparatus provided with a receiver and restorer and a cord for raising and lowering the same, of the forked arm *m* and a pulley with the spring-roller mechanism, as set forth.

4. In a store-service apparatus, the combination of the car, the track, a cord upon which the car is received and lowered at the end of the track, a spring mechanism which takes up the slack of said cord when the car is placed on the track, another cord and spring mechanism which automatically elevates the end of the track, and buttons for holding the last said cord and spring mechanism from moving, substantially as described.

5. In a store-service apparatus, the combination, with the car and the track, of a rope upon which the car is received and lowered, a cord by which one end of the track is raised, a button on said cord, and a pivoted forked arm, with which said button engages, adapted to be tripped by the rope on which the car is received to permit the last said cord and spring mechanism to operate, substantially as described.

402,568. STORE-SERVICE APPARATUS. JAMES T. COWLEY, New York, N. Y., assignor, by mesne assignments, to the Lamson Consolidated Store Service Company, of New Jersey. Filed Oct. 30, 1886. Serial No. 217,613. (No model.)



Claim.—1. In a cash-carrier apparatus, the combination, with a pendant having a guide parallel with the way, of a carriage push-block adapted to slide on said guide, a spring-operated retractor connected to said block, and an operating-cord and a spring applied thereto for giving the forward impulse to said block, substantially as described.

2. In a cash-carrier apparatus, the combination, with a pendant having a guide parallel with the way and a push-block thereon, of jointed rods, an automatic retractor for the rods, an operating-cord connected to the block and supported by pulleys, as described, and a propelling-spring in the line of said cord, for the purpose specified.

3. The combination, in a cash-carrier apparatus, of a car push-block applied to reciprocate on a horizontal guide and operated by the means described with the adjustable cushioned stop and the elastic cushion 10, applied at the end of said guide, substantially as described.

4. In a cash-carrier apparatus, the combination, with a supporting-bracket having a hollow pendant, of a reciprocating car push-block, an actuating or pull cord therefor, and a car-propelling spring applied

402,568.

to this cord and arranged within the hollow pendant, to operate substantially as described.

5. The combination, with the way of a store-service apparatus, of a push-block supported by a guide to move parallel with the way, said guide extending parallel with and along the terminal part of the way traversed by the car, and connections between the block and the station of the attendant, whereby the block may be moved by the latter to propel the carrier upon the way, substantially as set forth.

6. The combination of the way, a push-block guided over the end of the way traversed by the car and moving parallel thereto and having a projection extending in close proximity to the way, and a carrier provided with a bearing for contacting with said projection, whereby the contact between the push-block and the carrier is in immediate proximity to the way, substantially as and for the purpose set forth.

7. The combination of the way, a car, a guide projecting over the end of the way traversed by the car, a push-block upon the guide, a flexible connection extending to the operator's station, whereby the push-block may be moved in one direction, and a spring for moving the push-block in the opposite direction, substantially as set forth.

8. The combination of the way, a guide, a push-block, and a connection extending from the latter to the station, a jointed connecting-rod, I, connecting the push-block and its support, and a spring acting to extend the said rod and retract the push-block, substantially as set forth.

9. The combination of the way, a sliding push-block, a guide therefor extending parallel with and along a portion of the way traversed by the carrier, a flexible connection between the push-block and the operator's station, and a spring in the line of the said connection and constituting a part thereof, substantially as set forth.

10. The combination of the way, a guide supported by a tubular rod, a push-block upon the guide, and a flexible connection extending from the push-block to the operator's station and through the tubular rod, substantially as set forth.

11. The combination, with the guide and its support, of the push-block, a connection extending from the latter to the operator's station, and a spring in the line of said connection inclosed by a concealing-casing, substantially as set forth.

12. The combination of the way and a bracket or hanger consisting of a vertical rod terminating above the way and having a horizontal guide, a push-block sliding upon the guide, and a flexible connection extending from the push-block around guide-pulleys upon the hanger to the operator's station, substantially as set forth.

13. The combination of the way, a horizontal guide carrying a push-block, a vertical tubular rod supporting the guide and provided with guide-pulleys, and a flexible connection between the push-block and operator's station, extending from the push-block around said pulleys and through the tubular rod, substantially as set forth.

14. The combination, with the bracket provided with a horizontal guide and sliding push-block, of elastic buffers, one of which is adjustably arranged to limit the movements of the push-block to regulate the force acting on the car, substantially as set forth.

15. The combination, with the way and a device for propelling the car upon the way, of yielding catches provided with shoulders or bearings, and contact-pieces, one supported adjacent to the way, but inside of the fixed end thereof, to permit the car to pass beyond the same toward said end, and the other upon the car and arranged to permit the unobstructed inward movement of the car and to offer a frictional resistance to the outward movement thereof, substantially as set forth.

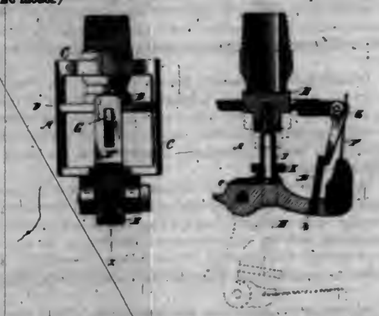
16. The combination, with a way and a propelling device, of a car provided with contact-pieces and yielding catches supported adjacent to and on opposite sides of the way in position to be struck by said contact-pieces to yield to the inward movement of the car, and with shoulders affording a frictional resistance to the outward movement of the car, substantially as set forth.

17. The combination, with the way and a car provided with yielding contact-pieces, of pivoted catches upon opposite sides of the way hung to swing freely upon the inward movement of the car and provided with springs for throwing them outward to offer a frictional obstruction to the outward movement of the car, substantially as set forth.

18. The combination of the way, a car, and yielding contact-pieces and pivoted catches on opposite sides of the way, actuating-springs, bearings, and set-screws 22, substantially as and for the purpose set forth.

19. The combination of the yielding shouldered catches E E and a car provided with two contact-pieces consisting of vertical yielding rollers, substantially as set forth.

20. The combination of the way, a car, catches, and a yoke provided with arms having converging faces or sides *v v*, substantially as and for the purpose described.

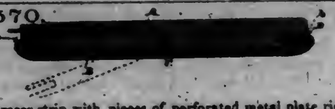


21. The combination with the way, a guide, a propelling device, and a car, of a yoke supporting catches for retaining the car and supported by the guide, substantially as set forth.

22. The combination of a car having bevel-ended catch-bolts upon the frame and a detachable receptacle provided with a continuous end flange, 41, having a beveled upper edge, and lugs forming part of and below said flange, and having inclined faces at the sides thereof, substantially as and for the purpose set forth.

23. A store-service car provided with vertical elastic rollers 29 on opposite sides of the center of the car, substantially as and for the purpose set forth.

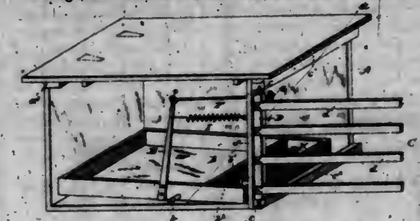
24. The combination of a way and a hanger consisting of a vertical rod and a horizontal rod having its lower end above the way, constituting a guide for the push-bar, and extending from the vertical rod over the way and toward the station, substantially as set forth.



402,569. AUTOMATIC SPRINKLER. DYER H. DAVIS and REUBEN WESTERVELT, Elmira, N. Y. Filed Sept. 4, 1888. Serial No. 284,569. (No model.)

Claim.—1. The combination, with a sprinkler-valve, of a drop holding the valve to its seat, a detent for the drop, and a piece of hard rubber serving as a stop for the detent, whereby, when the hard rubber softens, the drop and valve will be released, as and for the purpose set forth.

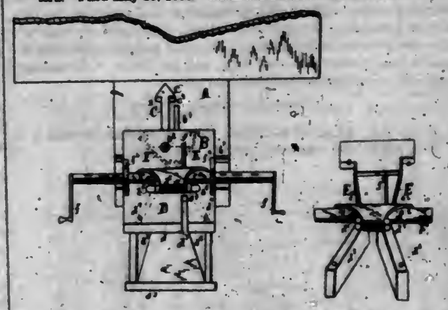
2. In a sprinkler, a connecting-pipe and a frame supported thereby, the said frame in its turn supporting an apron and a pivot-drop, in combination with a detent for the drop supported by the apron and a piece of hard rubber held frictionally within the drop, serving as a stop for the detent, whereby, when the hard rubber softens, the drop and valve will be released, as and for the purpose set forth.



402,570.

justable eraser-strip with pieces of perforated metal plate rigidly attached to the ends, all substantially as set forth.

2. In a blackboard-eraser, the combination of a hand block or frame with an adjustable eraser-strip having attached to each end thereof strips of metal plate perforated in the manner shown, as and for the purpose specified.



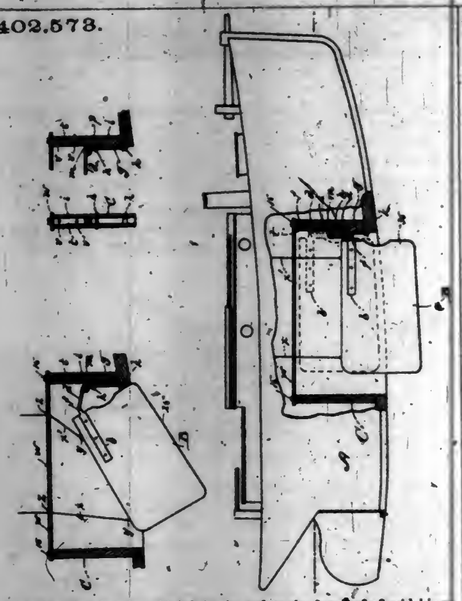
402,571. NEST-BOX FOR FOWLS. ALEXANDER K. DRESSER, Millsborough, Pa. Filed Jan. 28, 1889. Serial No. 297,906. (No model.)

Claim.—1. The combination, with the box A, of the tray B, pivoted in the sides of said box, the gate C, hinged to the latter, as described, the upright post E, attached to one side of the tray B, and the rod F, attached at one end to said post and at its other end to the gate, in the manner and for the purpose specified.

2. The combination, with the box A, of the tray B, pivoted in the sides of said box, the gate C, hinged to the latter, as described, the upright post E, attached to one side of the tray B, the rod F, attached at one end to said post and at the other end to the gate, and the spring I, attached at one end to the post and at the other end to the box A, in the manner and for the purpose specified.

402,572. CAR-COUPLING. ALBERT G. DENNARD, Cypress Ridge, Ark. Filed May 25, 1888. Serial No. 275,066. (No model.)

Claim.—In a car-coupler, the combination, with the draw-head B, having a transverse slot in its upper face, of the cam d^3, working in said slot, the arm f^7, secured rigidly to the cam-supporting bar and working in a longitudinal opening in the draw-head, the jaws d^2, located in the draw-head, and springs F^2, for forcing the jaws in, substantially as described.

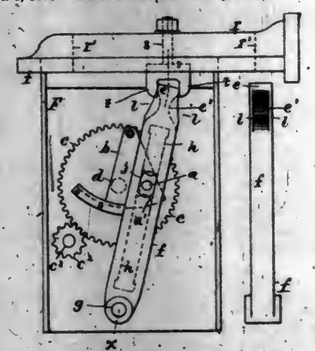


402,573. CENTER-BOARD. CHARLES A. DURFEE, Boston, Mass., and RICHARD M. SMITH, Providence, R. I. Filed Jan. 11, 1889. Serial No. 296,962. (No model.)

Claim.—1. The combination of a center-board box, a center-board adapted to slide vertically therein, a hinge movable vertically in said box, a support for one leaf of said hinge, the other leaf thereof being pivotally connected to one of the upper corners of said center-board, and two suspension-lines connected to said center-board near opposite ends thereof.

2. In a boat, the combination of a center-board box, a hinge having one leaf loosely disposed between a guard-pin and one of the box-stanchions, a lip on the knuckle of said hinge resting on a shoulder in said stanchion, a stop-plate engaging said lip, and a center-board pivoted by one end to the free leaf of said hinge, substantially as described.

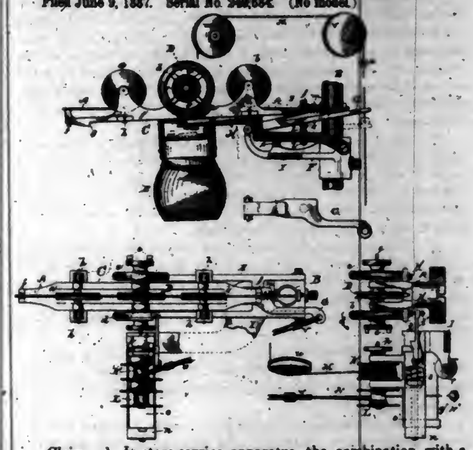
3. In a boat, the combination of a center-board box provided with a detachable cap, a board fitted to slide vertically in said box, a hinge detachably secured by one leaf to a box-stanchion, straps on said



402,573.

board having lugs by which it is pivoted to the free leaf of said hinge, a lip on the hinge resting on a shoulder in said stanchion, a detachable stop-plate on the stanchion engaging said lip, and ropes secured to said board and working in openings in said cap, substantially as described.

4. In a boat, the combination of the box C, the board B, fitted to slide therein, a hinge having the leaf *g*, resting on a hook, *k*, and disposed between a pin, *h*, and a stanchion, *i*, of said box, the free leaf *d* of said hinge being pivoted to said board, the lip *m* on the hinge-knuckle and resting on a shoulder, *p*, of said stanchion, the detachable plate *t*, engaging said hinge, and the lines *x x'* for manipulating said board, substantially as described.



402,574. SHAPING-MACHINE. ULRICH EBERHARDT, Newark, N. J. Filed Dec. 8, 1888. Serial No. 292,901. (No model.)

Claim.—1. In a crank-planer, the combination, with the ram *r*, the crank-pin *a*, and the crank for driving the pin, of the crank-lever *f*, formed with the slot *h* in one side adjacent to the crank, the crank-pin box fitted movably thereto, the web *i*, connecting the bars upon the opposite sides of the slot, and the aperture *j* through such web, the whole arranged and operated as and for the purpose set forth.

2. In a crank-planer, the combination, with the ram *r*, the crank-pin *a*, and the crank for driving the pin, of the crank-lever *f*, formed with the slot *h* in one side adjacent to the crank and having the crank-pin box fitted movably thereto, the web *i*, connecting the bars upon the opposite sides of the slot, the rounded head *e*, connected with the lever by the neck *e'*, the flanges *l*, projected at opposite sides of the neck, and the lugs *t*, connected with the ram and fitted to the opposite sides of the head, as and for the purpose set forth.

402,575. STORE-SERVICE APPARATUS. HENRY RICHRATH, Mount Vernon, N. Y., assignor to William S. Lamson, Lowell, Mass. Filed June 9, 1887. Serial No. 240,654. (No model.)

Claim.—1. In store-service apparatus, the combination, with a way, of a receptacle-carrier traveling upon the way, and a weighted wheel on the carrier adapted to be spun and having sufficient weight to propel the carrier from one end of the way to the other by its momentum, substantially as set forth.

2. In store-service apparatus, the combination, with a way, of a receptacle-carrier traveling upon the way, a weighted wheel on the carrier adapted to be spun and having sufficient weight to propel the carrier from one end of the way to the other by its momentum, and a catch for holding the carrier at the end of its movement, substantially as set forth.

3. In store-service apparatus, the combination, with a way, of a receptacle-carrier traveling upon the way, a weighted wheel on the carrier adapted to be spun and to propel the carrier along the way by its momentum, and a rotating spinning device for spinning said wheel at the end of the way, substantially as set forth.

4. In store-service apparatus, the combination, with a way, of a receptacle-carrier traveling upon the way, a spinning traction-wheel on the carrier for propelling it along the way, and a platform for raising the traction-wheel out of contact with the way, substantially as set forth.

5. In store-service apparatus, the combination, with a way, of a receptacle-carrier traveling upon the way, a spinning traction-wheel on the carrier for propelling it along the way, a platform for raising the traction-wheel from the way, and a spinning device for spinning the said traction-wheel when raised by the platform, substantially as set forth.

6. In store-service apparatus, the combination, with a way, of a carrier traveling upon the way, a spinning traction-wheel on the carrier for propelling it along the way, a spinning device and operating-cord for spinning the traction-wheel, and a catch for holding the carrier, said carrier being automatically released from the catch, substantially as set forth.

7. In store-service apparatus, the combination, with a way, of a receptacle-carrier traveling upon the way, a spinning traction-wheel on the carrier for propelling it along the way, a spinning device brought into connection with the traction-wheel at the end of the way, and an operating-cord, said spinning device being automatically withdrawn from its connection with the traction-wheel, substantially as set forth.

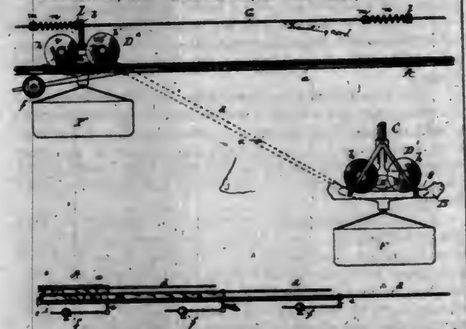
8. In store-service apparatus, the combination, with a way, of a receptacle-carrier traveling upon the way, a spinning traction-wheel on the carrier for propelling it along the way, a platform for raising the traction-wheel from the way, and a spinning device, the spinning device being automatically withdrawn by the depression of the platform before the traction-wheel touches the way, substantially as set forth.

9. In store-service apparatus, the combination, with a way, of a receptacle-carrier traveling upon the way, a spinning traction-wheel on the carrier for propelling it along the way, a platform raising the traction-wheel from the way, a catch-bar for holding the carrier on the platform, an operating-cord, and a button thereon for simultaneously releasing the carrier from the catch and lowering the traction-wheel to the way, substantially as set forth.

10. In store-service apparatus, the combination, with a way, of a receptacle-carrier traveling upon the way, a spinning traction-wheel on the carrier for propelling it along the way, a platform and catch for raising the traction-wheel from the way and locking the carrier, a spinning device brought into connection with the traction-wheel, the operating-cord for working the spinning device, and a button thereon engaging the catch, and thereby releasing the carrier from the catch, depressing the platform, and withdrawing the spinning device, substantially as set forth.

11. In store-service apparatus, the combination, with a way, of a receptacle-carrier traveling upon the way, a spinning traction-wheel on the carrier for propelling it along the way, a spinning device, an operating-cord, and a weight for winding up the operating-cord, substantially as set forth.

12. In store-service apparatus, the combination, with a way, of a carrier traveling upon the way, a spinning traction-wheel on the carrier for propelling it along the way, a spinning device mounted on a spring-retracted slide, and a latch for locking the slide forward, said latch being automatically released, substantially as set forth.



13. In store-service apparatus, the combination, with a way, of a receptacle-carrier traveling upon the way, a spinning traction-wheel on the carrier for propelling it along the way, a vertically-movable platform upon which the carrier runs to raise the traction-wheel from the way, and the side rollers on the carrier for riding on such platform, substantially as set forth.

14. In store-service apparatus, the combination, with a way, of a receptacle-carrier traveling upon the way, a spinning traction-wheel on the carrier for propelling it along the way, the pivoted inclined platform, the catch-bar, a spring for throwing the platform up, a spring for raising the catch-bar from the platform, and a button on the operating-cord engaging the catch-bar, so that the catch-bar will be depressed, and will in turn depress the platform, substantially as set forth.

15. In store-service apparatus, the combination, with a way, of a receptacle-carrier traveling upon the way, a spinning traction-wheel on the carrier for propelling it along the way, the inclined platform and catch, and the two end wheels on the carrier for permitting the traction-wheel to be raised from the way while one end wheel rests thereon, substantially as set forth.

16. In store-service apparatus, the combination, with a way, of a receptacle-carrier traveling upon the way, a spinning traction-wheel on the carrier for propelling it along the way, the inclined pivoted platform, the catch-bar, the springs for supporting the platform and catch-bar, the spinning-spindle mounted on a spring-retracted slide, the latch for holding the slide forward, released by the downward movement of the platform, and the operating-cord wound on a drum on the spinning-spindle and connected with the tail of the catch-bar, substantially as set forth.

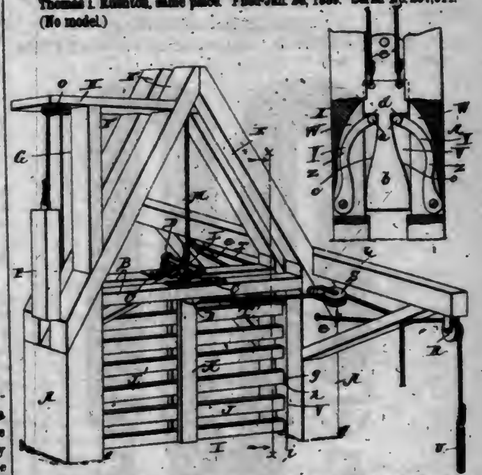
402,576. STORE-SERVICE APPARATUS. HENRY RICHRATH, Mount Vernon, N. Y., assignor to William S. Lamson, Lowell, Mass. Filed June 20, 1887. Serial No. 242,022. (No model.)

Claim.—1. In store-service apparatus, two or more tracks extending parallel throughout their length and supported close together as a single structure, such tracks being in succession from one side of the structure to the other, each of greater length than the immediately preceding track, in combination with wheeled carriers riding on the separate tracks, and having frames or bails depending on that side of the track structure on which the tracks terminate, substantially as set forth.

2. In store-service apparatus, two or more tracks extending parallel throughout their length and supported close together as a single structure, such tracks being in succession from one side of the structure to the other, each of greater length than the immediately preceding track, in combination with wheeled carriers riding on the separate tracks, and having frames or bails depending on that side of the track structure on which the tracks terminate, the depending frames or bails having for the carriers of the longer tracks a greater lateral extension both above and below the track structure than for the carriers of the shorter tracks, substantially as set forth.

3. In store-service apparatus, two or more tracks extending parallel throughout their length and supported close together as a single structure, such tracks being in succession from one side of the structure to the other, each of greater length than the immediately preceding track, in combination with wheeled carriers riding on the separate tracks, and having frames or bails depending on that side of the track structure on which the tracks terminate, and a pivoted end section at the end of each track for transferring the carrier riding on that track to a station at that point, substantially as set forth.

4. In store-service apparatus, two or more tracks extending parallel throughout their length and supported close together as a single structure, such tracks being in succession from one side of the structure to the other, each of greater length than the immediately preceding track, in combination with wheeled carriers riding on the separate tracks, and having frames or bails depending on that side of the track structure on which the tracks terminate, and a counterbalanced pivoted end section at the end of each track which is depressed by the carrier and transfers the carrier riding on that track to a station at that point, and then returns to position to permit the passage of carriers for more distant stations, substantially as set forth.



402,577. CAPODASTRO. LARSEN FILSTRUP, Chicago, Ill. Filed Aug. 20, 1888. Serial No. 284,099. (No model.)

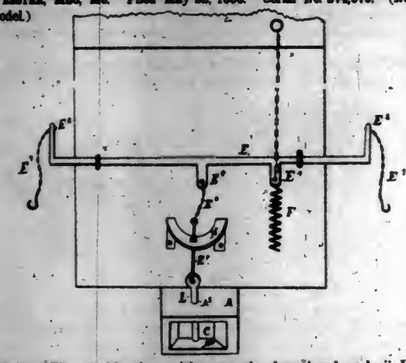
Claim.—1. Upon a capodastro, the combination of cushion D, constructed with clasping-lips *d d*, with spring C, as specified and shown.

2. On a capodastro constructed substantially as above described, an elastic spring hinged to the under side, substantially in form as indicated by C, forming of itself a latch and fitting into a corresponding slot.

402,578. GATE. GIDEON PLANK, Centre Valley, Ind., assignor to Thomas I. Rushton, same place. Filed Jan. 26, 1889. Serial No. 297,611. (No model.)

Claim.—1. The combination, with the gate-post and the gate having notches in the opposite sides of its end bar, of the inwardly-swinging detents pivoted within the posts and having locking-pins at their upper ends engaging the notches in the end bar of the gate, as set forth.

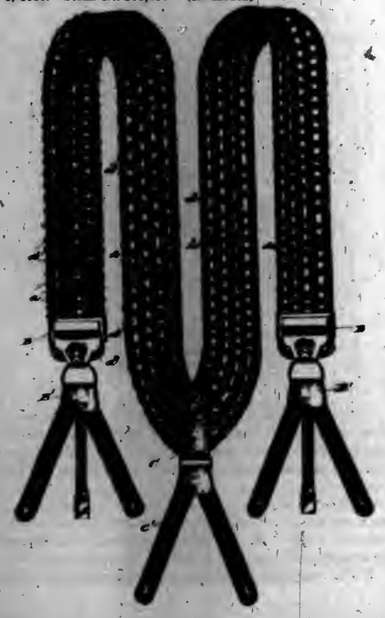
2. The combination, with the gate-post, of the detents pivoted therein and having locking-pins at their inner ends, and the gate having the lower end of its end bar tapered, and having notches in the opposite sides of the end bar, as and for the purposes set forth.



3. The combination, with the post and the gate, of the detent piv-

oted in the post and adapted to engage the gate, the disengaging-plate having inclined surfaces bearing against the detent, and mechanism for raising said disengaging-plate, as set forth.

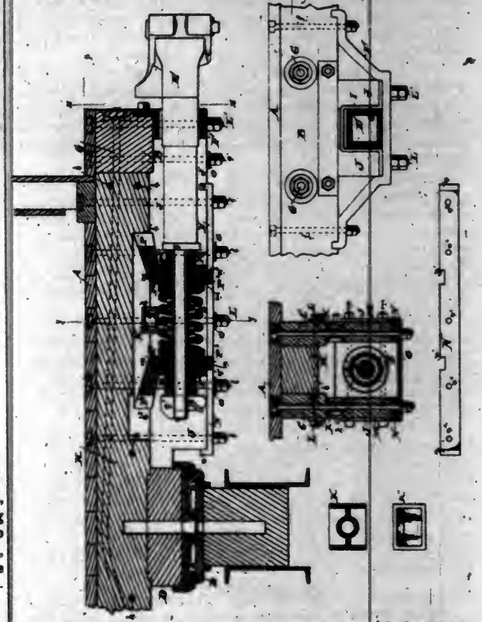
4. The combination, with the post, of the gate moving vertically between the posts and having notches in the opposite sides of its end bar, a lifting-weight connected to the gate to raise the same, mechanism for lowering the gate, and the latches arranged within the posts and engaging the notches in the end bar of the gate to hold it lowered, as set forth.



5. The combination, with the gate-post, the latch arranged within one of the posts and adapted to hold the gate lowered, the converging standards E, secured thereon, the frame F, erected on said standards, the pulleys in said frame, the gate moving between the posts, the T-casting at the upper end of the gate, the cable secured to said casting and extending over the pulleys in the frame F, and provided with a weight, the bar Q, the pulleys K at the ends of the same, the pulleys S at the upper ends of the gate-posts, and the cable passing over said pulleys and secured to the ends of the T-casting, as specified.

402,579. CAR-COUPLING. HORACE P. FOSTER and ERNEST L. WEBSTER, Milo, Me. Filed May 22, 1888. Serial No. 274,679. (No model.)

Claim.—The combination, with a car, the draw-head, and pin L, of the cross-rod E, extending across the end of the car and having outwardly-extending arms, as E^4 and E^5, a spring, as F, attached to the under side of one of said arms, and a chain, E^3, having a rod, E^7, on its end attached to the other arm, and the guide H, secured to the car, said rod E^7 being connected with the pin L, substantially as described.



402,580. SUSPENDERS. BURKARD GOODMAN, New York, N.Y. Filed Jan. 3, 1889. Serial No. 295,763. (No model.)

Claim.—1. As an improved article of manufacture, a suspender consisting of shoulder-straps formed of warp cords or threads interlaced or interwoven with braids or threads to form ventilating interstices or reticulations having adjustable buckles carrying tabs, and a rear tab centrally secured thereto, substantially as described.

2. As an improved article of manufacture, a suspender consisting of shoulder-straps formed of elastic warp-cords interlaced with braids to form ventilating interstices or reticulations having adjustable buckles carrying tabs, and a rear tab centrally secured thereto, substantially as described.

402,581. DRAFT-RIGGING FOR RAILWAY-CARS. JAMES A. GRAHAM, Fort Wayne, Ind. Filed Sept. 8, 1888. Serial No. 284,572. (No model.)

Claim.—1. In a draft-rigging, the combination, with the center stringers, of a railway-car with a block, H, framed between and bolted securely to said stringers, draft-timbers J J, cross-straps O, and draft-irons N N, bolted firmly together and to the center stringers, and buffer-blocks secured between the draft-timbers and bolted thereto.

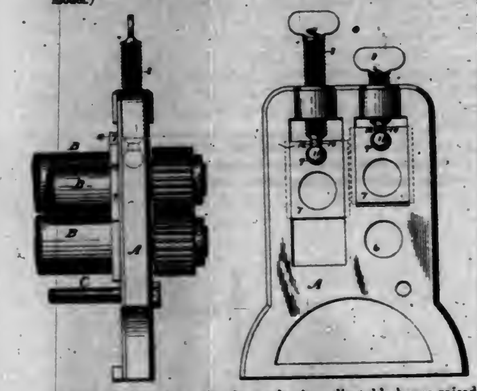
2. In a draft-rigging, the combination, with the center stringers, of a railway-car with a block, H, framed between and bolted securely to said stringers, draft-timbers J J, cross-straps O, and draft-irons N N, having slots n' n' bolted firmly together and to the center stringers, and buffer-blocks having their lower edges formed to enter slots n of the draft-irons secured between the draft-timbers and bolted thereto.

3. In a draft-rigging, the combination, with the center stringers, of a railway-car with a block, H, framed between and bolted securely to said stringers, draft-timbers J J, cross-straps O, and draft-irons N N, bolted firmly together and to the center stringers, and buffer-blocks P, having upwardly-extending shoulders P', formed to extend above and rest against shoulders h' h^3, formed in block H, said blocks being secured between the draft-timbers and bolted thereto.

4. In a draft-rigging, the combination, with the center stringers of a railway-car with a block, H, framed between and bolted securely to said stringers, draft-timbers J J, cross-straps O, and draft-irons N N, having slots n' n' bolted firmly together and to the center stringers, and buffer-blocks P, having their lower edges, P^2, formed to enter the slots n' of the draft-irons, shoulders P', formed to extend above and rest against shoulders h' h^3, formed in block H, said blocks being secured between the draft-timbers and bolted thereto.

402,582. STOVE-PIPE FORMER. HIAL S. GRAVES, Southington, Conn., assignor to the Peck, Stow & Wilcox Company, same place. Filed Feb. 6, 1889. Serial No. 298,895. (No model.)

Claim.—1. The combination of the non-adjustable upper roller, C, hinged box 11, for holding and releasing one end of said roller, mechanism for tilting said roller, and two under rollers provided with adjusting-screws 8, for adjusting said under rollers relatively to the upper tilting roller, substantially as described, and for the purpose specified.

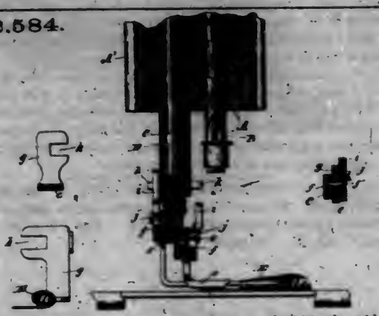


2. The combination, in a former, of the hinged box 11, the upper roller, C, provided with a shaft-like projection having a peripheral groove, 17, the rigid horn 18 upon the frame, provided with a fulcrum-bead for said shaft-like projection, the box 20, and lifting-screw 23, for lifting said roller and swinging it on its fulcrum at the end of the rigid horn 18, substantially as described, and for the purpose specified.

3. In a former having an upper tilting roller, the combination of the frame B, provided with the lug 15, the hinged box 11, for holding one end of said upper roller, the link 13, hinged to the outer end of said box, and the cam-lever 14, substantially as described, and for the purpose specified.

4. In a former having an upper tilting roller provided with a shaft-like projection having the peripheral groove 17, the frame B, having the horn 18 and fulcrum-bead 19, fitted to said groove 17, the projecting ledges 22, also formed on said frame, and the box 20 and lifting-screw connected thereto, said box 20 being provided with side ledges, the faces of which, together with the faces of the ledges 22, are on the arc of a circle of which the fulcrum-bead 19 is the center, substantially as described, and for the purpose specified.

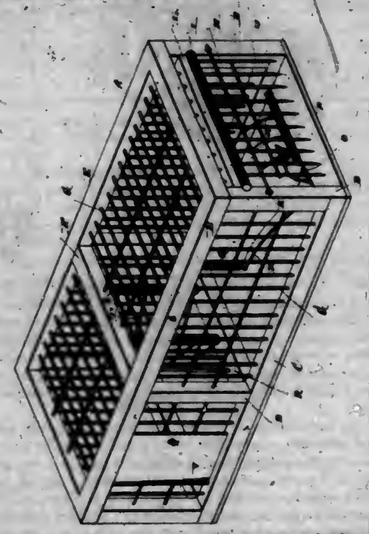
402,583. ADJUSTABLE BOX FOR STOVE-PIPE FORMERS. HIAL S. GRAVES, Southington, Conn., assignor to the Peck, Stow & Wilcox Company, same place. Filed Feb. 6, 1889. Serial No. 298,896. (No model.)



Claim.—1. In a stove-pipe former having adjustable boxes raised and lowered by screws, the combination of lifting-screws 8, provided with a narrow neck and knob, the shoulder or upper part of which is rounded off, substantially as described, and the boxes 7, provided with a transverse recess and narrow slot, the overhanging walls of which are fitted to the upper rounded shoulder of the knobs of said screws, substantially as described, and for the purpose specified.

2. In a stove-pipe former having adjustable boxes raised and lowered by screws, the combination of the lifting-screws 8, provided with a narrow neck and spherical knob, 11, and the boxes 7, provided with transverse recesses of a cylindrical form and a narrow slot opening into said recesses, substantially as described, and for the purpose specified.

402,584. ATTACHMENT-HOLDER FOR SEWING-MACHINES. JOHN M. GRIMM, Chicago, Ill., assignor to The Singer Manufacturing Company of New Jersey. Filed Dec. 27, 1887. Serial No. 259,069. (No model.)



Claim.—1. The combination, with a sewing-machine head carrying the usual needle and presser bars, of an attachment-holding bar independent of the said needle and presser bars, rigid with the said head, depending from the latter rearward of the said needle-bar, and provided at its lower end with a screw clamping device, by which attachments may be removably secured thereto in operative position.

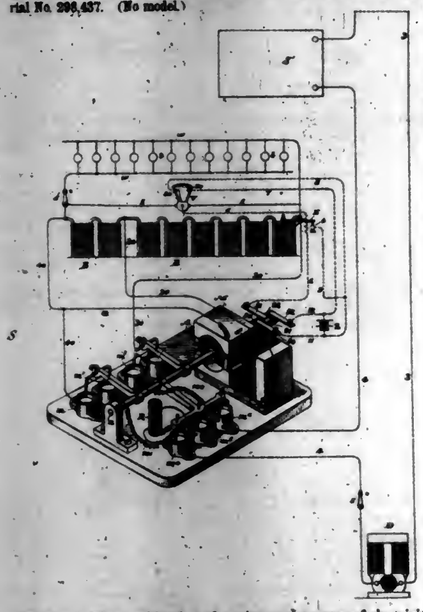
2. The combination, with a depending sewing-machine head, of a tubular attachment-holding bar rigidly secured within the said head and surrounding the presser-bar, said attachment-holding bar being separate from the said head and the said presser-bar, and being provided at its lower end with a clamp, by which attachments may be removably secured thereto in operative position.

3. The combination, with a vertical bar having a horizontal lug or tenon on its face near its lower end, of a presser-foot or attachment having a slotted shank, a screw tapped in the said bar through said tenon and having its head provided with a series of scalloped notches, a hand-lever to turn said screw, and a notched shanked screw tapped in said hand-lever and connecting the latter with the former screw.

402,585. TRAP. THEOPHILUS GRIFFIN, Sheridan, Ark., assignor of two-thirds to J. M. Hall and W. W. Wilkeson, same place. Filed Jan. 30, 1889. Serial No. 298,093. (No model.)

Claim.—1. The combination, with the frame having an open front end, of the vertically-swinging door mounted in said open end, the cam arranged within the trap in rear of the door and bearing on the same, and a spring acting on said cam to hold the door normally closed, as set forth.

2. The combination of the frame having an open front end, the inwardly and upwardly swinging door mounted therein, the rock-shaft arranged in rear of the said door, the cam secured on said shaft and bearing on the door and provided with a rearwardly-projecting arm, and the spring extending between said arm and the top of the frame, as set forth.



3. The combination of the frame having an open front end, the door mounted therein and consisting of a cross-bar and a series of depending wires or fingers secured thereto, the rock-shaft mounted in the frame in rear of the said door, the fingers projecting from said shaft, the cam secured on said shaft and bearing against the door and provided with a rearwardly-extending arm, and the spring extending between the said arm and the top of the frame, as set forth.

4. The combination, with the frame having an open front end, of the inwardly and upwardly swinging door mounted in said end, mechanism for holding said door normally closed, the transverse par-

tition within the frame, the rearwardly-extending doors projecting from said partition, and the spring secured to and extending between the said doors, as set forth.

5. The combination of the frame having an open front end, the inwardly and upwardly swinging doors mounted in said end, the transverse partition in the frame, the doors comprising the vertical posts journaled in the top and bottom of the frame, the fingers projecting rearwardly from said posts, and the coiled spring secured to and extending between said fingers, as set forth.

402,586. DISTRIBUTION OF ELECTRICITY BY SECONDARY BATTERIES. WILLIAM W. GIBBON, Haverford College, assignor to the Electro Dynamic Company, Philadelphia, Pa. Filed Feb. 2, 1889. Serial No. 298,437. (No model.)

Claim.—1. The combination of a primary generator of electricity located in a charging-circuit, a secondary battery to be charged from said circuit, a switching device for changing the position of said battery with respect to the charging-circuit, and means for automatically controlling said switching device, consisting of an indicating-instrument in circuit with the battery, a local circuit operated thereby, and a polarized electro-magnet having a double winding, substantially as described.

2. The combination of a charging-circuit containing a suitable source of electricity, a secondary battery, and means for automatically changing the position of said battery with respect to said circuit, consisting of a suitable switching device, an electro-magnet having two coils or windings, a local battery normally in circuit with both windings, and means for rendering either coil effective, consisting of an indicating-instrument in circuit with the battery and operating a local-circuit switch, substantially as described.

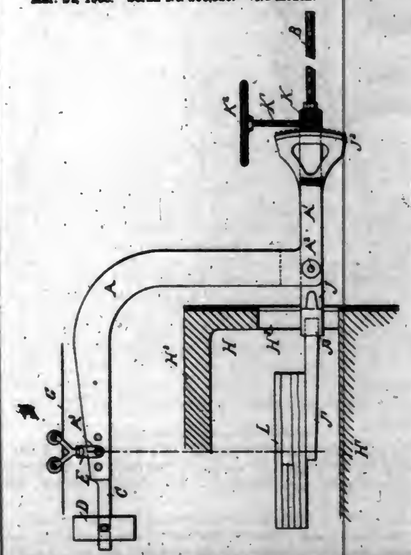
3. The combination of a charging-circuit containing a suitable source of electricity, a secondary battery, and means for automatically changing the position of said battery with respect to said circuit, consisting of a suitable switching device, an electro-magnet for operating said device, a local circuit therefor, an indicating-instrument in circuit with the battery controlling said local circuit, and a circuit-closer in said local circuit operated by the accumulation of gas due to the current of charge, substantially as described

4. The combination of a charging-circuit containing a suitable source of electricity, a secondary battery, a suitable switching device for inserting and withdrawing said battery with respect to said circuit, means for automatically operating said switch in either direction, and means for operating said switch to withdraw said battery, consisting of a circuit-closer controlled by the accumulation of gas in a cell due to the operation of the charging-current, substantially as described.

5. The combination of a charging-circuit containing a suitable source of electricity, a secondary battery, a switching device for inserting and withdrawing said battery with respect to said circuit, means for automatically operating said device, consisting of a permanently-magnetic field, a magnetic core in said field having two parallel windings, a local battery in circuit with both windings, and a circuit-closer for practically neutralizing one winding to render the other effective, substantially as described.

6. The combination of a charging-circuit containing a suitable source of electricity, a secondary battery, a switching device for inserting and withdrawing said battery with respect to said circuit, and means for automatically operating said device to withdraw said battery when subjected to a current of abnormal intensity or duration in the charging-circuit, consisting of an electro-magnet, a local circuit therefor, a circuit-closer in said local circuit, and a cell of battery having an inverted dish or bell to catch the evolved gases, a pipe or outlet, and a cock or valve controlling the passage through said pipe, substantially as described.

7. The combination of a charging-circuit containing a suitable source of electricity, a secondary battery, an artificial resistance in amount equal to the effect produced by the counter electro-motive force and resistance of said battery, and a switching device for inserting and withdrawing said battery and said resistance with respect to the charging-circuit, successively, substantially as described.



402,587. MEANS FOR CONNECTING SPINDLES TO THE WALLS OR DOORS OF SAFES. HENRY GRAM, Chicago, Ill., assignor to the Chicago Safe and Lock Company, same place. Filed June 28, 1888. Serial No. 278,404. (No model.)

Claim.—1. The combination, with the door or wall of a safe or vault, of a spindle provided with a shoulder or offset and a recessed nut or plug formed with a slot or cut-away space, whereby said nut or plug is rendered expansible, substantially as described.

2. The combination, with the door or wall of a safe or vault, of a spindle provided with a conical shoulder and a nut or plug provided with a conical recess, said nut or plug being split to permit it to expand by the action of forcing inward the spindle, substantially as described.

402,588. PEEL FOR HEATING-FURNACES. SAMUEL M. GOSS, Pottstown, assignor of one-half to Jacob S. Ammon, Reading, Pa. Filed Mar. 24, 1888. Serial No. 268,329. (No model.)

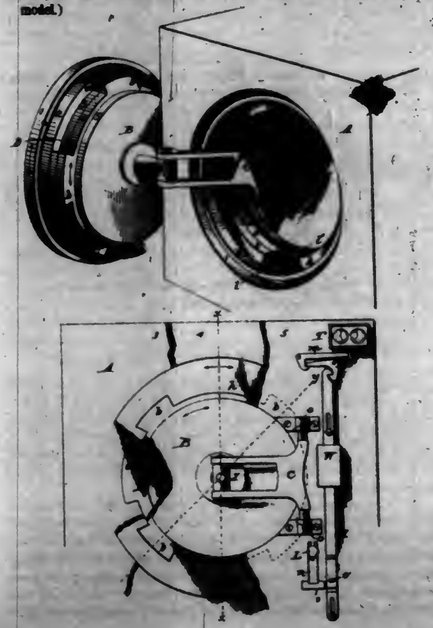
Claim.—1. An apparatus for charging furnaces, consisting of a peel secured to a bent arm movably suspended at a point vertically above a weight on the peel-blade J', substantially as and for the purpose set forth.

2. An apparatus for charging furnaces, consisting of a peel secured to a bent arm movably suspended at a point vertically above a weight on the peel-blade J', and a counter-balance, D, substantially as and for the purpose set forth.

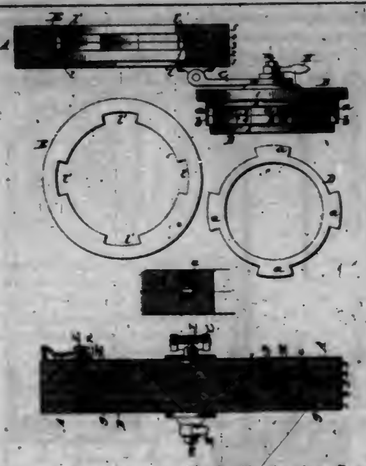
3. The combination, with the movably-suspended bent arm A, having a guide-handle, of a blade, J', pivoted to said arm and adapted to be raised or lowered without moving said arm, substantially as and for the purpose set forth.

4. The combination of the bent arm, the operating-handle, the pivot-blade, with a quadrant, J^3, and the worm K, all arranged substantially as and for the purpose set forth.

5. In a peel for charging furnaces, the blade J', removably secured to an operating-handle, substantially as and for the purpose set forth.



402,589. ICE-ELEVATOR. JOHN HALL, Creston, Iowa. Filed Dec. 4, 1888. Serial No. 292,642. (No model.)



Claim.—1. An ice-elevating apparatus comprising, essentially, a rigid inclined frame, a platform at the lower end thereof adapted to be let into a lake and adjustably connected with said rigid frame, the platform being supported on uprights which carry threaded rods for raising and lowering said platform, substantially as specified.

2. The combination, with the main frame, of the platform, the uprights having threaded apertures at their upper ends, the threaded adjusting-rods secured at their lower ends to the platform and bearing in the threaded apertures of the uprights, and the link connecting the platform with the main inclined frame, substantially as specified.

402,590. SAFE. JOSEPH L. HALL, Cincinnati, Ohio; Sarah J. Hall, Edward C. Hall, and Richard T. Pullen executors and trustees of said Joseph L. Hall, deceased. Filed Jan. 5, 1889. Serial No. 295,792. (No model.)

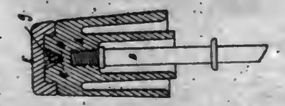
402,590.

Claim.—1. In combination with the circular door B, provided with lateral projections *b*, the loose ring E, provided with correspondingly-shaped recesses located in the wall of the safe in line with the projections *b* of the door when the latter is closed, substantially as and for the purpose set forth.

2. In combination with the circular door B, the loose ring D, provided with lateral projections *a*, said ring being so located in the door that when the latter is closed the projections *a* of said ring shall occupy the recesses *l* in the locking-plate of the wall, substantially as shown and described.

3. In combination with a safe and its door, one or more loose rings, constructed as described, located in each of said parts, respectively, and arranged to operate as set forth, whereby the lateral recesses in the door and its jamb are filled with solid metal when the door is closed.

4. In combination with the circular door, provided with lateral projections arranged to fit in the recesses *l* of the loose ring E and turn therewith, one or more locking-bolts, L, arranged to operate as described, whereby the ring E is prevented from turning, and thereby locking the door.

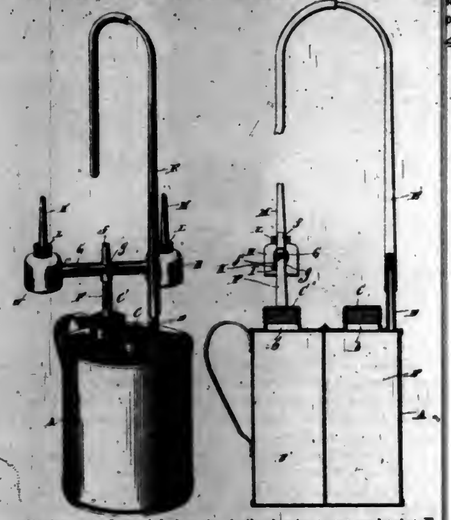


5. The combination, in a safe, of a movable ring, substantially such as shown, and a friction device arranged to hold the ring in position, substantially as described.

402,591. BUCKLE. RICHARD HASKEL, Burlington, Iowa. Filed Aug. 24, 1888. Serial No. 283,067. (No model.)

Claim.—In a harness-buckle, the combination, with the straight side bars having upturned ends provided with cross-bars forming loops, of a downwardly-projecting ear at the central point of each side bar, said ears being connected by a cross-bar, *d*, and two cross-bars, *e* and *f*, connecting the side bars at points intermediate the cross-bar *d* (or central loop) and the end loops, one of said cross-bars being provided with a post and the other with a pivot-hole, substantially as described.

402,592. ELECTRIC-WIRE INSULATOR. ARTHUR W. HEAVISIDE, Newcastle-upon-Tyne, England. Filed Nov. 14, 1888. Serial No. 290,770. (No model.) Patented in England Apr. 20, 1888, No. 5,913.

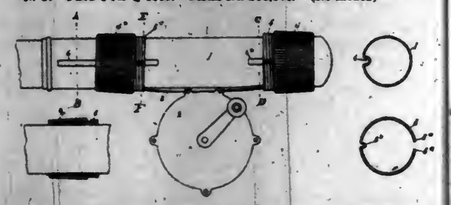


Claim.—1. A screw-cap for insulators, having a central projection, combined with an insulator having a central cavity to receive such projection and provided with a vertical slot to receive the wire, both the cap and insulator being screw-threaded, and the cap being adapted, when screwed home, to exert a pressure upon the wire, substantially as set forth.

2. A screw-cap for insulators, made with a central projection having an exterior thread, in combination with an insulator having a cor-

responding interior thread and a vertical slot to receive the wire, and adapted, when screwed home, to exert a pressure upon the wire inclosed in an elastic envelope or bed, substantially as set forth.

402,593. INHALER. DAVID R. HERSEY, Amsterdam, N. Y. Filed Sept. 8, 1888. Serial No. 284,916. (No model.)



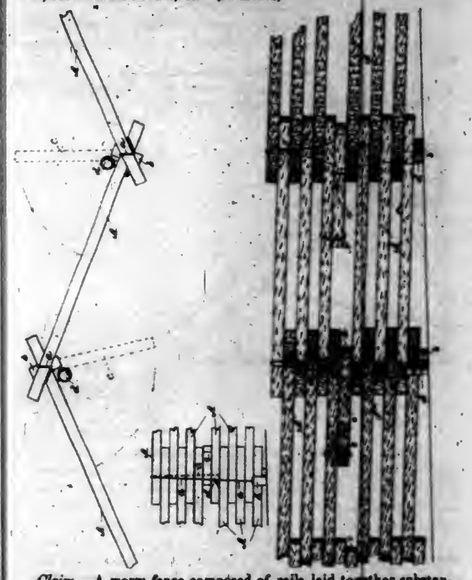
Claim.—1. In an inhaler, the boiler having a tapered tube, F, communicating with its upper end and provided with an opening, *f'*, the pipe G, provided with a transverse opening fitting over the upper end of the tube F, so that the bore of the pipe registers with the opening *f'*, and the cups on the ends of the pipe provided with outlet-tubes, substantially as specified.

2. In an inhaler, the boiler provided with a vertical tapered tube, F, an opening, *f'*, near its upper end, the tip *f*, fitting on the upper end of the said tube, the horizontal pipe G, provided with a transverse opening, *g*, fitting over the upper end of the tapered tube and held in place by the tip *f*, the detent or stud on the pipe G, to engage a socket or keeper on the side of the tapered tube, and the cups on the ends of the pipe G and provided with outlet-tubes, substantially as specified.

3. In an inhaler, the boiler B', having a screw-cap covering an opening in its top, the tube F, affixed to the said cap and provided with an opening, *f'*, the revolnble pipe G, fitting on the tube F and adapted to have one of its arms aligned with the opening *f'*, the cups on the ends of the pipe G, and the screw-caps on the said cups provided with tubes M M, substantially as specified.

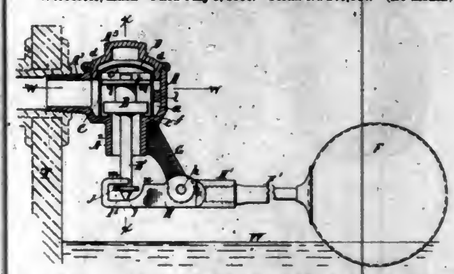
4. In an inhaler, the boiler provided with the compartments B B', provided with openings in their upper ends, which are covered by the screw-caps C C', the short tube D, communicating with the compartment B, the conductor-tube E, the short tube F, affixed to the screw-cap C', the horizontal pipe swiveled on the pipe F and communicating therewith, and the cups on the ends of the said pipe and provided with short outlet-tubes, substantially as and for the purpose specified.

402,594. FERRULE FOR REEL-PLATES. JAMES P. H. HOOK, Rome, N. Y. Filed Feb. 4, 1889. Serial No. 298,673. (No model.)



Claim.—1. The combination, with a fishing-rod, of a split ferrule directly embracing the rod and tapered upon its outer surface, and a thimble embracing the ferrule and oppositely tapered upon its inner surface, substantially as and for the purpose described.

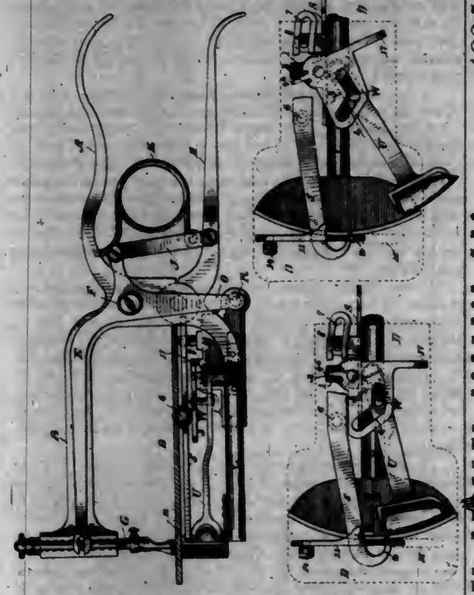
2. The combination, with a fishing-rod, of a pair of split ferrules directly embracing the rod and tapered upon their outer surfaces, and a pair of thimbles oppositely tapered upon their inner surfaces and each embracing one of the split thimbles, substantially as and for the purpose set forth.



3. The combination, with the rod longitudinally recessed at its butt, of the split ferrules having inwardly-extending projections to enter said recesses, and externally threaded and tapered oppositely to said ferrules and embracing the same, substantially as and for the purpose specified.

402,595. FENCE. GEORGE A. HOBB, Newark, N. Y. Filed Feb. 27, 1888. Serial No. 301,319. (No model.)

Claim.—A worm fence composed of rails laid together substantially in the usual manner, in combination with a wire or cable binder for the rails at the angle of the fence and a tightener for said binder, the binder being formed in a loop to encircle the upper rails of the fence, and said tightener for the wire binder being shorter than the rails of the fence and placed between the rails midway of the height of the fence, said tightener being passed through the loop and turned to a position parallel with the superincumbent rail and contiguous to the under surface thereof, and a fastener or holder for said tightener and superincumbent rail, substantially as shown and described.



402,596. AUTOMATIC FLOAT TANK-COCK. ALBERT P. HOWES, Worcester, Mass. Filed July 5, 1888. Serial No. 279,007. (No model.)

Claim.—1. The combination, substantially as described, of the shell A, provided with the arm (or arms) G and valve-seat *c*, the valve B, arranged to close onto said seat and having its depending stem provided with the flange J and rounded point I, the operating-lever H, provided with the stop surface I', overhanging ends *m*, and shoulder *n*, and the fulcrum-pin *h*, connecting said lever to the arm G, for the purposes set forth.

2. In combination, substantially as described, the body-shell A, having the internal chamber, *a*, with inlet and outlet passages, valve-seats *c* and *f*, and screw-cap A^1, the puppet-valve B, having the disk *b* and dependent stem B', provided with flange J and point I, the lifting-lever H, fulcrumed at *h* to the body-arm G, and engaging the point and flange of said valve-spindle, and the buoyant float F, all constructed and arranged for operating as and for the purpose set forth.

402,597. HAND SEWING-MACHINE. GEORGE I. HUSSELL, Bridgeport, Conn. Filed May 10, 1888. Serial No. 273,512. (No model.)

Claim.—1. The combination, with the stitch-forming and cloth-feeding devices of a hand sewing-machine, of a slide-bar arranged to reciprocate longitudinally beneath the bed-plate, a driving-plate pivoted upon the top of the slide-bar and provided with a curved slot, whereby movement is imparted to the carrier-bar, a detent for normally retaining said plate in its driving position, and means, as a handle, for turning said plate upon its pivotal point, whereby the carrier-bar and shuttle are projected beyond their normal limit of traverse and the latter carried to a point outside the edge of the bed-plate, substantially as specified.

2. The combination, with the stitch-forming and cloth-feeding device of a hand sewing-machine, of the driving-plate having a deflected slot thereon for the actuation of the shuttle and a tooth and handle thereon, as shown, a projection or bracket upon which said plate is pivoted, said bracket having a detent for the tooth, and means, as described, whereby movement is imparted to the said plate, substantially as described.

3. In combination with the needle and shuttle and means for driving the same, the feed-bar-operating lever having the curved slot near its heel end and the hook 9 at its other extremity, the reciprocating pin engaging said slot and actuating said lever, the forked feed-bar pivoted as to one end and spring-actuated away from the plate, and the incline and projection upon the feed-bar arranged within the field of the hooked end of the lever, and whereby said feed-bar is actuated in both directions, substantially as specified.

4. The combination, with the stitch-forming and cloth-feeding devices of a hand sewing-machine, of the stationary handle, the movable handle, the needle-bar-actuating lever and the link between the latter and the movable handle, and the spring whose coils are arranged in a vertical plane and the ends whereof are connected, respectively, to the stationary handle and a stud on the link, substantially as shown and described.

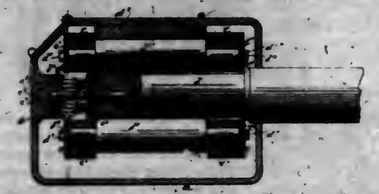
5. The combination, with the needle-bar and means for driving the same, of the swinging shuttle-carrier and its shuttle, the pivoted driving-plate having a deflected slot and a detent engaging the base on which it is pivoted, the curved and slotted feed-lever hooked as to its outer end, and the forked, pivoted, and spring-actuated feed-bar having the incline and projection thereon, whereby, through the hooked end of the feed-lever, the goods are fed beneath the needle, as set forth.

402,598. CURTAIN-FIXTURE. PLEASANT B. HOFFMAN, Chandlerville, Ill., assignor of one-half to George W. Looper and Henry S. Looper, same place. Filed Jan. 18, 1889. Serial No. 296,701. (No model.)

Claim.—1. The combination, with a window-frame, of screw-eyes located at the middle of the top and bottom of said frame and at its four corners, an endless cord threaded through the said screw-

eyes, as described, crossing itself between the middle screw-eyes, and a shade-roller attached to the parts of the said cord between the upper and lower corner screw-eyes, substantially as described.

2. The combination, with a window-frame, of screw-eyes located at the middle of the top and bottom of said frame and at its four corners, an endless cord threaded through the said screw-eyes, as described, crossing itself between the middle screw-eyes, and a shade-roller having annular grooves near its ends, attached to the parts of said cord between the upper and lower screw-eyes by winding said cord once around each end of the roller in the grooves in the latter, substantially as set forth.



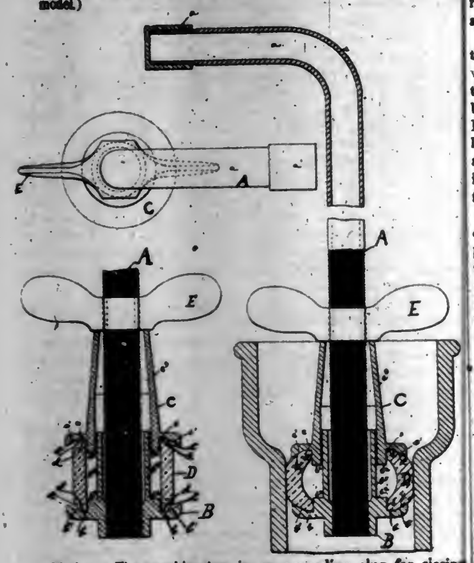
3. The combination, with a window-frame, of screw-eyes at the middle of the top and bottom and at the four corners thereof, an endless cord threaded through said screw-eyes, as described, a shade-roller attached to said cord by winding the parts of the latter between the corner screw-eyes once around each end of the roller, and friction-links having eyes, whereby they are adjusted upon the endless cord at each end of the roller, so as to bear against the latter, substantially as set forth.

4. The combination, with a window-frame, of screw-eyes at the middle of the top and bottom and at the four corners thereof, an endless cord threaded through the said screw-eyes, as described, a shade-roller attached to said cord by winding the latter once around each end of the roller, a stiffening-slat at the lower end of the shade, and loops attached to the ends of said slat and encircling the endless cord, substantially as set forth.

5. The combination, with a window-frame, of screw-eyes at the middle of the top and bottom and at the four corners thereof, an endless cord threaded through said screw-eyes, as described, a shade-roller attached to said cord by winding the latter once around each end of the roller, axial pins extending from the ends of the roller, and brackets secured near the uppr corners of the window-frame to form bearings for the said pins, substantially as set forth.

6. As an improvement in curtain-fixtures, the combination, with a window-frame, of screw-eyes at the middle of the top and bottom and at the four corners thereof, an endless cord threaded through said screw-eyes, as described, a shade-roller attached to said cord by winding the latter once around each end of the roller, friction-links adjusted upon the endless cord over and bearing against each end of the roller, axial pins extending from the ends of the latter, brackets secured near the upper corners of the window-frame to form bearings for the said pins, and loops at the lower corners of the shade encircling the endless cord, all arranged and operating substantially as set forth.

402,599. ANTI-FRICTION JOURNAL-BEARING. HARLEY M. JOHNSON, Chicago, Ill. Filed Mar. 21, 1888. Serial No. 267,947. (No model.)



Claim.—1. In a roller-bearing, the combination, with a series of large rollers for engaging the shaft, journaled in suitable revolving circular boxes, of a series of small rollers placed in these boxes around each of large roller-journals, substantially as and for the purpose set forth.

2. The combination, with a journal box or casing provided with a socketed projection on its inner side and a shaft in line therewith, and also formed with a longitudinal socket, the ends of both the shaft and projections being provided with concentric grooves, of a spindle with projecting bearings socketed loosely in said parts, and a series of anti-friction wheels on said spindle running in said grooves, substantially as and for the purpose set forth.

3. The combination, with a shaft having its ends formed with a concentric groove, and a projection on the journal box or casing with a circular groove aligned with the shaft, of a series of small friction-wheels placed between the shaft and projection and running in said grooves, substantially as and for the purpose set forth.

4. In a journal-bearing, the combination, with a casing having a socketed projection formed with a circular groove in its face, and a shaft also formed with a socket and groove, of a series of rollers arranged around the shaft, each of which is also provided with a roller-journal at each end in a revolving circular boxing, and a loose spindle with projecting bearings socketed in the shaft and the box projection and provided with a series of small wheels to take the end thrust, substantially as shown, and for the purpose set forth.

402,600. EXPANDING PLUG FOR CLOSING PIPES, &c. CLARENCE M. KEMP, Baltimore, Md. Filed Jan. 16, 1889. Serial No. 296,566. (No model.)

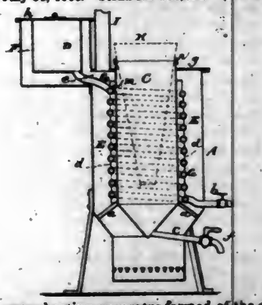
Claim.—The combination, in an expanding plug for closing pipes, of washer C, with its projecting shoulder c^2, flat part c, and flaring part c', and washer B, with projecting shoulder b^2, flat part b, and flaring part b', with rubber cylinder D, with flat part of end d and flaring part of end d', as and for the purpose described.

402,601. DIFFERENTIAL GEARING FOR HOISTING-MACHINES. RICHARD LAVERY, Boston, Mass. Filed Dec. 27, 1887. Serial No. 259,176. (No model.)

Claim.—1. In a differential-gear apparatus for hoisting, a frame, a central rod, as B, the central gear, C, provided with a bearing, I, and lifting-sheave C', mounted loosely on said rod, the central gear, D, provided with bearing I', flange D^2, and shank D', combined with an operating-wheel rotating upon the said bearings, and a series of differential gears, as K K', free to revolve upon shafts, as J J', engaging, respectively, the central gears, C D, to operate substantially as described.

2. The frame A A', the rod B, the central gear, D, provided with a bearing, I', a flange, D^2, a shank, D', and a screw, F, and a nut, F', to secure the shank to the said frame, combined with the central rotating gear, C, bearing I, lifting sheave C', permanently connected integral with the said gear and bearing and free to rotate upon the said rod, the operating-wheel H, mounted upon the said bearings, a series of shafts, as J, therein, and a series of differential gears, as K K', on the said shafts J, the opposite ends of each gear engaging the said central gears, C D, to operate substantially as described.

3. In a differential-gear hoisting apparatus, the frame or housing A', provided with a hole, as E, through it centrally, in combination with the gear D, provided with a bearing, I', a flange, D^2, and a shank, D', to fit the said hole E, a screw, F, and nut F', whereby the said gear is made a fixture with the frame or housing A', and a rod, B, enlarged and provided with screws and nuts G G', as and for the purpose specified.



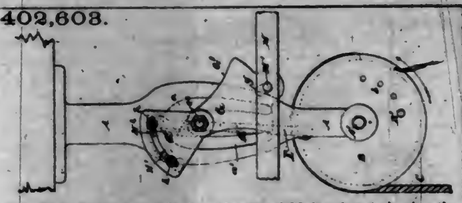
4. In a differential-gear hoisting apparatus, the frame A A', rod B, and the central externally-toothed gear, C, provided with bearing I and lifting-sheave C', both integral mounted and free to revolve upon the said rod B, the frame A', and central externally-toothed gear, D, provided with bearing I', flange D^2, shank D', and screw F, together with the nut F', whereby the said frame and gear are held together and the gear made non-revolving, in combination with the hollow annular operating-wheel H, provided with differential pinions K K', and shafts J J', the said operating-wheel being mounted and free to revolve upon the aforesaid bearings I I', as and for the purpose shown and specified.

5. The frame or housing A A', in combination with the fixed central gear, D, having the bearing I', flange D^2, and shank D', provided with screw F, the nut F', hollow annular operating-wheel H, differential pinions K K', shafts J J', revolving central gear, C, and bearing I, both integral with lifting-sheave C', frame or housing A, center rod, B, provided with nuts G G', seating and unseating device W W', lifting-chain N, bolt and link L M, sheave-wheel R, tackle-block and swivel-hook S T, cross-head and swivel-hook U V, hand operating-chain Q, and guide O O', as and for the purpose shown and specified.

6. In a differential-gear hoisting apparatus, the frame A A' and central rod, B, and a series of pairs of differential external toothed pinions made integral, one gear of each pair having a less number of teeth than the other, in combination with two central gears, one of which is integral with the lifting-sheave and is adapted to revolve upon the said central rod, the other being fixed, and a hollow annular operating-wheel mounted and free to revolve upon bearings integral with the aforesaid central gears, the series of differential pinions being mounted and free to revolve upon shafts passing through and supported by the sides or arms of the hollow annular operating-wheel and gearing simultaneously into the revolving and fixed central gears aforesaid, as and for the purpose specified.

7. In differential-gearing apparatus for hoisting, the side frames and operating-wheel, combined with a guide for the endless chain, the said guide being composed of two members, O O', one of which is integral with one side of the frame or housing of the machine, while the other member is secured to the first member, and also to the frame or housing aforesaid, the guide being in the form of two segments of a circular flange joined together at their extremities and standing apart sufficiently to admit between them the said operating-wheel, having pockets upon its periphery, into which fits an endless chain, the guide inclosing the rim of one-half of the said operating-wheel, substantially as shown and described.

402,602. WATER-HEATING APPARATUS. GEORGE LIGHT, Narka, Kans. Filed July 30, 1888. Serial No. 281,434. (No model.)

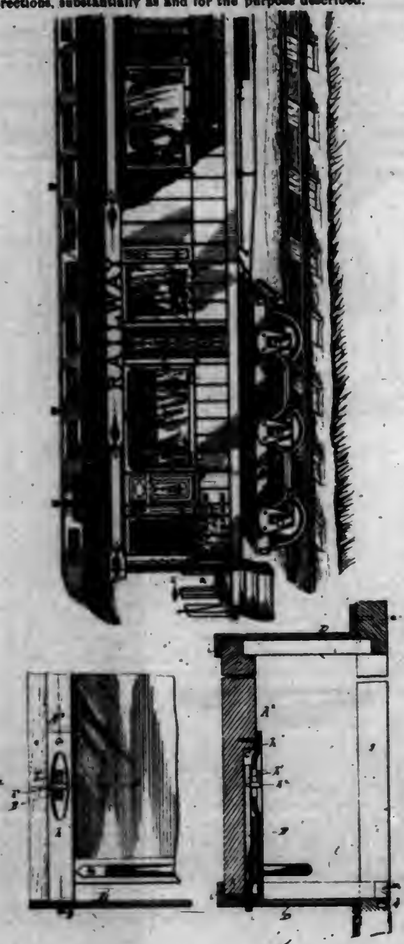


Claim.—A water-heating apparatus formed of the casing A, provided with the fire-box B, the inner and outer tanks, C D, having a pipe-connection and surrounded by connected heating-chambers, the funnel H, supported in tank C, and the coiled pipe G, connected with each tank, surrounding the tank C and having its discharge end extending through the casing, whereby said apparatus may be used, as set forth.

402,603. BELT-SHIPPER AND LOCK. FRANCIS W. MALLETT, New York, N. Y., assignor to Dennis Fristie, same place. Filed Jan. 9, 1889. Serial No. 295,848. (No model.)

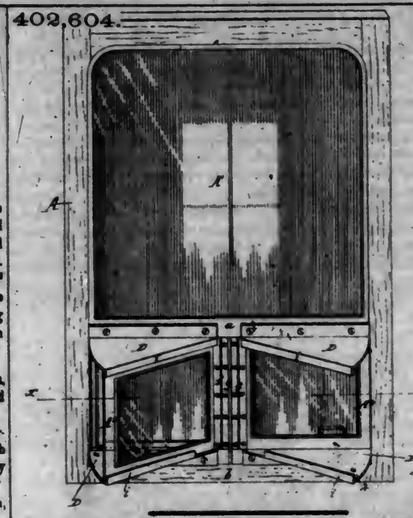
Claim.—1. In a belt shifting and locking device, the turning part G, having the wings G' G^2 and the top blocks H' H^2, with their notches

402,603.



A' A^2, in combination with the shipper-rod M, bracket A, having the aperture a a' a^2 and the notch a^3, and with the pin E' and mechanical connections, substantially as specified, for moving the latter up and down, all arranged for joint operation, substantially as herein specified.

2. In a belt shifting and locking device, the notched blocks H' H^2 and their adjusting means A' A^2, in combination with the turning-piece G G' G^2 and shipper-rod M, and with the pin E' and its operating means, and the bracket A, having the aperture a a' a^2 and the notch a^3, all substantially as herein specified.



402,604. CAR-VENTILATOR. FRANK B. MALLORY, Flemington, N. J., assignor of one-fourth to Charles C. Dunham, same place. Filed Dec. 26, 1888. Serial No. 294,637. (No model.)

Claim.—1. A single sliding sash having a stationary glazed portion and two hinged ventilating portions provided, respectively, with a fastening device and swinging in opposite directions, substantially as described.

2. The single sliding sash A, having a stationary upper portion, A', and two lower hinged ventilator portions, A^2 A^3, provided, respectively, with a guard and a fastening device and swinging in opposite directions, substantially as and for the purpose described.

402,604.

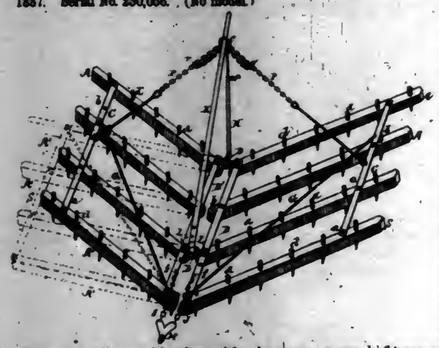
402,605. CARTRIDGE FEED-PACK FOR MAGAZINE-GUNS. PAUL MAUSER, Oberndorf-on-the-Neckar, Würtemberg, Germany, assignor to Waffenfabrik Mauser, same place. Filed Oct. 31, 1888. Serial No. 289,657. (No model.)

Claim.—A cartridge-holder consisting of a frame formed with longitudinal side flanges and a top flange, said flanges adapted to confine between them the base of a cartridge, and said frame constructed to engage the cartridge with a yielding pressure.

402,606. PLATE-LIFTER. SAMUEL T. MICKEY, Salem, N. C. Filed Apr. 7, 1888. Serial No. 269,979. (No model.)

Claim.—1. In a plate-lifter, the metal plate I, provided with a central longitudinal sleeve, J, and the rolls i i on its under side, and the inner jaw provided with the inwardly-convex wire H, and having its extensions G' G' secured in the rolls i, in combination with the outer jaw provided with the outwardly-convex wire F, facing the wire H, and the shank C, formed by two adjoining portions or extensions of the wire of which the outer jaw consists and sliding in the sleeve J, substantially as specified.

2. The improved plate-lifter comprising the plate I, the inner jaw affixed to the plate I and consisting of the diverging parts G G, the vertical parts g g, depending from the ends of the parts G G, the converging parts k k, extending outward from the lower ends of the parts g g, and the curved portion H, extending between the parts k k and having its convexity inward, and the outer jaw provided with a shank sliding on the plate I and composed of the diverging parts E E, the vertical portions e e, depending from the ends of the parts E E, the converging parts f f, extending inward from the ends of the parts e e, and the outwardly-convex portion F, connecting the parts f f, as specified.

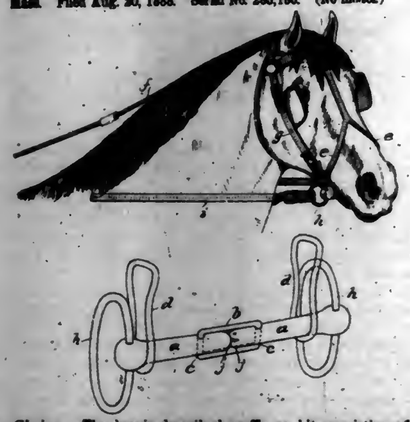


3. The combination, with the plate-lifter having the rigid jaw A and the movable jaw B, of the removable toaster attached to the jaw A, and having fingers arranged thereon, substantially as specified.

4. The combination, with the plate-lifter having the jaw A, provided with the vertical portions e e, of the toaster N, comprising the plate O, having the inclined flanges P P, engaging the said vertical portions e, and the hook-shaped fingers Q, consisting of loops secured

at their ends to the said plate, substantially as and for the purpose specified.

5. The herein-described plate-lifter, comprising the plate I, provided at its rear end with an offset or projection, K, and having a sleeve, J, on its under side, the inner jaw, B, at the front end of the plate, having the depending parts *g g*, and rearwardly-convexed wire H, connecting the lower ends of the said parts, the shank C, extending through the sleeve J and provided at its rear end with the ratchet *m*, the outer jaw on the opposite end of the said shank having the depending parts *e e*, and the forwardly-convexed wire F, connecting the lower ends of the said depending parts, and the pawl L, pivoted at its upper end to the offset or projection K and provided with an opening, M, fitting around and sliding on the shank C, the upper side of the said opening engaging the teeth of the ratchet *m* to lock the jaws A B in the desired relative position, substantially as specified.



402,607. HARROW. ELI MILLER, Canton, Ohio. Filed Mar. 7, 1887. Serial No. 230,056. (No model.)

Claim.—1. The combination, with a harrow composed of two sections, of a hand-lever, the front end of which is supported by the pivotal pin of the front hinge, the rear end supported by an upright support that is adjustable vertically, and chains connecting said hand-lever to the outer edge of the harrow, substantially as described, and for the purpose set forth.

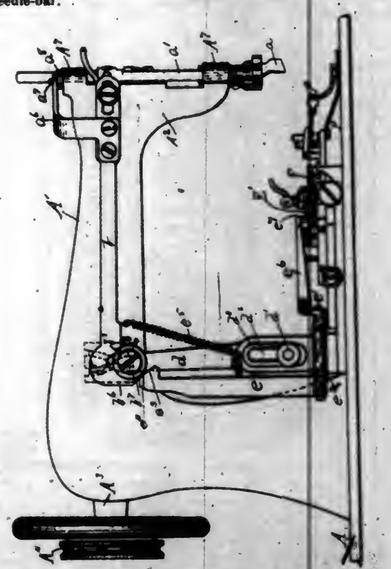
2. The combination, with a harrow composed of two sections hinged together, of a vertically-adjustable handle-support, the lower end of said support having a pivotal connection with the harrow-hinge, substantially as described, and for the purpose set forth.

402,608. BRIDLE-BIT. JOEL MCKENNEY, Boston, Mass., assignor of one-half to W. O. Robson, same place, and John M. French, Chelsea, Mass. Filed Aug. 20, 1888. Serial No. 283,186. (No model.)

Claim.—The herein-described snaffle or bit, consisting of two bars or pieces, the inner ends of which meet or nearly meet, said bars or pieces being jointed together by means of a link connected therewith at an appreciable distance beyond the meeting ends, all substantially as and for the purposes described.

402,609. PLOW-CLEVIS. HENRY G. NILES and PETER VAN HUFFEL, Mishawaka, Ind. Filed Jan. 21, 1889. Serial No. 296,178. (No model.)

Claim.—1. A plow-beam, A, provided with a series of notches, *b*, in its end, combined with a clevis, C, connected to said beam by a pivot-bolt, D, a removable adjusting-pin, F, adapted to rest in one or another of said notches and so large in its horizontal diameter that it will project out of said notch, and a coupling-link, G, provided with a lip, *k*, to engage under said pin, substantially for the purpose set forth.

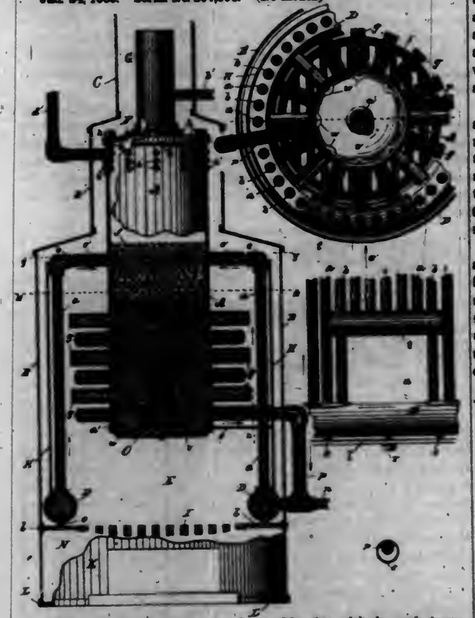


2. A plow-beam, A, provided with a series of notches, *b*, in its front end, a clevis, C, connected to said beam by a pivot-bolt, D, and provided with a rib or shoulder, *i*, on the inner surface of its front end, an adjusting-pin, F, adapted to rest in one or another of said notches and project part way out of the same, and a coupling-link provided with a lip, *k*, to engage under said pin and ledge, substantially for the purpose set forth.

3. The clevis C, a removable adjusting-pin, F, provided with a notch, *k*, and a coupling-link, G, provided with the notch *l* on its upper part, all in combination to retain said pin F in place except when said link is in a position which it cannot assume without assistance, substantially as set forth.

402,610. CUTTING DEVICE FOR BUTTON-HOLE SEWING-MACHINES. JAMES A. OSTERHOUT, Troy, and JOSEPH P. HALLENBECK, New York, assignors to the National Machine Company, Troy, N. Y. Filed July 3, 1888. Serial No. 278,964. (No model.)

Brief.—The device cuts the button-hole at one stroke, and is then thrown out of action, so that it can strike once only. The cutting device is tripped by a pin upon the rotating cam-disk which operates the clamp. The cutter is actuated directly through connection with the needle-bar.

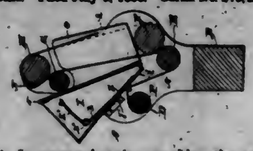


Claim.—1. The combination, with a button-hole sewing-machine, of a button-hole cutter, a rotary and vertically-reciprocatory cutter-bar, means for communicating to such bar rocking and vertically-reciprocating movements consisting of the slide-bar *b*, connected at one end with the arm a^3, which arm is spliced to the cutter-bar, and detachably connected at the other end with the sewing-machine driving mechanism, the vertically-reciprocating needle-bar, and means for engaging and disengaging the cutter-bar therewith, substantially as described.

2. The combination, with a button-hole sewing-machine, of a button-hole cutter, a rotary and vertically-reciprocatory cutter-bar, means for communicating to such bar rocking and vertically-reciprocating movements, consisting of the slide-bar *b*, connected at one end with the arm a^3, which arm is spliced to the cutter-bar, and at the other end with the sewing-machine driving mechanism, the vertically-reciprocating needle-bar, and means for engaging and disengaging the cutter-bar therewith, a spring-controlled slide-bar-detaching post, *e*, provided at its upper end with a beveled head adapted to engage said slide-bar and fixed at its lower end upon a rock-shaft, said rock-shaft, trip-lever e^3, fixed upon said rock-shaft, and a trip, E, fixed upon the feed-wheel of the clamp-moving mechanism, substantially as described.

3. The combination, with a button-hole sewing-machine, of a button-hole cutter, a rotary and vertically-reciprocatory cutter-bar, means for communicating to such bar rocking and vertically-reciprocating movements, consisting of the slide-bar *b*, connected at one end with the arm a^3, which arm is spliced to the cutter-bar, and at the other end with the sewing-machine driving mechanism, the vertically-reciprocating needle-bar and means for engaging and disengaging the cutter-bar therewith, a spring-controlled slide-bar-detaching post, *e*, provided at its upper end with a beveled head adapted to engage said slide-bar and fixed at its lower end upon a rock-shaft, said rock-shaft, trip-lever e^3, fixed upon said rock-shaft, a trip E, fixed upon the feed-wheel of the clamp-moving mechanism, auxiliary detaching-post e^5, provided at its upper end with a beveled head adapted to engage said slide-bar and pivoted at the lower end upon post *e*, auxiliary post-actuating spring e^{10}, and stop e^{12}, secured to one post and adapted to engage with the other, substantially as described.

402,611. STEAM-BOILER. MARVIN R. OTIS, Rochester, N. Y. Filed Jan. 24, 1888. Serial No. 297,300. (No model.)



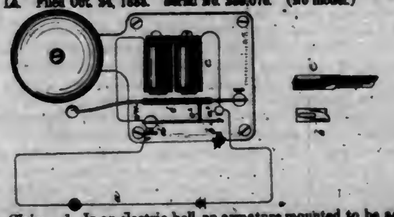
Claim.—1. In a steam-boiler, in combination with the main body, a hollow ring below the body, a series of tubes joining the ring and body, said tubes being equidistant from the body, the latter being extended below the upper ends of said tubes and having its convex surface provided with radial horizontal tubes closed at their outer ends, and circulating or return pipes outside of said series of tubes joining the ring and body, substantially as shown and described.

2. In combination with the body of a steam-boiler, a hollow ring below the body, a series of tubes, *a b*, extended upward from the ring and joined to the body, the latter being extended downward below the upper ends of said tubes, circulating-pipes *p*, joining said rings and body, and protectors for said pipes, substantially as described.

3. In a steam-boiler, in combination with a central body, a hollow ring below the body, a series of tubes joining the ring and body, an inner cylindrical deflecting-jacket, H, surrounding said tubes, an annular deflecting-plate above said tubes, and an outer jacket, E, said deflecting-jacket and plate forming an annular space between their adjacent edges, substantially as shown.

402,612. PAPER-HANGING MACHINE. LIBERTY B. POLK, Wilmington, Ohio. Filed July 9, 1888. Serial No. 279,436. (No model.)

Claim.—1. In a paper-hanging machine, the combination, with a frame, a paper-carrying roller, and an applying-roller mounted in the frame, and intermediate guide-rollers mounted in the lower part of said frame, of a paste-box secured to said frame between the paper-carrying roller and applying-roller and above the guide-rollers and having a discharge-aperture in its lower portion, all constructed, arranged, and operating substantially as shown and described.



2. In a paper-hanging machine, the combination, with a frame, a paper-carrying roller, D, and applying-roller H, mounted in the frame, and intermediate lower guide-rollers, E and F, and upper guide-roller, G, mounted in said frame, of a paste-box, I, secured to the frame between the roller D and rollers G and H and above the lower rollers, E and F, and having a discharge-aperture in its lower portion, all constructed, arranged, and operating substantially as shown and described.

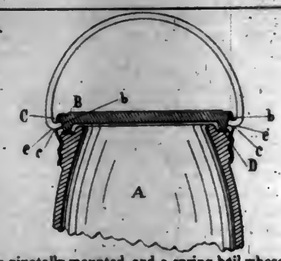
3. In a paper-hanging machine, the combination, with a frame, a paper-carrying roller, D, and applying-roller H, mounted in the frame, and intermediate guide-rollers, E and F, mounted in the lower part of said frame, of a paste-box, I, secured to the frame between the rollers D and H and above the guide-rollers E and F, and having a discharge-aperture covered by a perforated material, *i*, a spring-actuated valve, K, a rod, k^2, having arms *k*, engaging with said valve, and a crank, k^3, and means for operating said crank, whereby the valve may be moved to regulate the discharge of paste, all constructed, arranged, and operating substantially as shown and described.

4. In a paper-hanging machine, the combination, with a frame, a paper-carrying roller mounted in the frame, and an applying-roller mounted in said frame, over which the paper passes, of a knife hinged to the frame parallel with and in close proximity to the applying-roller and having its edge normally resting against said applying-roller, between the same and paper, and means for raising said knife to sever the paper, all constructed, arranged, and operating substantially as shown and described.

5. In a paper-hanging machine, the combination, with a frame, a paper-carrying roller, D, and an applying-roller, H, mounted in the frame, and intermediate lower guide-rollers, E and F, and upper guide-roller, G, mounted in said frame, of a laterally-adjustable guide, O, secured to the frame between the lower guide-rollers, E and F, and upper guide-roller, G, and adapted to engage the edge of the paper and hold it to one side of the machine, all constructed, arranged, and operating substantially as shown and described.

402,613. ELECTRIC BELL. WILLIAM K. RAINEY, New Orleans, La. Filed Oct. 24, 1888. Serial No. 289,076. (No model.)

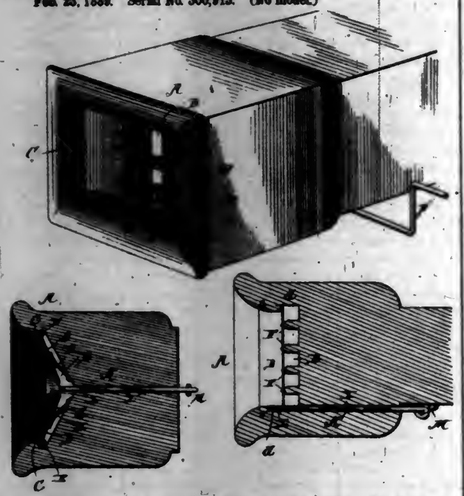
Claim.—1. In an electric bell, an armature mounted to be adjustable longitudinally and adapted to swing laterally, in combination with a switch-arm, also adjustable longitudinally, and a connection between said armature and switch-arm, whereby a movement of the armature will operate the switch-arm, for the purpose set forth.



2. The combination, with post *c'* and arm *b*, of the post c^2, the armature *c*, the arm c^3, having a toe of insulating material, and the main and local circuits, arranged substantially as described.

3. In an electric bell, the combination, with the magnets and armature, said armature being provided with a slot for purposes of adjustment, and also carrying a laterally-projecting finger having a tip of insulated material, of a spring-strip, as *b*, also provided with a slot for adjustment, substantially as described.

402,614. COVER FOR CANS OR JARS. PHINEAS K. MEEVER, Irvington, N. J. Filed Aug. 8, 1888. Serial No. 282,267. (No model.)



Claim.—The combination, with a jar or can having a screw-thread on its neck, of a screw ring or clamp which fits said threaded jar, a lid having an edge which is entirely inclined, on which the screw

402,614.

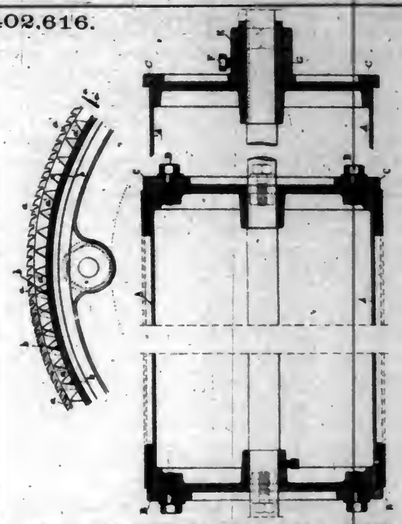
ring or clamp is pivotally mounted, and a spring-bail whose ends pass inwardly through apertures in the screw ring or clamp and press elastically against the inclined edge of the lid to secure the screw-ring thereto, substantially as set forth.

402,615. CAR-COUPLING. SIMON L. REEVES, Atlanta, Ga. Filed Feb. 23, 1889. Serial No. 300,913. (No model.)

Claim.—1. In a car-coupling, the combination, with the draw-head provided with a recess in its front end, of the spring-actuated swinging leaves pivoted therein and inclined rearwardly toward their adjacent edges, and the draw-bar provided with a beveled or wedge-shaped head, which is arranged between the leaves to enable the latter to be separated, substantially as specified.

2. In a car-coupling, the combination, with the draw-head provided with a recess in its front end, of the swinging spring-actuated leaves pivoted therein and inclined rearwardly toward their adjacent edges, the draw-bar provided with a wedge-shaped head which is arranged between the leaves, and the crank-shaft mounted on the draw-head and connected to the draw-bar, whereby the latter may be drawn rearwardly to separate the leaves, substantially as specified.

3. In a car-coupling, the combination, with the draw-head provided with a flared or V-shaped recess having shoulders C C at its sides and shoulders *d d* at its top and bottom, of the swinging spring-actuated leaves pivoted in rear of the shoulders C C and normally bearing at their upper and lower edges against the shoulders *d d*, and the draw-bar provided with a wedge-shaped head arranged between the leaves, substantially as and for the purpose specified.



4. The combination of the draw-head, the leaves pivoted therein, and the draw-bar mounted in the draw-head and adapted to separate the leaves, as set forth.

5. The combination of the draw-head having the tapered supporting-blocks F, the leaves pivotally mounted in the draw-head, and the draw-bar sliding in the draw-head and adapted to separate the leaves, as set forth.

402,616. CYLINDER FOR CARDING-MACHINES, &c. JEAN J. RIBIER, Lure, France. Filed Oct. 3, 1888. Serial No. 287,464. (No model.) Patented in France July 4, 1888, No. 191,607; in Belgium July 30, 1888, No. 86,794; in England Aug. 3, 1888, No. 11,172; in Germany Aug. 6, 1888, No. 45,421, and in Italy Sept. 21, 1888, No. 24,068.

Brief.—The object of the invention is to improve the construction of cylinders for carding and other machines.

402,616.

Claim.—1. The combination, with the cylinder A, of the rigid washer B, projecting beyond the periphery of the cylinder, an adjustable washer, C, adapted to fit upon the opposite end of the cylinder, a spirally-wound blade wrapped about the cylinder, and screws D, adapted to draw the washer C onto the cylinder and compress the blade.

2. The combination, with the hollow cylinder A, provided with heads or spiders, of the flanged washer B, secured rigidly to one head, a similar washer, C, applied to the spider or head at the opposite end of the cylinder and flanged circumferentially to embrace the cylinder, screws D, passing through the washer C and into the head of the cylinder, and the continuous spirally-wound blade applied to the cylinder between the washers B C.

402,617. LIGHTING DEVICE. ISRAEL M. ROSE, Philadelphia, Pa. Filed Sept. 8, 1888. Serial No. 284,904. (No model.)

Claim.—1. The combination of a case, an igniting-tape strip guided therein, said tape strip having pellets or projections of combustible material or explosive material capable of being ignited by friction, a lamp-vessel, also held in the case, said lamp-vessel being provided with an oil and wick reservoir, the wick projecting from the top of said reservoir in close proximity to the igniting-tape, a feed-worm for feeding the tape strip through the case, the thread of said feed-worm separating the upper pellets from each other, and a striker to press or scratch upon the combustible or explosive material on the tape strip to ignite or explode it.

2. The combination of a case, a tape strip having pellets or projections of combustible or explosive material capable of being ignited by friction, a lamp-cylinder being provided with an oil and wick reservoir, the wick projecting from the top of said reservoir in close proximity to the igniting-tape, and said lamp-cylinder having a worm to work in connection with said pellets on the tape strip to feed them through the case.

3. The combination of a case, a tape strip having pellets or projections of combustible or explosive material capable of ignition by friction, a lamp-cylinder having a worm to work in connection with said pellets or projections to feed them through the case, a striker on the cylinder, and a flexible backing or support for the tape strip, said lamp-cylinder being provided with an oil and wick reservoir, the wick projecting from the top of said reservoir in close proximity to the igniting-tape.

4. The combination of a case, a tape strip having pellets or projections of combustible or explosive material capable of ignition by friction, a lamp-cylinder provided with an oil and wick reservoir, the wick projecting from the top of said reservoir in close proximity to the igniting-tape, and said reservoir having a worm to work in connection with said pellets or projections on the tape strip to feed them through the case, a striker, and a spring secured to the case and pressing upon the cylinder to prevent its accidental rotation.

5. The combination of a case, an igniting-tape strip supported by the case, means, substantially as described, to feed said tape strip through the case, a lamp-cylinder within said case, said lamp-cylinder being provided with an oil and wick reservoir, the wick projecting from the top of said reservoir in close proximity to the igniting-tape, and a striker carried by the cylinder, and a plug for the bottom of said cylinder for holding it in the case and providing means to seal it as well as rotate it.

6. The combination of a case, an igniting-tape strip supported by the case, a lamp-cylinder journaled within said case and provided with an oil and wick reservoir, the wick projecting from the top of said reservoir in close proximity to the igniting-tape, said cylinder having a screw or worm on its upper end to feed said strip through the case and an aperture on its lower end or bottom for filling said cylinder, and a plug at the bottom of said cylinder for holding it in the case and providing means to seal it as well as to rotate it.

7. The combination of a case, D, having grooves G, tape strip I, having igniting pellets or projections i, the lamp-cylinder A, said lamp-cylinder being provided with an oil and wick reservoir, the wick projecting from its top in close proximity to the igniting-tape, said cylinder being provided with a worm, C, and striker J, plug E, and spring-arm H.

8. The combination of a guide for a tape strip having pellets or projections of combustible material, with a screw to feed the igniting-tape strip and its pellets in proper position to be acted upon by the ignitor, the thread of the screw separating the top pellets from those beneath, whereby the top pellet may be ignited and burned without destroying the remaining pellets.

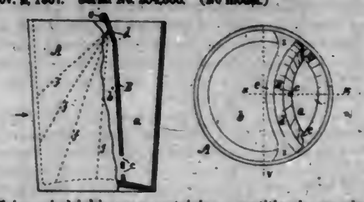
402,618. FEED-MILL. GUILFORD D. ROWELL, Appleton, Wis. Filed Oct. 15, 1888. Serial No. 288,130. (No model.)

Claim.—1. In a feed-mill, the combination of the driving-shaft G, the thereon-supported grinding-burr B, adjusting-screw H, friction bearing-block J, and block-retaining screw L, all substantially as and for the purpose specified.

2. In a feed-mill, the combination of the feed-chamber F, provided with gate-retaining guideways D D, feed-gate T, provided at its lower end with a central recess, 1, for the reception of the driving-shaft, vertical partition 2, located below said shaft and adapted to close the lower end of said recess 1 beneath the shaft, and means, substantially as described, for adjusting said feed-gate, substantially as and for the purpose specified.

3. In a feed-mill, the combination of the feed-chamber F, provided with gate-retaining guideways *d d*, feed-gate T, provided at its lower end with a central recess, 1, for the reception of the driving-shaft, vertical partition 2, located below said driving-shaft and adapted to close the lower end of said recess 1 beneath the shaft, upward-projecting arm 3, provided with series of cog-teeth 4, shaft 6, supported in journal-bearings at its respective ends from the burr-inclosing case, pinion 5, affixed to said shaft 6 and meshing in the cogs of said arm 3, hand-wheel 7, affixed to one of the protruding ends of said shaft 6, and spiral spring 9, interposed between said hand-wheel and one of said shaft-supporting bearings, all substantially as and for the purpose specified.

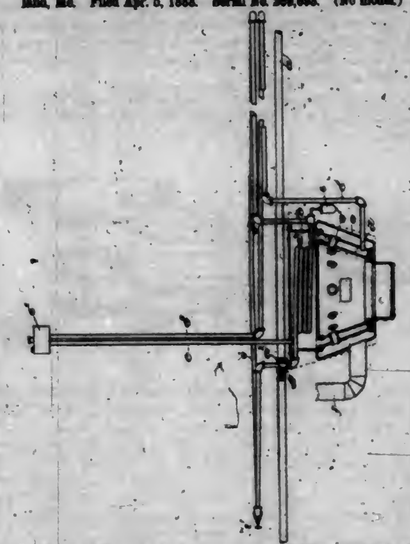
402,619. HEAD-BAND FOR SURGICAL MIRRORS. JOHN L. SARDY, New York, N. Y. Filed Aug. 20, 1888. Serial No. 283,201. (No model.)



Claim.—1. The combination of a mirror and a head-band of rigid material adapted to be folded over and to protect the same.

2. The duplex or centrally-divided head-band, preferably concave on its inner face, the two parts being pivoted together, in combination with a mirror swiveled to said head-band, whereby the latter can be folded over to protect the mirror, as set forth.

3. The combination of a mirror and a head-band connected by a double ball-and-socket joint.



4. The combination of the centrally-divided head-band and the mirror by double ball-and-socket joint, all the parts being arranged substantially as and for the purposes set forth, and provided with a latch for locking the parts together when in the collapsed position.

402,620. DRINKING-CUP. JOHN SCHUH, Rochester, N. Y. Filed Nov. 4, 1887. Serial No. 254,300. (No model.)

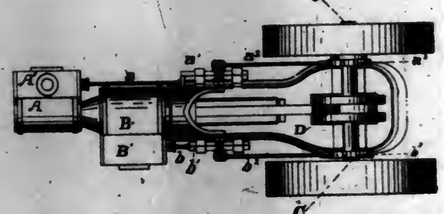
Claim.—A drinking-cup containing a partition in one piece with the cup and joined to the bottom surface thereof, and extending beyond the upper edge of the cup and terminating in a plane parallel with the plane of the upper edge of the cup, said partition being composed of two conical parts of different inclination and notched at its respective edges next to the inner surface of the cup, substantially as shown.

402,621. CAR-HEATING APPARATUS. JAMES H. SEWALL, Portland, Me. Filed Apr. 5, 1888. Serial No. 269,693. (No model.)

Claim.—1. In a car-heating apparatus, the hot-water-circulation pipes arranged within the car, a water-reservoir beneath the car and with which said pipes communicate, and means to heat said reservoir to cause free circulation of the water, combined with steam-circulation pipes arranged within the car, and a coil placed within said reservoir communicating with said steam-circulating pipes, and means for supplying said coil and pipes with steam, substantially as described.

2. In a car-heating apparatus, the hot-water-circulation pipes within the car, the main steam-pipe and water-reservoir, and the auxiliary heater surrounding said reservoir, combined with the steam-circulation pipe *i*, also within the car, connected to the said main steam-pipe, and also to a branch pipe passing through said reservoir, substantially as described.

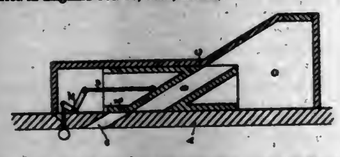
3. In a car-heating apparatus, the combination of the main steam-pipe *a* outside the car, branch pipe *a'*, valve a^2 therein, the independent steam and hot-water circulation pipes within the car, said steam-circulating pipes being connected with the branch pipe *a'* and the water-reservoir *b* beneath the car, and with which the water-circulation pipes directly communicate, the heating-coil a^3 within said reservoir and connected to the main and steam-circulation pipes, and the auxiliary heater *c*, surrounding said reservoir, whereby the car may be heated by the circulation therethrough of both steam and water, or by water alone, the water in the water-circulating pipes being heated by steam passed through the coil a^3 from the main steam-pipe, or by the surrounding auxiliary heater *c*, or by both, substantially as described.



4. In a car-heating system, the main steam-pipe, coil a^2, and boiler *b*, placed in contact with a fire-pot, combined with the hot-water-circulation pipes communicating with the boiler, and the steam-circulation pipes located within the car communicating with the coil, substantially as described.

5. The combination, with a car having a system of water-circulating pipes within said car and two heaters, both in operative contact with said circulating system, or with branches thereof, and adapted to be operated simultaneously or separately for imparting heat thereto, of an independent system of steam-circulating pipes in said car, the said system including therein as a part of its continuous circuit one of the said heaters, substantially as described.

6. In a car-heating system, the combination, with a system of water-circulating pipes within the car and a suitable radiator in contact with said circulating system or a branch thereof, mechanism for supplying said radiator with steam as a primary means of heating said circulating system, and a secondary heater also in operative contact with said circulating system and adapted to heat the same, of an independent system of steam-circulating pipes within said car, the said system including within it as a part of its continuous circuit the steam-supply mechanism for the said radiator, substantially as described.

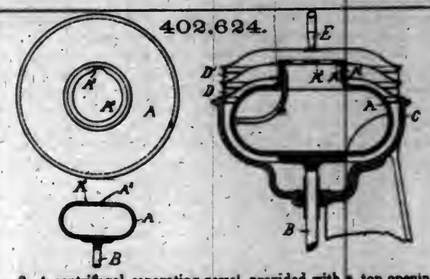


7. In a car-heating system, the combination, with a system of water-circulating pipes within the car, a main steam-pipe attached to the car and means for connecting it with a suitable generator, a steam-radiator in operative contact with said circulating system or a branch thereof, and a branch pipe connecting said main steam-pipe with said radiator and adapted to supply the same with steam, of an independent system of steam-circulation pipes within said car deriving its supply from said main steam-pipe, the said steam-radiator being included in said independent system as a part of its continuous circuit, substantially as described.

402,622. STEAM-ENGINE. JAMES A. SEYMOUR and JOHN E. MCINTOSH, Auburn, N. Y. Filed July 23, 1888. Serial No. 280,759. (No model.)

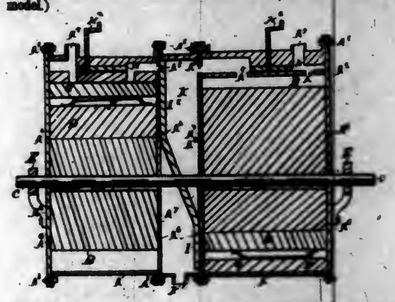
Claim.—In a compound engine, the cylinders A' and B, arranged in line axially and having their respective steam-chests A' and B' upon opposite sides thereof, in combination with the double-crank shaft O D C, which is provided with two eccentrics, a^3 and b^3, upon either side of the crank, respectively, said crank-shaft being in the plane of and at right angles to the axes of the cylinders A and B, and the valve-rods *a* and *b*, connected, respectively, to the eccentrics a^3 and b^3, through the eccentric-rods a^2 and b^2, substantially as described.

402,623. LETTER-BOX. EDWARD A. SHARP, Epworth, County of Lincoln, England. Filed Feb. 20, 1888. Serial No. 265,756. (No model.) Patented in England Oct. 20, 1886, No. 13,374.



Claim.—In a letter-box, the combination, with the diagonally-arranged hollow receptacle B, having separate openings at its upper and lower ends, of the bell-crank and cord for raising the said receptacle, the plane surface A, having an opening, *a*, for the introduction of letters into the receptacle, and the plane surface C and receptacle D, communicating with the receptacle B after its descent, whereby the letters are automatically discharged therefrom into the said receptacle D, substantially as set forth.

402,624. CENTRIFUGAL LIQUID-SEPARATOR. PHILIP M. SHARPLES, West Chester, Pa. Filed Feb. 20, 1888. Serial No. 265,671. (No model.)



Claim.—1. A centrifugal separating-vessel provided with a top opening or mouth eccentric with the axis of said vessel, substantially as and for the purpose set forth.

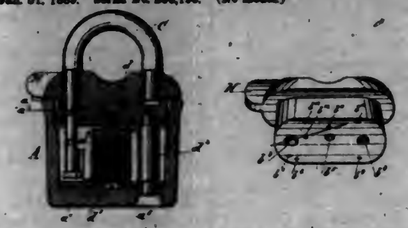
402,624.

2. A centrifugal separating-vessel provided with a top opening or mouth mainly concentric with the axis of said vessel, but having a depression or notch, A^2, substantially as and for the purpose set forth.

402,625. ROTARY ENGINE. JOHN W. SHALLWOOD and DAVID R. AUSTIN, Nevada, Mo. Filed Aug. 20, 1888. Serial No. 283,216. (No model.)

Claim.—In a rotary engine, a reversing-valve, H, having a winch, H^3, ports A^4 A^5, a steam-box, L, cylinder-casings having grooves A^6 and abutments A^3, pistons B, having wing D, having spring-packing steam-chest K, revolving valve composed of portions I and I^3, arranged as shown, and shaft C, all substantially as and for the purpose set forth.

402,626. ELECTRICAL ANNUNCIATOR. BENJAMIN SHEAD, Chicago, Ill. Filed Feb. 12, 1889. Serial No. 299,634. (No model.)



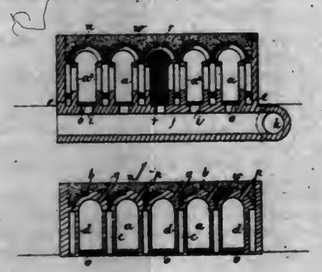
Claim.—1. In an annunciator, the combination, with magnets electrically connected to a battery and to a push located at a distance, of a stem connected to the pivot of the armature of the magnets and having its free end movably connected with a pivoted segment, a marking-finger secured to turn with the pivot of the segment, a pivoted pin adapted to be rocked on its pivot by the movement of the segment, insulated spring-contact points adapted to be closed by the movement of the pin in one direction, and a push joined in circuit with the spring-contacts and one of the magnets, whereby when the push is operated the finger is returned to its normal position and the circuit through the spring-contacts opened, substantially as described.

2. A movable contact device forming one terminal of a circuit including the armature-magnet, and engaging first the other terminal of the circuit, and on its further movement breaking said circuit and engaging the other terminal of a circuit including a bell-magnet, substantially as described.

3. In combination, a spring-seated contact device forming one terminal of a circuit including the armature-magnet, and adapted by its initial movement to engage the other terminal of said circuit, and by its further movement to engage the terminal of a second circuit including a bell, and by its return movement under the influence of the spring to break said circuits in reverse order, substantially as described.

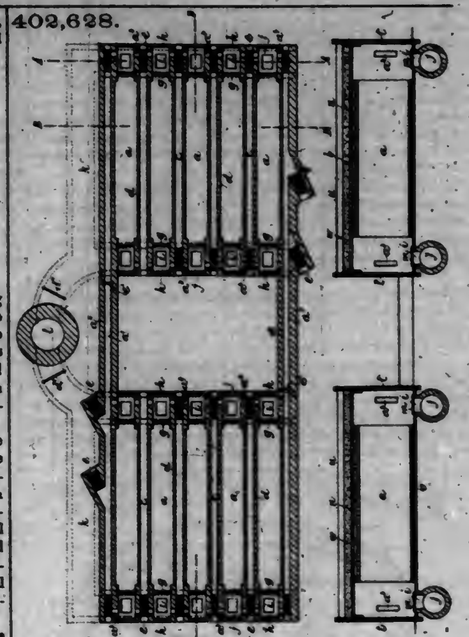
402,627. ART OF MAKING LOCKS. ROBERT C. SMITH, New York, N. Y., assignor to the Universal Lock Company, of New York. Filed Jan. 31, 1889. Serial No. 298,199. (No model.)

Claim.—1. The hereinbefore-described art of manufacturing locks of the kind shown, to wit: forming the sides and bottom of the lock-case in one integral body, forming the top of the lock in a piece separate from said body and with a circumferential depression in its edge, assembling the said body and the said top pieces together, and then uniting said body to said top by exerting great pressure upon the said body, whereby its metal is forced into the aforesaid depression in the said top, as hereinbefore described.



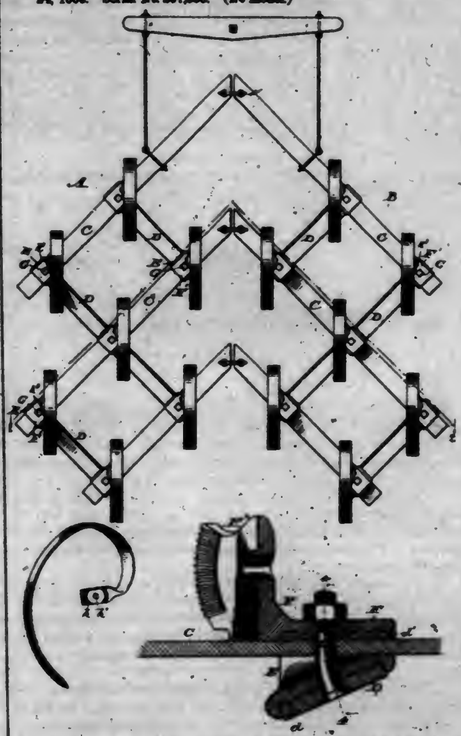
2. The hereinbefore-described art of manufacturing locks of the kind shown, to wit: forming the bottom and sides of the lock-case in one integral body, forming the top of the lock-case in a piece separate from the said body and with a downwardly-projecting part of a size to fit loosely the said body, said downwardly-projecting part having a circumferential depression around its edge and a circumferential shoulder around its upper part, assembling the said body and the said top pieces together, and then uniting the aforesaid body to the aforesaid top by exerting great pressure upon said body, whereby its metal is forced into the aforesaid depression in the aforesaid downwardly-projecting part of the aforesaid top, as herein described.

3. The hereinbefore-described art of manufacturing locks of the kind shown, to wit: forming the sides and bottom of the lock-case in one integral body and with an external outwardly-projecting ridge around its upper part, forming the top of the lock in a piece separate from the said body and with a downwardly-projecting part of a size to fit loosely the aforesaid body, said downwardly-projecting part having a circumferential depression around its edge and a circumferential shoulder around its upper part, assembling the said body and the said top pieces together, and then uniting the aforesaid body and the aforesaid top by exerting great pressure upon the aforesaid ridge of the aforesaid body, whereby its metal is forced into the depression in the aforesaid downwardly-projecting part of the said top, as herein described.



4. The hereinbefore-described art of manufacturing padlocks of the kind shown, to wit: forming the sides and bottom of the lock-case in one integral body, forming the shackle-guide openings and the orifices for the axis of the locking mechanism in the same base separate from the said body, building up and adjusting the locking mechanism on the said base before insertion in the said body, assembling the said body-piece and the said base and mechanism together, and then uniting the said body and the said base into one lock-case by exerting great pressure upon the said body, whereby its metal is forced into a depression on the edge of said base, as herein fully described.

402,628. BRICK-KILN. REGINALD STANLEY, Nuneaton, County of Warwick, England. Filed Nov. 14, 1888. Serial No. 290,773. (No model.)



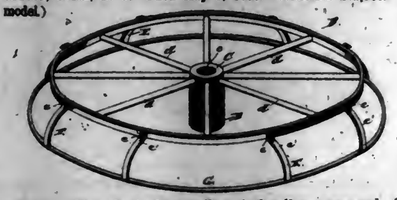
Claim.—An oven or kiln for burning bricks in which the chambers are muffled or closed, provided with the flues *a'*, lateral flues *e e*, underneath flues, *j*, and the flues *k*, leading to the chimney and having front and back doors or wickets, *g h*, with holes *r r* therein for expelling the steam in the process of drying, all substantially as set forth.

402,628.

402,629. HARROW. GEORGE SWEET, Dansville, N. Y. Filed Jan 24, 1888. Serial No. 297,253. (No model.)

Claim.—1. In a harrow-frame, the combination, substantially as hereinbefore set forth, of the flat horizontal tooth-bearing bars ar-

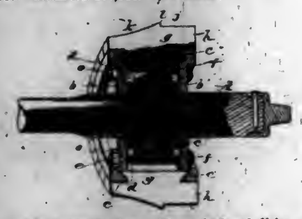
ranged at an angle to the line of draft and flexibly connected together at their inner ends, and the cross-bars secured to the under sides of the tooth-bearing bars and inclined from their front edges rearwardly.



2. The combination, substantially as hereinbefore set forth, of a series of flat horizontal tooth-bearing bars parallel with each other and extending at an angle to the line of draft from their front ends rearwardly and flexibly connected at their inner ends, and the cross-bars secured to the under sides of the tooth-bearing bars, arranged at right angles therewith, inclined from their front edges rearwardly and downwardly and facing inwardly.

3. The combination, substantially as hereinbefore set forth, of a horizontal tooth-bearing bar, a cross-bar inclined from its front edge rearwardly, a chair having an inclined seat in its under side for the cross-bar and a horizontal seat in its upper end for the tooth-bearing bar, and a bolt for connecting the bars with the chair.

4. The combination, substantially as hereinbefore set forth, of the tooth-bearing bar, the cross-bar, the chair having seats in its upper and lower sides for the bars, the tooth-supporting bracket having a horizontal arm resting in a seat of the chair above the tooth-bearing bar, and an upwardly-extending arm to which the tooth is secured.



5. The combination, substantially as hereinbefore set forth, of the tooth-bearing bar, the cross-bar, the chair to which said bars are secured, the harrow-tooth, the tooth-supporting bracket having a horizontally-extending arm secured to the chair, and an upwardly-extending serrated arm to which the harrow-tooth is secured and extending at an angle of about forty-five degrees to the tooth-bearing bar.

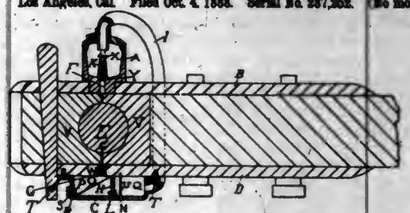
402,630. SUPPORT FOR ENDLESS CLOTHES-LINES. MARTIN V. TEETOR, Sodus, N. Y. Filed May 5, 1888. Serial No. 272,968. (No model.)

Claim.—The wheel of an endless clothes-line, composed of the central hub, the rim connected with the hub by radial spokes, the wire ring a suitable distance below and of larger diameter than the rim, and the arms connecting the rim and wire ring, having their upper ends extended somewhat above the rim, and bearings for the traveling line formed on their upper portions, which bearings are concave outwardly and aligned with the rim, so that the line will travel on the rim between the bearings and avoid making bends at the latter, substantially as specified.

402,631. SAND-REEL. CALEB M. THOMPSON, Greenville, Pa. Filed Jan. 25, 1889. Serial No. 297,511. (No model.)

Claim.—1. The combination, with a shaft, of disks, a key or feather secured to the shaft, bolts passing through the disks, devices for locking both disks to the key or feather, and a series of segments secured to and between the disks, substantially as set forth.

2. The combination, with a shaft and disks thereon, one of the latter being provided on its inner face with projections, of a key or feather secured to the shaft and engaging the projections on said disk, bolts, and a series of segments secured to and between the disks, substantially as set forth.



3. The combination, with a shaft and disks thereon, one of the latter having projections on its inner face, of a key or feather secured to the shaft and engaging the projections on said disk, bolts passing through the disks and end of the key or feather, and a series of segments secured to and between the disks, substantially as set forth.

4. The combination, with a shaft, disks mounted thereon, a feather passing through the shaft, and bolts passing through the disks and the end of the feather, whereby the disks are held together and prevented from turning on the shaft, of a series of segments secured to and between the disks, substantially as set forth.

5. The combination, with a shaft, disks having lugs thereon, feather, and bolts arranged substantially as described, of segments held between the disks, and nuts on the bolts adapted to be turned, whereby the disks are forced nearer together and the segments are forced nearer the shaft, substantially as set forth.

6. The combination, with a shaft and disks, the latter having annular V-shaped grooves therein, of segments having a straight and a slanting exterior face to form a combined friction and lock brake with beveled sides and notched ends, and bolts for holding the disks firmly against the notched ends of the segments, and nuts whereby these disks may be drawn closer together, thereby forcing the segments nearer together and nearer to the shaft, substantially as set forth.

402,632. OILER. WEBSTER F. TRAVIS and CHARLES K. TRAVIS, Los Angeles, Cal. Filed Oct. 4, 1888. Serial No. 287,262. (No model.)

Claim.—1. An oiler comprising a feed oil-cup located above the crank-pin, a collecting oil-cup located below the crank-pin, there being a feed oil-passage between the feed oil-cup and the crank-pin and an escape oil-passage between the bearing and the collecting-cup, a cross-partition in the collecting-cup between the escape oil-passage and one end of the collecting-cup, there being a passage through such partition, a momentum-actuated valve for such passage to allow the oil to flow into the discharge-chamber from the receiving-chamber and prevent its return, and a tube connecting the exterior end of the collecting-cup with the top of the feed oil-cup.

2. An oiler comprising a feed oil-cup located above the crank-pin, a collecting oil-cup located below the crank-pin, there being a feed oil-passage between the feed oil-cup and the crank-pin and an escape oil-passage between the bearing and the collecting-cup, a cross-partition in the collecting-cup between the escape oil-passage and one end of the collecting-cup, there being a passage through such partition, the valve-pin provided at one end with a head and having longitudinal grooves in the body of the pin, and a tube connecting the exterior end of the collecting-cup with the top of the feed oil-cup.

3. In an oiler provided with a feed oil-cup and a collecting oil-cup connected by a tube, the combination of the collecting oil-cup set forth, comprising the receiving-chamber, the discharging-chamber, the partition therebetween, the top of which is not flush with the top of the walls of the collecting-cup, the bottom strap provided with an oil-passage therethrough, the filter seated below such oil-passage and having its upper end clamped between the partition and the strap, and fastenings to secure the collecting-cup to the strap.

4. In an oiler, the combination of the apex split cone of spring metal seated in the oil-passage of the feed-cup, having its outer face threaded and being provided with an axial passage forming an outlet through the base of the cone, and the nut screwed upon the upper end of the cone.

5. In an oiler such as set forth, the means for collecting the oil and conducting it from the bearing to the collecting-cup, comprising the brasses having a space between them extending from side to side beneath the bearing to allow the oil to pass from the pin to the bottom strap, a gutter extending almost from side to side of the top of the strap beneath such space and sloping downward from each end toward the middle of the gutter, and the central passage opening approximately at the middle of the gutter and extending downward through the bottom strap to the collecting-cup.

402,633. TANK-HEATER. ANDREW J. UPHAM, Sycamore, Ill. Filed Jan. 12, 1889. Serial No. 296,152. (No model.)

Claim.—1. In combination with the heater A, designed for submersion within a tank of water and provided with the heating coil or tube G, a discharge-tube, L, attached at one end of the exit of said tube G and supported at its outer and discharge end adjustably at or near the water-line of the water within said tank, and means for adjustably supporting the discharge end of the tube G, substantially as shown, and for the purpose described.

2. The combination of the tank B, the tank-heater A, the tube G, having communication at each end with the water in said tank, the adjustable tube L, attached at one end to the exit of said tube G and projected in an upward direction, and the float M, suitably supported upon the water within said tank and in turn supporting the discharge end of tube L, substantially as shown, and for the purpose described.

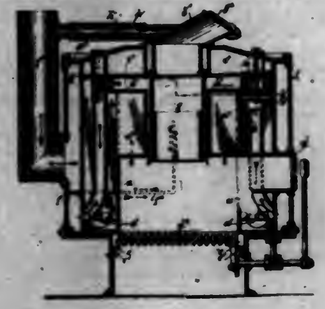
402,633

3. In combination with a tank-heater provided with the water-circulation within its fire-box, of a float, M, and a tube, L, flexibly or removably connected at one end with the exit-port of said water-circulation and supported at its other end by said float suitably buoyed upon the water in said tank, substantially as shown, and for the purpose described.

4. In a tank-heater, the combination of the heater A, heating tube or coil G, seated within said heater, the adjustable tube L, attached to the exit K of tube G, and a suitable float, M, attached to and adjustably supporting the discharge end of said tube L, substantially as shown, and for the purpose described.

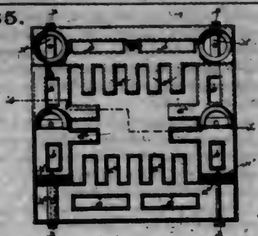
402,634. SOLDERING-TOOL. CHARLES L. WAGANDT, Baltimore, Md., assignor of one-half to Keen & Hagarty, same place. Filed Dec. 22, 1888. Serial No. 294,363. (No model.)

Claim.—1. In a soldering-tool, the combination of a central burner-tube having lateral jet-orifices at its lower end, a soldering tip or iron mounted and adapted to slide longitudinally on said tube, and a stop on said tube whereby said motion is arrested when the jet-orifices are opposite to the end of the soldering-tip, said stop being adjustable to compensate for the consumption of the tip, substantially as set forth.



2. In a soldering-tool, the combination of a central burner-tube having lateral jet-orifices at its lower end, a soldering tip or iron consisting of a hollow cylinder mounted and adapted to slide longitudinally on said tube, and a stop on said tube whereby said motion is arrested when the jet-orifices are opposite to the inner surface of the lower end of the cylinder, said stop being adjustable to compensate for the consumption of the tip, substantially as set forth.

402,635. STEAM-HEATER. EDWARD P. WAGGONER, Syracuse, N. Y. Filed Aug. 10, 1888. Serial No. 282,402. (No model.)



Claim.—1. The herein-described heater, having each side thereof formed of a separate section connected together and formed on their inner faces with integral heating-chambers projecting over the fire, substantially as and for the purpose specified.

2. In an angular steam-heater, a hollow section forming one side of said heater, flues running through said section, openings adapted to be connected to the other sections, and projecting hollow chambers formed integral with the heater-section and extending over the fire, substantially as and for the purpose set forth.

3. In a steam-heater, the section composed of the lower box, *a*, and a series of projections above the box on the inner face of said

402,635.

heater-section and extending over the fire, and a bearing-face on said heater provided with a water-passage, substantially as and for the purpose set forth.

4. In a steam-heater, the section composed of the lower box, *a*, a series of hollow projections above the box *a* and extending over the fire, and the raised chamber a^4 on the top face of the heater, substantially as and for the purpose set forth.

5. In a steam-heater, the heater-section composed of the lower box, *a*, a series of integral projecting hollow chambers above the box, the raised projecting chamber on the top face of the heater-section, and the flues running through the heater and opening through the same on the inside of the said projecting chamber, substantially as and for the purpose set forth.

6. In a steam-heater, the heater-section composed of the lower box, *a*, a series of integral projecting chambers above the box, the raised projecting chamber on the top face of the heater-section, and the flues *b*, running through the heater and opening on the inside of the projection a^4 and on the outside wall of the heater, substantially as and for the purpose set forth.

7. In a steam-heater, a main body formed of flat hollow water-sections cast independently, each section being formed on the surface adjacent to the fire with a series of parallel hollow projections above the fire-box, and also with the vertical smoke-flue opening through the top of the section and also through its lower side wall, substantially as and for the purpose set forth.

8. A steam-heater having each wall composed of a separate section or water-chamber connected to the adjacent section, and its top composed of a horizontal section connected to the sections forming the heater-walls, substantially as and for the purpose set forth.

9. In a steam-heater the sides of which meet each other at an angle, the combination of separate heater-sections composing the main body and provided with integral projecting heating-chambers, water passages between the said sections, and flues extending downwardly from the top of the main body, with a top section imposed above the main body, and a space inclosed by the top section, and the sections forming the walls of the heater, and water-passages between said top section and main body, substantially as and for the purpose set forth.

10. In a steam-heater, the combination of the separate sections or water-chambers having integral projecting heating-chambers and the raised projections on the top face thereof, connections between the heater-sections, with the top section abutting against the said raised projection, connections between the heater-sections and top section, a space inclosed by said top section and heater-sections, and flues leading therefrom, substantially as and for the purpose set forth.

402,636. BALE-COMPRESS. SAMUEL J. WEBB, Minden, La. Filed June 19, 1888. Serial No. 277,575. (No model.)

Claim.—1. In a bale compress, the combination, with the cross-head, base, and risers thereof, of a steam-cylinder mounted on the base and having a second cylinder sliding within the same and a piston-rod provided with heads adapted to operate in each of the cylinders, and means for connecting the piston-rod with the pressing devices, substantially as specified.

2. In a bale-compress, the combination, with the frame-work thereof, of a steam-cylinder provided with a smaller sliding cylinder, a piston-rod mounted in the steam-cylinder and carrying a piston-head for reciprocation therein and a second piston-head for reciprocation in the smaller cylinder, and means for connecting the piston-

rod with the pressing devices, and flanges on the smaller cylinder for limiting its movement in the larger cylinder, substantially as specified.

3. The combination, with the base of a bale-compress provided with an exhaust-opening, of a steam-cylinder mounted on the base and provided with a piston-rod terminating as a valve for controlling said exhaust, substantially as specified.

4. In a bale-compress, a steam-cylinder carrying a smaller sliding cylinder and a piston-rod provided with heads for operating in said cylinders, in combination with a hydraulic plate mounted above the cylinders and a system of toggle-levers connecting the upper piston-head and the plate, substantially as specified.

5. In a bale-compress, a steam-cylinder carrying a smaller sliding cylinder and a piston-rod having piston-heads for operating in the cylinders, in combination with a hydraulic plate mounted above the cylinders, a system of toggle-levers connecting the piston-rod and plate, and a follower or platen mounted above said plate, substantially as specified.

6. In a bale-compress, a steam-cylinder having a smaller sliding cylinder, a piston-rod carrying heads adapted to operate in the cylinders, and a hydraulic plate mounted above the same, in combination with a system of toggle-levers connecting the piston-rod and plate and a hydraulic plunger on said rod and operating in the plate, substantially as specified.

7. In a bale-compress, the combination of a steam-actuated movable hydraulic plate having a central bore provided with a cylinder and a headed piston-rod for operating in said cylinder, and having an annular hydraulic chamber surrounding the cylinder, in combination with a superimposed platen having an annular depending flange adapted to take into the annular hydraulic chamber of the plate, substantially as specified.

8. The cylinder 4, having the ring 6, in combination with the sliding cylinder 7, having the flanges 8 and 9, the base 3, having the exhaust-opening 13, the piston-rod 10, terminating in a valve, and the head 11, substantially as specified.

9. The cylinder 4, the rod 10, having heads 11, 12, and 27, and sliding cylinder 7, in combination with the hydraulic plate 14 and the toggle-levers consisting of the sections 15 and 16, the section 15 pivoted to the plate, as at 19, to the section 16, as at 18, and the section 16 to the piston-rod, as at 19×, and the levers 20, pivoted to the sections 15 and 16 and to pins 21, journaled in the risers 2 of the framework, substantially as specified.

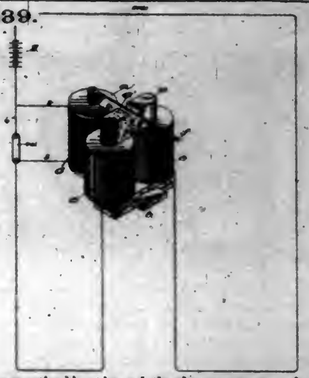
10. The combination, with the piston-rod 10, having heads 11, 12, and 27, and cylinders in which said heads slide, of the hydraulic plate 14, having the hydraulic bore 25 and cylinder 26 mounted therein, substantially as specified.

11. The combination, with the piston-head 12 and piston-rod 10, having heads 27 and 11, of the plate 14, having the cylinder 26 and chamber 24, and the platen 28, having the depending flange 30 and head 31, substantially as specified.

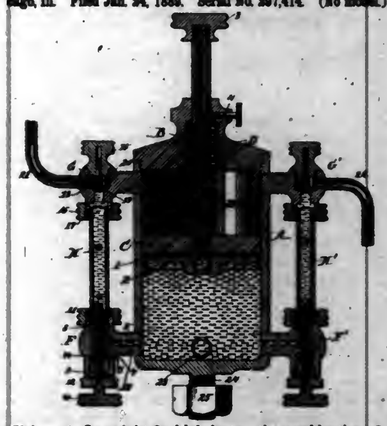
12. In a bale-compress, a steam-cylinder, risers, a cross-head, a hydraulic cylinder-plate, yokes 23, and a sliding cylinder, in combination with a piston-rod having heads working in said hydraulic plate and in said cylinders, and pairs of three-linked toggle-joints pivoted to said piston-rod, said hydraulic plate, and said risers, substantially as specified.

402,637. PROCESS OF MAKING CHAIN-LINKS. WILLIAM H. WHITELEY, Springfield, Ohio, assignor to the William H. Whiteley Company, same place. Filed June 7, 1888. Serial No. 276,317. (No model.)

Claim.—Casting chain-links of high-carbon iron with a chill in their fork shaped to correspond therewith, for the purpose of making the casting solid where the sides join the cross-bars, and afterward removing the carbon from the iron by an annealing process.



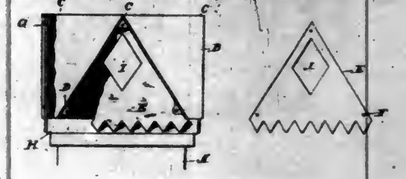
402,638. WHIFFLETREE. JOHN H. WILLEY, Manchester, N. H. Filed Feb. 27, 1888. Serial No. 301,266. (No model.)



Claim.—A whiffletree consisting of the combination of a bar, a flat spring on the front side thereof, which has longitudinally-slotted flanged portions at its ends extending backward over the ends of said bar and encircling pins therein, and trace-hooks attached to the spring, substantially as described.

402,639. POLARIZED RELAY. JOHN C. WILSON, Boston, Mass. Filed Nov. 9, 1886. Serial No. 218,304. (No model.)

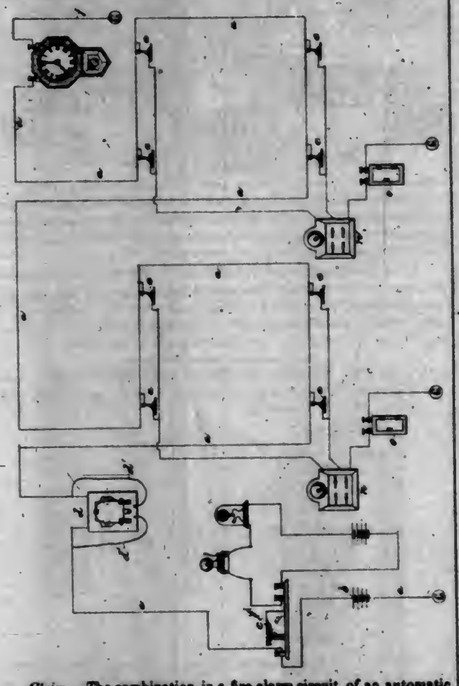
Claim.—The polarized relay herein described, comprising the permanently-magnetized bent bar *a b*, the electro-magnet *c*, placed in magnetic contact with the said permanently-magnetized bar and having its coils in the line-wire *m*, the armature *f*, pivoted to the arm *a* of said permanently-magnetized bar and vibrating between the pole-pieces *c' c'* of said electro-magnet *c*, combined with the auxiliary inductive coil C, placed or wound upon the arm *a* of said permanently-magnetized bar, and connected with the line-wire *m* and the switch *n*, for shunting out the said coil C, all substantially as and for the purpose specified.



402,640. SIGHT-FEED LUBRICATOR. WILLIAM WOODWARD, Chicago, Ill. Filed Jan. 24, 1888. Serial No. 297,414. (No model.)

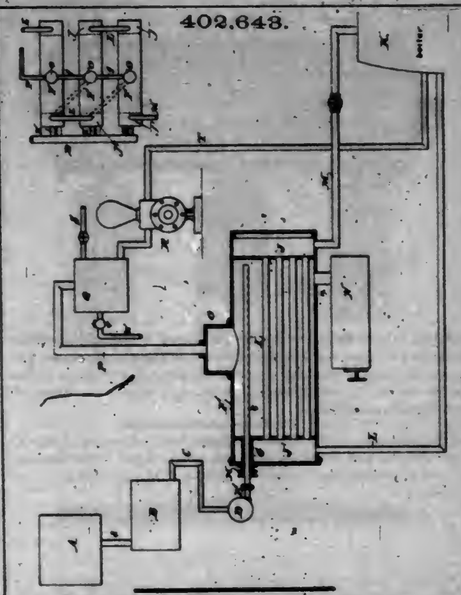
Claim.—1. In a sight-feed lubricator, the combination of an oil-cup provided in the lower part with an oil-inlet and an oil-outlet, a water-filled glass tube, a needle-valve for controlling the passage of oil from the oil-cup outlet to said glass tube, a tube, as 21, communicating with the glass tube and leading to the place to be lubricated, and a spring-actuated piston located in the oil-cup, substantially as described.

2. In a sight-feed lubricator, the combination of an oil-cup provided in its lower part with an oil-inlet and an oil-outlet, a glass tube, a valve for controlling the passage of oil from the oil-cup outlet to said glass tube, a tube, as 21, communicating with the glass tube and leading to the place to be lubricated, a spring-seated valve intermediate said tubes, a piston located in the oil-cup and having a hollow piston-rod provided with a cap at its upper end, and a spring acting on the piston-head to force it down, substantially as described.



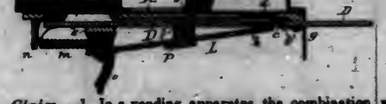
402,641. CHIMNEY-PROTECTOR. WILLIAM WRIGHT, Willink, N. Y. Filed June 25, 1886. Serial No. 206,191. (No model.)

Claim.—1. A chimney-protector comprising the roofing-piece cast in a single piece, and the wall-pieces attachable thereto by means substantially as shown, whereby they are adjustable, so as to fit against and firmly embrace the chimney and secure the protector in position, substantially as set forth.



2. The combination, with the roof-piece B, having the right-angled gables C formed integrally therewith in a single piece of cast-iron, of the wall-pieces E, provided with the openings I and removably secured in the gables by means, substantially as shown, whereby said wall-pieces are adjustable, so as to fit against and firmly embrace the chimney, as and for the purposes set forth.

402,642. TESTING APPARATUS FOR FIRE-ALARMS. JOHN YOUNG, Chicago, Ill., assignor to the Western Electric Company, same place. Filed Nov. 21, 1884. Serial No. 148,540. (No model.)



Claim.—The combination, in a fire-alarm circuit, of an automatic circuit-closing mechanism operating at stated intervals, a high-resistance annunciator in the circuit at the patrol-station, and a shunt around said annunciator-coils closed by the falling of the shutter, substantially as and for the purpose specified.

402,643.

402,644. VENDING APPARATUS. HENRY BAILEY, New York, N. Y., assignor, by mesne assignments, to The Automatic Selling Machine Company, same place. Filed Jan. 7, 1889. Serial No. 295,989. (Model.)

Claim.—1. In a vending apparatus, the combination, with an external coin-chute casing, of a pair of removable plates loosely held side by side within such casing and locked together, one of such plates having a continuous recess forming a chuteway, substantially as set forth.

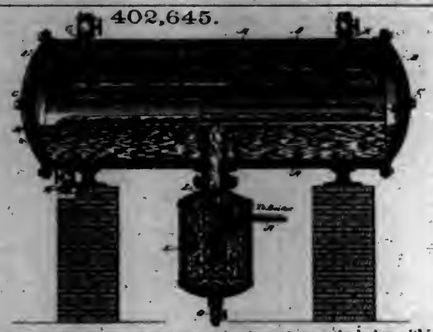
2. In a vending apparatus, the combination, with the hinged coin-chute casing, of a pair of removable plates loosely fitted within the same, one of such plates being recessed to form the chuteway, substantially as set forth.

3. In a vending apparatus, the combination, with a box or case containing the locking and delivery mechanism, of a hinged or pivoted coin-chute outside of said box, substantially as described.

4. In a vending apparatus, the combination, with a box or case containing the locking and delivery mechanism, of an external hinged coin-chute and a locking-pin for locking said chute to said case, substantially as set forth.

5. The combination, with the plate A, having the slot *d'*, of a sliding delivery-bar, as D, and a support for articles of sale connected to said bar by a pin which passes through said slot and sliding with said bar, substantially as described.

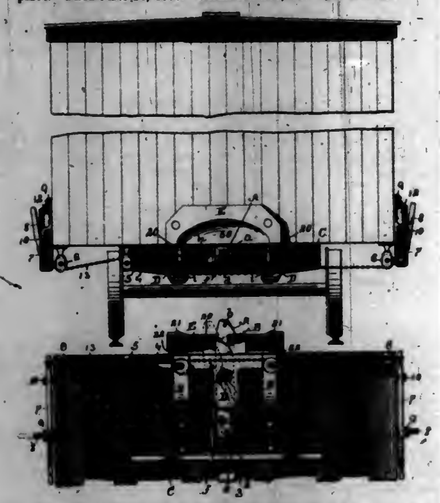
6. The combination of the sliding bar D, the locking-lever, and the double stop l^2 l^3, substantially as set forth.



7. The combination of the sliding bar D, the locking-lever, and stops l^2 l^3, each having a lip, as l^4 l^5, substantially as described.

402,645. FEED-WATER HEATER AND PURIFIER. HENRY D. BARASWANATH, Chicago, Ill. Filed Aug. 28, 1888. Serial No. 283,994. (No model.)

Claim.—1. The combination, with the feed-water heater, of a settling-chamber, a vertical pipe therein opening at both ends above and below the surface of the water, respectively, a hollow cone protecting the upper end thereof, and a feed-pipe leading to the boiler and connecting with said pipe below the upper protected end thereof, substantially as described.



2. The combination, with a feed-water heater, of a series of reversely-inclined shelves located in the heating-chamber thereof, a settling-chamber and pipe connecting said chamber and heater and

402,645.

opening in the latter above the bottom thereof, a vertical pipe within said chamber open at both ends, the lower end only being submerged, a cone protecting the upper open end thereof, and a feed-pipe to the boiler connecting with said pipe below the upper protected end thereof, substantially as described.

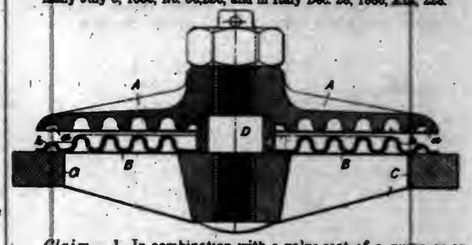
402,646. CAR-COUPLING. JAMES BARRY, Kansas City, Mo., assignor of part to William H. H. Tainter and Daniel W. Tainter, same place. Filed June 12, 1888. Serial No. 276,736. (No model.)

Claim.—1. In a car-coupler, the combination, with a car and a draw-head pivoted thereto, of brackets secured to the car at each side, levers mounted in said brackets, pawls to engage said levers, a chain connecting one of said levers with the draw-head, and another chain connecting the other lever with the first-mentioned lever, substantially as set forth.

2. In a car-coupler, the combination, with the pivoted draw-head, of a spring bearing on one side of the draw-head and a frame composed of spring-plates and a connecting-bar bearing on the under face of the draw-head, substantially as set forth.

3. In a car-coupler, the combination, with the draft-timber, of a pivoted draw-head yieldingly connected thereto, a spring bearing on one side of the draw-head, and a spring-frame having a tongue bearing on the under face of the draw-head, substantially as set forth.

4. In a car-coupler, the combination, with the draft-timber having a slot, of the rounded shank of a draw-head passing through said slot, springs encircling the shank at opposite sides of the draft-timber, a draw-head connected with the shank, a spring bearing on one side of the draw-head, and a spring-frame having a rearward projection bearing on the under face of the draw-head, substantially as set forth.

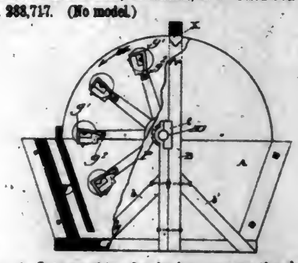


5. In a car-coupler, the combination, with a pivoted draw-head, of a spring-frame having a tongue to bear on the under face of the draw-head, substantially as set forth.

6. The combination, with a draw-head adapted to move laterally and vertically, and springs for holding the draw-head elevated, of a bumper located on the car immediately above the draw-head and provided with an inclined face adapted to engage the draw-head of the next adjacent car and force it downwardly, substantially as set forth.

7. The combination, with a draw-head adapted to move laterally and vertically, and springs for holding the draw-head elevated, of a spring-bumper secured to the car above the draw-head and provided with an inclined face adapted to engage the draw-head of the next adjacent car, substantially as set forth.

8. In a car-coupler, the combination of the operating-lever 7, the slotted bracket 9, and pawl or catch 8, for the purpose substantially as set forth.



402,647. PUMP-VALVE. ASPLAN BELDAM, London, County of Middlesex, England. Filed Sept. 22, 1886. Serial No. 214,219. (No model.) Patented in England Sept. 10, 1885, No. 10,730; in France June 18, 1886, No. 176,837; in Belgium July 1, 1886, No. 73,630; in Germany July 3, 1886, No. 38,226, and in Italy Dec. 28, 1886, XLI, 228.

Claim.—1. In combination with a valve-seat of a pump or an analogous structure, a valve having a peripherical channel or channels or corrugations, whereby the gentle settling of the valve upon its seat is effected, substantially as described.

2. In combination with a valve-seat of a pump or an analogous structure, a valve having corrugations, and a guard having corrugations adapted to receive and correspond with the corrugations of the valve, whereby a cushioning effect is obtained between said valve and guard upon the left of the valve, substantially as described.

402,648. MACHINE FOR DYEING YARN ON THE SKEIN. JOHN R. BRAY and OTIS S. PIERCE, Pawtucket, R. I. Filed Oct. 20, 1888. Serial No. 288,717. (No model.)

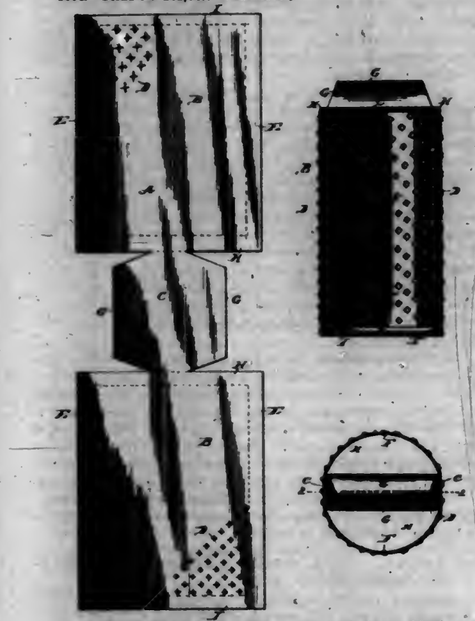
Claim.—1. In a machine for dyeing yarn on the skein, the combination, substantially as hereinbefore described, of a tank containing dye or liquor, a frame secured thereto supporting a journal-box, a rotary central shaft alternately rotating in either direction, flanged hubs mounted upon the said shaft, longitudinally-slotted spokes secured to said hubs, a frame for holding the skeins of yarn fitting into the slotted groove of said spokes, and means for locking said frame into said spokes.

2. In a machine for dyeing yarn on the skein, the combination, substantially as hereinbefore described, of a tank, a frame secured thereto, a rotary shaft, flanged hubs, longitudinally-slotted spokes, means for holding said shaft and spokes while in the process of loading and unloading, a frame for holding the skeins, adjustable for any length of skein, fitting into the slotted groove of the spokes, means for locking said frame into said spokes, and a friction-disk, N, mounted upon the extended shaft J of the upper reel-stick of the frame colliding with a buster extending downward from the cross-bar of the supporting-frame.

3. The combination, in a dye or liquor tank, of a tank, a rotary shaft, flanged hubs secured thereto, longitudinally-slotted spokes secured to said hubs, and a frame for holding the skeins of yarn, having side arms formed of corresponding strips of metal slotted and adjustable to each other for any length of skein, fitting into the groove of said spokes and securely locked in said spokes by the swinging arm *g*, which fits by means of the hole in its bent end upon the pin *i*.

402,649. RIVET. MELLEN BRAY, Newton, Mass. Filed Jan. 3, 1889. Serial No. 295,373. (No model.)

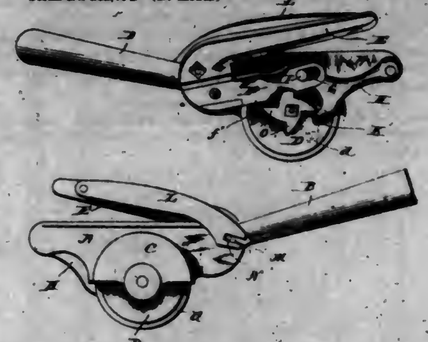
Claim.—1. A rivet made from solid wire provided with a head and two prongs, each having a rounded outer surface and a flat inner surface, said inner surfaces of said prongs being parallel, or nearly so, longitudinally to each other and to the rounded outer surfaces of said prongs for a considerable portion of their lengths, said prongs being provided with central cutting-edges and made tapering widthwise from their junction to their cutting ends, and having a distance from the outside of one prong to the outside of the other greater at the point where said prongs are parallel to each other than at their junction with each other and with the head.



2. A rivet made from solid wire provided with a head and two prongs, each having a rounded outer surface and a flat inner surface, said flat inner surfaces being parallel, or nearly so, longitudinally with each other and with the outer rounded surfaces of said prongs for a considerable portion of their lengths, each of said prongs being provided with a central cutting-edge, and the distance from the outside of one prong to the outside of the other being greater at the point where said prongs are parallel to each other than at their junction with each other and with the head.

402,650. PROCESS OF MANUFACTURING PRONGED RIVETS. MELLEN BRAY, Newton, Mass. Filed Jan. 3, 1889. Serial No. 295,374. (No model.)

Claim.—The process of forming pronged rivets from sections of solid wire, which consists in first forming a head upon a short section of said wire, then subjecting the shank of the solid rivet thus formed to pressure to flatten two opposing sides thereof, and then punching out the central portion of the stock of said flattened shank by subjecting it to the action of male and female dies.

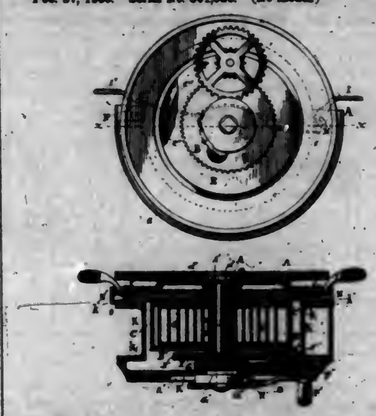


402,651. CULINARY GRATER. HYMAN I. BLOCK, Chicago, assignor of one-third to Hyman Lobowich, Cook County, Ill. Filed Apr. 26, 1888. Serial No. 272,145. (No model.)

Claim.—1. The herein-described grater made from a blank composed of two perforated rectangular portions connected by an intermediate strip of metal, the rectangular portions being bent to the desired form and united at the edges to form the body of the grater and the intermediate strip being bent to form the handle of the grater, substantially as described.

2. The herein-described grater made from a blank composed of two perforated portions connected by an intermediate strip of metal, the rectangular portions being bent to the desired form and united at the edges to form the body of the grater, the intermediate strip being bent to the desired form to form the handle of the grater, said handle joining the walls of the grater at a point between its uniting-seams, substantially as described.

402,652. CLOTH-CUTTING APPARATUS. CHARLES W. BOETTNER and HOWARD H. GILBERT, Little River, Kans. Filed Aug. 14, 1888. Serial No. 282,704. (No model.)

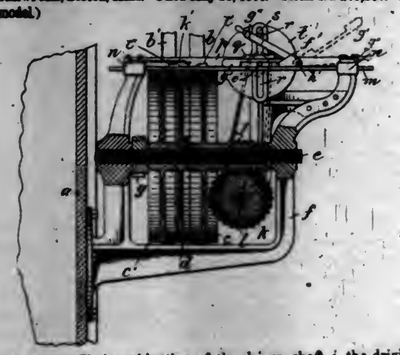


Claim.—1. In shears, the combination, with the main blade, of the upper blade pivoted thereto and provided with an operating-arm, F, the swinging link H, connecting the outer end of the operating-arm to the outer end of the main blade and provided with the projection or tooth K, and the friction-roller mounted on the main blade and provided with radial arms or spurs adapted to alternately engage the operating-arm and the projection or tooth K, substantially as specified.

2. In shears, the combination, with the main blade, the friction-roller mounted thereon, the upper blade mounted on the main blade and provided with an operating-arm connected to the friction-roller, the pin on the side of the main blade, and the pressure-spring attached to the end of the upper blade and provided with a slot operating on the said pin, substantially as specified.

3. In shears, the combination, with the main blade provided with a suitable casing or housing, of the friction-roller mounted in the casing or housing, provided with a rubber periphery, and having arms or spurs on its side, the upper blade pivoted to the main blade and provided with the operating-arm F, having a slot, G, and a shoulder, *f'*, adapted to be engaged by the arms or spurs, and the swinging link H, mounted on the outer end of the main blade and provided with a stud, I, operating in the slot G, the said swinging link being further provided with a projection or tooth, K, adapted to be engaged by the arms or spurs on the roller, substantially as specified.

402,653. FISHING-REEL. FRANK CAREY, Penn Yan, N. Y. Filed Feb. 27, 1889. Serial No. 301,328. (No model.)

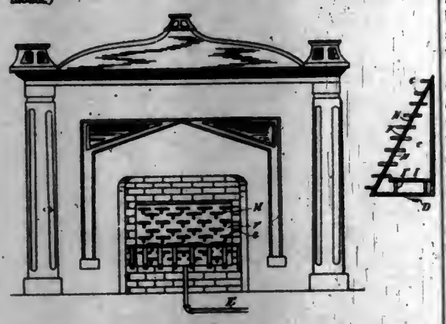


Claim.—1. In a fishing-reel, a case having corrugations on the inner side of the barrel, a spiral spring within said case having its inner end detachably secured to a sleeve upon which said barrel is journaled and having its opposite end curved or hooked to engage with the corrugations in the barrel, substantially as set forth.

2. In a fishing-reel, the double brake consisting of levers I I', pivoted at its opposite extremities to operate the same either above or below the reel, in combination with the lever *m* and pawl *d'* and ratchet-wheel *d*, whereby a backward or forward motion is given to the central shaft, D.

3. The rod-plate having a fixed hollow spindle and attached to it two levers supplied with cams, in combination with the exterior surface of the case K, whereby the case may be prevented from rotating when required, substantially as described.

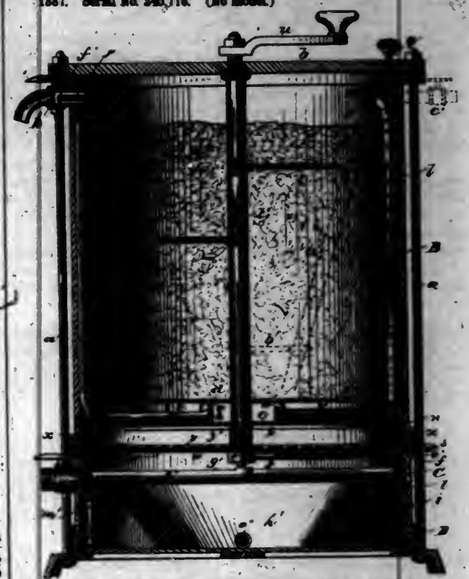
4. In a line-reel, a rod-plate having a bar extending across and parallel thereto, and having at its opposite extremities suitably-pivoted levers for actuating said bar and by it the pawl-and-ratchet mechanism on the reel-shaft, substantially as described.



402,654. AUTOMATIC REVERSING MECHANISM. JAMES G. CRAWFORD, Boston, Mass. Filed May 26, 1888. Serial No. 275,287. (No model.)

Claim.—1. The combination of the driven shaft *i*, the driving-shaft *c*, geared to the driven shaft, the fast pulley *d* and loose pulleys *c c'* on the driving-shaft, the worm *j* on the hub of the loose pulley *c*, the shaft *l*, having the worm-wheel *k*, meshing with said worm, the sprocket-wheel *a'* on the shaft *l*, the shaft *u*, having the sprocket-wheel *v* and the eccentric-pin *s*, the sprocket-chain *w*, connecting the wheels *a' v*, the shipper-bar *m*, and means, as described, between the shipper-bar and the eccentric-pin *s*, whereby said bar is reciprocated by the revolutions of said pin, as set forth.

2. The combination of the driven shaft *i*, the driving-shaft *c*, geared to the driven shaft, the fast pulley *d* and loose pulleys *c c'* on the driving-shaft, the worm *j* on the hub of the loose pulley *c*, the shaft *l*, having the worm-wheel *k*, meshing with said worm, the sprocket-wheel *a'* on the shaft *l*, the shaft *u*, having the sprocket-wheel *v* and the eccentric-pin *s*, the sprocket-chain *w*, connecting the wheels *a' v*, the slide *q*, adapted to move on a fixed guide and provided with a slot, *r*, receiving the pin *s*, and with a stud or pin, *c'*, and the shipper-bar *m*, engaged, as described, with the stud or pin *c'*, as set forth.



402,655. GAS-BURNER FOR GRATES AND STOVES. JOSEPH A. DAILEY, Toledo, Ohio. Filed May 26, 1888. Serial No. 275,283. (No model.)

Claim.—1. An improved gas-burner for stoves, &c., consisting of a shell having one or more of its walls formed with perforations disposed in rows, substantially as described, and provided with heat-conducting ribs located one above each opening and projecting from both the inner and outer sides of the wall, as and for the purpose set forth.

2. In a burner for gas-stoves, &c., a shell having an inlet in its base and having one or more of its walls formed with perforations disposed in rows, substantially as specified, and provided also with heat-conducting ribs located one above each opening and projecting from both the inner and outer sides of the wall, in combination with a solid deflecting-plate located within the shell above said inlet-opening, as and for the purpose set forth.

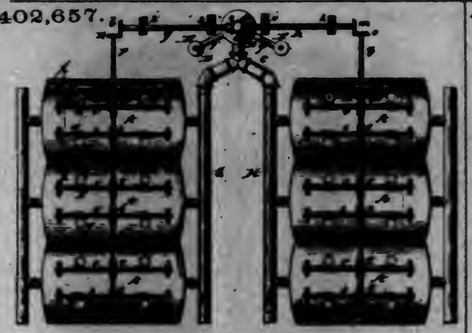
402,656. FILTER. JOHN DAVIS, Allegheny, Pa. Filed July 30, 1887. Serial No. 245,716. (No model.)

Claim.—1. In a filter, the combination of a supply-pipe, a receiving and precipitating chamber, a filter-chamber, an interposed straining-diaphragm, a chamber between the diaphragm and the bottom of the filter-bed, pipes communicating with the chamber above the diaphragm, the filter-chamber above and below the filter-bed, and an agitator, substantially as described.

2. In a filter, the combination of a supply-pipe, a receiving and precipitating chamber, a filter-chamber, an interposed straining-diaphragm, a chamber between the filter-bed and the bottom of the filter-chamber, pipes communicating with the intermediate chamber and discharging above and below the filter-bed, a pipe for drawing off liquid above and below said bed, valves for controlling each of said pipes, and an agitator, substantially as described.

3. In a filter, the combination of a supply-pipe having a valve and provided with distributing-branches, a receiving and precipitating chamber, a chamber for containing chemicals, a circulating-pipe of smaller area than the supply-pipe and communicating with the chemical-chamber and one of said branches, a filter-chamber, a chamber between the receiving-chamber and the filter-bed, pipes for supplying and drawing liquid from the filter-chamber, and an agitator, substantially as described.

4. A filter composed of an upper and a lower detachable section, the lower section being provided with a receiving and a precipitating chamber, a chemical-chamber, and a circulating-pipe communicating with the chemical-chamber, the upper section having a filter-chamber provided with a foraminous diaphragm supporting the filter-bed, a supply-pipe extending above the filter-bed, an inlet and a discharge pipe under said diaphragm, and a waste-water discharge above the filter-bed, in combination with an agitator, substantially as described.



5. In a filter, the combination of a filter-chamber, a water-supply pipe, an agitator, and a flexible transfer-pipe connected to an arm on the agitator, substantially as described.

402,657. FILTER. JOHN DAVIS, Allegheny, Pa. Filed Mar. 10, 1888. Serial No. 266,845. (No model.)

Claim.—1. A filter having an elongated body and provided with a combined receiving and precipitating chamber, a separate filter-chamber above the receiving-chamber, and a filter-liquid chamber between the filter and receiving chambers, in combination with a supply-pipe provided with a flattened and laterally-distended nozzle, a pipe for conducting liquid from the receiving-chamber into the filter-chamber at one end thereof, and a pipe for drawing filtered liquid from the liquid-chamber at the opposite end of the filter, substantially as described.

2. A filter having a receiving and precipitating chamber, in combination with a supply-pipe provided with a flattened and laterally-distended nozzle arranged to discharge liquid in a thin horizontal sheet at the top of said chamber, whereby sediment is precipitated, a filter-chamber, and suitable pipes for conducting liquid to and from the filter-chamber, substantially as described.

402,657.

3. A filter provided with a receiving and precipitating chamber, in combination with a horizontal supply-pipe and a similar discharge-pipe, each having a flat nozzle, a transverse vertical bar between the nozzles, and a filter-chamber, substantially as described.

4. A filter having a horizontally-elongated body and provided with a receiving and precipitating chamber, a chemical-chamber crossing one end of the receiving-chamber, a horizontal supply-pipe passing through and communicating with the chemical-chamber, a laterally-distended discharge-nozzle in the receiving-chamber, and means of communication between the receiving and chemical chambers, in combination with a filter-chamber, substantially as described.

5. A filter having a horizontally-elongated body and provided with a bottom composed of separate sections of angle-iron crossing the filter transversely and having water-passages between them, supporting beams and columns, in combination with a filter-chamber above said bottom and a liquid-chamber below the same, substantially as described.

6. A filter-vessel consisting of a horizontally-elongated body having its ends curved transversely, its sides curved vertically, and its top curved transversely from side to side, whereby each wall braces the walls adjacent thereto without the intervention of stay-rods, substantially as described.

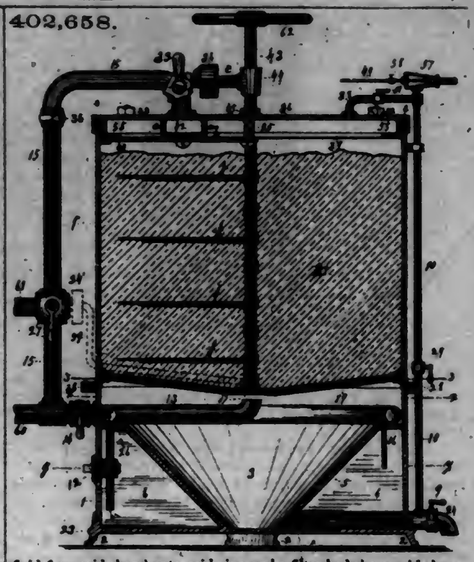
7. In a filter, an agitator consisting of a shaft and a series of blades projecting therefrom in the same vertical plane and at an oblique angle to the horizon, whereby the filter-bed is raised in columns and forms passages for the liquid supplied from beneath the bed to cleanse it, substantially as described.

8. The combination of a motor operated by water from a supply-conduit, an air-compressor, and suitable pipes for conducting air from the compressor into the water flowing into the motor, in combination with a supply-main communicating with the motor and a filter or filters, substantially as described.

9. The combination of a water-motor, an air-compressor operated by said motor and discharging compressed air into the water, a supply-main, and one or more filters, substantially as described.

10. The combination of a motor, a series or system of filters provided with agitators, suitable operating mechanism connecting the motor and the agitators of all the filters, and shipping devices whereby all of the filter-beds may be agitated simultaneously, or one or more beds agitated, substantially as described.

402,658. FILTER. JOHN DAVIS, Allegheny, Pa. Filed Nov. 20, 1886. Serial No. 220,215. (No model.)



Claim.—1. In a filter, the combination of a supply-pipe, a receiving and precipitating chamber, a chamber for containing chemicals, a circulating-pipe supported above the latter chamber and communicating therewith, and a filter-chamber above said chemical-chamber and within the same vessel, substantially as described.

2. In a filter, the combination of a supply and a circulating pipe, a combined receiving and precipitating chamber, a chamber for containing chemicals, a pipe communicating with both of said chambers, a sediment-discharge pipe communicating with the precipitating-chamber, and a filter-bed above said chamber and within the same vessel, substantially as described.

3. In a filter, the combination of a supply and a circulating pipe, a combined receiving and precipitating chamber, a chamber for containing chemicals, a pipe connecting said chambers, a separate pipe for conducting fluid from the chemical-chamber to the circulating-pipe, and a filter-bed above said chambers and circulating-pipe and within the same vessel, substantially as described.

4. In a filter, the combination of a supply and a circulating pipe, a receiving and precipitating chamber, a chamber for containing chemicals, means of communication between said chambers, a separate pipe for conducting liquid from the chamber containing the chemicals to the circulating-pipe, suitable means for regulating the quantity of

402,658.

fluid from said chamber to said pipe, and a filter-bed above said chambers and pipes and within the same vessel, substantially as described.

5. In a filter, the combination of a supply-pipe, a receiving and precipitating chamber, a filter-chamber, an interposed straining-diaphragm, a chamber for containing chemicals, and a circulating-pipe communicating with the chemical-chamber and the receiving-chamber and within the same vessel, substantially as described.

6. In a filter, the combination of a supply and a circulating pipe, a concentric conical precipitating-chamber, an annular chamber for containing chemicals, pipes for conducting liquid to the latter chamber, and pipes for conducting liquid impregnated with chemicals into the circulating-pipe, substantially as described.

7. A filter provided with a chamber having a conical compartment to receive precipitated sediment, a discharge-pipe communicating with the small end thereof, and an annular supply-pipe supported above said sediment-chamber and discharging at or near the center of the receiving-chamber, in combination with a filter-bed above said parts, and a discharge-pipe for filtered liquids, substantially as described.

8. In a filter, a receiving and precipitating chamber, an annular chamber divided into separate compartments for containing different kinds of chemicals, a supply and a circulating pipe communicating with each of the several compartments and discharging into the receiving-chamber, in combination with a filter-bed above said chambers, and a suitable discharge-outlet, substantially as described.

9. In a filter, the combination of a supply-pipe, a sediment-chamber, a chamber for containing chemicals, pipes for conducting liquids to and from the latter chamber, a filter-bed, a separate chamber for the filtered liquid provided with a breakwater, and a discharge-pipe communicating with said separate chamber, substantially as described.

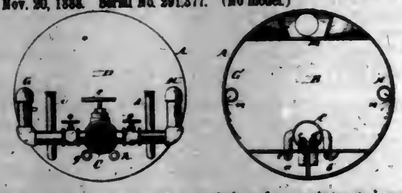
10. In a filter, the combination of a supply-pipe, a filter-bed, a sediment-chamber below and a purified-water chamber above said filter-bed, and an ejector connected to both of said chambers for raising sediment from one or discharging purified water from the other, substantially as described.

11. In a filter, the combination of a filter-bed, an agitator provided with a hollow shaft extending through said bed and provided with a series of vanes arranged in different horizontal planes and at an angle to a horizontal plane, and having a groove or grooves on their lower surfaces for conducting liquid to the outer extremities of said vanes, substantially as described.

402,659. FILTER. JOHN DAVIS, Allegheny, Pa. Filed Nov. 20, 1886. Serial No. 201,276. (No model.)

Claim.—1. An article of manufacture, a filter bottom or support for a filter-bed, consisting of two foraminous heads, a vertical wall to which said heads are permanently secured, and hollow perforated supports interposed between the heads, substantially as described.

2. An article of manufacture, a filter bottom or support for a filter-bed, consisting of two foraminous heads, a vertical imperforate wall to which said heads are permanently secured at their extremities, and hollow supports having their sides perforated and the lower end open, substantially as shown and described.



402,659.

3. An article of manufacture, a filter bottom or support for a filter-bed, consisting of two foraminous heads permanently secured to a vertical wall, interposed supports for the upper head, and a filling of granulated filtering material surrounding the supports, substantially as described.

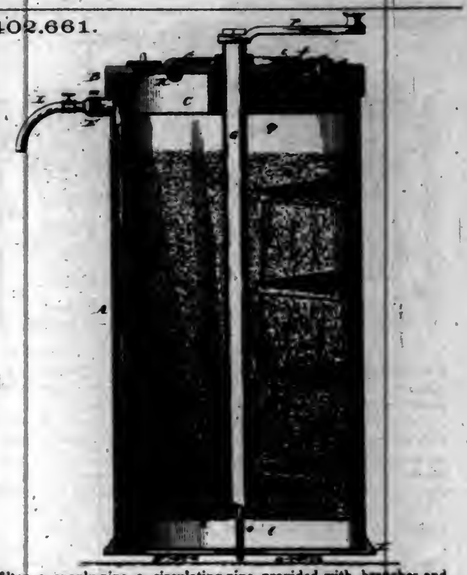
4. An article of manufacture, a filter bottom or support for a filter-bed, consisting of an upper head of wire, a lower head or perforated sheet metal, an imperforate metallic wall to which said heads are secured at their extremities, hollow perforated supports for the upper head, having a closed and an open end and perforated sides interposed between the heads, and a filling of granulated filtering material surrounding the supports, substantially as described.

402,660. **WATER-PURIFIER.** JOHN DAVIS, Allegheny, Pa. Filed Nov. 20, 1888. Serial No. 291,377. (No model.)

Claim.—1. A water-purifier consisting of an unobstructed coagulating and precipitating chamber, a chemical-chamber contained within the former chamber, and a supply-pipe communicating with both of said chambers, in combination with a pipe communicating with the upper part of the precipitating-chamber for discharging purified water, substantially as described.

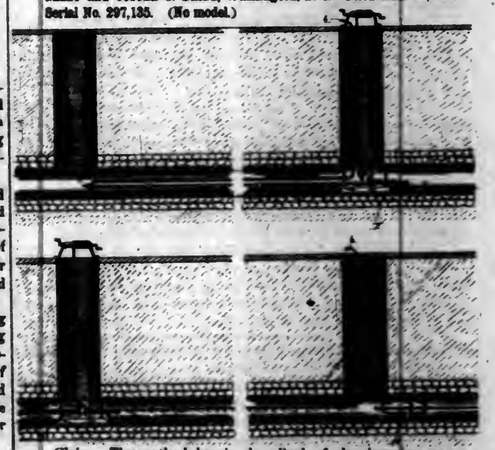
2. A water-purifier consisting of an unobstructed coagulating and precipitating chamber, a chemical-chamber within and at one end thereof, a supply-pipe connected with the chemical-chamber by supply and discharge pipes, and a valve for controlling the supply of chemicals, in combination with a pipe communicating with the upper part of the precipitating-chamber for discharging purified water, and a sediment-discharge pipe, substantially as described.

3. A water-purifier consisting of a coagulating and precipitating chamber, a chemical-chamber, a main supply-pipe communicating with the chemical-chamber by means of a pipe within the main supply, and the receiving end of which is bent forward in the direction of the incoming water, and a pipe for conducting the water impregnated with chemicals into the main supply-pipe, in combination with a pipe communicating with the upper part of the precipitating-chamber for discharging purified water, substantially as described.



4. A water-purifier having a coagulating and precipitating chamber, and a main supply-pipe provided with a valve, in combination with pipes passing through one end of the vessel, communicating with the main between its source of supply and the valve, extending along the inner sides of the vessel, having elongated openings adjacent to the sides of the vessel for discharging water in thin sheets, and provided with valves for controlling the supply of water from the main, substantially as described.

402,661. **FILTER.** JOHN DAVIS, Allegheny, Pa. Filed Nov. 20, 1888. Serial No. 291,378. (No model.)



Claim.—1. In a filter, the combination of a chemical-chamber at the upper end thereof, a supply-pipe, a circulating-pipe communicating with said chamber and discharging into the filter, a filter-bed below the chemical-chamber, and a coagulating-chamber between the cover of the filter and the filter-bed, and all of said parts being within the filter-vessel, substantially as described.

2. In a filter, a chemical-chamber supported by the cover of the filter, a supply-pipe, a circulating-pipe provided with branches and communicating with said chamber, and a valve for controlling the supply of chemicals to the water, in combination with a filter-bed below the chemical-chamber, and a coagulating-chamber between the chemical-chamber and the filter-bed, and all of said parts being within the filter-vessel, substantially as described.

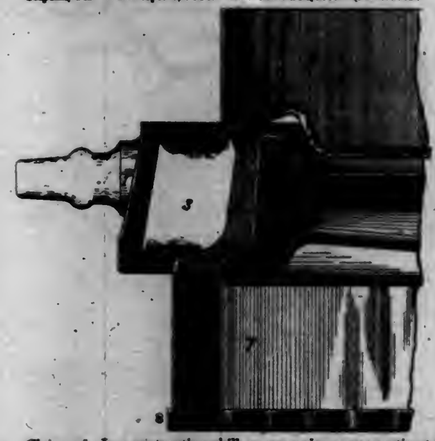
402,661.

402,662. **METHOD OF CLEANING PIPE SEWERS.** OWEN DOHERTY and COTTER T. BRIDE, Washington, D. C. Filed Jan. 22, 1889. Serial No. 297,135. (No model.)

Claim.—The method herein described of cleaning pipe sewers, which consists, first, in mechanically projecting a starting implement into the sewer by means of power apparatus located above, and simultaneously trailing along with said starter a draft cable or rope, then successively attaching additional lengths to the starter and repeating the forcing of them into the sewer mechanically, as before, and finally attaching to the rear end of said draft cable or rope a suitable cleaning device and drawing the same through the sewer, substantially in the manner and for the purpose set forth.

402,663. **PADLOCK.** WILLARD D. DORRELL, Washington, D. C., assignor to the Corbin Cabinet Lock Company, New Britain, Conn. Filed Jan. 18, 1888. Renewed Jan. 29, 1889. Serial No. 297,982. (No model.)

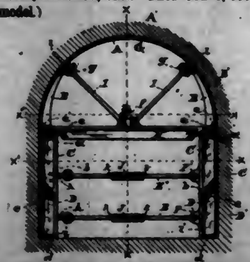
Claim.—1. In a padlock, the combination, with the tumblers and the dog, of a detent-piece, C, pivoted in the casing, and formed with a lug to engage the end of the dog and prevent it from engaging the notches of the tumblers, and an arm terminating in an inclined piece to set across the key-hole of the lock, substantially as and for the purpose stated.



402,663.

2. The combination, with the casing, of the key-guard and tumbler-rest 15, arranged at an incline over the key-hole, the tumblers pivoted to rest on the guard and rest 15 in their downward movement, and the detent-piece pivoted on the lock and formed with an arm adapted to set across the key-hole, substantially as and for the purpose specified.

3. The combination, with the casing having the shackle, of the spring-actuated dog having a lug to engage the notches of the tumblers, the tumblers, a detent-piece pivoted in the casing and formed with a lug to engage the said lug of the dog and an arm terminating in an angular piece to set across the key-hole, and a key formed with an angle in its shank, whereby the tumblers may be lifted and the detent moved out of engagement with the dog, substantially as described.

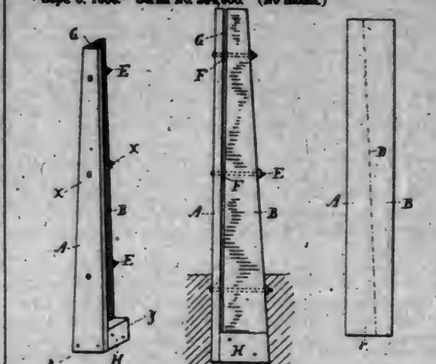


402,664. **CHILL FOR CAR-WHEELS.** LUTHER B. FAUSSET, Philadelphia, Pa. Filed Apr. 7, 1887. Serial No. 234,085. (No model.)

Claim.—1. In a contracting-chill, an expansion or connecting bar of reduced depth relatively to the inner section of the chill and having at its junction therewith its top face depressed below the top of said inner section and its bottom face elevated above the bottom thereof, substantially as set forth.

2. The combination, in a chill, of a continuous rim or outer section, an inner section composed of a divided circular series of chilling blocks or segments, and a series of expansion-bars connecting the outer to the inner section and suited to the latter wholly within and clear of its parting-faces, substantially as set forth.

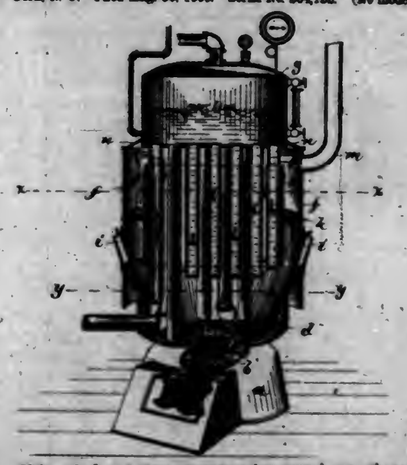
402,665. **ADJUSTABLE FRAME FOR BUILDING SEWERS, &c.** GEORGE M. GRAHAM, Cleveland, Ohio. Filed Oct. 8, 1888. Serial No. 287,580. (No model.)



Claim.—1. A metallic frame-work for building sewers, conduits, &c., consisting of a series of plates bearing one upon another by inwardly turned and inclined flanges of the lower and middle plates, hinged and hooked cross-rods for spreading said plates, and cross-bars supported by the middle plates for suspending the upper and crown plates by means of rods hooked in lugs of said bars, substantially as and for the purpose set forth.

2. As a means for building sewers of concrete material, the combination of the plates D D, C C, B B, and A, set successively one upon the others, having non-parallel joints for the side or middle plates, and cross-bars for supporting the upper plates, all united by means of rods, substantially as and for the purpose set forth.

3. The cross-bars H and sockets *d* at the base of the plates B B, in which to attach the terminals of the cross-bars, in combination with rods E E, having threaded coupling J, arranged in connection with the plates C C and D D, constructed substantially as set forth.



402,666. **FENCE-POST.** HIRAM B. GRANT, Cleveland, Ohio. Filed Sept. 5, 1888. Serial No. 284,600. (No model.)

Claim.—1. In a wooden fence-post, the combination of the tapering posts A and B, forming the complementary parts of a plank, the cross-bolts E, securing them together in the form of a T, and the washers F upon the cross-bolts to form an air-space between the parts, substantially as described.

2. In a wooden fence-post, the combination of the tapering posts A B, forming the complementary parts of a rectangular plank, the cross-bolts E, securing them together in the form of a T, the washers F between the posts and forming the air-space G, and the cleats H, secured at the base of the posts in the angles thereof, substantially as described.

402,667. **SECTIONAL STEAM-BOILER.** CHARLES GORTON, New York, N. Y. Filed Aug. 30, 1888. Serial No. 284,122. (No model.)

Claim.—1. In a steam-generator or hot-water heater, the combination of a base, a supporting-annulus angular or L-shaped in cross-section and resting on the base, a grate deeper in the middle, a downwardly or inwardly converging fire-pot resting on the annulus, a fuel-reservoir around the side of the fire-pot, and a series of coal-pockets around the outer shell, substantially as described.

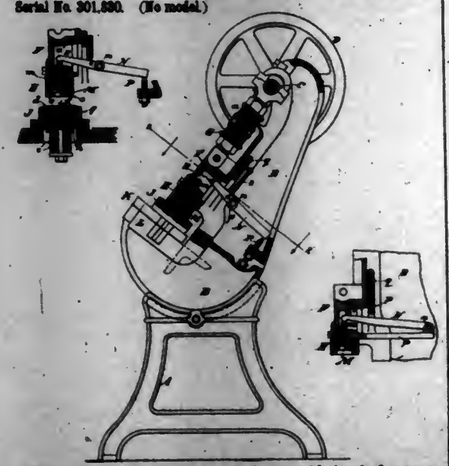
2. In a steam-generator, the combination, with a downwardly or

inwardly converging fire-pot, a coal-reservoir around and above the same, coal-pockets, a nest of water-tubes above the fire-pot, and sets of water-tubes extending down through the fire-pot on each side of the coal-pockets, substantially as described.

3. In a steam-generator, the combination, with the fire-pot having an annular side feed, of a boiler located above the same and comprising a steam-drum, and a nest of drop-tubes arranged in circles and depending from the drum and ending above the fire-pot, every alternate suitable number of tubes in the outer circle being extended down through the fire-pot to the base, and serving as water-legs and supporting the boiler, substantially as described.

4. In a steam-generator, the combination, with a base and a supporting-annulus angular in cross-section and resting upon the base, of a ring forming the sides of the fire-pot and having its lower edge resting upon said annulus, a boiler provided with drop-tubes, a suitable number of which are extended downwardly to rest upon the annulus and support the boiler, and a casing inclosing the boiler and resting on the ring.

5. In a steam-generator, the combination of the converging fire-pot, an annular side feed, and coal-pockets, and a nest of water-tubes arranged in circles above the fire-pot, the tubes in the outer circle being arranged in sets, every alternate set extending down through the fire-pot on each side of the coal-pockets to allow the coal to freely feed downwardly and spread laterally, substantially as described.



6. The combination of the fire-pot, a fuel-reservoir, fuel-pockets for the same, an outer casing, a nest of depending water-tubes formed in circles, the tubes in the outer circle being formed in sets of long and short tubes, the tubes in each set of long tubes being arranged in a straight line, an asbestos covering around the outer circle of tubes, and a cylindrical shell inclosing the asbestos covering, substantially as described.

7. In a steam-generator, a fire-pot, in combination with an outer casing, a nest of water-tubes inclosed by a cylindrical shell forming an annular smoke-chamber between its upper portion and the outer casing, with communication between the upper portion of the space between said water-tubes and the smoke-chamber, a ring cutting off outside communication of the smoke-chamber and fire-pot, and one or more exits for the smoke-chamber, substantially as described.

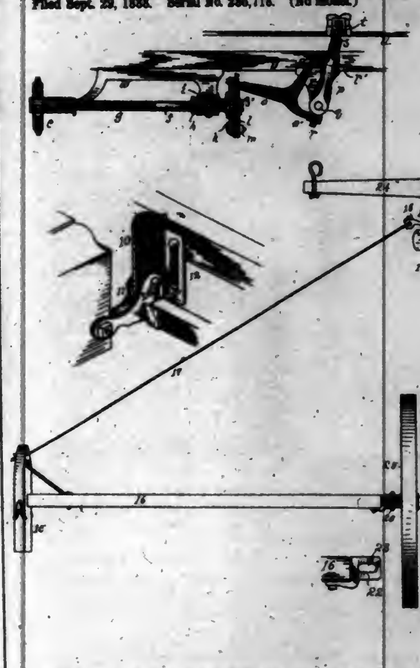
8. In a steam-generator, the combination, with the annular smoke-chamber, the water-tubes, a cylindrical shell inclosing the water-tubes, but leaving a communicating space between the upper portion of the smoke-chamber and upper portion of space around the tubes, and a removable ring formed in sections closing the top of the smoke-chamber, for the purpose described.

9. In a steam-generator or hot-water heater, the combination of a base, a supporting-annulus L-shaped in cross-section and resting upon the base, an inwardly and downwardly converging ring having its lower edge resting upon the horizontal part of the annulus to form an inwardly-converging fire-pot, the annulus forming a dead-air space around the fire-pot, a casing resting upon the upper edge of the ring and provided with coal-pockets above the upper edge of the ring, and a boiler in the casing and above the fire-pot, substantially as described.

402,668. STAMPING-PRESS. CHARLES L. HART, Brooklyn, N. Y., assignor to the E. W. Bliss Company, same place. Filed Mar. 5, 1888. Serial No. 301,830. (No model.)

Claim.—1. The combination, with the movable head of a stamping-press and its die and knockout-plunger, of a knockout-lever arranged to project into the path of said plunger and a stop against which said lever abuts, whereby during the upstroke of the head the lever stops the plunger and the continued upward movement of the head expels the work from the die.

2. The combination, with the movable head of a stamping-press and its die and knockout-plunger, of a knockout-lever arranged to project into the path of said plunger and an adjustable stop-screw against which said lever abuts.



3. The combination, with the movable head of a stamping-press and its die and knockout-plunger, of a knockout-lever arranged to project into the path of said plunger, mounted to turn on a fixed fulcrum, and formed with a tail projecting to the opposite side of said fulcrum, and a stop against which said lever abuts.

4. The combination, with the movable head of a stamping-press and its die and knockout-plunger, of a knockout-lever arranged to project into the path of said plunger, a stop against which said lever abuts, and a spring arranged to exert a tension against said lever to prevent rattling.

5. The combination, with the movable head of a stamping-press and its die and knockout-plunger, the said head formed with a cavity in its rear, of a knockout-lever with its end projecting within said cavity into the path of said plunger and a stop against which said lever abuts.

6. The combination, with the frame of a stamping-press and with its movable head, die, and knockout-plunger, of a knockout-lever arranged behind the head and within the frame, with its end projecting forwardly and standing in the path of said plunger, and a stop against which said lever abuts in order to arrest the plunger.

402,669. SEED-PLANTER. GEORGE D. HAWORTH, Decatur, Ill. Filed Sept. 29, 1888. Serial No. 286,718. (No model.)

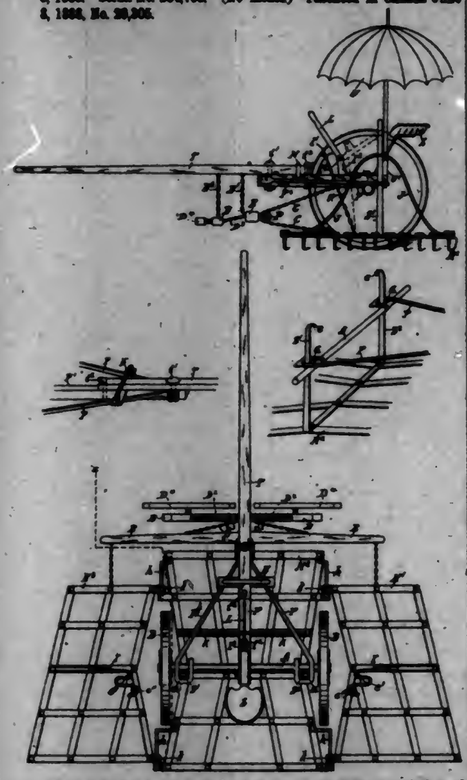
Claim.—1. In drill mechanism for seed-planters, in combination, a rotating head and an L-lever having one arm pivoted on the the other and connected the one arm with the head and the other arm with the seed-slide of the planter, as and for the purpose set forth.

2. In drill mechanism for seed-planters, in combination, a rotating head having a bearing for a lever adjustable with relation to the center of rotation, and an L-lever pitman connected at one end with the bearing of the head and at the other end with the seed-slide of the planter, as and for the purpose set forth.

3. In drill mechanism for seed-planters, in combination, a shaft, a head on the shaft, an L-lever having one arm pivoted on the other and connected the one arm with the head and the other arm with the seed-slide of the planter, and sprocket-gearing connecting the shaft with a wheel of the planter, as and for the purpose set forth.

4. In combination, the shaft having the laterally-projecting pins, the head adapted to move longitudinally on the shaft and having slots to engage the pins, a lever to move the head with relation to the pins, and an L-lever pitman connecting the head with the seed-slide of the planter, as and for the purpose set forth.

5. In combination, the shaft having the pins, the head movable on the shaft and having slots to engage the pins, the slide engaging the head and having the tooth, the lever having the projections adapted to strike the tooth of the slide, and the L-lever pitman connecting the head with the seed-slide of the planter, as and for the purpose set forth.



6. In combination with slotted bracket 10, secured to the wheel-frame of the planter, slotted bracket 11, secured to the planting mechanism, and bolt 26, extended through the slots of the brackets, adjustable bracket 12, having projection 13 extended under bolt 26, as and for the purpose set forth.

7. In combination, lever 1, fulcrumed on the frame, supported by the wheels, and connected with the planting mechanism, bar 2, having catch projection 3, and lock-bar 4, adapted to pass ordinarily with its back to the catch, and having teeth on its face to engage the catch, as and for the purpose set forth.

8. In combination, washer 20 on the wheel-hub, having knob 21, marker-bar 16, having the oblong slot adapted to the knob, the marker, the hook 18, the line 17, connecting the marker with the eye of the hook, and line 19, connected with the bow of the hook, as and for the purpose set forth.

9. In combination with a marker for planters, a hook having an ordinary eye to connect with a brace-line, and also having a connection in a bow for a detaching-line, as and for the purpose set forth.

402,670. SULKY-HARROW. WILLIAM HEWITT, London, Ontario, Canada, assignee of one-half to Frank B. Pollard, same place. Filed Sept. 6, 1888. Serial No. 284,709. (No model.) Patented in Canada June 8, 1888, No. 26,305.

Claim.—1. The combination of the harrow-frame, consisting of the central section, H^3, having brackets A, the outer sections, H' and H^2, having knuckles A, by which they are hinged to the brackets, the axle A, the wheels B between the central section and side sections, the beam F, the oblique bars F, the tongue T, the bracket P on the beam, the lever L, having an arm, l, and the chain K, by which the arm and central section are connected, substantially as described.

2. The combination of the central section, H^3, the axle A, the wheels B, the beam F, the oblique bars F, the tongue T, the evener E, supported on the tongue, the pulley P, secured to the rear side of the evener, and the chain C, passed between the evener and the pulley and having its ends connected to the central section and to the beam, respectively, substantially as described.

3. The combination of the central section, H^3, the axle A, the wheels B, the beam F, the oblique bars F, the tongue T, the evener E, supported on the tongue, the doubletree D, supported on the tongue and connected to the evener, the pulley P, secured to the rear side of the evener, and the chain C, passed between the evener and the pulley and having its ends connected to the beam and to the central section, respectively, substantially as described.

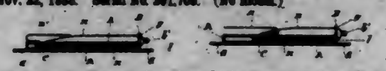
4. The combination of the central section, H^3, the sulky-frame, the tongue T, the evener E, the pulley P, secured to the evener, and the chain C, passed between the evener and the pulley and having its ends connected to the central section and to the sulky-frame, respectively, substantially as described.

5. The combination of the central section, H^3, the outer sections, H' and H^2, hinged thereto, the axle A, the bars F, having bent ends forming apertures G, the standards S' and S^2, secured to the central section and passed through the apertures, having hooks *e*, and the handles I, secured to the outer sections and provided with loops *d'*, for engaging the hooks, substantially as described.

6. The combination of the central section, H^3, the outer sections, H' and H^2, hinged thereto, the axle A, the bars F, having bent ends forming apertures G, the standards S' and S^2, secured to the central section and passed through the apertures, having hooks *e*, the arched braces J, secured to the central section and to the standards, and the handle I, secured to the outer sections and provided with loops *d'*, for engaging the hooks, substantially as described.

7. The combination of the central section, H^3, the outer sections, H' and H^2, hinged thereto, the standards S' and S^2, secured to the central section, having hooks *e*, the handles I, secured to the outer sections, having loops *d'* and hand-pieces *d''*, and the sulky-frame, substantially as described.

8. The combination of the central section, H^3, the axle A, the wheels B, the beam F', the bracket P^3, the lever L, having arm *l'*, the chains K, the oblique bars F, having bent ends forming apertures G, the standards S' S^2, the tongue T, the chain D', the evener E, the pulley P, and the chain C, substantially as described.

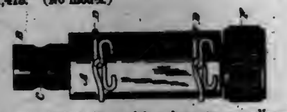


10. The combination of the central section, H^3, the axle A, the wheels B, the rigid beam F', the bracket P^3, the lever L, having arm *l'*, the chains K, the bracket N, having a socket and rigidly secured to the beam, the pivoted tongue T, and the pivot-bolt *t'*, substantially described.

402,671. SYSTEM OF ELECTRICAL DISTRIBUTION AND CONVERSION. THOMAS H. HINES, Detroit, Mich., assignor to the Hines Induction-Light and Motor Company, of Michigan. Filed July 5, 1888. Serial No. 278,120. (No model.)

Claim.—In a system of electrical distribution and conversion, the combination of a source of high-tension intermittent electrical impulses of one direction, a main circuit connected thereto, a derived local circuit containing translating devices, and a reaction-coil having all or a portion of its helices in the main circuit and a portion in the local circuit, both portions being in the same magnetic field.

402,672. BROOCH-PIN. MERRILL HOWARD, New York, N. Y. Filed Nov. 22, 1888. Serial No. 291,709. (No model.)



Claim.—1. The combination, with the mounting-plate of a brooch, a guide in and upon said mounting-plate, and an ear upon said mounting-plate at the end of said guide, of a pronged needle of the form specified, one prong of which, passing through said ear, slides in said guide, and the other prong of which, also passing through said ear into a garment, partly holds said brooch in position, and an auxiliary stationary needle attached to said mounting-plate and arranged to assist said sliding needle in securing said brooch to a garment, all substantially as and for the purpose set forth.

2. The combination, with the mounting-plate of a brooch, a guide in and upon said mounting-plate, and an ear upon said mounting-plate at the end of said guide, of a pronged needle of the form described, one prong of which, passing through said ear, slides in said guide, and an enlargement upon the end of said prong adapted to said guide and moving therein, the other prong of said needle also passing

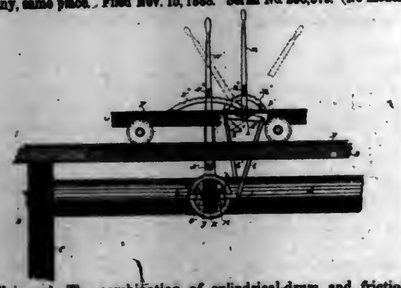
through said ear, a part of the garment to which said brooch is to be fastened, and into a supporting-piece upon said mounting-plate, and said supporting-piece, formed and attached as specified, all substantially as and for the purpose set forth.

3. The combination, with the mounting-plate of a brooch, tubes upon said mounting-plate extending across and parallel thereto and parallel to each other, and ears formed upon said mounting-plate at either end of said tubes, of two pronged needles, substantially as specified, one prong of each of said needles passing through one of said ears and sliding in one of said tubes, and the other prong of each of said needles passing through one of said ears and extending without said tubes to and beyond the middle thereof nearly parallel thereto, so as to overlap each other in the garment to which said brooch is to be attached, all substantially as and for the purpose set forth.

402,673. APPLIANCE FOR UNITING AND REPAIRING RUBBER HOSE. CHARLES E. HUDSON, Leominster, Mass. Filed Apr. 21, 1888. Serial No. 271,413. (No model.)

Claim.—1. A metal ring for uniting hose to couplings, formed from a band having its ends bent outwardly and backwardly into the form of the open hooks, with their bow parts lapping past each other, substantially as specified.

2. A metal ring for uniting hose and couplings, formed by a band having ends lapping past each other and bent outward and backward in the form of open hooks, with the free ends of the said hooks pointing toward each other and separated by a space for the purpose of allowing the shorter arms of the tool-levers E E to be inserted between them and the said ends to be entered into the transverse holes of said levers, substantially as described.



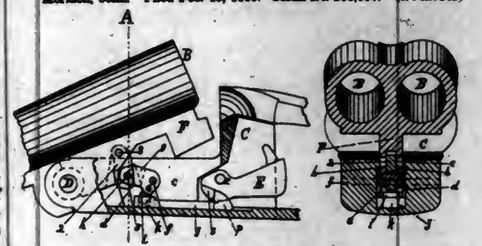
3. The combination, with a hose and coupling, of a wire ring formed by a band having its ends lapping past and bent around each other and provided with outwardly-recurved open hooks, with their free ends pointing toward each other, substantially as described.

4. The combination, with a hose and coupling, of a wire ring formed by a band having its ends lapping past and bent around each other, and provided with outwardly-recurved open hooks with their free ends pointing toward each other and separated by a space for the purpose of allowing the closing up and withdrawal of the shorter arms of the tool-levers E E from and between the same, whereby the hose is secured to its coupling by the band, substantially as described.

5. A metal ring for uniting hose to couplings, formed by a band having its ends lapping past each other and bent outward and backward in the form of open hooks, said hooks being situated in substantially the same plane with relation to each other, with their free ends pointing toward each other and separated by a space for the purpose of allowing the shorter arms of the tool-levers E E to be inserted between them and the said ends to be entered into the transverse holes of said levers, substantially as described.

6. The combination, with a hose and coupling, of a ring formed by a wire band having its ends lapping past and bent around each other, and provided with outwardly-recurved open hooks situated in substantially the same plane with relation to each other, their free ends pointing toward each other and separated by a space for the purpose of allowing the closing up and withdrawal of the shorter arms of the tool-levers E E from and between the same, whereby the hose is secured to its coupling by the band, substantially as described.

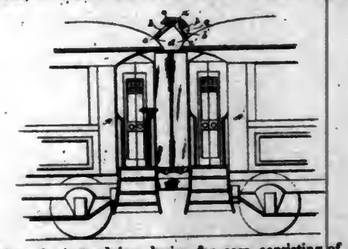
402,674. MECHANICAL MOVEMENT. WESTCOTT L. JUDSON, Minneapolis, Minn., assignor to the Judson Pneumatic Railway Company, same place. Filed Nov. 15, 1888. Serial No. 290,879. (No model.)



Claim.—1. The combination of cylindrical-drum and friction-wheel devices capable of angular engagement with each other, there being one device of one kind and two of the other, and the angles of engagement variable at will, whereby the rotation of the device or devices of one kind gives a rectilinear movement, the speed of which is proportionate to the angle of engagement to such of the other as are engaged thereby, substantially as described.

2. The combination of cylindrical-drum and friction-wheel devices capable of angular engagement with each other, there being one device of one kind and two of the other, such as are employed of one kind being mounted in fixed, and such as are employed of the other in movable, supports, substantially as described.

3. The combination, with a cylindrical driving-drum, of two friction-wheels capable of angular engagement therewith, the said wheels being mounted in movable bearings, whereby their angles of engagement with said drum may be varied, substantially as described.



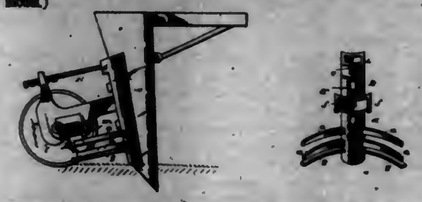
4. The combination, with a cylindrical driving-drum mounted in fixed supports, of two friction-wheels capable of angular engagement therewith on opposite sides, said wheels being mounted in a movable support and in movable bearings in said support, substantially as described.

402,675. BREECH-LOADING FIRE-ARM. CHARLES A. KING, Meriden, Conn. Filed Feb. 15, 1889. Serial No. 299,997. (No model.)

Claim.—In a breech-loading self-cocking gun, the combination, with a tilting barrel, of a hammer pivoted within the frame in the rear of the barrel, a longitudinal slide arranged in the frame below the pivot of the hammer, a projection on the said slide, adapted to engage a corresponding point upon the hammer below the pivot upon which the hammer is hung, the said slide extending forward beneath the barrel, with a bell-crank lever hung in the frame in the rear of the pivot upon which the barrel is hung, one arm of said lever in connection with said slide, the other arm being provided near its extreme end with projecting ears or lugs extending into recesses formed in the side walls of the central slot of the frame in which said lever is hung and adapted to contact with the upper walls of said recesses in its upward movement, and a link or hook connecting said lever and the barrel, all arranged to operate substantially as described, and for the purpose set forth.

402,676. DEVICE FOR STEADYING CARS. SIDNEY D. KING, Pittston, Pa. Filed Feb. 5, 1889. Serial No. 298,701. (No model.)

Claim.—1. A steadying device for cars, consisting of a pair of arms having a swivel-connection constructed to permit them to be separated when longitudinal strain is exerted thereon and prevent lateral vibration.



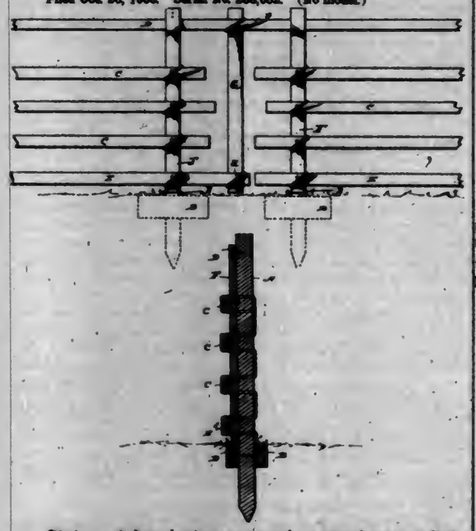
2. The combination, with a pair of arms and a swivel device supported in one arm, of a latch adapted to lock the other arm to the swivel device, substantially as set forth.

3. The combination, with a pair of pivoted arms and a swivel-sleeve in one of the arms, of a tongue projecting from the other arm adapted to enter the sleeve, and a latch for locking the parts together against lateral separation, substantially as set forth.

4. The combination, with a pair of pivoted arms, a slotted plate pivotally supported in one arm, and a sleeve pivoted in this plate, of a tongue projecting from the other arm adapted to enter the sleeve, and a pivoted spring-latch having a nose thereon adapted to reach over the sleeve and end of the tongue, whereby the parts are held together against lateral separation, substantially as set forth.

5. The combination, with a pair of arms removably pivoted to the ends of cars, one of said arms terminating in a pair of jaws, a slotted plate pivoted between said jaws, a sleeve pivoted within the slotted plate, and a circular disk secured to the edge of the slotted plate, of a tongue projecting from one arm adapted to enter the sleeve, and a pivoted spring-latch having a depending nose thereon adapted to reach over the sleeve and end of the tongue, whereby the parts are held together against lateral separation, substantially as set forth.

402,677. GRAIN-DRILL ATTACHMENT. WILLIAM C. LATHROP, Milton Centre, Ohio. Filed Apr. 9, 1888. Serial No. 270,145. (No model.)



Claim.—1. The combination, with a drill-tooth, of the attaching-plate having a slot or loop in its upper end, the roller-frame hinged to said attaching-plate and having an upwardly-directed slotted branch, and the arm or bar connecting the upper end of the attaching-plate with the upper branch of the roller-frame, substantially as specified.

2. The attaching-plate having the rearwardly-curved fenders *a* and the lower similarly-formed bearing-plate, *g*, in combination with the roller-frame adapted to be hinged to said attaching-plate, substantially as specified.

3. The combination, with a drill-tube, of a plate slotted for the attachment to the drill, carrying lug-journals, fenders, and bearing-plates at one end, and a rearward loop at its opposite end, of a roller-supporting frame provided with means for receiving said roller, an eye at its forward end, whereby it may be hinged to the attaching-plate, and a slot at its rear upper end, and connecting-rod having a cross-head at its forward end to enter the upper loop of the attaching-plate, and grooves and serrations at its opposite end, so as to be adjustably connected with the slot of the said frame, substantially as specified.

402,678. FENCE. WILLIAM C. LATHROP, Milton Centre, Ohio. Filed Oct. 20, 1888. Serial No. 288,632. (No model.)

Claim.—A fence having permanently-arranged posts as distinguishable from removable ones, in combination with top and bottom longitudinal rails and intermediate rails, all of which are secured to the permanent posts, the top and bottom rails being carried beyond the ends of the intermediate rails, which latter may be barely long enough to meet the posts, and a guard-rail, G, arranged between the adjacent ends of the fence-sections and secured at opposite ends to the top and bottom rails, so as to partly fill the interspace caused by the failure of the intermediate rails to meet, substantially as shown and described.

402,679. COVER FOR PAINT-CANS. CLINTON H. LIBBEY, New York, N. Y. Filed Nov. 14, 1888. Serial No. 290,771. (No model.)

Claim.—1. The combination, with a paint-can having a closed and soldered top adapted to be cut out to open the can, of a separate cover applied to the can and adapted to fit over its top when the latter has been cut open, said cover formed with an opening in its top of such size as to admit the handle of a paint-brush and provided with a slide for closing said opening, whereby the brush may be left in the paint and the cover applied to the can to inclose the paint and protect it from the air, the brush-handle passing out through said opening.

2. A separate cover for a paint-can, formed with an opening in its top and provided with a rotatively-mounted disk-shaped slide for closing said opening, fastened to the cover by a pivotal rivet, and formed with two or more openings of different sizes registering with said opening in the cover.

3. A separate sheet-metal cover for a paint-can, formed with an annular concentric corrugation in its top and with an eccentric opening within said corrugation, combined with a disk-shaped slide for closing said opening cut from sheet metal arranged concentrically within said corrugation, with its cut peripheral edge directly within and protected by the projecting corrugation and fastened rotatively to the cover by a central pivotal rivet.

4. A separate cover for a paint-can, formed with an opening in its top and provided with a rotatively-mounted disk-shaped slide for closing said opening, a lifting-handle consisting of a ring and a plate to which said ring is pivoted, and a central rivet passing through the cover, the slide, and said plate, whereby a single rivet both fastens said plate and slide together and pivotally connects the slide to the can-cover.

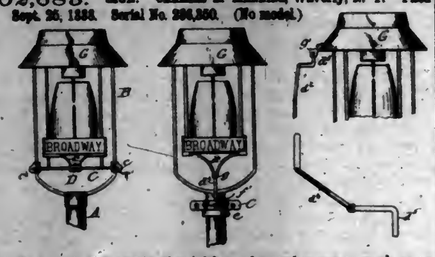
402,680. FILM-SUPPORTING FRAME FOR PHOTO-CAMERAS. WILLIAM H. LEWIS, Brooklyn, assignor to E. & H. T. Anthony & Company, New York, N. Y. Filed Dec. 13, 1888. Serial No. 293,492. (No model.)

Claim.—As a new article of manufacture, a frame for a sensitized photographic film or sheet comprising a supporting-plate having flanges at opposite sides thereof, the ends of which fall short of the edges of the supporting-plate by a distance sufficient to clear the plate-supporting ledges of the plate-holder, substantially as set forth.

402,681. SMOKING DEVICE. LOUIS C. LINDEMAN, Brooklyn, N. Y. Filed Sept. 15, 1888. Serial No. 285,492. (No model.)

Claim.—1. The combination, in a smoking device, of a cylinder carrying at one end inlet and discharge pipes and corresponding valves, and a piston working through the other end, substantially as and for the purpose specified.

2. The combination of the cylinder A, having piston B working therein, a spring, C, working said piston in one direction, inlet-valve D and outlet-valve E at the upper end of the cylinder, inlet-pipe F and outlet-pipe G, communicating with said valves, and the finger-rings H on the outside of the cylinder, all constructed substantially as shown and described.



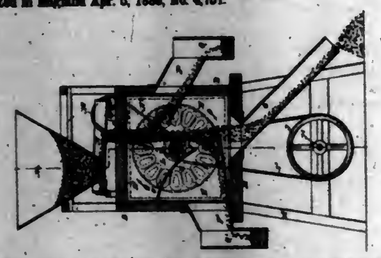
402,682. GRINDING-WHEEL. HIRAM S. LUCAS, Chester, Mass. Filed Mar. 26, 1888. Serial No. 268,572. (No model.)

Claim.—1. A grinding-wheel, substantially as described, consisting of a porous vitrified body and a cohesive substance, as described, applied thereto and filling the pores thereof, substantially as set forth.

2. A grinding-wheel, substantially as described, consisting of a porous vitrified body and a cohesive substance consisting of a composition of glue and bichromate of potash applied thereto and filling the pores thereof, substantially as set forth.

402,683. SIGN. CHARLES E. MANNING, Waverly, N. Y. Filed Sept. 26, 1888. Serial No. 286,260. (No model.)

Claim.—1. In combination with an elevated support—such as an electric lamp—a sign-holder adjustable vertically to various angles relatively to the surface of the street, substantially as set forth.



2. In combination with an elevated support—such as an electric lamp—a ring or collar, and a sign-holder supported by said collar and adjustable vertically relatively to the surface of the street, substantially as set forth.

3. In combination with an elevated support—such as an electric lamp—a ring or collar, and a sign-holder supported thereby and hinged so as to adjust the sign vertically with relation to the surface of the street, substantially as set forth.

4. In combination with the vertical side rods of an electric lamp, a ring or collar supported by said rods, and a vertically-adjustable sign-holder mounted upon said ring, substantially as set forth.

5. In combination with the support for an electric lamp, a ring or collar having a socket, and a sign-holder mounted in such socket and hinged so as to be vertically adjustable, substantially as set forth.

402,684. MAGNETIC SEPARATOR. HIRAM S. MAXIM, London, England. Filed Feb. 24, 1887. Serial No. 228,735. (No model.) Patented in England Apr. 5, 1886, No. 4,751.

Claim.—1. In an apparatus for separating metals and non-metallic substances, the combination, with approximating magnets or magnetic poles adapted to maintain intermediate fields of force, of a hopper or receptacle from which the material under treatment passes freely through said fields of force and means for producing rapid reversals or alternations of the polarity of the fields or lines of force through which the material is passing, as set forth.

2. In an apparatus for separating metallic and non-metallic substances, the combination, with the magnets E E, mounted so as to leave an open space between their poles capable of receiving the material to be exposed to the action of said magnets, of means for continuously and rapidly reversing or alternating the polarity of the magnetic fields or lines of force acting upon the material, as set forth.

3. In an apparatus for separating metallic from non-metallic substances by magnetic induction, the combination, with a series or group of magnets, of a second series or group of magnets arranged opposite to the first group and at such distance as to leave an open space between the two series, the poles of each series being alternately opposite and arranged so that unlike poles on the two series face each other, and means for introducing into the space between the two series the materials to be separated or acted upon, as set forth.

4. In an apparatus for separating metallic from non-metallic substances, the combination, with two series of magnets arranged opposite each other with an open space between them in such manner that the poles of each series of magnets face unlike poles of the other series, of means—such as a hopper—for introducing into the space between the two series of magnets the material to be acted upon, and a source of power for moving or driving the said series of magnets simultaneously in the same direction, as set forth.

5. In an apparatus for separating metallic from non-metallic substances by magnetic induction, the combination, with circular groups or series of magnets arranged opposite each other with an open space between their poles and in such order that the magnetic fields thus produced are alternately of opposite polarity, of a hopper or a means for introducing the material to be acted upon into the space between the magnets, and a source of power for simultaneously rotating the two groups or series of magnets, as set forth.

6. In a magnetic separator, the combination of series or groups of magnets arranged opposite each other so that magnetic fields of alternate polarity exist in a space between them, means, substantially such as above described, for simultaneously moving the said series or groups of magnets in the same direction, and chutes for receiving and conducting away the separated materials, substantially as and for the purposes set forth.

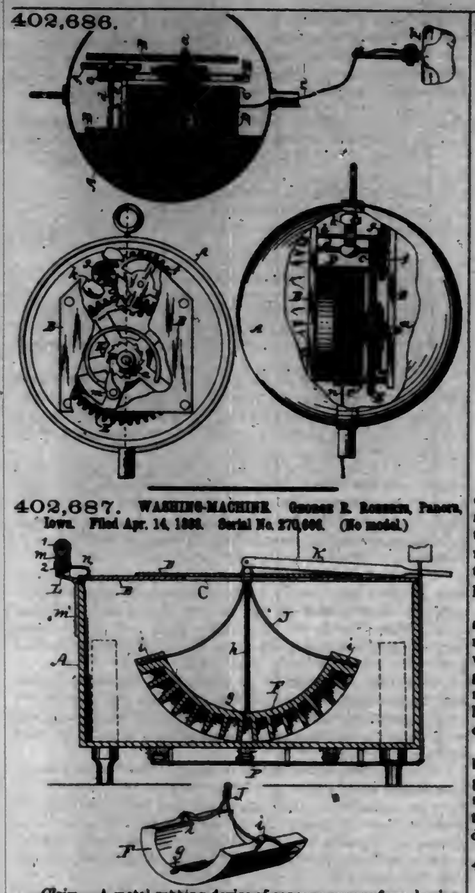
7. In a magnetic separator, the combination of circular series or groups of magnets arranged opposite each other so that magnetic fields of alternate polarity exist in a space between them, means, substantially such as above described, for simultaneously rotating the said series or groups of magnets in the same direction, and diaphragms arranged between the said series or groups of magnets and having a space between them wherein the air will be unaffected by the movement of the magnets, as and for the purposes above specified.

8. In a magnetic separator, the combination of series or groups of magnets having pole-pieces inclined toward each other, the said series or groups of magnets being arranged opposite each other so that unlike poles face each other and a space is left between the said series or groups, substantially as and for the purposes set forth.

9. In a magnetic separator, the combination of the circular series or groups of magnets E, the rotating shaft D, on which the said series or groups are mounted opposite each other, the casing B, inclosing the said magnets, the diaphragms L, arranged between the said series or groups of magnets, the hopper M, and the chutes P P' O, all substantially as and for the purposes set forth.

402,685. LADY'S CUFF-FASTENER. CHARLES L. MOORE, Worcester, Mass. Filed Aug. 13, 1888. Serial No. 282,569. (No model.)

Claim.—1. A cuff-fastener consisting of a body, a spring-arm standing over the body and provided with an orifice near its free end, a spring-clasp formed longitudinally opposite to the spring-arm, said spring-arm and spring-clasp both lying and operating in parallel planes, and a hooked pin secured to the body opposite the orifice in the spring-arm and adapted to wholly enter said orifice when the spring-arm is compressed toward the body, substantially as described.



2. A cuff-fastener consisting of a body, a spring-arm bent over the body and provided with a slot near the end, and a spring-clasp, all integral with each other, and a retaining-hook secured in the body opposite to the slot in the spring-arm, substantially as described.

3. In a cuff-fastener, an extended body, a curved pointed hook secured thereto adjacent to an end, a spring-arm diverging from a face of the body and standing over the same substantially parallel, and provided with an aperture adapted to wholly and without contact receive said hook, and a spring-clasp diverging from the opposite face of the body and lying parallel thereto, substantially as described.

402,686. CHALK-HOLDER. PHILIP R. NEWTON, Brooklyn, assignor of two-thirds to Ben L. Fairchild, New York, and Peter B. Reeves, Brooklyn, N. Y. Filed Dec. 2, 1887. Renewed Aug. 31, 1888. Serial No. 284,285. (No model.)

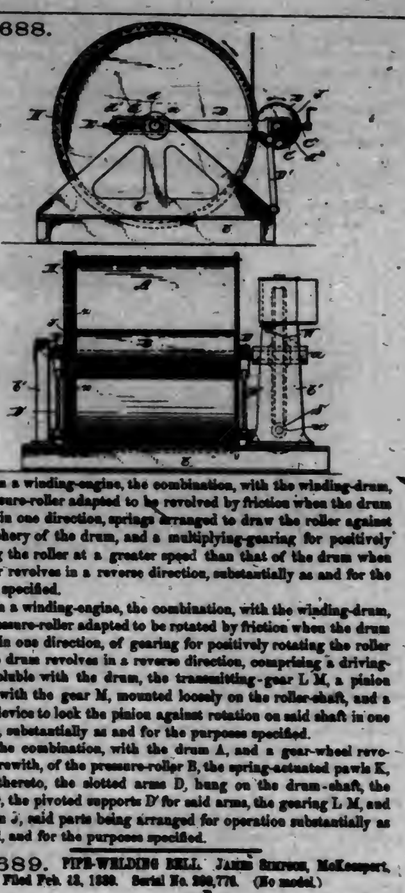
Claim.—In the mechanism of a chalk-holder, a reel mounted on a shaft, *a*, provided with a ratchet-wheel, in combination with a governor mounted on a shaft which is connected by gearing with a wheel, E, on shaft *a*, and a pawl attached to wheel E and in position to engage with the ratchet-wheel, substantially as and for the purposes described.

402,686.

402,687. WASHING-MACHINE. GEORGE R. ROBBINS, Panora, Iowa. Filed Apr. 14, 1888. Serial No. 270,666. (No model.)

Claim.—A metal rubbing device of concavo-convex form, having open chambers or cells on its convex surface, integral perforated lugs on its ends, a forked handle attached to said lugs, and integral journals on its edges, in combination with a tub having grooves in the inside faces of its parallel sides, for the purposes stated.

402,688. HOSE-WINDING DRUM. RICHARD SCHULZ, Tegel, near Berlin, Germany. Filed June 23, 1888. Serial No. 278,068. (No model.) Patented in Germany Feb. 18, 1888, No. 44,306; in France Feb. 18, 1888, No. 188,830; in England May 22, 1888, No. 7,830; in Italy June 30, 1888, XLVI, 308, XXII, 23,888, and in Austria-Hungary Oct. 6, 1888, No. 21,608 and No. 39,060.



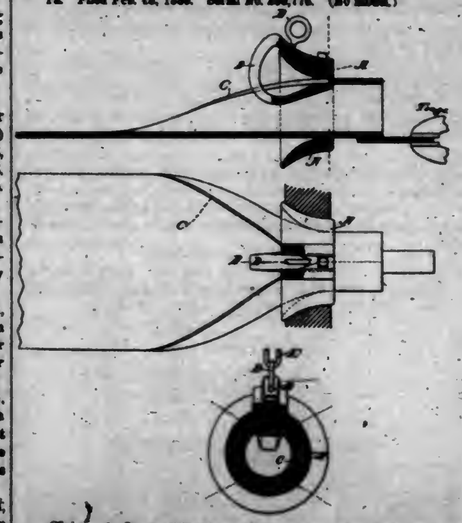
Claim.—1. In a winding-engine, the combination, with the winding-drum, of a pressure-roller, supporting-arms for said roller hung on the drum-shaft, springs operating to draw the roller toward the periphery of the drum, and gearing to revolve said roller, substantially as and for the purposes specified.

2. In a winding-engine, the combination, with the winding-drum, of a pressure-roller adapted to be rotated by friction when the drum rotates in one direction, and gearing for positively rotating the roller when the drum rotates in a reverse direction, substantially as and for the purposes specified.

3. In a winding-engine, the combination, with the winding-drum, of a pressure-roller adapted to be rotated by friction when the drum rotates in one direction, springs arranged to draw the roller against the periphery of the drum, and gearing for positively rotating the roller when the drum rotates in a reverse direction, substantially as and for the purposes specified.

4. In a winding-engine, the combination, with the winding-drum, of a pressure-roller adapted to be revolved by friction when the drum revolves in one direction, and a multiplying-gearing for positively revolving the roller at a greater speed than that of the drum when the latter revolves in a reverse direction, substantially as and for the purposes specified.

402,688.

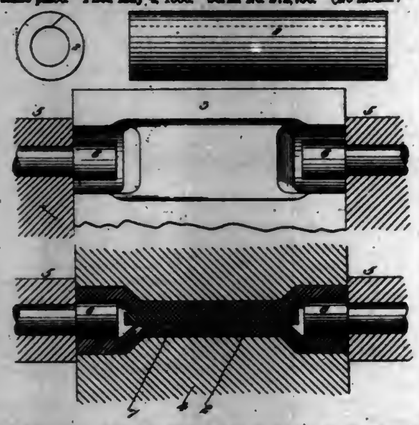


5. In a winding-engine, the combination, with the winding-drum, of a pressure-roller adapted to be revolved by friction when the drum revolves in one direction, springs arranged to draw the roller against the periphery of the drum, and a multiplying-gearing for positively revolving the roller at a greater speed than that of the drum when the latter revolves in a reverse direction, substantially as and for the purposes specified.

6. In a winding-engine, the combination, with the winding-drum, and a pressure-roller adapted to be rotated by friction when the drum revolves in one direction, of gearing for positively rotating the roller when the drum revolves in a reverse direction, comprising a driving-gear revoluble with the drum, the transmitting-gear L M, a pinion meshing with the gear M, mounted loosely on the roller-shaft, and a locking device to lock the pinion against rotation on said shaft in one direction, substantially as and for the purposes specified.

7. The combination, with the drum A, and a gear-wheel revoluble therewith, of the pressure-roller B, the spring-actuated pawls K, pivoted thereto, the slotted arms D, hung on the drum-shaft, the springs O, the pivoted supports D' for said arms, the gearing L M, and the pinion J, said parts being arranged for operation substantially as described, and for the purposes specified.

402,689. PIPE-WELDING BELL. JAMES SIMPSON, McKeesport, Pa. Filed Feb. 13, 1889. Serial No. 299,776. (No model.)



Claim.—1. In combination with a pipe-welding bell, a tongue arranged within the bell at a short distance from the interior wall thereof, directly beneath the position of the seam in the bell, for the purpose of supporting the seam, substantially as and for the purposes described.

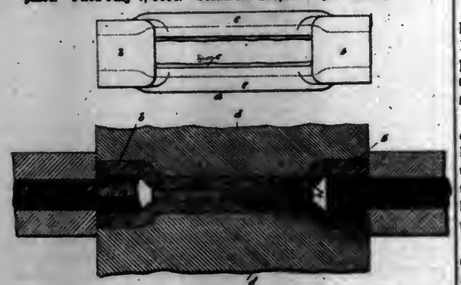
2. In combination with a pipe-welding bell, a tongue fixed to the exterior of the bell and projecting therein in position to fit on the inner side of and to support the seam, substantially as and for the purposes described.

3. In combination with a pipe-welding bell, a tongue removably fixed to the exterior of the bell and projecting therein in position to fit on the inner side of and to support the seam, substantially as and for the purposes described.

402,690. MANUFACTURE OF TURN-BUCKLES. JAMES H. SIMPSON, Pittsburg, Pa., assignor to Carnegie, Phipps & Company, (Limited,) same place. Filed May 4, 1888. Serial No. 272,756. (No model.)

Claim.—1. An improvement in the art of making turn-buckles, which consists in dividing a tubular or hollow blank longitudinally between its ends and then shaping the blank by forging, substantially as and for the purposes described.

2. An improvement in the art of making turn-buckles, which consists in flattening a tubular or hollow blank between its ends and forming the straps by cutting out the flattened part longitudinally, substantially as and for the purposes described.

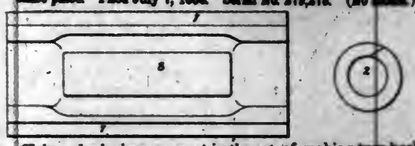


3. An improvement in the art of making turn-buckles, which consists in forming the straps by dividing a tubular or hollow blank longitudinally between its ends and compressing and shaping the ends to form the nuts, substantially as and for the purposes described.

4. An improvement in the art of making turn-buckles, which consists in forming the straps by dividing a tubular or hollow blank longitudinally between its ends, forging the strap portions, and compressing and shaping the ends to form the nuts, substantially as and for the purposes described.

5. An improvement in the art of making turn-buckles, which consists in flattening a tubular or hollow blank between its ends upon an inserted filling and forming the straps by cutting out the longitudinal middle part of the flattened portion and filling, and then shaping and welding the blank by forging, substantially as and for the purposes described.

6. An improvement in the art of making turn-buckles, which consists in forming a blank with straps, and hollow or tubular nut portions, and compressing endwise and shaping the nut portions upon mandrels and within dies, substantially as and for the purposes described.



402,691. BLANK FOR TURN-BUCKLES. JAMES H. SIMPSON, Pittsburg, Pa., assignor to Carnegie, Phipps & Company, (Limited,) same place. Filed July 7, 1888. Serial No. 279,277. (No model.)

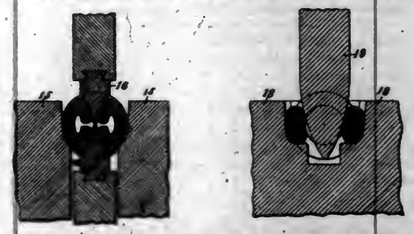
Claim.—1. A blank for turn-buckles, consisting of a hollow or tubular piece of metal divided longitudinally in its middle portion between the ends, substantially as and for the purposes described.

2. A blank for turn-buckles, consisting of a hollow or tubular piece of metal having a flattened middle portion which is divided longitudinally, substantially as and for the purposes described.

402,692. ART OF MAKING TURN-BUCKLES. JAMES H. SIMPSON, Pittsburg, Pa., assignor to Carnegie, Phipps & Company, (Limited,) same place. Filed July 7, 1888. Serial No. 279,278. (No model.)

Claim.—1. An improvement in the art of making turn-buckles, which consists in splitting a tubular or hollow blank longitudinally between its ends and turning in upon themselves the cut portions, substantially as described.

2. An improvement in the art of making turn-buckles from tubular or hollow blanks, which consists in forming the straps by splitting the blank longitudinally between its ends and turning in upon themselves and forging the cut portions without excising any of the substance, substantially as described.



3. An improvement in the art of making turn-buckles from tubular or hollow blanks, which consists in splitting the blank longitudinally from opposite sides between its ends without excision, folding in upon themselves and forging the cut portions to form the straps, and forging the end portions to form the nuts, substantially as described.

4. An improvement in the art of making turn-buckles from tubular or hollow blanks, which consists in splitting the blank longitudinally from opposite sides between its ends without excision, folding in upon themselves the cut edges of the blank to form the straps, spreading and compressing the straps, and forging the end portions to form the nuts, substantially as described.

5. An improvement in the art of making turn-buckles from tubular blanks, which consists in splitting the blank longitudinally between its ends and turning in upon themselves the cut portions and compressing the ends lengthwise upon mandrels to form the nuts, substantially as described.

6. An improvement in the art of making turn-buckles from tubular blanks, which consists in splitting the blank longitudinally between its ends to form embryotic straps and hollow nut portions, turning in upon themselves the cut edges to form the straps, compressing and spreading such strap portions, and compressing endwise and shaping the nut portions upon mandrels and within dies, substantially as described.

402,693. DIE FOR MAKING TURN-BUCKLES. JAMES H. SIMPSON, Pittsburg, Pa., assignor to Carnegie, Phipps & Company, (Limited,) same place. Filed Oct. 8, 1888. Serial No. 287,506. (No model.)

Claim.—1. An improvement in apparatus for making turn-buckles, which consists in the combination of the two opposite knives 16, having beveled or tapering sides, whereby a hollow blank interposed between the knives is slit longitudinally and the edges of the slit portion turned inward, substantially as and for the purposes described.

2. An improvement in apparatus for making turn-buckles, which consists in the combination of the two opposite knives 16, having beveled or tapering sides, whereby a hollow blank interposed between the knives is slit longitudinally and the edges of the slit portion turned inward, and a supporting-block, 15, which supports the blank laterally during the slitting operation, substantially as and for the purposes described.

3. The knife 16, having a cutting or slitting edge and tapering sides which are inwardly concaved or curved, whereby the knife is adapted to slit a hollow turn-buckle blank and to fold in the edges of the slit portion, substantially as and for the purposes described.

4. An improvement in apparatus for making turn-buckles, which consists in a mandrel, 19, for spreading or expanding the divided straps of a blank, said mandrel having a wedge-shaped working-edge, in combination with a supporting block or die, 18, having a cavity for receiving the turn-buckle, the width of the sides of the cavity being equal to the external width of the spread blank, whereby the mandrel shall expand the blank and shall compress the straps thereof against the sides of the cavity, substantially as and for the purposes described.

5. An improvement in apparatus for making turn-buckles, which consists in the combination of the shaping and forging dies 8 and 9, having working-faces provided with longitudinal cavities for the straps and end cavities for the heads or nuts of the buckles, substantially as and for the purposes described.

6. An improvement in apparatus for making turn-buckles, which consists in the combination of the dies 8 and 9, having working-faces provided with longitudinal cavities for the straps and end cavities for the heads or nuts of the buckle, and a compressing die or dies which enter between the dies 8 and 9 and engage the ends of the buckle, substantially as and for the purposes described.

7. An improvement in dies for making turn-buckles, which consists in the combination of the dies 8 and 9, having working-faces provided with longitudinal cavities for the straps, end cavities for the heads or nuts of the buckle, and a mandrel or mandrels at the end or ends of the dies which are adapted to enter the nuts of the buckle and which are provided with compressing portions 13, which engage and compress the ends of the blank, substantially as and for the purposes described.

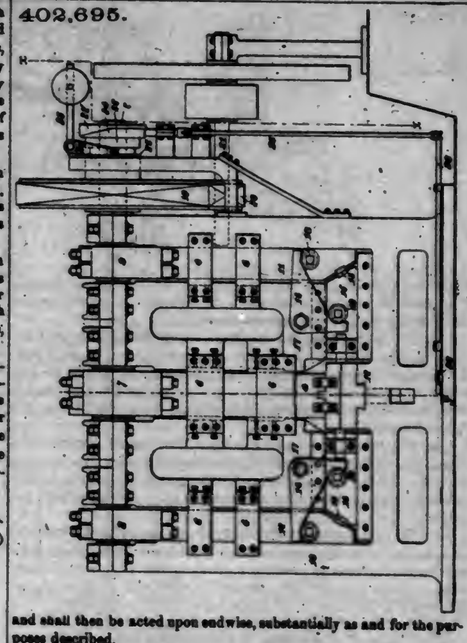
402,694. ART OF MAKING TURN-BUCKLES. JAMES H. SIMPSON, Pittsburg, Pa., assignor to Carnegie, Phipps & Company, (Limited,) same place. Filed Oct. 22, 1888. Serial No. 288,762. (No model.)

Claim.—1. An improvement in the art of making turn-buckles, which consists in cutting a solid blank longitudinally to form the straps, forging and compressing the straps, and forging and shaping the nuts, substantially as and for the purposes described.

2. An improvement in the art of making turn-buckles, which consists in forming a flattened blank, cutting the same longitudinally to form the straps, and forging and shaping the straps and the ends or nuts, substantially as and for the purposes described.

3. An improvement in the art of making turn-buckles, which consists in forming a blank with straps and with solid ends and punching and compressing said ends longitudinally, displacing the metal thereof laterally, the said ends being confined within die-cavities suitably recessed, into which recesses the displaced metal flows, substantially as and for the purposes described.

4. An improvement in the art of making turn-buckles, which consists in forming the straps of a blank having solid ends, punching and compressing said ends longitudinally and displacing the metal thereof laterally, the said ends being confined within die-cavities suitably recessed, into which recesses the displaced metal flows, and simultaneously compressing and forging the straps, substantially as and for the purposes described.



5. An improvement in the art of making turn-buckles, which consists in forming a flattened blank with solid ends, cutting the same longitudinally, spreading the cut side portions of the blank, and then compressing and forging the said side portions, and punching the end portions to form the nuts, substantially as and for the purposes described.

402,695. MACHINE FOR MAKING TURN-BUCKLES. JAMES H. SIMPSON, Pittsburg, Pa., assignor to Carnegie, Phipps & Company, (Limited,) same place. Filed Nov. 7, 1888. Serial No. 290,183. (No model.)

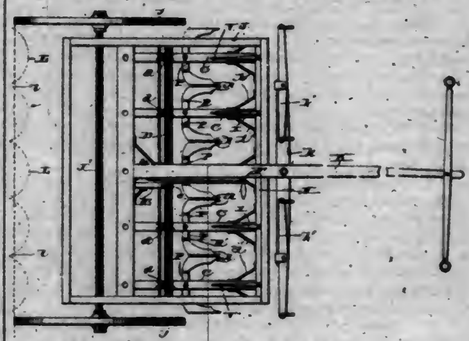
Claim.—1. In machines for die-forging, the combination of reciprocating plungers 4, 10, and 11, dies operated by motion of the plunger 4, other dies moving transversely to the path of motion of the plunger 4, and die-stocks carrying said dies and operated by the plungers 10 and 11, and retracting-levers 16, connecting the die-stocks with said plungers 10 and 11, substantially as and for the purposes described.

2. In machines for die-forging, the combination of the reciprocating plungers 4, 10, and 11, dies operated by motion of the plunger 4 to compress the blank, other dies moving transversely to the path of motion of the plunger 4 and acting on the blank with end compression, die-stocks carrying said dies and operated by said plungers, and mechanism—such as cams—which actuate the plungers, said cams being so timed that the blank shall first be compressed laterally

402,695.

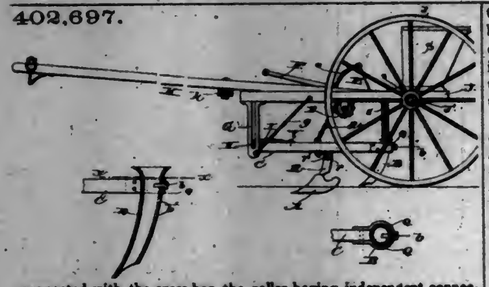
and shall then be acted upon endwise, substantially as and for the purposes described.

402,696. METHOD OF MAKING CAR-WHEELS. GEORGE S. SYRACUSE, New York, N. Y. Filed Aug. 2, 1888. Serial No. 281,746. (No model.)



Claim.—1. The mode herein described of forming car-wheels, said mode consisting in fitting over a hub-piece a web-plate having a central opening, securing the web-plate to the hub-piece by means of a ring fitted over a part of the hub-piece, and applying to the periphery of the web a grooved bar to form the tire, and welding these parts together.

2. The mode herein described of forming car-wheels, said mode consisting in securing a web-plate to a hub-piece, applying to the periphery of the web-plate a grooved bar overlapping the ends of the latter, and welding all the parts together, all substantially as set forth.



402,697. GRAIN-DRILL. ROLLAND G. STROTHER, Findlay, Ohio. Filed Aug. 21, 1888. Serial No. 283,286. (No model.)

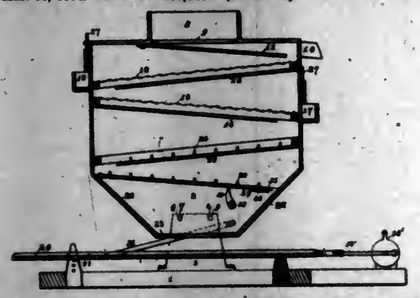
Claim.—1. In a grain-drill, the combination, with the gang-bars and the short cross-bars secured to the gang-bars and having their ends bent down, of the interchangeable shovels secured thereto, substantially as and for the purpose described.

2. The combination, with the frame having slotted brackets, and the cross-bar fitted in the slots of the said brackets, of the gang-bars

402,697.

connected with the cross-bar, the roller having independent connections with the gang-bars, and means for rotating the roller, substantially as described, for the purpose specified.

3. The combination, with the frame, the slotted brackets, and the cross-bar adjustable in the brackets, of the gang-bars connected with the cross-bar by hinge-connections, and the springs secured at one end to the cross-bar and having their opposite ends adapted to exert a pressure on the said gang-bars, substantially as described, for the purpose set forth.



4. The combination, with the frame, the slotted brackets, the cross-bar, and the gang-bars hinged to the cross-bar, of the springs, the roller having independent connections with the gang-bars, and means for rotating the roller, substantially as and for the purpose described.

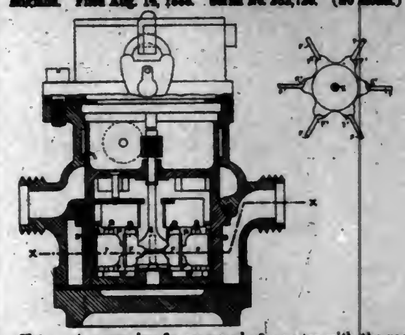
5. The combination, with the frame, of the vertically-movable cross-bar, and the gang-bars connected to the latter, each of said gang-bars having a cross-bar carrying a pair of plows adapted to form a ridge, and each gang-bar being further provided with a drill arranged for sowing in the crest of the ridge, substantially as set forth.

6. The combination, with the adjustable gang-bar provided with a pair of plows to form a ridge, of the drill-shoe connected with the gang-bar in rear of and intermediately between said plows and having an independent vertical adjustment, substantially as described.

7. The combination, with the gang-bar having a curved recess or semicircular groove framed vertically in its rear end, of the drill-shoe fitted in said recess so as to be vertically movable therein, a clip embracing said shoe and secured to the gang-bar by transverse bolts, and a pin passing longitudinally through the rear side of the clip and through one of a series of perforations in the shoe, which is thereby secured vertically adjustable to the bar, substantially as set forth.

402,698. ORE-WASHER. JAMES TALLEY, Denver, Colo. Filed Mar. 10, 1888. Serial No. 266,811. (No model.)

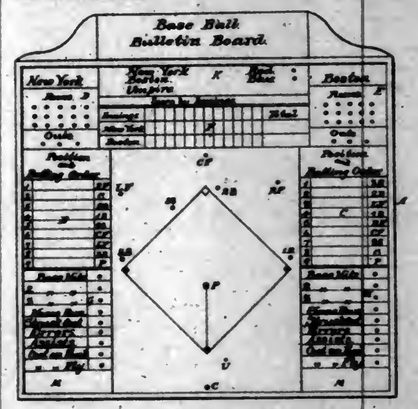
Claim.—1. A combined concentrator and amalgamator consisting of an inclosing-casing, a hopper seated thereon, a series of alternately-inclined screens each extending entirely across the space within the casing, imperforate conducting-plates, one below, substantially parallel to, and extending nearly to the lower end thereof, a discharge-passage being thereby left at the foot of each plate, and alternately-inclined riffle-plates, the inclination through the series of screens and of riffle-plates being alternately in opposite directions, substantially as set forth.



2. The combination of the inclosing-casing, a series of screens, a series of imperforate plates, a plate below and substantially parallel to each screen and conducting the material passing therethrough to the head of the next lower screen or the head of a riffle-plate, the screens and plates being inclined alternately in opposite directions, the standards 3, each with bearings 4 5, the pins 6 7, taking therein and attached to the casing, and a handle, 21, for rocking the casing in such bearings, substantially as set forth.

3. A rocker for saving fine metals, comprising a hopper, a grizzly in the bottom thereof, and an adjustable discharge-gate at the tail thereof, a series of inclined screens each having an imperforate plate beneath and parallel to it, a discharge-spout for each screen, a series of riffle-plates, the screens and riffle-plates being alternately inclined in opposite directions, an inclosing-case, and a pan, 20, located below the inclosing-casing and receiving the discharge therefrom, substantially as set forth.

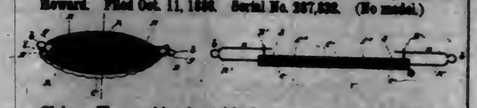
4. The combination of the inclosing-case, series of screens, and of riffle-plates alternately inclined in opposite directions, the screens extending entirely across the space within the casing, imperforate deflecting boards or plates, one for each screen, and extending substantially parallel thereto nearly to its lower end, the discharge-pan 20 beneath the lower riffle-plate, arms 25, detachably connecting it to the casing, and means, substantially as described, for simultaneously rocking the casing and reciprocating the pan, substantially as set forth.



5. The combination, with the lower riffle-plate, of a rubber or leather valve-strip secured at one edge to the lower part of the plate, a rod passing through the casing beneath such riffle-plate and carrying cams for controlling the position and operation of the valve-strip, and a pawl and ratchet for locking the rod and cams in position, substantially as set forth.

402,699. ROTARY WATER-METER. JOSEPH J. TYLOR, London, England. Filed Aug. 14, 1888. Serial No. 282,736. (No model.)

Claim.—A measuring fan or wheel of a meter with the roots or parts of the blades near the axis sloping alternately in opposite directions, as and for the purpose specified.



402,700. BULLETIN-BOARD AND BASE-BALL INDICATOR. EDWARD S. VAN ZILE, New York, N. Y., assignor to Edwin A. Grosier and Frederick A. Dunaka, same place. Filed Dec. 14, 1888. Serial No. 293,605. (No model.)

Claim.—1. A base-ball indicator consisting of a bulletin-board having a diagram of a base-ball field with the positions of the players marked thereon, and a series of indicating-markers, each bearing a color, number, or other distinguishing mark to denote a player, whereby the progress of a game may be set out as dispatches are received from the field, substantially as described.

2. The combination, with a bulletin-board having names and position of players and diagram of ball-field marked thereon and separate pins denoting players, of an adhesive marker to indicate the course of the ball, substantially as described.

402,701. BROOCH-PIN. RUDOLF VON BULTZINGSLOWEN and MORTON HOWARD, New York, N. Y.; said von Bultzingslowen assignor to said Howard. Filed Oct. 11, 1888. Serial No. 287,892. (No model.)

Claim.—The combination with the mounting-plate of a brooch, a tube upon and extending across said mounting-plate parallel thereto, and ears upon said mounting-plate at either end of said tube, of needles having two arms, substantially as specified, two of said arms passing through said ears and into said tube, one on either side of said brooch, the other arms of said needles passing through said ears, one on either side of said brooch, outside of said tube, extending toward the middle thereof and nearly parallel thereto, and a spring within said tube so connected with said needles that it draws said needles inward toward the middle of said tube, all substantially as and for the purpose set forth.

402,702. SAFETY-VALVE. MARSH WARREN, Rochester, N. Y. Filed July 26, 1888. Serial No. 281,041. (No model.)

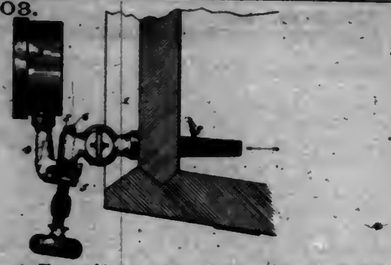
Claim.—1. The combination of a valve, a tension device to vary the resistance to the opening of the valve, and a movable scale, substantially as set forth, whereby the scale can be adjusted to correctly indicate the desired pressure to open the valve.

2. The combination of a valve, a spring tending to close the valve, a movable part to vary the tension of the spring, and a movable scale, substantially as set forth.

3. The combination of the valve, the spring, the milled wheel or plate, the screw-threaded cylinder, the longitudinally-movable nut, and the movable scale seated in a recess in the milled head, substantially as set forth.

4. The combination of the casing, the valve, the spring, the milled plate, the screw-threaded cylinder, the movable nut on said cylinder, and the clamp, substantially as set forth, whereby the milled plate is held in fixed position after adjustment of tension.

5. The combination of the valve, the spring, the milled plate, the screw-threaded cylinder, the longitudinally-movable nut on the cylinder, the movable scale, and the jam-nut for holding the scale against the plate, substantially as set forth.



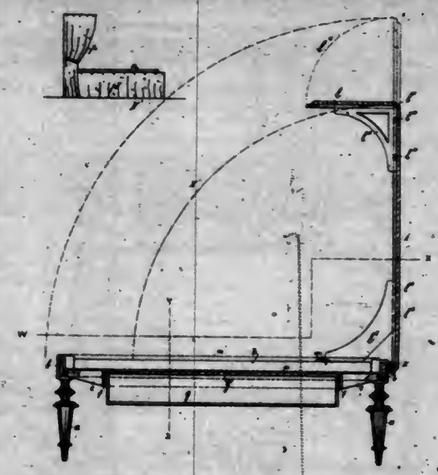
6. The combination of the valve, the spring, the milled plate, the screw-threaded cylinder, the longitudinally-movable nut thereon, the movable scale, the nut for holding the scale against the plate, and the clamp to hold the wheel or plate in fixed position, substantially as set forth.

7. In a fluid-pressure-regulating apparatus, a valve, a tension device, and a scale mechanically connected to the tension device, all combined substantially as set forth, whereby the scale is moved by the manipulation of said tension device.

8. In combination, in a fluid-pressure-regulating apparatus having a casing, a scale or indicator connected to a tension device, a valve adapted to close and disclose a passage for a fluid, and a branch pipe communicating with the interior of the casing to receive a pressure-gage, substantially as set forth.

402,703. DETACHABLE PRESSURE-GAGE. HARRIS WARREN, Rochester, N. Y. Filed Oct. 12, 1888. Serial No. 287,915. (No model.)

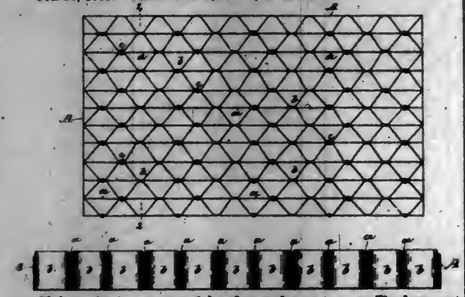
402,703.



Claim.—1. The combination of a cask, a faucet for drawing off its liquid contents, a pressure-gage provided with an extension which connects immediately with the gage and supports the same, and which is also applied immediately to the mouth of the faucet, and a clamping device which clamps said extension directly to the faucet, substantially as specified.

2. The combination of a pressure-gage having an extension and a packed seat in said extension, the link provided with the screw, and the faucet having a projection to engage the link, the projection and the screw being in the axis of the link, substantially as set forth, whereby the link may be readily applied to a faucet without removing its cock, and whereby the seat of the extension may be forced in a straight line against the mouth of the faucet.

3. A pressure-gage provided with a bent extension having a seat provided with a packing on its outer limb, a faucet with downwardly-directed mouth, and the clamp and screw, whereby the seat and the mouth of the faucet may be clamped together and the gage held directly upon the faucet and above it, substantially as set forth.

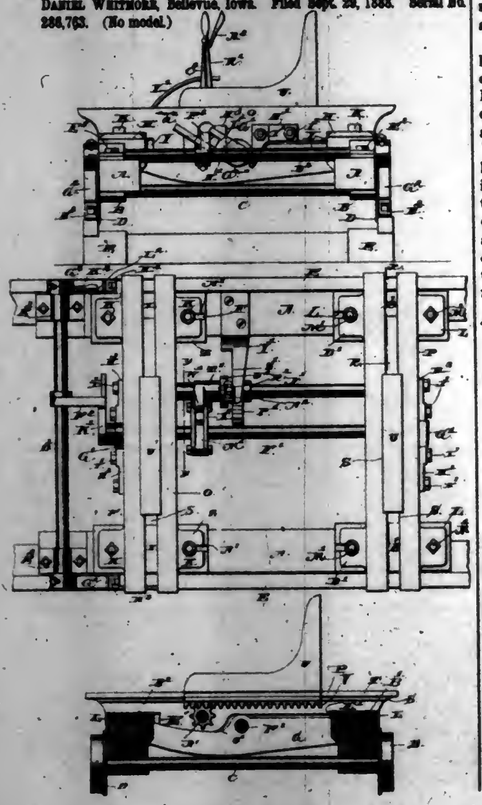


402,704. BEDSTEAD. MARY WRIGHTMAN, Newcastle-upon-Tyne, County of Northumberland, England. Filed Oct. 1, 1888. Serial No. 286,902. (No model.) Patented in England Jan. 21, 1888, No. 945.

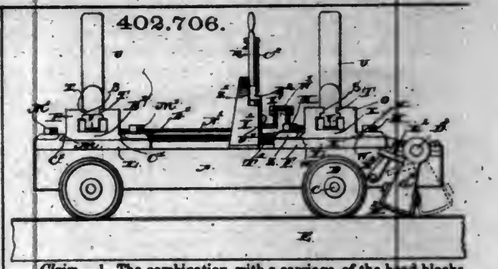
Claim.—1. In a table-bedstead, the combination, with the outer frames, *b*, of the pieces *c*, lower than the said outer frames and secured against their inside surfaces, the crossed frames *e* and *f*, for supporting the mattress, provided with tapering ends and secured with their tops level with the tops of said pieces *c* at some distance within the outer frame and parallel with the respective sides of it to which they are opposite, and the head-frame hinged to the outer frame and adapted to fold down upon and inclose the mattress and form the top of the table, substantially as set forth.

2. In a table-bedstead, the combination, with the outer frames, *b*, of the pieces *c*, lower than said outer frames and secured against their inside surfaces, the crossed frames *e* and *f*, for supporting the mattress, provided with tapering ends and secured with their tops level with the tops of said pieces *c* at some distance within the said outer frame and parallel with the respective sides of it to which they are opposite, the deep central box, *g*, secured between said frames *e* and *f* and provided with a removable cover level with the top of said frames, and the head-frame hinged to the outer frame and adapted to fold down upon and inclose the mattress and form the top of the table, substantially as set forth.

402,705. DOOR-MAT. OTTO WESTERHOLM, Chicago, Ill. Filed Oct. 26, 1885. Serial No. 180,890. (No model.)



Claim.—1. As a new article of manufacture, a metallic door-mat comprising the parallel strips *a*, standing on edge, zigzag intermediate strips, *b*, arranged between the strips *a*, and suitable connections uniting the said strips *a* and *b*, the whole being combined to form spaces through which dirt may pass, substantially as set forth.



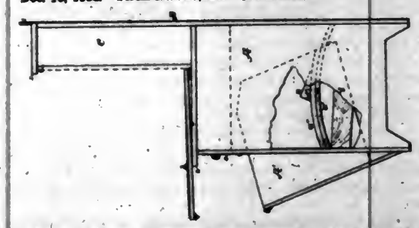
2. A metal door-mat consisting of the outer frame, A, and longitudinal strips *a*, connected to the ends of the frame, and intermediate strips, *b*, extending transversely between the adjacent strips *a*, to which they are secured at different points, substantially as described.

3. A metal door-mat consisting of the outer frame having longitudinal strips *a* and the intermediate transverse strips, *b*, lying between the adjacent strips *a*, the strips *b* being connected to the strips *a* at alternate contacting points, substantially as and for the purpose set forth.

4. A metal door-mat consisting of the outer frame, A, having longitudinal strips *a* and the intermediate strips, *b*, extending transversely between the strips *a*, to which they are secured, the upper edges of the strips *a* and *b* lying in different planes, substantially as described.

402,706. OFFSET MECHANISM FOR SAW-MILL CARRIAGES. DANIEL WHITMORE, Bellevue, Iowa. Filed Sept. 29, 1888. Serial No. 286,763. (No model.)

Claim.—1. The combination, with a carriage, of the head-blocks movable laterally thereon, the shaft F', journaled in rigid supports and having the cams engaging the head-blocks, the rock-shaft journaled on the carriage and having the friction-arms adapted to engage the track-rails, and devices, substantially as set forth, connecting the said rock-shaft to the shaft F', substantially as described.



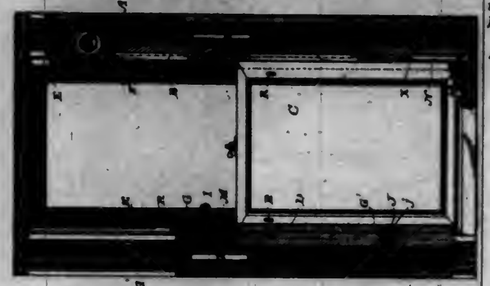
2. The combination, with a saw-mill carriage, of the laterally-movable head-blocks, knees or standards guided in said blocks and having the racks, the shaft N', journaled in and connecting the head-blocks and having the pinions engaging the racks, the ratchet-wheel secured to the said shaft, the sleeve loose on said shaft and having arm W', the head-lever loosely mounted on the shaft and having the dog to engage the ratchet-wheel and the locking device to engage the sleeve, the shaft F', having the cams engaging the head-blocks, the arm M', secured to said shaft F', and the links connecting said arms with the arm W', substantially as described.

3. The combination of the carriage having the plates or castings the laterally-movable head-blocks dovetailed in said plates or castings, the knees or standards guided in the head-blocks, the shaft N', journaled in the head-blocks and movable therewith, said shaft being geared to the knees or standards, the ratchet-wheel secured to said shaft, the shaft F', journaled in fixed supports and connected to and adapted to operate the head-blocks, the sleeve loose on shaft N', connections between the said sleeve and the shaft F', whereby the same may be partly rotated simultaneously, and the hand-lever loosely mounted on shaft N' and having the dog to engage the ratchet-wheel and the locking device to engage the sleeve, substantially as described.

4. The combination, with the carriage, of the laterally-movable head-blocks, the shaft F', journaled in fixed supports and having the cams engaging the head-blocks, and provided, further, with the arm K', the rock-shaft journaled on the carriage and having the arm F', engaging arm K', and the friction-arms secured to the rock-shaft and adapted to engage the track-rails, substantially as described.

5. The combination, with the carriage, of the laterally-movable head-blocks thereon, the shaft F', journaled in fixed supports and having the cams or devices engaging the head-blocks, the arm K', secured to the shaft F' and having the open slot L', the rock-shaft journaled on the carriage and having the arm F³, to engage slot L', the friction-arm secured to the rock-shaft and adapted to engage the track-rails, one of said friction-arms having the arm K³, and the detent L², secured to the carriage and adapted to engage said arm, for the purpose set forth, substantially as described.

402,707. KITCHEN-CABINET. HORACE S. WOLFE, Battle Creek, Mich., assignor of one-half to Nelson R. Hubbard, same place. Filed Dec. 10, 1888. Serial No. 293,217. (No model.)

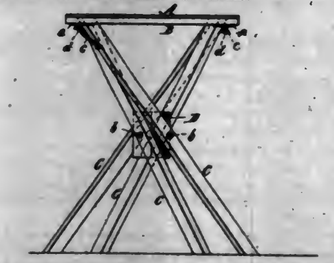


Claim.—1. In a kitchen-cabinet, the casing provided with arc-shaped cleats or ways, in combination with a flour-receptacle, also having arc-shaped cleats which extend from one end of said receptacle toward but not in contact with the opposite end thereof, stop-blocks secured to the case immediately above the cleats of the flour-receptacle, and corner-strips secured to the case and so disposed with relation thereto as to serve as stops for the flour-receptacle.

2. In a kitchen-cabinet, the case provided on its inner ends with arc-shaped cleats or ways and on its outer corners with strips, in combination with a flour-receptacle having arc-shaped cleats secured thereto, which extend from the rear end of said receptacle toward but not in contact with the front end thereof and are adapted to engage with the cleats of said case, and stop-blocks disposed on the interior of the case immediately above the cleats on the flour-receptacle, all substantially as and for the purposes herein specified.

3. In a kitchen-cabinet, the case provided with inclined blocks or strips, and also with arc-shaped cleats or ways, the extremities of which rest on said inclined blocks, and strips secured to the corners of said case, for the purpose set forth, and so disposed with relation thereto as to adapt them to serve as stops for a flour-receptacle, in combination with said flour-receptacle having arc-shaped cleats at its sides, which cleats extend from the rear end of said receptacle toward but not in contact with the front end thereof, as shown, and blocks secured to the case immediately above the cleats of the flour-receptacle and adapted, as set forth, to prevent accidental displacement of said receptacle.

402,708. WINDOW CASING AND SASH. JAN SALIESOWSKI, Chicago, Ill., assignor of three-fourths to August J. Kowalski, Theodore Lewandowski, and Andrew Schultz, same place. Filed Aug. 3, 1888. Serial No. 281,910. (No model.)

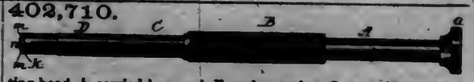


Claim.—1. A spring thumb-bolt, I, consisting of the screw-threaded bolt *i*, having button *i'*, spring i^2, nut i^3, and hollow knob i^4, in combination with the removable strip D, the plate J, having lug *j*, and the casing having socket-plates G G', substantially as and for the purpose described.

2. The rope-socket piece P, provided with the spring Q, in combination with the journal *o'* and its cam o^3, said spring pressing against the cam, substantially as and for the purpose described.

3. The outer sash, B, and inner sash, C, each pivoted to rope-socket pieces P at its lower edge, the socket-pieces of the outer sash having a longer section below the pivotal point than the socket-pieces of the inner sash, substantially as described.

4. The removable strips D and F, having their upper ends inclined, as described, in combination with the window-casing, and springs H, for holding the strips F, and spring-bolts I, for holding the strips D within the casing, substantially as and for the purpose described.

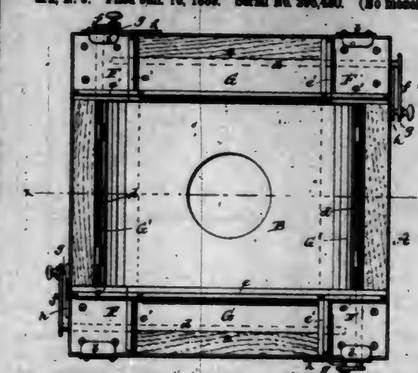


402,709. CAMP-STOOL. ALONZO M. ABBOTT, Lockland, Ohio. Filed Dec. 3, 1888. Serial No. 292,476. (No model.)

Claim.—A camp-stool comprising a central rectangular block, a series of legs having their ends beveled, as described, pivoted to the respective sides of said block, a rigid rectangular seat-frame provided on its under side at its corners with metal plates which project over the inner line of the frame, two of said plates located at diagonally-opposite corners, being provided with eyes, a seat secured to said frame, and hooks pivoted to two of the legs in such position as to permit them to engage with the eyes on the metal plates, all combined substantially as described, and for the purposes set forth.

402,710. INK-ERASER. HIRAM BALDWIN and JOSEPH J. SMITH, Toledo, Iowa. Filed Mar. 22, 1888. Serial No. 304,362. (No model.)

Claim.—1. In an eraser, the combination of a case, a rotary cutting-head, *k*, carried by a rod, F, and a spring, G, to hold the head against the paper, substantially as specified.



2. In an eraser, the combination of a case, a rotating head, *k*, carried by a rod, F, a spring to hold the face of the head *k* against the paper, a spirally-grooved rod, E, and a movable tube, A, having an extension, *b*, provided with a pin or stud, *y*, to enter the groove *f*, substantially as and for the purpose described.

3. In an eraser, the rod F, having at one end an erasing-head, *k*, and at the other end a socket, *j*, and a spring, G, in combination with a rod, E, having its lower end, *i*, formed to fit in the socket *j* and having its upper portion spirally grooved, and tube A, having an extension, *b*, provided with a pin or stud, *y*, substantially as and for the purpose specified.

4. In an eraser, a rod, F, provided with an erasing-head, *k*, and a spring, G, in combination with a case provided with a plate, A, and rotatable rod E, provided with a shoulder that rests against the plate *k*, substantially as and for the purpose specified.

402,711. PHOTOGRAPHIC CAMERA. BRANTUS B. BARKER, Newark, N. J. Filed Jan. 16, 1888. Serial No. 296,480. (No model.)

Claim.—1. In a photographic camera, the construction of the back with adjustable shutters, substantially as described, whereby the back and the back-opening may be quickly adjusted to the reception of the plate-holder for the taking of either vertical or horizontal pictures, as set forth.

2. In a photographic camera, the combination, with a back frame, of adjustable shutters adapted to enlarge or contract the opening in the back in horizontal and vertical directions, as and for the purposes herein shown and described.

3. In a photographic camera, the back frame provided with upper and lower and side or end movable wings or shutters adapted to provide for insertion of the plate-holder in directions transverse to each other, essentially as specified.

4. In a photographic camera, the back frame provided with upper and lower and side or end movable wings or shutters having guide-ribs on their faces for the plate-holder, and adapted to provide for the insertion of the plate-holder in directions transverse to each other, substantially as described.

5. The combination, with the back frame, A, of the hinged wings G G G' G', having their axis of motion in direction of their length, essentially as and for the purpose herein set forth.

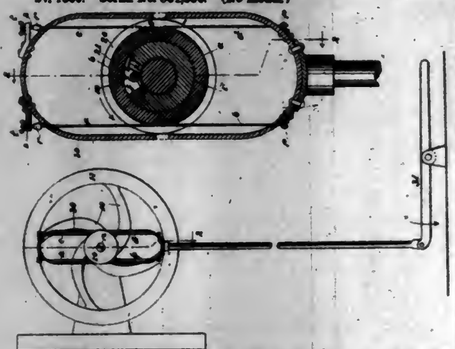
6. The combination, with the camera-back A, of the corner-plates F, arranged to project within the opening in said back and having guide-ribs *e'*, and the hinged shutters G G', having corresponding guide-ribs, *e*, for operation in relation with said plates, essentially as shown and described, and for the purpose specified.

7. The combination, with the camera-back A, of the hinged wings or shutters G G G' G', their attached hinged pins *d*, arranged to extend in direction of the length of said shutters and outside of the back A, and an adjusting and locking handle applied to the outer end extension of said rods for holding the shutters open or closed, as desired, substantially as specified.

402,712. GROUND-GLASS ATTACHMENT FOR CAMERAS. MAX BAUER, Brooklyn, N. Y. Filed Sept. 10, 1888. Serial No. 284,976. (No model.)

Claim.—1. A ground-glass attachment for cameras, comprising a back frame, springs secured to the said back frame, and a ground-glass frame, on which the free ends of the said springs are secured

402,712.



so that the said springs support the ground-glass frame on the said back frame, substantially as shown and described.

2. The combination, with a back frame provided with cleats each having a recess, of a spring secured in its middle in the recess of each of the said cleats, and a ground-glass frame secured to the free ends of the said springs at two opposite sides, substantially as shown and described.

3. The combination, with a back frame provided with two parallel cleats each having a recess, of a spring secured in its middle in the recess of each of the said cleats, each of the said springs being provided at its ends with slots, a frame containing the ground glass and supported on the said springs, and screws passing through the slots in the said springs into the said frame, so as to hold the latter on the said springs, at the same time permitting a free movement of the springs, substantially as shown and described.

402,713. MOTOR. WILLIAM R. BELL, New York, N. Y. Filed Feb. 27, 1889. Serial No. 301,230. (No model.)

Claim.—1. In a motor, the combination, with a driven member provided with pawls, of rings formed with internal ratchets that are engaged by the pawls, bands passed about the rings in opposite directions, and a frame to which the bands are connected, as and for the purpose stated.

2. In a motor, the combination, with a driven member provided with pawls, of rings formed with internal ratchets that are engaged by the pawls, bands passed about the rings in opposite directions, a frame to which the bands are connected, a treadle, and a connection between the treadle and the frame, substantially as described.

3. In a motor, the combination, with a driven member provided with pawls, of a ring, 19, formed with an internal ratchet that is engaged by one of the pawls, bands connected to the ring and passing in opposite direction about said ring, a frame to which the bands are connected, a ring, 21, also formed with an internal ratchet that is engaged by the other pawl, bands which pass in opposite directions about and are connected to the ring 21, the point of connection being opposite that of the ring 19, connections between the bands and the frame, and means for reciprocating the frame, as and for the purpose stated.

402,714. AIR-PURIFIER. BENJAMIN S. BENSON, Baltimore, Md. Filed Aug. 29, 1888. Serial No. 284,105. (No model.)

Claim.—1. In an air-purifying apparatus, the combination of a filtering-case provided with a fresh-air inlet at one end and outlets at its opposite end, a series of detachable filtering-webs disposed within the casing, forming compartments therein between the air inlet and outlet openings, and a heating case or drum having a hot-air chamber, said chamber communicating with the outlet-openings, and a discharge-pipe connected with said chamber, substantially as and for the purpose specified.

2. In an air-purifying apparatus, the combination, with the filtering-case provided with a fresh-air inlet at its lower end, a series of movable filtering-webs arranged therein, and outlet-openings in its top, of a heating-case disposed above said case, provided with air-inlet openings in its bottom arranged to align with the openings in the top of the filtering-case, said heating-case provided with a hot-air chamber having an extension or drum, I', a combustion-pipe arranged within said drum and connected to the heating-chamber, said drum provided with a pure-air outlet-pipe, all arranged substantially as described.

3. In an air-purifying apparatus, the combination, with the hot-

402,714.

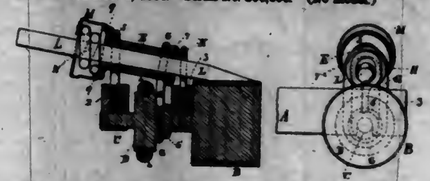
air case provided with air-passages for the filtered air, said case consisting of a heating-chamber provided with a combustion-outlet pipe and a hot-air space surrounding said heating-chamber, provided with a drum and a pure-air outlet, of a detachable lamp-support, said support consisting of a horizontal hollow chamber provided with the oil-chamber at its forward end, an extended portion or gate at its outer end adapted to fit the opening of the heating-chamber, and a horizontal air-tube extending from said gate portion and extending to the oil-chamber, substantially as and for the purposes set forth.

4. An air-purifying apparatus consisting of a filtering-case adapted to receive the fresh air at its lower end, provided with a series of movable filtering-webs arranged in the interior of said case, and air-outlets in its top, a heating-chamber arranged above said top and having air-passages aligning with the air-openings in the filter-top, said heater provided with an outlet for the pure air and an outlet for the products of combustion, and a cooling-box arranged to surround a portion of the pure-air pipe, substantially as and for the purposes described.

5. An air-purifying apparatus consisting of an air-filtering case having an air-inlet pipe connected with the outside of the building, a heating-case arranged above said filter-case, air-passages provided in said case and heating-box, said heating-case having a combustion-pipe connected to the heating-chamber and extending outside the building, a hot-air drum surrounding said heating-chamber, and a pure-air pipe connected with said drum, substantially as and for the purpose described.

6. The combination, with the air-filtering case A, the heating-case connected therewith, said heating-case provided with a hot-air drum, of the pure-air pipe connected therewith, said pipe provided with branch pipes at its outer end, said branch pipes provided with stop-cocks, and tubes connected with said branch pipes, substantially as and for the purpose specified.

7. In an air-purifying apparatus, substantially as described, the filtering-webs D, said webs consisting of a foraminous base-plate, D', a series of fingers, D^2, projecting upward from said base-plate, and a web-body of muslin or tape connected to said fingers, substantially as shown and described.



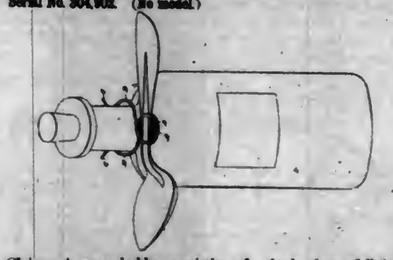
8. The filtering-webs D, said webs consisting each of a foraminous base-plate, D', upwardly-projecting finger D^2, a web-body of muslin or tape connected to said fingers, a perforated brace-board disposed between said web portion and base-plate, and a retaining metallic casing surrounding said web portion, substantially as shown and described.

9. An air-filtering apparatus consisting of the heating-case F, provided with an air-inlet, said inlet entering a heating-drum formed in said case, a combustion-pipe arranged in connection with the combustion-chamber and extending within said drum and passing through said drum to the outside of the building, and a fresh-air pipe connected with the drum and adapted to be secured to the head-board of a bed, substantially as and for the purpose described.

10. In an air-filtering apparatus, the combination, with the filtering-case and heating-case, substantially as shown and described, said

filtering-case provided with an air-inlet pipe extended through the window B, said heating-case provided with a combustion-pipe extending through said window, of detachable window-strips arranged at the top and bottom of said windows, said strips formed with apertures through which the pipes C and H extend, substantially as and for the purpose described.

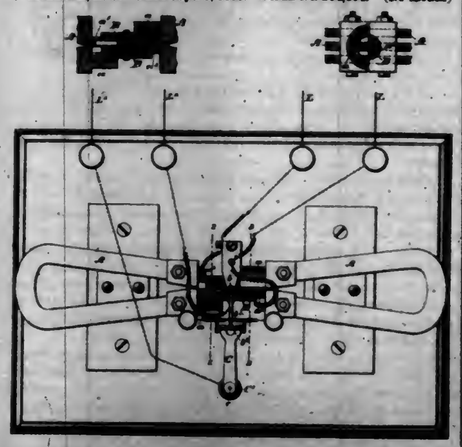
402,715. PENCIL-SHARPENER. BENJAMIN H. BLACK, Paterson, N. J. Filed Nov. 6, 1888. Serial No. 290,096. (No model.)



Claim.—1. The combination, with the rotary file and its shaft, of a wheel, D, adapted to be rubbed back and forth on the desk or floor, a handle with bearings for the shaft, and a tubular holder for the pencil, substantially as specified.

2. The wheel D, having an elastic rim, 4, the shaft C, and rotary file B, in combination with the tubular pencil-holder and a belt for giving motion to the same from the axis of the rotary file, substantially as set forth.

3. The tubular pencil-holder E, in combination with the clamping-shell M and clamp N, in the form of a strip, the ends of which are connected, respectively, to the clamping-shell and the flange of the tubular pencil-holder, substantially as set forth.



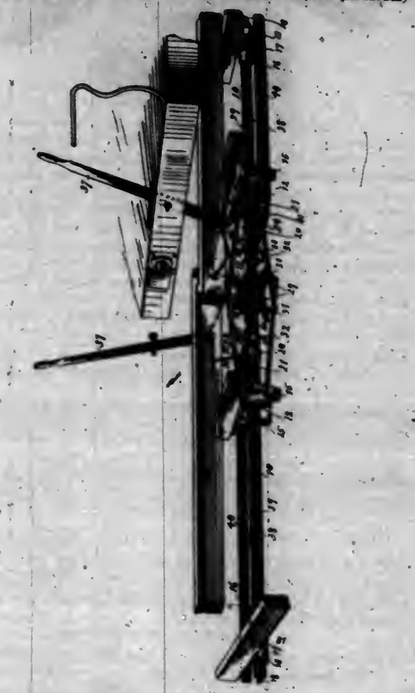
4. The combination, with the tubular pencil-holder, of a clamping-strip adapted to be wound around the pencil for holding the same, substantially as specified.

402,716. SPOON-HOLDER. DANIEL A. A. BUCK, Cheshire, Conn., assignor to the D. A. A. Buck Company, same place. Filed Mar. 26, 1888. Serial No. 304,902. (No model.)

Claim.—A spoon-holder consisting of a single piece of light wire bent to form coils adapted to be sprung apart to receive a spoon-handle edgewise between them, and two curved arms shaped to clasp the neck of an ordinary bottle, substantially as and for the purpose set forth.

402,717. TELEGRAPH-INSTRUMENT. CHARLES G. DURKEE, Richmond Hill, N. Y. Filed Sept. 5, 1883. Serial No. 294,891. (No model.)

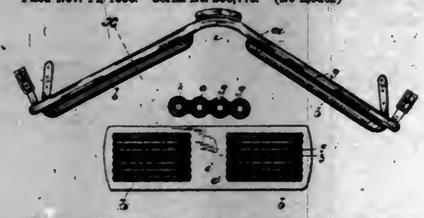
Claim.—1. The combination, with a spring-actuated rod, bearings for the same located beneath the car, a coupling-pipe secured to said rod, and a valve contained in said pipe, of a head secured to the coupling-pipe, gripping-fingers pivoted in said head, connecting-rods pivoted beneath the car and to said fingers, and a link-connection between one of said rods and the valve-stem, substantially as shown and described.



2. The combination, with a spring-actuated rod located beneath the car, a coupling-pipe secured to said rod, a valve contained in the pipe, and a head attached to the same having outwardly and oppositely flaring slotted arms, of gripping-fingers pivoted in the slots of said arms, connecting-rods secured to the car-frame and pivoted to said fingers, a link connecting one connecting-rod and the valve, and a cushion inserted in the head at the extremity of the coupling-pipe, substantially as shown and described.

3. The combination, with a spring-actuated rod located beneath the car, a coupling-pipe secured to the said rod, a coupling-head attached to said pipe at an angle approaching forty-five degrees provided with outwardly and oppositely flaring slotted arms, of gripping-fingers pivoted in said arms, a valve located in the coupling-pipe to the rear of the head, connecting-rods secured to the block and pivoted to said fingers, and a link-connection between one connecting-rod and the valve, substantially as shown and described.

4. The combination, with a spring-actuated rod located beneath the car, a coupling-pipe secured to said rod provided with an essentially-conical head at the point of juncture, a coupling-head attached to the outer end of the pipe at an angle approximately of forty-five degrees having outwardly-flaring and slotted arms, of gripping-fingers pivoted in said arms, a valve located in the coupling-pipe to the rear of the head, connecting-rods secured beneath the car-frame and pivoted to said fingers, a link-connection between one rod and the valve, a spring-latch projecting over the flange of the coupling-pipe, and means, substantially as shown and described, for manipulating said latch, as set forth.



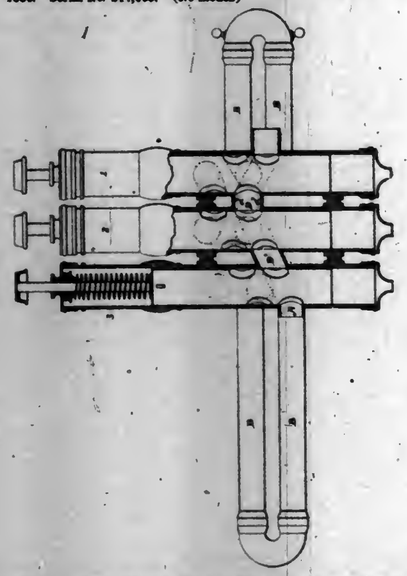
5. The combination, with the rod 18 and coupling-head 25, of

402,718. HOSE-COUPLING FOR RAILWAY-CARS. CHARLES H. BURNETT, Clay Centre, Kans., assignor of one-half to Harry G. Higinbotham, same place. Filed Sept. 5, 1888. Serial No. 284,594. (No model.)

the sleeve 10, bearing-block 13, spring 14, and bearing-block 12, carried by said spring, substantially as shown and described.

402,719. HARNESS-PAD. NELLIE M. CANOONE, Newark, N. J.
Filed Nov. 14, 1888. Serial No. 290,772. (No model.)

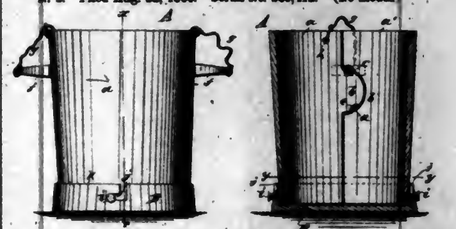
Claim.—1. The improved harness-saddle pad or other harness-pad, combining with a backing, *b'*, a series of parallel ribs of loose or unwoven fiber having arches therein to form said ribs, substantially as described, and a series of rows of stitching extending at right angles to said fiber and between said ribs and holding said fiber to the backing, substantially as and for the purposes set forth.



2. The improved harness-pad herein described, combining with the saddle part *a* a backing, *c'*, having wefts of fiber sewed to the face thereof at each side of a center portion, forming a recess, *i*, at which the said backing is uncovered, the said wefts between the rows of stiching forming arches or uncut ribs, substantially as herein shown and described.

402,720. PRODUCING MATRICES. FRANCIS M. F. CAHEN, West Fairlee, Vt. Filed Dec. 1, 1886. Serial No. 220,358. (No model.)

Claim.—The process for making a matrix, consisting in first taking a sheet of plastic material, next placing thin tissue upon opposite sides of said sheet of plastic material, and, lastly, subjecting the composite sheet so formed to the action of dies, in order to form impressions therein, substantially as specified.

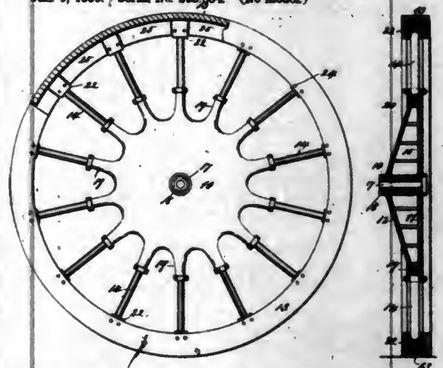


402,721. CORNET. CHARLES G. CONN, Elkhart, Ind. Filed Oct. 30, 1886. Serial No. 217,605. (No model.)

Claim.—1. In a cornet or other piston-valve musical instrument, the combination, with the valve-cylinders, of a straight connection, D, between an outside valve-cylinder and the middle valve-cylinder, and a diagonal connection, D', between the other outside valve-cylinder and the middle valve-cylinder, substantially as shown and described.

2. The combination, with the valve-cylinders 1 2 3, of a straight pipe-connection, D, between the first valve-cylinder, 1, and the second valve-cylinder, 2, and a diagonal pipe-connection, D', between the second valve-cylinder, 2, and the third valve-cylinder, 3, substantially as described.

402,722. TRANSPLANTING-POT. JONAS COOK, Mount Pleasant, N. C. Filed Aug. 22, 1888. Serial No. 283,412. (No model.)



Claim.—1. The combination of the two-part bottomless body having locking projections and recesses on its meeting edges, a separate bottom closing the lower end of the body and forming a support for the earth contained therein, and an interlocking groove and projection connecting said bottom and lower end of the body, substantially as set forth.

2. The combination, in a transplanting-pot, with the sectional longitudinally-divisible bottomless body, of the detachable bottom closing the lower end of the pot, having an annular flange receiving the lower ends of the body-sections, and interlocking grooves and projections between said sections and the flange, substantially as set forth.

3. In a transplanting-pot, the combination of the part *a*, provided with ears *b*, the part *a'*, having recesses *b'* and furnished with lugs *d*, the keys *f*, and the removable bottom B, substantially as described.

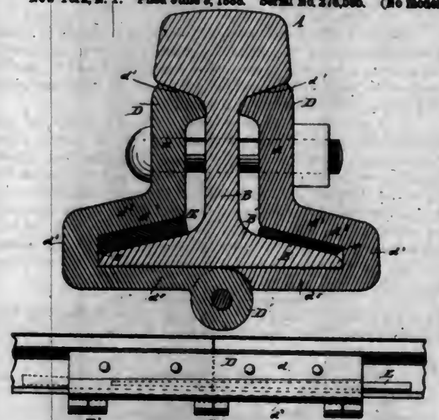
4. In a transplanting-pot, the combination of the part *a*, provided with the ears *b*, the part *a'*, having the recesses *b'* and furnished with the lugs *d*, the keys *f*, and the removable bottom B, provided with a bayonet-joint connection, substantially as described.

402,723. WHEEL. GEORGE E. CRUTCHFIELD, English, Ark. Filed Jan. 9, 1889. Serial No. 295,534. (No model.)

Claim.—1. A wheel comprising a hub, spokes radiating therefrom, a hollow tire open on its inner side, retaining-blocks 22 therein and with which the outer ends of the spokes are engaged, and the spacing and filling blocks 25 between the blocks 22, substantially as set forth.

2. The hollow hub 10, approximately in the form of a frustum of a cone and formed with integral screw-threaded spoke-sockets 19 and a central bore, 16, having longitudinal grooves, substantially as set forth.

3. The combination, with an essentially-tubular interiorly-braced metal hub and sockets projected from the periphery of said hub, of a hollow tire approximately rectangular in cross-section and open upon its inner face, blocks held within the channel of the tire, and spokes introduced into the said sockets and extending within the said blocks, substantially as shown and described.



4. The combination, with a metal hub and sockets projected from the periphery of the same, of a hollow tire approximately rectangular in cross-section and open upon its inner face, blocks held within the channel of the tire and provided with a cavity in the inner end, and spokes having one end introduced into the cavity of the block and the other end secured in the sockets of the hub, substantially as and for the purpose specified.

5. The combination, with a metal hub and a series of sockets projecting from the periphery of the same, of a hollow tire approximately rectangular in cross-section and open upon its inner face, blocks secured within the channel of the tire having a cavity in the inner end, spokes introduced into the cavity of the said blocks and into the sockets of the hub, and false segmental fally-blocks intervening each of the spoke-blocks, all combined for operation substantially as shown and described.

6. In a wheel, the combination, with a hollow metal hub representing in diametrical section the frustum of a flattened cone and provided with a series of radially-projecting screw-threaded spoke-sockets, and a central bore with a series of longitudinal grooves produced in the walls of the said bore, of a box provided with longitudinal ribs or lugs adapted to be shrunk in the bore of the hub, substantially as and for the purpose specified.

7. In a wheel, the combination, with an essentially-tubular iron hub representing in diametrical section the frustum of a flattened cone and provided with a series of internal integral braces and a central bore having longitudinal grooves produced in the walls thereof, of a steel box provided with longitudinal lugs or ribs upon its outer face, which box is adapted to be secured in the bore of the hub, substantially as and for the purpose specified.

402,724. RAILWAY-RAIL FISH-PLATE. THOMAS A. DAVIES, New York, N. Y. Filed June 9, 1888. Serial No. 276,585. (No model.)

Claim.—1. The combination, with a rail and two fish-plates having their lower ends hinged beneath the base of said rail, and the under face of the inclined section tapered longitudinally, of a wedge-shaped key intervening the upper flange-surface of the rail, and the under tapering face of the plates, substantially as shown and described.

2. The combination, with a rail and two fish-plates having their lower ends hinged beneath the base of said rail and the under face of the inclined section above the flange tapered longitudinally from end to end, whereby wedge-shaped spaces are produced, of a key having a flat under surface and a tapering upper face adapted to enter the said wedge-shaped spaces, substantially as shown and described.

3. A railway-rail fish-plate, substantially as shown and described, the same consisting of a vertical web-section, an inclined flange-section having a longitudinal tapering under face, a side section, and a horizontal base-section terminating in a series of apertured knuckles, all formed of one piece of metal bent in the direction specified.

402,725. RAILROAD FISH-PLATE. THOMAS A. DAVIES, New York, N. Y. Filed June 26, 1888. Serial No. 278,402. (No model.)

Claim.—1. A fish-plate consisting of a vertical body having a straight horizontally-parallel top and bottom surface, and provided with a longitudinal web-bearing upon the inner face at top and bottom, and a downwardly-extending lip integral with the outer face at the base, substantially as shown and described.

2. A fish-plate, substantially as shown and described, consisting of a vertical body of less height than the space intervening between a rail head and flange, having integral head and web bearings, and provided with a lip extending downward from the outer face at the base, substantially as set forth.

3. A fish-plate consisting of a vertical body of less height than the web of a rail, having an essentially straight horizontal parallel top and bottom, substantially as set forth.

4. A fish-plate consisting of a vertical body of less height than the web of the rail, having a web-bearing, a straight horizontal head-bearing, and a base parallel with said head-bearing, substantially as shown and described.

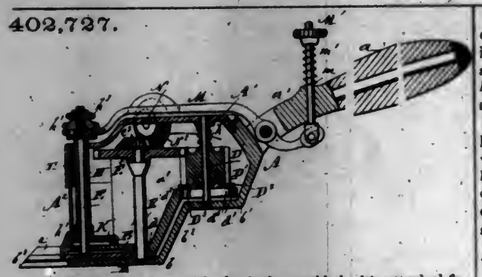
5. The combination, with a fish-plate consisting of a body of less height than the space intervening between a rail head and flange, having integral head and web bearings, and a lip extending downwardly from the outer face at the base, of a table provided with a lower face adapted to the incline of the rail-flange and a longitudinally-tapered upper face, and a key having a straight upper face and a longitudinally-tapered under face, substantially as shown and described.

6. The combination, with a rail having the under surface of the head essentially parallel with the base of the flange, a fish-plate of less height than the web, provided with an upper and lower surface essentially parallel with the base of the plate, and a lip extending downward from the outer face of the plate at the base, of a table resting upon the rail-flange and having a tapering upper face, and a key provided with a straight upper face and a tapering lower face, substantially as shown and described.

7. The combination, with a rail having the under surface of the head essentially parallel with the base of the flange, and a fish-plate of less height than the web, provided with an upper and a lower surface essentially parallel with the base of the rail, of a table resting upon the rail-flange having a tapering upper face, and a key provided with a straight upper face and a tapering lower face, substantially as shown and described.

402,726. APPARATUS FOR TESTING THE ACCURACY OF THE ADJUSTMENT OF A ROTATING SHAFT. BENJAMIN A. DOBSON, Bolton, County of Lancaster, England. Filed Dec. 4, 1888. Serial No. 292,686. (No model.) Patented in England Mar. 10, 1888, No. 3,699.

Claim.—1. The combination, with shaft-support having the fixed flange 1 concentric with the shaft-opening therein, and the eccentric adjustable sleeves C D, of the collar having a central shaft-opening and concentric flanges 2 on its face, which are adapted to embrace the flange 1 on said support, as and for the purpose specified.



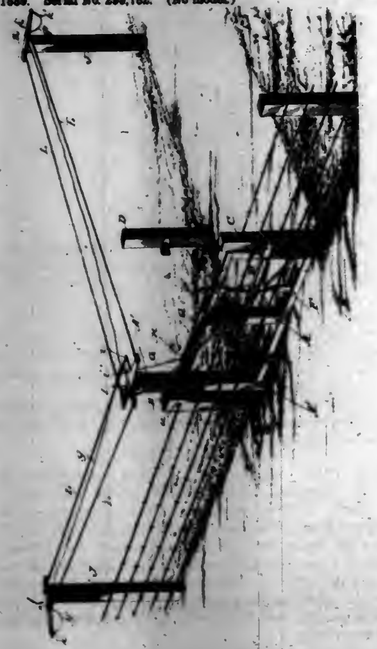
2. The combination, with the shaft-support having a flange, 1, concentric with the opening therein, of the collar F, which is cut away on one side, as shown, and has face flanges 2, adapted to embrace the said flange on the shaft-support, as specified.

3. The collar F, having the flanges 2 and a central circular opening adapted to receive the shaft and cut away on one side, as and for the purpose specified.

402,727. HAIR-CUTTER. JOHN W. EISENHUTH, San Francisco, Cal. Filed Sept. 12, 1888. Serial No. 285,260. (No model.)

Claim.—1. The combination, with a body provided with a series of fingers at its lower outer end, a cutting-plate held laterally secure above the fingers, and a second upper rotary reciprocating cutting-plate, of a post passing through the upper plate and secured to the lower plate, a sleeve surrounding the post, bearing upon the upper plate, an adjusting-nut in contact with said sleeve, and a lever fulcrumed upon the body and attached to the post, substantially as shown and described.

402,727.



2. The combination, with the body provided with attached fingers, a cutting-plate held laterally secure above the frame, a second cutting-plate held to rotary reciprocation upon the first plate, and provided with an essentially diamond-shaped opening removed from the cutting-edge, of a spindle attached to the body, a pinion loosely mounted upon the spindle, provided with a pin eccentric upon its under face engaging the walls of the plate-opening, a shaft journaled horizontally in the body, and gearing, substantially as shown and described, connecting the pinion and shaft, substantially as specified.

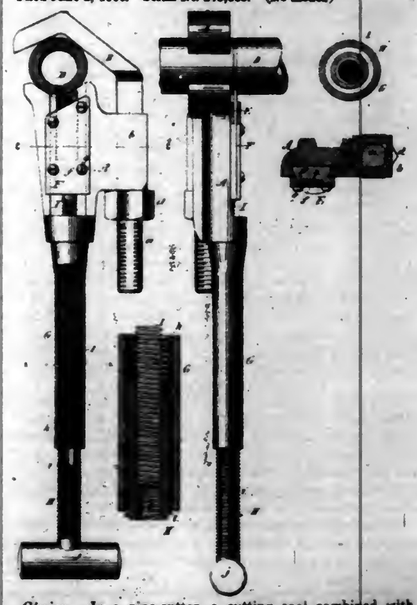
3. The combination, with a body provided with a series of fingers at its lower outer end, a cutting-plate held laterally secure above the fingers, a second upper cutting-plate held to rotary reciprocation upon the first plate, and a cap resting upon the movable plate, of a vertical post passing through the cap and upper plate and attached to the lower plate, and of a sleeve encircling the post, an adjusting-nut bearing upon the sleeve, a vertical shield supported upon the cap, and a lever attached to the post fulcrumed in the body, substantially as shown and described.

4. The combination, with a body provided with a series of fingers, a cutting-plate held laterally secure above the fingers, a second upper cutting-plate held to rotary reciprocation upon the first plate and having an essentially diamond-shaped opening removed from the cutting-edge, a cap resting upon the upper plate, a vertical post passing through the cap and upper plate and attached to the lower plate, and a shield supported upon said cap, of a sleeve encircling the post, an adjusting-nut bearing upon said sleeve, a lever fulcrumed in the body and engaging the post, a pinion provided with a pin eccentric upon the under surface, engaging the walls of the plate-opening, a shaft journaled transversely in the body, and gearing, substantially as shown and described, uniting the said shaft and pinion, as and for the purpose specified.

402,728. GATE. CORNELIUS C. ERP, Bradshaw, Nebr. Filed Feb 13, 1889. Serial No. 299,762. (No model.)

Claim.—1. In a gate, substantially as described, the combination of the gate proper provided with a latch, the hand-levers having openings *k*, the main lever, connections between said hand and main levers and the latch-operating cord, and branches *g*, passed through openings *k* in and secured at *k'* to the hand-levers, forming hand holds or loops, substantially as set forth.

2. In a gate, the combination of the gate proper, the latch, the latch-lever, the main or cross-shaped lever having its arm *i* provided with the opening *i'*, the latch-cord G, connected at one end to the latch-lever and carried through the guide-opening *i'*, the hand-levers, connections between said hand-levers and the main lever, and branch cords connecting the hand-levers with the cord G, all substantially as and for the purpose specified.

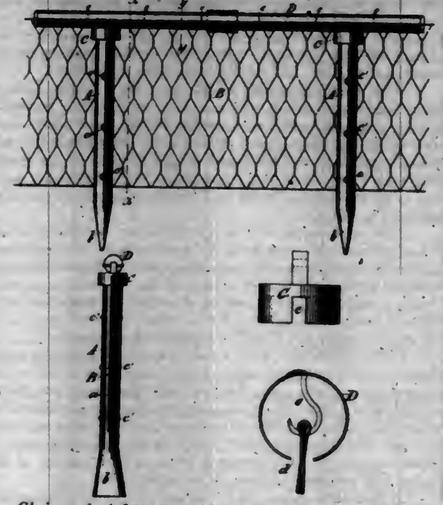


402,729. FENCE. JOHN M. FELLOWS, Burlington, Ind. Filed Sept. 12, 1887. Renewed Apr. 4, 1889. Serial No. 306,087. (No model.)

Claim.—1. The combination, in a fence, with the sill B, having a vertical mortise, of the post having a tenon at its lower end entering the mortise, and a rounded shoulder, *a'*, bearing on the sill at opposite sides of the mortise, the transverse pin C, and the brace connecting said post and sill, substantially as set forth.

2. In a fence, a base, B, rounded or beveled at one end and formed with a vertical longitudinal mortise between its ends, a post having a tenon at its lower end entering said mortise, and rounded shoulders resting on the base at opposite sides of the mortise, the upper end of the post being beveled or inclined on the side next to the correspondingly-shaped end of the base, and the brace D, secured at its lower end to the beveled or rounded end of the base and having a series of apertures at its upper end, and the fastening E, passing through one of said apertures into the beveled or rounded end of the post, substantially as set forth.

402,730. PIPE-CUTTER. EMANUEL FORESTER, New York, N. Y. Filed June 2, 1888. Serial No. 275,585. (No model.)

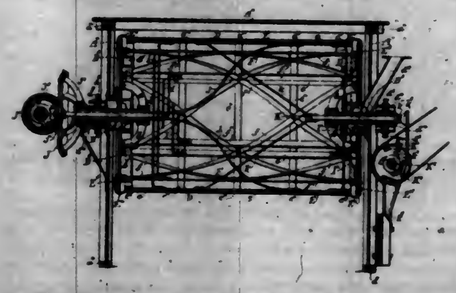


Claim.—In a pipe-cutter, a cutting-tool combined with the screw-rod I, connected therewith, internally and externally threaded tube H on said rod I and engaging with the thread thereof, and internally-threaded tube G around the tube H, the threads on the tubes G and H engaging, whereby the rod I will be moved but a slight degree with relation to the movement of the tube H, substantially as described.

402,731. COMPOUND FOR RESTORING THE COLOR OF BROWN LEATHER. EDWARD FRID, New Hamburg, assignor to himself, and HARRY JONES, New York, N. Y. Filed Nov. 26, 1888. Serial No. 291,891. (No specimens.)

Claim.—The herein-described composition of matter to be used for cleaning and restoring brown leather, consisting of oxalic acid and saffron dissolved in boiling water, in the proportions specified.

402,732. FENCE. EDWIN GILBERT, Georgetown, Conn., assignor to the Gilbert & Bennett Manufacturing Company, same place. Filed Feb. 25, 1889. Serial No. 301,045. (No model.)



Claim.—1. A fence comprising tubular posts slotted longitudinally, a wire-fence web arranged in said slots, and a top rail secured to said posts and slotted longitudinally to receive the web, substantially as specified.

2. A fence comprising tubular posts slotted longitudinally, a wire-fence web arranged in said slots, a top rail slotted longitudinally to receive said web, and caps for said posts, provided with slots to receive the web and secured to said top rail, substantially as specified.

3. A fence comprising tubular posts slotted longitudinally, a wire-fence web arranged in said slots, a top rail slotted longitudinally to receive said web, and caps for said posts, provided with projections extending into the slots in the top rail, substantially as specified.

4. A fence comprising tubular posts slotted longitudinally, a wire-fence web arranged in said slots, a top rail slotted longitudinally to receive said web, securing devices for securing the web in the slot in the top rail, and caps for said posts to which said top rail is secured, substantially as specified.

402,733. BOLTING-REEL. WILLIAM R. GORTON, Moline, Ill. Filed Nov. 15, 1887. Serial No. 255,199. (No model.)

Claim.—1. A bolting-reel comprising a cloth-supporting frame and spring-arms sustaining said cloth-supporting frame from the reel supports or trunnions, substantially as described.

2. The combination, with a reel embracing a cloth-supporting frame sustained from the reel-supports by elastic or spring connections, of a jarring device acting upon said cloth-supporting frame, substantially as described.

3. The combination, with a reel embracing a cloth-supporting frame and spring-arms sustaining said cloth-supporting frame from the reel-trunnions, of a knocking or jarring device acting upon said cloth supporting frame, substantially as described.

4. The combination, with a reel embracing a cloth-supporting frame sustained from the reel-frame by connections embracing springs or spring-arms, of a jarring device embracing a rod or bar passing through one of the trunnions and connected at its inner end with the frame, and a vibrating knocker acting upon the outer end of said bar, substantially as described.

5. The combination, with a reel embracing a cloth-supporting frame having elastic connection with the reel-trunnions, of a jarring device embracing a rod or bar passing through one of the trunnions, elastic arms connecting said bar with the cloth-supporting frame, and a vibrating knocker acting upon the outer end of said bar, substantially as described.

6. The combination, with a reel embracing a cloth-supporting frame movably sustained from the reel-supports by connections embracing elastic or spring arms, of a jarring device acting upon the cloth-supporting frame, and a shaking device connected with and giving reciprocatory motion to the said cloth-supporting frame, substantially as described.

7. The combination, with a reel embracing a cloth-supporting frame and transversely arranged spring arms or strips sustaining said cloth-supporting frame from the reel-trunnions, of a shaking device connected with the said frame and giving reciprocatory motion to the latter, substantially as described.

8. The combination, with a reel embracing a cloth-supporting frame movably connected with the reel-trunnions, of a cloth-shaking device embracing a rod passing through one of the reel-trunnions and connected at its inner end with the said cloth-supporting frame, and a crank connected with and giving reciprocatory motion to said rod or bar, substantially as described.

9. In a bolting-reel, the combination of the reel-trunnions, elastic arms connected therewith, ribs made of thin elastic material supported by said arms, and the cloth supported immediately upon said ribs, substantially as described.

10. The combination, with a reel-frame having exterior cloth-supporting ribs and spirally or obliquely directed truss-ribs crossing each other and secured together at their points of intersection, and attached to and supporting the exterior ribs, said ribs being made of thin elastic material, of elastic or spring arms sustaining said frame from the reel-trunnions, and a jarring device acting upon said frame, substantially as described.

11. The combination, with the reel-heads, a vibrating or shaking cloth-supporting frame and bolting-cloth thereon, of connecting strips or bands of flexible material attached to the heads and to the said vibrating or shaking frame, substantially as described.

12. The combination, with a reel embracing heads, a cloth-supporting frame which is movable with relation to the heads, the bolting-cloth and flexible strips uniting the ends of the cloth-supporting frame with the heads, of a shaking device connected with said cloth-supporting frame and giving reciprocatory motion to the latter, substantially as described.

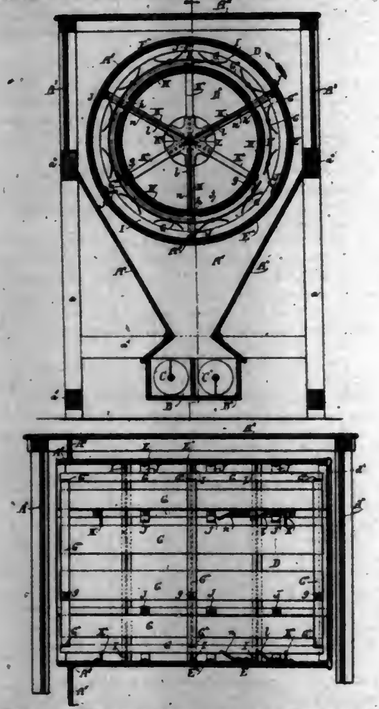
13. The combination, with a cloth-supporting frame made of thin elastic material and provided with a thin metal circumferential rib at the end of said frame, a bolting-cloth covering the frame, of means for attaching the bolting-cloth to the said circumferential rib, comprising a leather strip attached to the flat outer surface of the rib, to which strip the bolting-cloth is tacked or otherwise secured.

14. The combination, with a reel-head and a cloth-supporting frame embracing longitudinal ribs and a circumferential rib, *c'*, at the end of said frame, of a strip of flexible material attached to the cloth-supporting frame and to the head, and a leather strip attached to the said rib *c'*, the said flexible strip being tacked or otherwise secured to the said leather strip and to the head, substantially as described.

15. A reel embracing reel-heads, a trussed frame attached to and rigidly connecting the heads, and an exterior cloth-supporting frame sustained from the main part of the reel-frame by elastic or spring connections, substantially as described.

16. The combination, with a revolving cylindric bolting-reel provided with external circumferentially-arranged studs or projections, c^4 c^4, of a cloth-cleaning device comprising hinged arms H H, resting against the reel and engaging the said projections c^4 c^4, a cord, h^3 h^3, attached to and stretched between said hinged arms H H, and a sheet or strip of flexible material attached to said cord throughout its full length and resting in contact with the bolting-cloth.

17. The combination, with the reel-housing and a reel provided with external studs or projections, c^4 c^4, of a cloth-cleaning device con-



sisting of arms H H, hinged to the housing and arranged to engage the said projections c^4 c^4 at their free ends, a cord, H^3, attached to the said arms H H and connected at its ends with the housing, a spring applied to said cord to keep the latter taut, and a sheet or strip of flexible material attached to the cord and resting against the bolting-cloth of the reel, substantially as described.

18. The combination, with a revolving reel, of a cloth-cleaning device embracing two or more sets of circumferentially-arranged studs or projections, c^4 c^4, disposed upon the exterior of the reel at intermediate angular positions, pivoted arms H H, engaging said studs or projections, a cord, H^3, attached to said arms, and a strip or sheet of flexible material attached to said cord and resting in contact with the bolting-cloth of the reel, substantially as described.

19. A cut-off valve provided with grooves in its side edges and having a packing of granular material within the groove, substantially as described.

20. The combination, with the conveyer-boxes and machine-housing provided with vertical partitions B^2 B^2, of cut-off valves provided with grooves in their side edges and having a packing of granular material within the grooves, a horizontal slat, B^3, located centrally between the boxes beneath said valves and sustaining the latter, stops upon the housing constructed to engage the lower margins of the valves to limit the lateral movement of the bottom ends of said valves, and other stops upon the housing engaging the upper ends of said valves to limit the lateral movement thereof, substantially as described.

402,734. BOLTING-REEL. WILLIAM R. GORTON, Moline, Ill. Filed Aug. 13, 1888. Serial No. 282,568. (No model.)

Claim.—1. The combination, with a reel, of an exterior cloth-supporting frame, spring-arms sustaining said cloth-supporting frame from the reel-trunnions, and a series of longitudinal troughs or buckets sustained upon the reel inside of said exterior cloth-supporting frame, substantially as described.

2. The combination, with a reel comprising an external cloth-supporting frame, of spring-arms sustaining said cloth-supporting frame from the reel-trunnions, a shaking or jarring device acting upon said cloth-supporting frame, and a series of longitudinal troughs or buckets sustained upon the reel inside of said cloth-supporting frame, substantially as described.

3. The combination, with a reel comprising an external cloth-supporting frame, of spring-arms sustaining said cloth-supporting frame from the reel-trunnions, a series of annular inwardly-extending partitions or rings attached to said cloth-supporting frame, and deflectors located upon said frame between said partitions or rings, substantially as described.

4. The combination, with a reel embracing a cloth-supporting frame, and spring-arms sustaining said cloth-supporting frame from the reel-trunnions, of a combined shaking and jarring apparatus comprising a shaking device connected with and giving a reciprocatory motion to said cloth-supporting frame, a rod or bar connected with and partaking of the motion of the cloth-supporting frame, and a resisting part or surface located in position for contact with said rod or bar as the frame is reciprocated, substantially as described.

5. The combination, with a reel embracing a cloth-supporting frame, and spring-arms sustaining said cloth-supporting frame from the reel-trunnions, of a combined shaking or jarring apparatus comprising a shaking device connected with and giving reciprocatory motion to the said cloth-supporting frame, a rod or bar connected with and partaking of the motion of said cloth-supporting frame, and a resisting part or surface located upon the machine-frame in position for contact with said rod or bar, said part or surface being adjustable toward and from said rod or bar, substantially as described.

6. The combination, with a reel embracing a cloth-supporting frame movably connected with the reel-trunnions, of a combined shaking or jarring apparatus comprising a shaking device connected with and giving reciprocatory motion to the said cloth-supporting frame, a part or bar connected with and partaking of the movement of the said frame, and a yieldingly-supported weight located in position to be encountered by the said reciprocating part or bar, substantially as described.

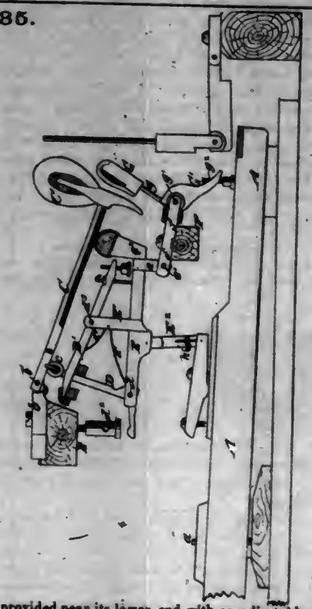
7. The combination, with a reel embracing a cloth-supporting frame movably connected with the reel-trunnions, of a combined shaking or jarring apparatus comprising a shaking device connected with and giving reciprocatory motion to the said cloth-supporting frame, a longitudinally-arranged bar connected by elastic arms with the said frame, and a resisting part or surface located in position to be encountered by said rod or bar, substantially as described.

8. The combination, with a reel embracing a cloth-supporting frame movably connected with the reel-trunnions, of a rod or bar connected by elastic arms with the cloth-supporting frame, means connected with said rod or bar giving reciprocatory motion to the same, and a second bar also connected by means of elastic arms with the said cloth-supporting frame, and a resisting part or surface located in position to be encountered by the said rod or bar as the frame is reciprocated, substantially as described.

9. The combination, with a reel embracing a cloth-supporting frame connected with the reel-trunnions, of a shaking device connected with and giving reciprocatory motion to the said cloth-supporting frame, a longitudinally-arranged bar connected with and partaking of the motion of the frame, and a sliding weight supported in one of the reel-trunnions in position for contact with said bar, substantially as described.

10. The combination, with a reel embracing a cloth-supporting frame movably connected with the reel-trunnions and provided with a tubular trunnion, of a shaking device connected with and giving reciprocatory motion to said cloth-supporting frame, a longitudinally-arranged bar sliding in the said tubular trunnion and connected with the said frame, a weight mounted to slide in the said tubular trunnion, and adjusting devices for shifting the position of the weight, substantially as described.

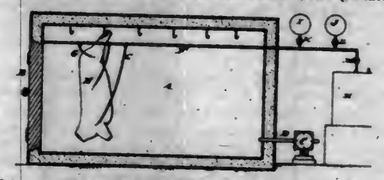
11. The combination, with a reel embracing a cloth-supporting frame movably connected with the reel-trunnions, of a shaking device connected with and giving reciprocatory motion to the said cloth-supporting frame, a longitudinally-arranged bar connected with and partaking of the motion of the said frame, a sliding weight located in position to engage said bar, a spring applied behind said weight, and an adjustable abutment behind the spring affording adjustment of the tension of the same, substantially as described.



12. The combination, with a reel comprising an outer cloth-supporting frame and an inner trussed frame connecting the reel-heads, of means for movably connecting the cloth-supporting frame with the trussed frame, comprising flexible radial arms attached at their outer ends to the said cloth-supporting frame and trussed frame, and connected with each other at their inner ends, substantially as described.

402,735. PIANO-FORTE ACTION. SIEGFRIED HARMUS, New York, N. Y., assignor to Wessell, Nickel & Gross, same place. Filed Oct. 10, 1887. Serial No. 251,903. (No model.)

Claim.—1. The combination, with the hammer, repetition-lever, and jack of a piano-action, of a rest-support for the lever and jack having a downwardly-extending arm or lug which receives the pivot-pin on which the rest-support is fulcrumed, substantially as and for the purpose herein described.



2. The combination, in a horizontal piano-action, with a hammer and key-lever, of a back check or stop consisting of a bell-crank lever having two rigid arms, one of which constitutes a check and the other

402,735.

of which is provided near its lower end with an adjustable stop, substantially as specified.

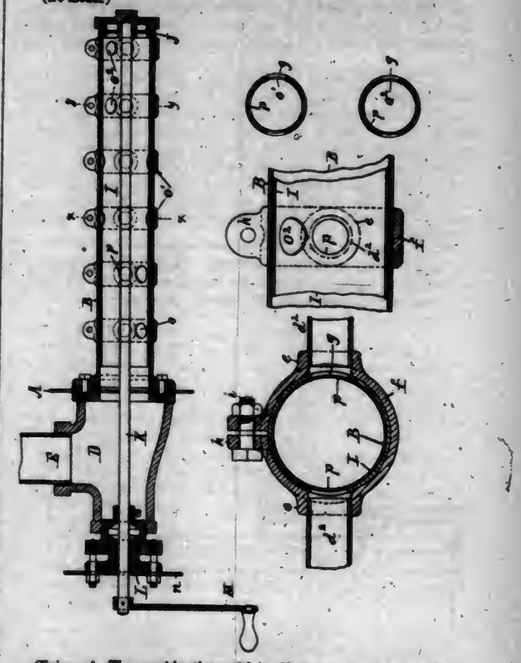
402,736. CURING AND PRESERVING MEATS. GEORGE HOLGATE, Philadelphia, Pa. Filed Apr. 17, 1888. Serial No. 270,898. (No model.)

Claim.—1. The method of chilling or cooling meats, consisting in taking the meat immediately after slaughtering, putting it in a tank or chamber capable of being made air-tight, creating a partial vacuum in and around the meat, and then by means of tubes placed into the meat letting into the interior or below the surface of the meat air that has first had the heat extracted from it either by natural or artificial means.

2. The method of chilling or cooling of meats, consisting in taking the meat immediately after slaughtering, putting the meat into a tank or chamber capable of being made air-tight, creating a partial vacuum in and around the meat, then by means of tubes inserted into the meat letting into the interior or below the surface of the meat air from which the heat has been extracted by natural or artificial means, and removing the heated air from the tank or chamber so soon as it escapes from the meat into the tank or chamber.

3. The method of chilling or cooling and preserving meats, consisting in taking the meat immediately after slaughtering, putting it into a tank or chamber capable of being made air-tight, creating a partial vacuum in and around the meat, then by means of tubes letting into the interior or below the surface of the meat air from which the heat has previously been extracted by natural or artificial means, removing the heated air from around the meat as soon as it escapes into the tank or chamber, and then letting into the meats preservative gas or gases, thereby chilling and curing or preserving at one and the same time.

4. The method of cooling or chilling and preserving meats, which consists in taking the meat after it has been chilled and putting it into a tank or chamber capable of being made air-tight, then admitting into the interior of the meat anhydrous preservative gas or gases, allowing said gas or gases to expand, (thereby expelling such heat from the interior of the meat as has not been extracted by the previous chilling process,) and simultaneously therewith exhausting the gases with their contained heat from the tank or chamber as soon as liberated from the meat, whereby the meat is chilled and preserved at one and the same operation.

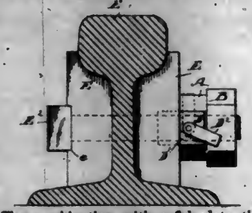


402,737. HEAD-BLOCK FOR VEHICLES. EDWARD HUTCHINSON, New York, N. Y. Filed Sept. 25, 1888. Serial No. 286,207. (No model.)

Claim.—1. A head-block for vehicles, consisting of a body portion, arms extending from the ends of the same, curved downwardly and outwardly, and integral perch-plates downwardly curved at their intersection with the body of the block, substantially as shown and described.

2. A head-block for vehicles, consisting of a body portion, arms extending from the ends of the same, curved, respectively, downward from the said body and upward and outward, provided with an essentially horizontal surface intervening the two curves, and perch-plates extending from the side of the body, downwardly curved at their intersection with the same, and provided with horizontally-aligning side ears, substantially as shown and described.

402,738. VALVE MECHANISM FOR WASHING FILTER-BEDS. JOHN W. HYATT, Newark, N. J. Filed June 15, 1888. Serial No. 277,343. (No model.)

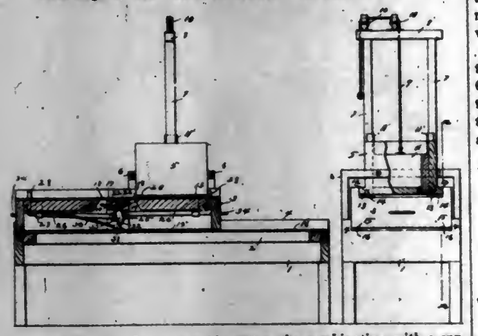


Claim.—1. The combination, with a filter casing or receptacle containing several outlet-strainers, of a trunk or header having a series of apertures connected, respectively, with the several strainers inside the filter-casing, and a movable sleeve fitted within the trunk and provided with a series of openings adapted to connect such strainers in turn with the interior of the trunk, as and for the purpose set forth.

2. The combination, with a filter-receptacle containing several outlet-strainers arranged and operated to wash the filter-bed by a reversed current, of a trunk or header having a series of apertures connected, respectively, with the several strainers inside the filter-casing, and a movable sleeve fitted within the trunk and provided with one series of openings to connect all the strainers at once with the interior of the trunk, and with another series of openings adapted to connect such strainers or groups of strainers in turn with the interior of the trunk during the washing operation, as and for the purpose set forth.

3. The combination, with a filter casing or receptacle containing several outlet-strainers, of a trunk or header having a series of apertures connected, respectively, with the several strainers inside the filter-casing, a movable sleeve fitted within the trunk and provided with a series of openings adapted to connect such strainers in turn with the interior of the trunk, a rod extended outside the trunk to move the sleeve, and an index to show the adjustment of the rod, as and for the purpose set forth.

402,739. NUT-LOCK. GEORGE C. ILLINGWORTH, Raritan, N. J. Filed Nov. 23, 1888. Serial No. 292,064. (No model.)



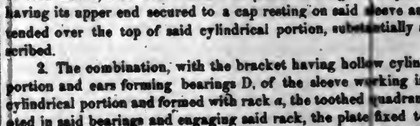
Claim.—1. The combination, with a fish-plate, the tie-bolts, a main lock, and an auxiliary nut, of a key inserted in the fish-plate, projected to one side of the main nut, and an arm pivoted upon the key and projected to one side of the auxiliary nut, substantially as shown and described.

2. The combination, with a fish-plate, the bolts, and the main lock-nut, of a key inserted into the fish-plate and projected to one side of the main nut, and an auxiliary nut secured against the main nut, said auxiliary nut being of greater diameter than the main nut, forming a projecting flange, said flange projecting over and against the outer edge of said key, substantially as and for the purpose specified.

3. The combination, with a fish-plate, the bolts, a main lock-nut screwed upon the same, provided with an exteriorly-threaded projection, of a key inserted in the fish-plate and projected to one side of and in contact with the main nut, said key provided with a downwardly-inclined shoulder on its outer face, an auxiliary nut screwed on the projecting end of the main nut and against the outer edge of the key, and a button pivoted to the said key and adapted to be swung to one side of the auxiliary nut, and limited in its downward movement by the inclined shoulder, substantially as and for the purpose described.

402,740. VEGETABLE-CUTTER. JOHANN A. W. IOTTI, Charleston, S. C., assignor to himself and Charles Kerrison, Jr., same place. Filed Aug. 16, 1888. Serial No. 282,850. (No model.)

Claim.—1. In a vegetable-cutter, the combination, with a supporting-frame and a receptacle carried thereby, of a reciprocating frame below the receptacle, cutters carried by said reciprocating frame, and bars connected to the cutters and projecting through the reciprocating frame, to be struck by the receptacle as the said frame is reciprocated, substantially as described.



2. In a vegetable-cutter, the combination, with a supporting-frame and a receptacle carried thereby, of an apertured and slotted reciprocating frame, a rock-shaft journaled in the reciprocating frame, cutters carried by the rock-shaft, and bars secured to the rock-shaft and having apertured ends projecting through the slots of the said reciprocating frame and adapted to be struck by the receptacle as the frame is reciprocated to rock the shaft, and thereby move one of the cutters in position and the other out of position, substantially as described.

3. In a vegetable-cutter, the combination, with a supporting-frame and a receptacle carried thereby, of a slotted reciprocating frame below the receptacle, a rock-shaft journaled in the reciprocating frame, cutters adjustably secured to the rock-shaft and adapted to be alternately projected through the slots of the frame, and a spring for engaging the rock-shaft for holding the cutters in the position for cutting, substantially as herein shown and described.

4. The combination, with a vegetable-receptacle, of a reciprocating sliding frame located below the receptacle and having openings for the cutters and the passage of the cut material, a rock-shaft with cutters located beneath said openings, and reciprocating rods pivoted to the rock-shaft and having upturned ends projecting through slots in the ends of the reciprocating frame, substantially as described.

5. The combination, with frame 1, having rails 2 with friction-plates 16, and frames 6, with receptacle 5, having friction-plates 13, and vertically-movable weight-box 11, with operating-cord 9, of the reciprocating sliding frame 3, having friction-plates 15, slots 29 in the ends thereof, openings 18, rock-shaft 20 adjacent thereto, with projection 33, having angular end 32, plates 22, cutters 19, having slots 24 and connected to plates 22 by screws 23, reciprocating rods 26, pivoted to projection 25 and having upturned ends 28 projecting through slots 29, and spring 30, with angular projection 31, bearing against angular end 32 of projection 33, substantially as shown and described.

402,741. CONDUIT-YOKE FOR CABLE-WAYS. JOHN B. JOHNSON, St. Louis, Mo. Filed May 26, 1888. Serial No. 275,142. (No model.)

Claim.—1. In a conduit-yoke for cable railways, the combination, with the inner and outer flanges, of a solid continuous web connecting said flanges together and cast integral therewith, substantially as set forth.

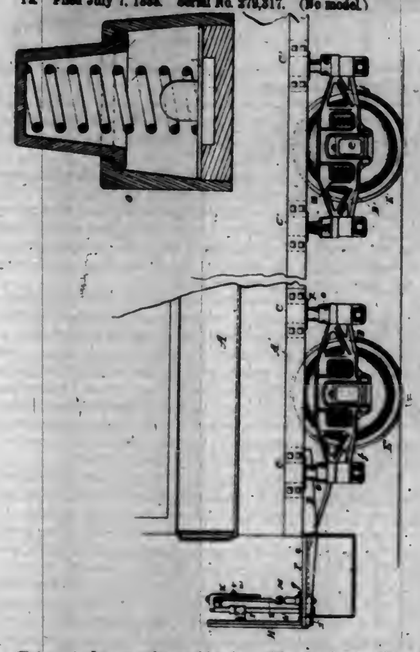
2. In a conduit-yoke for cable railways, the combination, with the inner and outer flanges, 1 2, respectively, of the bottom downwardly-curved flange, 3, and a solid continuous web connecting said flanges and formed integral therewith, substantially as set forth.

3. In a conduit-yoke for cable railways, the combination, with the inner and outer flanges, 1 2, respectively, the bed-rests for the slot and track rails supported by said flanges, respectively, and the flange 6, connecting said bed-rests, of a solid continuous web connecting all of said flanges and bed-rests and formed integral therewith, substantially as set forth.

4. In a conduit-yoke for cable railways, the combination, with the inner flange, 1, and outer flange, 2, of the bottom flange, 3, connecting said flanges and having a thickened medium and a web cast with said flanges, as set forth.

5. In a conduit-yoke for cable railways, the combination, with the bed-rests 4 5 for the slot and track rails, respectively, the flanges 6, connecting said bed-rests, and the inner and outer flanges, 1 2, of the flange 3, connecting the outer flanges, 2, downwardly curved and thickened at its mid-length, and a solid web connecting said flanges and bed-rests and cast integral therewith, substantially as set forth.

402,742. CORK-EXTRACTOR. THOMAS KELLY, Elmvale, Ontario, Canada. Filed May 21, 1888. Serial No. 274,525. (No model.)



Claim.—1. The combination, with the bracket having hollow cylindrical portion and ears forming bearings D, of the sleeve working in said cylindrical portion and formed with rack *a*, the toothed quadrant pivoted in said bearings and engaging said rack, the plate fixed to said sleeve, and the twisted wire passed through said plate and having its upper end secured to a cap resting on said sleeve and extended over the top of said cylindrical portion, substantially as described.

2. The combination, with the bracket having hollow cylindrical portion and ears forming bearings D, of the sleeve working in said cylindrical portion and formed with rack *a*, the toothed quadrant pivoted in said bearings and engaging said rack, the plate fixed to said sleeve, and the twisted wire passed through said plate and having its upper end secured to a cap resting on said sleeve, the cap J, extended over the top of said cylindrical portion, and the plate K, suspended from said cap within the sleeve and upon each side of the wire, substantially as described.

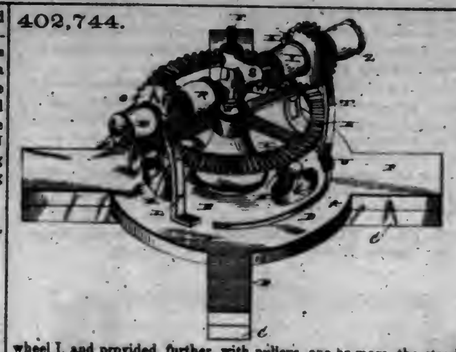
3. A cylinder, C, sleeve G, a cap, J, resting thereon and extended over the top of said cylinder, the twisted wire or wires I, the cork-screw L, connected to and forming part of the twisted wire or wires I, the upper end of which is pivotally connected to the cap J, and a plate, H, fixed to the sleeve G and having a hole, *b*, made to fit the twisted wire I, in combination with the toothed quadrant E, provided with a handle, F, and arranged to engage with a rack formed on the sleeve G, a plate, M, fitted into a horizontal slot made in the cap J and designed to be held below the heads of the bolts N by the spring O and to be pushed out of contact with the said bolts by the passing of the handle F, substantially as and for the purpose specified.

402,743. STREET-RAILWAY CAR. SIDNEY D. KING, Pittston, Pa. Filed July 7, 1888. Serial No. 279,317. (No model.)

Claim.—1. In a car, the combination, with a car-frame, of a swiveled truck, buffer-frame located between the top of the truck and the bottom of the car-frame and adapted to limit the lateral vibrations of the car-body, and a device for adjusting the truck, substantially as set forth.

2. In a car having two two-wheeled trucks, the combination, with a car-frame, of a two-wheel swiveling truck, buffer-springs adapted to cushion oscillations of the frame on the truck, and mechanism to limit and arrest the swiveling motion of the car-truck, substantially as set forth.

3. A car-body provided with two two-wheeled trucks, each adapted to swivel or be locked from side movement on their centers, devices to control swiveling movement of the trucks, and buffer-cushions secured to the truck-frame and forming bearings or rests for the car-body, substantially as set forth.



4. In a car having two two-wheeled trucks, each pivoted to swing on a center-pin, a device located on each end platform of the car for controlling the swiveling movement of the trucks independently, and buffer-cushions interposed between the truck-frames and car-body and adapted to absorb end and side vibrations of the car-body, substantially as set forth.

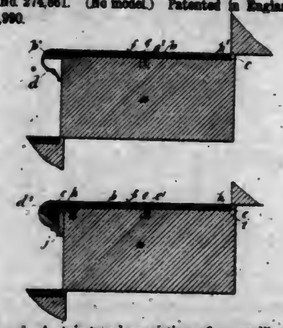
5. In a four-wheeled car, the combination, with two truck-frames, each supported on an axle and pair of wheels and connected to the car-body by a center pin for each truck, of duplicate devices adapted to control the swinging movement of the trucks, and spring buffer-cushions located on the corners of the car-trucks, which absorb vibrations of the car-body, substantially as set forth.

402,744. MACHINE FOR TRANSMITTING MOTION. SAFFORD D. KINNEY, Byron, Mich. Filed Nov. 30, 1888. Serial No. 292,289. (No model.)

Claim.—1. The combination of the platform, the shaft F thereon, the wheel I, loose on the shaft, the rigid standard L, the shaft M, journaled in said standard and having the gear-wheel O engaging the

402,744.

wheel I, and provided, further, with pulleys, one or more, the standard T, secured to and adjustable concentrically on the platform, whereby it may be arranged at any desired angle with relation to the shaft M, and the shaft W, journaled in the standard T, having the gear-wheel X engaging wheel I, the bearings loose on the shaft F, and in which the inner ends of the shafts M W are journaled, and the pulleys, one or more, substantially as described.



2. The combination of the platform having the concentric slot D, the standard L, the movable standard T, having the clamping-bolts working in the slot D, the central shaft, F, the wheel I, loose thereon, the bearings N S, loose on the shaft F, and the shafts M W, journaled in the standards L T and having their inner ends journaled in the bearings N S, said shafts being provided with the gears engaging wheel I and also provided with the pulleys, substantially as described.

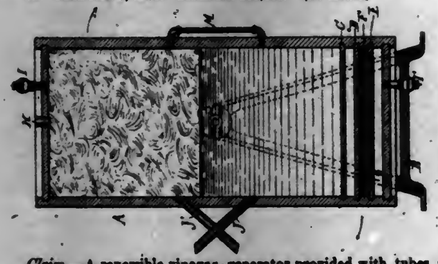
3. The platform having the curved slot D the central shaft, F, wheel I, loose thereon, the rollers supporting the rim of the wheel, the rigid standard L, the bearing N, loose on shaft F, the shaft M, journaled in standard L and bearing N and having the gear engaging wheel I and the pulleys, the standard T, the clamping-bolts working in the slot D to secure said standard to the platform at any desired adjustment, the bearing S, loose on shaft F, the shaft W, journaled in standard T and in bearing S and having the wheel X engaging wheel I, and the pulleys, substantially as described.

4. In combination with the toothed wheel I, the rollers H, for supporting the same by bearing on the under side thereof, the shaft F, on which the wheel I is loosely mounted, the shaft W, the gear-wheel X, mounted on the shaft W and engaging the toothed wheel I, and the standard T for the shaft W, adjustable in a curved line around the wheel I, substantially as described.

5. In combination with the toothed wheel I, the shaft F, on which the wheel I is loosely mounted, the shaft W, the gear-wheel X, mounted on the shaft W and engaging the toothed wheel I, and the standard T for the shaft W, adjustable in a curved line around the wheel I, substantially as described.

402,745. METALLIC REVERSIBLE COVERING FOR THE TREADS OF STAIRS, &c. JOHN KNIGHT, London, England. Filed May 23, 1888. Serial No. 274,861. (No model.) Patented in England Nov. 3, 1887, No. 14,990.

Claim.—1. A stair-tread consisting of a metallic frame *a*, a nose at its front, a reversible slab, *b*, having recesses in its treading-surface, the plates *f*, fitted in said recesses flush with the slab, and the screws *e*, detachably securing the slab, so that it can be reversed, substantially as described.



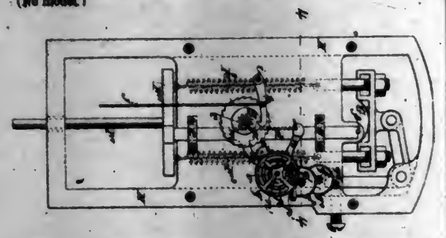
2. A stair-tread consisting of a metallic, supporting-frame and a nose at its front edge and a reversible slab of hardened lead or similar material removably located in the frame and extending over the nose of the metallic frame to prevent slipping, substantially as described.

3. A stair-tread consisting of a metallic supporting-frame and a reversible slab of hardened lead or similar material removably secured in the metallic frame and extending over the front edge portion thereof to prevent slipping, substantially as described.

4. The combination, in a stair-tread, of a metallic supporting-frame, *e*, and a nose at its front with a reversible cast-metal slab, *b*, removably secured in the metallic frame and extending over the nose to prevent slipping, substantially as described.

5. The combination, with the metallic supporting-frame *e* and the reversible cast-metal slab *b*, of the separate metallic frame *f*, containing a lead or similar filling to form the nose d^3, substantially as described.

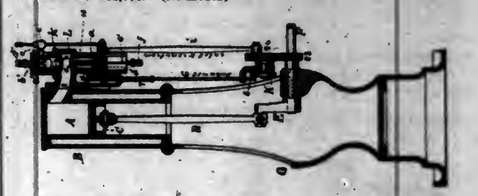
402,746. VINEGAR-GENERATOR. PETER H. KOHLSAAT, Chicago Ill. Filed Jan. 3, 1888. Serial No. 295,808. (No model.)



Claim.—A reversible vinegar-generator provided with tubes at its middle at a sufficient angular position for their inlets and outlets to be respectively above and below the line of the mash and crosswise to pass each other, so that one at a time will act as an air-circulating vent, substantially as set forth.

402,747. DIE-STOCK. WILLIAM H. LAGUIRE, Amber, Mich. Filed June 5, 1888. Serial No. 276,065. (No model.)

Claim.—In a combined tool and tool-holder, the combination of the lever D, pivoted in the direct line of the longitudinal axis of the cylinder A, central stem, C, cylinder A, square B, adapted to receive dies and clamps, pawl G, and ratchet-belt a, all constructed and arranged to operate as and for the purpose shown and described.



402,748. COIN-CONTROLLED WEIGHING-MACHINE. FREDERICK J. LANCASTER, New York, N. Y., assignor to the National Weighing Machine Company, same place. Filed May 23, 1888. Serial No. 275,300. (No model.)

Claim.—1. The combination, with the index-spindle *a* and the pinion *c* and ratchet-wheel *m* on the said spindle, of the pawl *n*, for engaging with said ratchet-wheel, the rack *d*, disconnected from the platform or part of the machine which receives the load and gearing with said pinion *a*, and the pawl-support *d'*, attached to said rack *d*, all substantially as herein described.

2. The combination, with the index-spindle and the ratchet-wheel *m* thereon, the pawl *n*, for engaging with said ratchet-wheel, and the arbor *n'*, on which said pawl works, of the ratchet-wheels *o* and *p* and wheel *q* on said arbor, the pawls *o'* and *p'*, engaging with said ratchet-wheels, and the train of gearing actuated by said wheel *q*, all substantially as herein described, whereby the descent of the said pawl *n* is retarded, but its ascent is left free from retardation, substantially as and for the purpose herein described.

402,749. GAS-ENGINE. SAMUEL LAWSON, New York, N. Y., assignor to himself and Alonzo T. Welch, same place. Filed Aug. 4, 1888. Serial No. 281,996. (No model.)

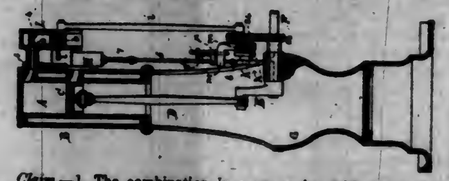
Claim.—1. The combination, in a gas-engine, of a tubular valve closed at both ends and having ports for the gas and air, an igniter, and a hollow piston having ports for admitting gas, for admitting the flame for igniting said gas, and for passing the flame to the cylinder, and mechanism, substantially as specified, for operating said valve and piston, substantially as set forth.

2. The combination, in a gas-engine, with a valve-case and pipes for supplying gas and air and a burner having an igniting-flame, of a tubular valve having ports for admitting gas and air, a hollow piston having a port for admitting gas and ports for igniting said gas and allowing the ignited gas to escape, and a valve and stem and mechanism, substantially as herein described and shown, for operating the valve and piston, substantially as set forth.

3. In a gas-engine, the combination, with the cylinder and piston, the driving-shaft, and connecting mechanism, of the valve-case composed of the parts *c c'* and having beveled seats, the tubular valve *b*, having ports 2 3 4 for gas and air, a hollow piston, *d*, having ports 14 15 16, for admitting gas and an igniting-flame and for passing the flame to the cylinder, a pipe, *l*, for admitting gas into said hollow piston, the valve *e*, having a valve-stem, and mechanism, substantially as herein shown and described, for imparting a downward movement to the valve *b*, an upward movement to the piston *d* and valve *e*, and for moving said valves to their seats, substantially as set forth.

4. In a gas-engine, the combination, with the two-part valve-case *c c'*, having beveled seats and pipes for supplying gas and air, of the tubular valve *b*, having ports 3 4 5, the stem *b'* and arm, and tubular hub *c c'*, connected to the valve *b*, the hollow piston *d*, having ports 14 15 16, the valve *e*, and a valve-stem, *d'*, connected therewith and passing through the piston *d*, pivoted levers *f f'*, connected at one of their ends to the stems *b'* and *d'*, and a helical spring, *h*, connected to the other ends of said levers and acting to keep said valves upon their seats, a rod, *i*, connected to the piston *d*, and mechanism, substantially as specified, for operating the same, and an arm, *k*, connected to the pivot of the rod *i* and to the hub or arm *c c'* of the valve *b*, whereby, when the piston is drawn down, the valve is operated, substantially as set forth.

5. The combination, in a gas-engine, of a valve-case, the hollow sliding valve and piston having ports for air, gas, and the flame, and conical valves at the ends of the hollow valve and piston for closing the passage-way leading to the engine-cylinder, substantially as specified.

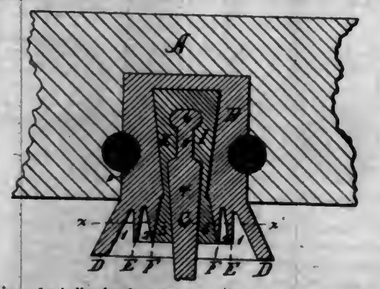


402,750. GAS-ENGINE. SAMUEL LAWSON, New York, N. Y., assignor to himself and Alonzo T. Welch, same place. Filed Aug. 4, 1888. Serial No. 281,999. (No model.)

Claim.—1. The combination, in a gas-engine, with a valve-case having a port to connect with the cylinder and air and gas supply pipes, of a vertically-sliding tubular valve having upper and lower chambers, *c c'*, and ports 3 4 14 15, a second gas-supply pipe and an igniter adjacent to an opening in the valve-case, and a valve moving with the tubular valve at the top of the lower chamber, and whereby the air and gas for the cylinder are admitted through the upper chamber and ports of the valve and the gas admitted to the lower chamber is ignited and passes the central valve to the cylinder, substantially as specified.

2. The combination, with the valve-case L, having a port, *s*, and pipes 12 13 for supplying gas and air, of the valve *b*, having ports and a lower chamber, *c*, and an upper chamber, *c'*, the ports to the upper chamber, *c'*, passing gas and air to the cylinder by the port *s*, a pipe, *l*, for gas, the ports in the chamber *c* admitting the gas and the igniting-flame, and a valve, *e*, pivoted in a central opening in the valve *b*, a spring, *g*, for closing said valve, a screw or equivalent device, *f*, for tripping and opening said valve, and a rod, *i*, by which the valve *b* is moved, substantially as set forth.

402,751. GAS-ENGINE. SAMUEL LAWSON, New York, N. Y., assignor to himself and Alonzo T. Welch, same place. Filed Aug. 4, 1888. Serial No. 282,000. (No model.)



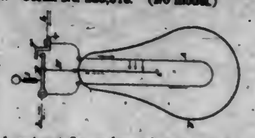
Claim.—1. The combination, in a gas-engine, with the vertical valve-case L, closed at the upper end, and pipes for supplying gas and air, of the tubular valve *b*, the rod *i*, and mechanism, substantially as specified, for imparting an up-and-down movement to the valve, a pipe, 1, for admitting gas, a burner, 30, there being an opening, *r*, in the valve-case, and ports 2 3 5 in the tubular valve by which gas is received within the tubular valve and ignited and the flame passed into the cylinder of the engine, there being a port, *s*, to the cylinder, by which when the tubular valve is depressed air and gas pass through the case over the valve into the cylinder, substantially as set forth.

2. The combination, in a gas-engine, with the cylinder, valve-case, valve, and an exhaust-valve and case, and the cams K K', of the valve-stem 6 and its roller 8, an arm connected to said stem, and a movable rod passing through said arm and adapted to be held against or away from the cam K', whereby the exhaust-valve can be opened every revolution or every second revolution of the engine, substantially as specified.

3. The combination, in a gas-engine, with the cylinder and piston, valve-case and valve, and mechanism, substantially as herein shown and described, for operating the same, of an exhaust-valve and case, the stem 6, the arm *n*, the slotted rod *o*, the cam K', the pin 18 in the arm *n* and engaging the slot of the rod *o*, and a spring, *o'*, substantially as set forth.

4. The combination, in a gas-engine, with the valve-case L, closed at the upper end, and pipes for supplying gas and air, of the tubular valve *b*, the rod *i*, and mechanism, substantially as specified, for imparting an up-and-down movement to the valve, a pipe, 1, for admitting gas, a burner, 30, there being an opening, *r*, in the valve-case and ports 2 3 5 in the tubular valve, by which gas is received within the tubular valve and ignited and the flame passed into the cylinder of the engine, there being a port, *s*, to the cylinder, by which when the tubular valve is depressed air and gas pass through the case over the valve into the cylinder, and a port, 4, in the tubular valve and a port, 9, in the valve-case, whereby when gas and air are drawn into the cylinder foul gas is exhausted from within the valve *b*, substantially as set forth.

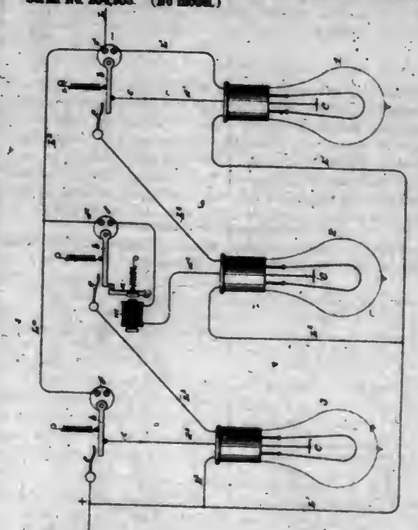
402,752. INSULATOR. FREDERICK M. LOCKE, Victor, and JOHN LAPP, Honeoye Falls, N. Y. Filed Oct. 5, 1888. Serial No. 287,532. (No model.)



Claim.—1. A line-hook consisting of a body having a line-support at one end, a cylindrical body, a flattened neck, and spherical head upon the opposite end, substantially as described.

2. The combination, with an insulator recessed to receive a line-hook, of a line-hook consisting of a body having a line-support at one end, a cylindrical body, a flattened neck and a spherical head upon the opposite end, and an insulating-packing within the recess and around the line-hook, head, neck, and a part of the cylindrical body, substantially as described.

3. The combination, with an insulator recessed to receive the line-hook and provided with concentric petticoats upon its lower end outside of the recess, of a line-hook consisting of a body having a line-support at one end, a cylindrical body, a flattened neck, and a spherical head upon the opposite end, and a non-conducting packing in said recess inclosing the head, neck, and part of the cylindrical body, substantially as described.

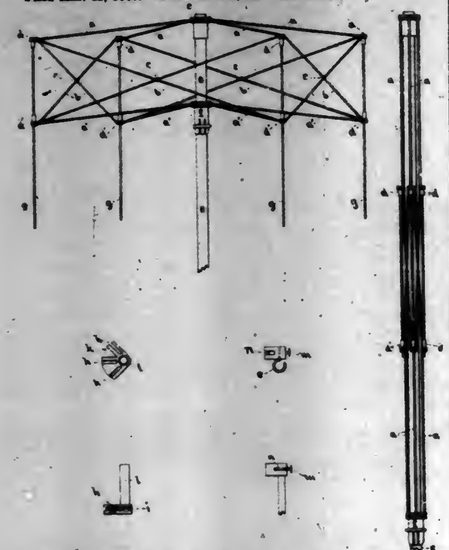


402,753. CUT-OUT. OSBORN P. LOCKE, Somerville, Mass., assignor to the Locke Electric Manufacturing Company, New York, N. Y. Filed Jan. 24, 1887. Serial No. 225,318. (No model.)

Claim.—1. A cut-out for an incandescent electric lamp, embodying, essentially, a normally-idle conductor arranged in proximity to the lamp-circuit in the path of the arc forming on the rupture of the filament, and connected by way of a fusible wire to one side of the circuit, and a cut-out controlled by said fusible wire for cutting out the lamp upon fusion of said wire.

2. In an incandescent electric lamp, the combination, with a normally-idle conductor, C, sealed within the lamp between the branches of the lamp-filament in the path of the arc forming on the rupture of the filament and connected to line by way of the fusible wire H, of a cut-out held from operation by said fusible wire and acting to cut out the lamp upon fusion of said wire, substantially as and for the purpose set forth.

402,754. AUTOMATIC CIRCUIT-CONTROLLER FOR ELECTRIC LIGHTS. OSBORN P. LOCKE, Somerville, Mass., assignor to the Locke Electric Manufacturing Company, New York, N. Y. Filed Apr. 15, 1887. Serial No. 234,953. (No model.)



Claim.—1. The combination, with a group of two or more incandescent electric lamps, having conductors sealed between the branches of the filament in the path of the arc forming on rupture of the filament, as set forth, one of which lamps is placed in circuit first, circuits connected with said conductors and in electrical communication with normally-open circuit-closers and the line, fusible wires in the path of said circuits, cut-out devices also located in said circuits normally held from operation by said fusible wires, and electrical connections, whereby when the filament of the first lamp fails the second will be brought in circuit, and when the second fails the third will be brought in circuit, and so on, substantially in the manner specified.

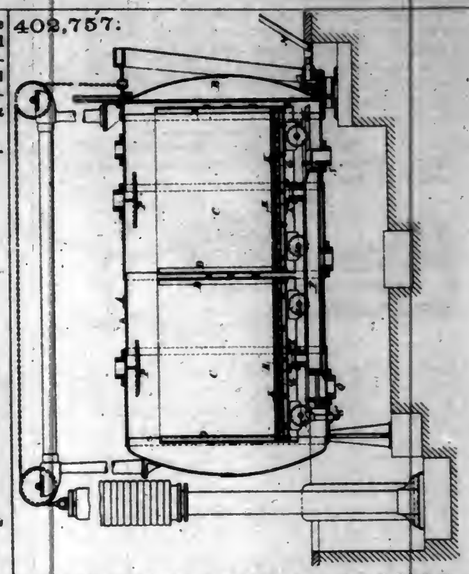
2. The combination of two or more incandescent lamps, as 1 2 3, the former of which is in the main line L L', a T-shaped conductor, C, sealed in the globe of each lamp between the branches of the filament in the path of the arc forming on rupture of the filament idle-

circuits d^2 d^3 d^4, &c., connected with the same, a fusible wire in the path of each of said idle-circuits, automatic cut-out devices in said circuits normally held from operation by said fusible wires, and normally-open conductors L^3, L^4, and L^5, &c., connected to the lamps and to the line, arranged to be successively placed in circuit by said fusible cut-out devices, all operating and combined for the purpose set forth.

402,755.. EXPANSIBLE FRAME. George H. Lyon, Bradford, Pa. Filed Mar. 12, 1885. Serial No. 158,650. (No model.)

Claim.—A combination of pairs of cross-bars hinged together at their points of crossing each other, and said pairs severally situated in intersecting planes forming the sides of a polyhedron, combined at the edges of intersection by hinging the meeting arms upon a body constituting chords or projections for axes, and operated to work together expansibly by hinging one or more of said arms in combination with a rod or beam, and the reciprocating arm or arms, in combination with a sleeve or runner sliding upon said rod or beam.

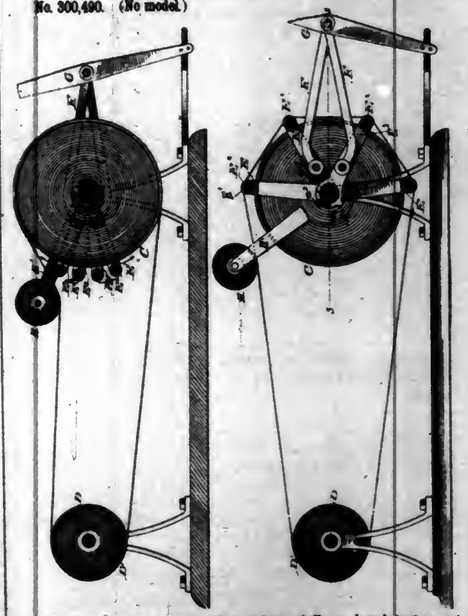
402,756. SIGN. Charles H. Manning, Waverly, N. Y. Filed Feb. 14, 1889. Serial No. 299,837. (No model.)



Claim.—1. The combination, with the vertical rods of an electric light, of a vertical support, a sign suspended therefrom, and clamps connecting and securing together the said rods and support, substantially as described.

2. The combination, with the vertical rods of an electric light, of a clamp having a hinge-joint and secured to one of said rods, and also having a sleeve, and a ring or collar secured within said sleeve and supporting a sign, substantially as described.

402,757. APPARATUS FOR TREATING TEXTILE FABRICS. William Mather, Salford Iron Works, Manchester, County of Lancaster, England. Filed Jan. 31, 1889. Serial No. 298,228. (No model.) Patented in England Nov. 24, 1888, No. 15,943.



Claim.—In apparatus for treating textile materials with liquids, gases, or vapors, consisting of a keir containing trucks charged with the materials, a truck made as a shell of metal plate with open top,

402,757.

vertical ends, imperforate curved sides, and a perforated distributing bottom plate with a compartment below it having a spring junction-pipe, substantially as described.

402,758. BELT-SHIFTER. Philip Medart, St. Louis, Mo., assignor of one-half to William Medart, same place. Filed Feb. 19, 1889. Serial No. 300,490. (No model.)

Claim.—1. The combination, substantially as hereinbefore set forth, of a shaft, a pulley thereon, a belt encircling the pulley, positively-actuated shifting-arms movable independently in opposite directions to opposite sides of the pulley, and lifting-bars carried by the shifting-arms, interposed between the belt and pulley.

2. The combination, substantially as hereinbefore set forth, of a shaft, a pulley thereon, separate sets of radial shifting-arms, each set independently pivoted on the shaft and each set separable from each other set, lifting-bars carried by the arms, and devices which positively and simultaneously traverse the lifting-bars over the surface of the pulley and spread them apart.

3. The combination, substantially as hereinbefore set forth, of a shaft, a pulley thereon, separate sets of radial shifting-arms independently pivoted on the shaft, lifting-bars carried by the arms, devices causing at least two sets of arms positively and simultaneously to traverse the surface of the pulley in opposite directions, and corresponding sets of separate independently-pivoted shifting-arms interposed between and moved by the corresponding positively-actuated ones and in the same direction.

4. The combination, substantially as hereinbefore set forth, of a shaft, a pulley thereon, separate radial shifting-arms independently pivoted on the shaft on opposite sides of the pulley, a lifting-bar connecting each pair of arms close to and substantially parallel with the face of the pulley, an actuating-lever, and interposed pivoted links respectively connecting the actuating-lever and corresponding arms on opposite sides of the shaft, to cause the lifting-bars to be moved positively and simultaneously in opposite directions around the driving-pulley.

5. The combination, substantially as hereinbefore set forth, of a shaft, a pulley thereon, separate radial shifting-arms independently pivoted on the shaft on opposite sides of the pulley, a lifting-bar connecting each pair of arms substantially parallel with the face of the pulley, an actuating-lever interposed, pivoted links respectively connecting the actuating-lever, and corresponding arms on opposite sides of the shaft, and interposed arms carrying additional lifting bars or rollers crossing the face of the pulley and movable loosely around the driving-pulley.

6. The combination, substantially as hereinbefore set forth, of a driving-shaft, a driving-pulley thereon, a driven pulley and its shaft, a belt traversing the pulleys, separate sets of radial shifting-arms independently pivoted on the driving-shaft and carrying lifting-bars simultaneously and independently traversing the driving-pulley in opposite directions to lift the belt therefrom.

7. The combination, substantially as hereinbefore set forth, of a driving-pulley, a driven pulley, a belt traversing them, lifting-bars simultaneously traversing the face of the driving-pulley in opposite directions to lift the belt therefrom, and a tightening-pulley mounted in radial arms on the driving-shaft.

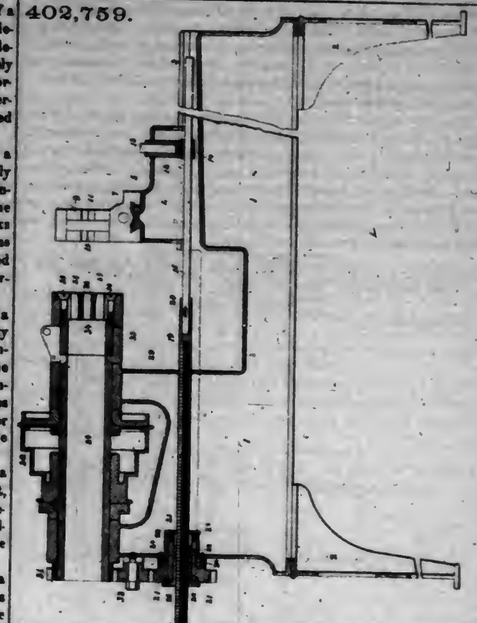
8. The belt-shifting apparatus hereinbefore described, consisting of the combination of a driving-shaft, a driving-pulley, a driven pulley, a belt traversing the pulley, separate radial shifting-arms independently pivoted upon the driving-shaft on opposite sides of the driving-pulley, lifting-bars crossing the face of the driving-pulley and connecting said arms in pairs, actuating-links respectively pivoted to their corresponding arms on opposite sides of the driving-shaft to traverse them simultaneously and positively in opposite directions, interposed lifting-bars carried by concentrically-pivoted arms interposed between the pivotally-actuated ones, and a tightening-pulley movable concentrically with the lifting-bars.

9. The combination, substantially as hereinbefore set forth, of the driving-shaft, the pulley thereon, the belt-shifting arms, their enlarged bearing-surfaces split or opened, as described, at their inner ends, and the sleeve on which the arms are mounted inclosing the shaft.

10. The combination, substantially as hereinbefore set forth, of the shaft, the pulley, the sectional sleeve thereon, the sectional collars secured to the driving-shaft on each side of the sleeve, and the belt-shifting arms mounted on the sleeve between the collars.

11. The combination, substantially as hereinbefore set forth, of the belt-shifting arms E^2, having lugs or nibs e^2, the belt-shifting arms E, with which the lugs or nibs e^2 engage, the driving-shaft, the driving-pulley, the operating-lever, and connections between the operating-lever and the arms E^2.

402,759. SCREW-THREADING MACHINE. Frederick C. Miller, Newport, Ky. Filed June 30, 1887. Serial No. 243,012. (No model.)



Claim.—1. A screw-cutting machine consisting, essentially, of the die-holder, screw-cutting die contained therein, the clamp by which the rod to be threaded is held by one end, the carriage permitting relative longitudinal movement between the rod and die, the feed-screw and nut corresponding in pitch with the screw to be produced and imparting positive feed movement, the means for connecting the feed-screw and nut to the carriage and die-holder, respectively, and gearing communicating corresponding rotation from the screw-cutting to the feeding devices, substantially as herein described.

2. The combination, with the carriage 4, the rod 5, and feed-screw and nut and connecting-gear for moving said rod longitudinally, of the block 14, perforated for the passage of the rod 15, and having the spring-jaws 16 17, and the screw 18, for closing said jaws, substantially as set forth.

3. The combination, with the carriage 4, having the hollow stud 12, and the longitudinally-movable rod 15, of the stem 13, fitting said hollow stud, and means at the lower extremity of said stem for engaging the rod, substantially as set forth.

4. The combination of the carriage, rod-holding clamp, die-holder,

402,759.

feed-screw and nut, means for connecting the feed-screw and carriage, and connecting-gearing for imparting equal rotation to the screw-cutting and feeding mechanism and relative longitudinal motion to the parts, as described and shown.

5. The combination of the carriage, the feed-screw having the socket in the extremity thereof, nut and gearing for imparting longitudinal motion to said screw, and the feed-rod having one extremity inserted in said socket and adjustably secured to the carriage, substantially as set forth.

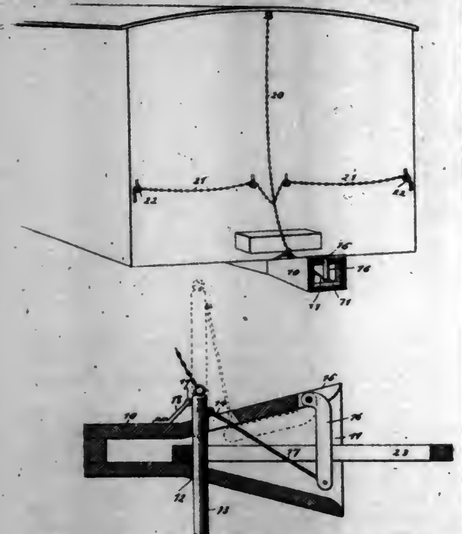
6. The combination of the carriage, the feed-screw adjustably secured thereto, the feed-pinion having a removable internally-screw-threaded bushing, and gearing for rotating said feed-pinion, substantially as set forth.

7. The combination, with the carriage, the feed-screw, and the internally-screw-threaded feed-pinion having the hub 22, of the annular bearing-plate secured to the end of said hub for holding it in place, substantially as set forth.

8. The combination, with the carriage, the feed-screw, and the internally-screw-threaded feed-pinion having the hub 22, of the bearing-sleeve, and the annular bearing-ring secured to the end of the hub and projecting over the end of the bearing-sleeve, substantially as set forth.

9. The combination, with the carriage, the feed-screw, and the internally-screw-threaded feed-pinion having the hub 22, of the bearing-sleeve 23, having the flange 24, secured to the frame of the machine, and the annular bearing-plate secured to the extremity of the hub 22 and projecting over the bearing-sleeve, substantially as set forth.

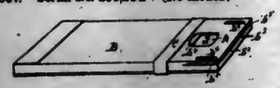
402,760. CIGAR-CUTTER. Joseph B. Moon, Chicago, Ill., assignor of one-half to Eugene Vallens, same place. Filed Jan. 12, 1889. Serial No. 296,142. (No model.)



Claim.—1. In a cigar-cutter, the combination of a box provided with holes in its top, a knife or blade movable forward and backward across the holes, guides or ways in which the knife or blade moves,

and by which it is held close to the under side of the holes, and levers for advancing and a spring for retracting the knife or blade, the body of the box being hinged to the base at one end and secured by a clasp at the other, whereby, by pressing the clasp, the body or base may be swung on its hinge to open the box for the removal of cigar ends, substantially as described.

2. In a cigar-cutter, the combination of a box provided with holes in its top, a knife or blade movable forward and backward across the holes, guides or ways in which it is held close to the under side of the holes, levers for advancing and a spring for retracting the knife or blade, and a handle connecting with the levers in position to be depressed by the hand or wrist of the hand holding the cigar in one of the holes, whereby the levers are operated and the knife or blade advanced, substantially as described.



402,761. CAR-COUPLING. JAMES A. MOSER, Fort Bowie, Ariz. Filed Jan. 21, 1889. Serial No. 297,029. (No model.)

Claim.—1. The combination, with a draw-head provided with a pin aperture, a coupling-pin held in said aperture, and a standard attached to the draw-head, provided with a friction-roller engaging with the pin, of a lever-arm pivoted at one end in the upper front surface of the draw-head, and a link-connection between the upper end of the said pin and the lower extremity of the said arm, all combined for operation substantially as shown and described.

2. The combination, with a draw-head provided with a flaring or bell-shaped mouth and a pin-aperture at the base of the flaring portion, of a coupling-pin held in the said aperture, a lever-arm pivoted in the upper front surface of the said draw-head to extend vertically downward, a rod connecting the lower extremity of the lever-arm and the upper contiguous face of the coupling-pin, and a standard secured to the upper face of the draw-head and provided with a friction-roller engaging with the pin, all arranged for operation substantially as shown and described.

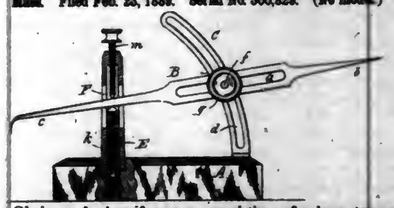
402,762. RAILWAY-TICKET HOLDER. PETER E. MCDONALD, Detroit, Mich., assignor of one-half to S. O. Brooks, same place. Filed Nov. 26, 1887. Serial No. 256,204. (No model.)

Claim.—1. A ticket-holder having a continuous coupon-ticket in combination therewith, said holder provided with an orifice through which said ticket may be projected, and constructed to permit a bearing of the thumb upon said ticket to operate said ticket, substantially as described.

2. A ticket-holder having a continuous coupon-ticket in combination therewith, said holder provided with an orifice through which said ticket may be projected, and a margin, b^3, abutting against the ticket, said holder constructed to permit a bearing of the thumb upon the ticket to operate the ticket, substantially as set forth.

3. A ticket-holder having a continuous coupon-ticket in combination therewith, said holder constructed with covers embracing the ticket, one of said covers provided with an orifice through which the ticket may be projected, substantially as set forth.

4. A ticket-holder having in combination therewith a continuous coupon-ticket, said holder consisting of covers embracing said ticket, one of said covers provided with an orifice through which the ticket may be projected from the end of the holder in line with the under face of said cover, substantially as described.



5. A ticket-holder having in combination therewith a coupon-ticket, said holder constructed of covers embracing said ticket, one of said covers provided with an end margin, b^3, and with an orifice between said margin and the under face of the cover through which the ticket may be projected, substantially as set forth.

6. A ticket-holder having in combination therewith a coupon-ticket, said holder constructed of covers to embrace the ticket, one of said covers provided with an end margin, b^3, an orifice between the said margin and its cover, and an orifice in the face of the cover through which the thumb may bear upon the ticket to operate the same, substantially as set forth.

7. The combination, with the holder, of the continuous coupon-ticket, said holder constructed of covers embracing said ticket, one of said covers provided with a loop through which the ticket may be projected, substantially as set forth.

8. The combination, with a casing, of the covers B' B^2, one of which is provided with longitudinal raised margins b b' and with the end margin, b^3, and the other with an aperture, b^4, of a continuous flexible coupon-ticket secured at one end to one of the said covers and adapted to be projected with its opposite end through a slot, as b^5, formed at the end of said cover, the said ticket being entirely inclosed within said casing, substantially as set forth.

402,763. SURFACE-GAGE. WILLIAM H. H. NORTHEND, Boston, Mass. Filed Feb. 23, 1889. Serial No. 300,829. (No model.)

Claim.—1. A surface-gage consisting of a base, two supports thereon, and a needle slotted in part and upheld at two points by said supports, pivoting upon one for quick adjustment, upon the other for slow adjustment, substantially as herein described.

2. A surface-gage composed of a base and two supports—a slotted standard and post—and a bar or needle upheld at two points and adapted to swing upon either support as an axis in a vertical plane, substantially as and for purposes herein set forth.

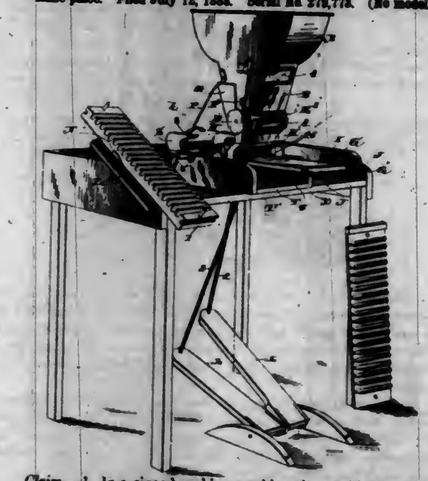
3. In combination with a suitable base, a curved slotted standard, and the needle apertured in part pivoted thereto at one end, the hollow post with a transverse slot, in which the needle is upheld and capable of adjustment in a vertical plane, swinging upon the opposite end as a pivot, substantially as stated.

4. The reversible needle slotted in part, adjustable in a vertical plane, and having endwise movement, two pivots, one at each end, combined with a slotted standard and a clamping-bolt, a hollow post, with its adjusting screw and spring, and the base, all operating as herein specified.

5. A suitable base, a hollow post transversely apertured, with the co-operating spring and screw therein, a reversible needle-bar having endwise movement through said post and oscillating upon it for one adjustment, combined with a standard, its longitudinal slot, and the clamping-bolt engaging said needle, which swings upon said bolt for the other adjustment, substantially as herein stated.

402,764. CHIN AND LIP ADJUSTER FOR CORSETS. JOHN I. NUHN, Cleveland, Ohio. Filed Mar. 6, 1889. Serial No. 302,063. (No model.)

Claim.—The combination, with a chin-adjuster, of a lip-adjuster, the latter being adjustably connected with and supported by the former, substantially as set forth.



402,765. WINDOW-VENTILATOR. JAY F. OSDEN, Buckhannon, W. Va. Filed Feb. 4, 1889. Serial No. 298,643. (No model.)

Claim.—1. A ventilator for windows, composed of a box-like shield, substantially as described, attached to the upper part of a window-frame, and a plate or partition, B, secured to the window-sash, so as to extend into the shield, substantially as shown and described.

2. A ventilator for windows, composed of a box-like shield, substantially as described, attached to the upper part of a window-frame, and a plate or partition secured to the window-sash, so as to extend across the open space between said shield and the window to form a practically complete partition in any position to which it may be adjusted in the shield by the movement of the window, as described.

402,766. CIGAR-BUNCHING MACHINE. GOTLIEB F. PALM and MARO SMITH, Coshocton, Ohio, assignors of one-third to Samuel Irvine, same place. Filed July 12, 1888. Serial No. 279,773. (No model.)

Claim.—1. In a cigar-bunching machine, the combination of the hopper, the vertically-rotating pocket-wheel arranged below the hopper and having a ratchet-wheel secured on the end of its horizontal shaft, the sliding bunching-table below the pocket-wheel, and the spring-rod carried by the bunching-table and adapted to engage the ratchet-wheel, as set forth.

2. In a cigar-bunching machine, the combination of the hopper, the rotatable agitator-wheel therein, the rotatable pocket-wheel arranged beneath the hopper, gearing between the agitator and the pocket-wheel, the ratchet-wheels on the shaft of the pocket-wheel, the sliding bunching-table arranged below the pocket-wheel, and the spring-rods carried by the bunching-table and engaging the ratchet-wheels, as set forth.

3. In a cigar-bunching machine, the combination, with the hopper and the pocket-wheel, of the adjustable gage 22, substantially as described.

4. In a cigar-bunching machine, the combination, with the hopper and the pocket-wheel, of the adjustable gage having a lip projecting from its lower end, substantially as specified.

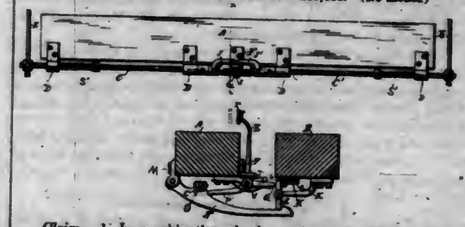
5. In a cigar-bunching machine, the combination, with the hopper and the pocket-wheel, of the brackets 23, secured to the side of the hopper, the gage 22, having the nuts 24 secured thereto, and the set-screws 22, for adjusting the gage.

6. In a cigar-bunching machine, the herein-described pocket-wheel composed of a shaft having heads at each end, the partitions 12, V-shaped in cross-section, secured between the heads, the nuts 11, secured between the heads and disks contiguous thereto, the bottoms C of the pockets, and the set-screws 10, for adjusting the bottoms of the pockets, substantially as specified.

7. In a cigar-bunching machine, the pocket-wheel consisting of the heads, the partitions 12, the nuts 11 on rings D^2, the concave bottoms C, having notches in each end, and the set-screws having grooves in their heads and having their lower ends secured in the said nuts, substantially as described.

8. The combination, with the heads D^2 and the transverse partitions 12, bent in substantially the form shown, of the trough-shaped bottoms C, and the set-screws 10, for adjusting the bottoms, substantially as and for the purpose described.

9. The herein-described agitator for a cigar-bunching machine, composed of the shaft E' and the radial arms e at the ends of the shaft, having their ends bent inward to form agitator-fingers, substantially as specified.



10. In a cigar-bunching machine, the combination, with the base and the reciprocating bunching-table, of the castings R, having slots, the bunching-roller mounted in the slots, and the arms s' on the bunching-table, for effecting a vertical movement of the bunching-roller in the said castings, substantially as described.

11. The combination of the base, the slotted castings thereon, the bunching-roller having its shaft mounted in said castings and extended beyond the same, the springs secured to the base and bearing on the shaft of the bunching-roller, and the bunching-table reciprocating under the bunching-roller and having arms adapted to come in contact with the roller and raise the same, as set forth.

12. In a cigar-bunching machine, the combination of a base, a pocket-wheel arranged above the base, the bunching-roller mounted loosely in slotted bearings on the base, the reciprocating bunching-table, and the brackets S, secured to the bunching-table, and having upper arms adapted to actuate the pocket-wheel and lower arms adapted to raise the bunching-roller, as set forth.

13. The combination, with the base and plates 28, forming troughs near each side of the base, of the reciprocating bunching-table having cleaner-blades which are adapted to travel in the said troughs, substantially as set forth.

402,767. STOP-MOTION FOR LOOMS. ANDREW J. PIROTTE, Manton, R. I. Filed Feb. 6, 1888. Serial No. 263,185. (No model.)

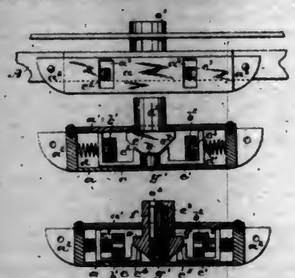
Claim.—1. In combination, the breast-beam, the shipper-disengaging lever, and the tripping-lever, the lay-beam, the spring-operated dagger, the hook-lever provided with the transversely-arranged pivoted bar, the shuttle-binders, and the duplicate protector-rods, each provided with a pressure-finger resting upon a shuttle-binder, a finger resting upon the spring-operated dagger, a finger which operates upon the pivoted bar of the hook-lever, and a spring which holds the pressure-finger against the shuttle-binder, whereby the loom will be stopped either for the presence of a shuttle in the box at the wrong time or for the improper absence of the shuttle, substantially as described.

2. In combination, the breast-beam, the shipper-disengaging lever, and the tripping-lever, the lay-beam, the hook-lever provided with the transversely-arranged pivoted bar and pivoted to the lay-beam, the shuttle-binders, the duplicate protector-rods, each provided with a pressure-finger resting upon the shuttle-binder, a finger which operates upon the pivoted bar of the hook-lever, and a spring which holds the pressure-finger against the shuttle-binder, whereby either of the pressure-fingers can be separately moved outward without imparting an engaging movement to the hook-lever, but the conjoint outward movement of both of the pressure-fingers will cause the engagement of the hook-lever with the tripping-lever and the consequent stopping of the loom, substantially as described.

402,768. BAG-LOCK. CHARLES REINISCH, Newark, N. J. Filed Nov. 25, 1887. Serial No. 256,062. (No model.)

Claim.—1. In a bag-fastening, the combination, with catching bolts or pins and catching-loops, of a bolt-operating device consisting of a bolt-plate arranged and secured to a finger-piece and sliding longitudinally within a casing provided with hasp-loop-receiving openings therein, said bolt-plate being provided with projecting flanges at right angles thereto and catching bolts or pins attached to and projecting at right angles from said projecting flanges and moving longitudinally with said bolt-plate within said casing and across the loop-openings therein, and a spring whereby said bolts or pins are held normally across said openings, said finger-piece moving reciprocally

on the casing and operating to cause the sliding longitudinal movement of the bolt-plate, for the purposes set forth.



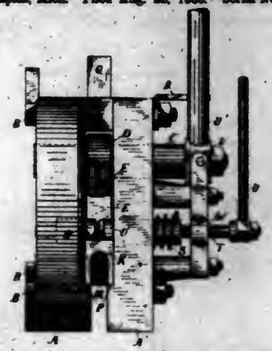
2. In a bag-fastening, the combination, with catching bolts or pins and catching-loops, of a casing provided with loop-receiving openings therein, said bolts or pins being concealed and moving longitudinally within said casing and across the loop-openings, a spring whereby said bolts or pins are normally held across said openings, and a finger-piece connected with said bolts or pins, substantially as described, the catching-loops being beveled on one side and engaging with the beveled ends of the catching bolts or pins to receive the same in the perforations or eyes in said loops, substantially as and for the purposes set forth.

3. A bag-lock consisting of a casing, B, a sliding finger-piece, D, moving reciprocally on said casing, a sliding plate, *c*, arranged within said casing B and secured to and sliding with said finger-piece, said plate being provided with bolts having beveled ends and concealed and moving longitudinally within the casing B, and a catching-loop plate provided with catching-loops projecting therefrom and adapted to enter loop-openings in the casing B, said catching-loops having beveled portions which engage with the beveled surfaces on and receive the longitudinally-sliding bolts in the perforations in said loops, for the purposes set forth.

4. A bag-fastening consisting of a casing provided with catching-loop-receiving openings therein, catching-loops adapted to enter the openings in said casing and to engage with bolts arranged therein, a sliding plate to which said bolts are attached, said plate being secured to a finger-piece moving reciprocally on said casing, a plate, *a*, provided with a post, *a'*, and a lug, a^3, thereon, a spring engaging with said lug a^3, and a lug, c^3, on one of the bolts, all arranged substantially as and for the purposes set forth.

5. A bag-fastening consisting of a casing provided with catching-loop-receiving openings therein, catching-loops adapted to enter the openings in said casing and to engage with bolts arranged therein, a sliding plate to which said bolts are attached, said plate being secured to a finger-piece moving reciprocally on said casing, a plate, *a*, provided with a post, *a'*, and a lug, a^3, thereon, a spring engaging with said lug a^3 and a lug, c^3, on one of the bolts, and means for locking said finger-piece to prevent any movement of the bolts, for the purposes set forth.

402,769. BAG-LOCK. CHARLES REHBOCK, Newark, N. J. Filed Apr. 20, 1888. Serial No. 271,317. (No model.)



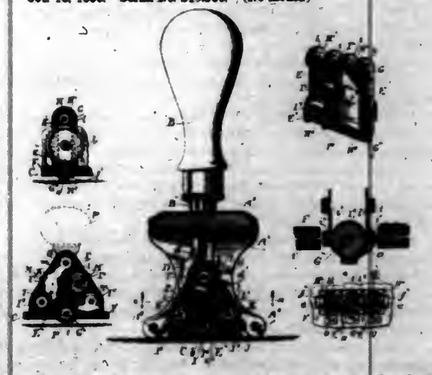
Claim.—1. A bag-fastening consisting of a casing provided with catching-loop-receiving openings therein, catching-loops adapted to enter the openings in said casing and to engage with bolts arranged therein, independently-arranged sliding bolts moving reciprocally within the casing across the loop-openings therein and attached to sliding plates having inclined surfaces thereon, a finger-piece provided with a beveled surface or surfaces thereon which engage with the inclined surfaces on the bolt-plates when said finger-piece is operated, to cause the disengagement of the bolts and catching-loops, and springs arranged to cause the return of the bolts to their normal position across the loop-openings in the casing, for the purposes set forth.

2. A bag-fastening consisting of a casing having openings a^3 therein, catching-loops b' and b^3, which enter said openings and engage with sliding bolts in the casing, bolts c^3 and c^3, moving reciprocally in said casing across the openings and secured to bolt-plates *c* and *c'*, and having inclined surfaces c^4 c^4 thereon, a finger-piece projecting up through the casing and provided with beveled surfaces on the lower end thereof, which engage with the inclined surfaces on the bolt-plates, and springs *d* and *d'*, arranged to cause the return of said bolts to their normal position, substantially as and for the purposes set forth.

3. In a bag-fastening, a locking device consisting of a hollow cylinder provided with a slot, f, and slots f' and f^3 on the inside thereof and formed substantially as herein set forth, a collar, g', provided with pins or points g^3 and g^3, and a pin, g, about which said collar turns for the purposes set forth.

4. A combined bag fastening and lock, consisting of a casing having openings a^3 therein, catching-loops b' b^3, which enter said openings and engage with sliding bolts arranged in said casing, bolts c^3 and c^3, moving in said casing across said openings and secured to bolt-plates *c* and *c'*, having inclined surfaces c^4 and c^4 thereon, a finger-piece, c^5, projecting up through the casing and provided with beveled surfaces on the lower end thereof, which engage with the inclined surfaces on the sliding bolts, springs *d* and *d'*, arranged to cause the return of said bolts to their normal position, said finger-piece being hollow and provided with a key-hole on the top thereof and slots f' and f^3, a collar provided with points or projections g^3 and g^3 thereon, and a pin, g, about which said collar turns, all of said parts being arranged substantially as and for the purposes set forth.

402,770. SAW-TOOTH-SWAGING DEVICE. JAMES R. RHODES, Grand Rapids, Mich. Filed Aug. 22, 1888. Serial No. 283,495. (No model.)



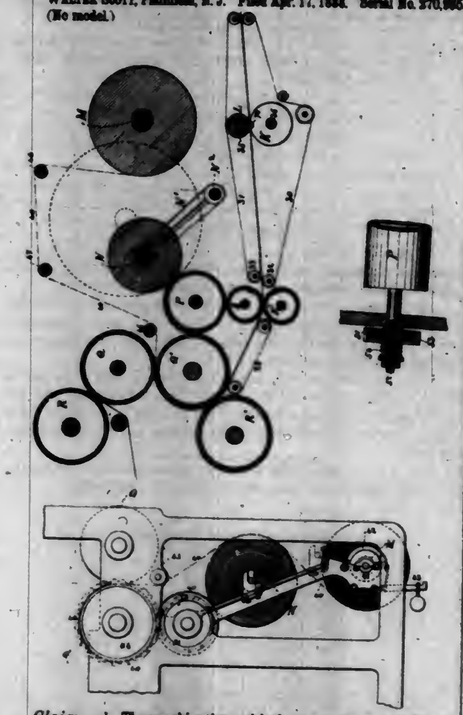
Claim.—1. In a saw-tooth swage, the combination, with the stationary anvil and the movable upper die, of a spring fastened to the anvil and located between the said anvil and upper die, said spring adapted to stop the saw-tooth and to return the upper die to its normal position when pressure is removed therefrom, substantially as described.

2. In a saw-tooth swage, the combination, with the bed-plate and cap, each provided with a longitudinal shoulder, P, and the upper die secured between said bed-plate and cap, of the anvil adapted to rest on said shoulders between the bed-plate and cap and secured therein by bolts, substantially as described.

3. In a saw-tooth swage, the combination, with the bed-plate and cap, of an anvil secured between the two, said anvil having a flat top face for receiving the saw-tooth, and an inclined groove beneath the flat surface, the upper die, and a spring between the anvil and the upper die adapted to stop the saw-tooth and to raise the upper die to its normal position when pressure is removed therefrom, substantially as described.

402,771. HAND-STAMP. LOUIS K. SCOTFORD, Chicago, Ill. Filed Oct. 18, 1886. Serial No. 216,500. (No model.)

Claim.—1. The combination, with the type band or bands of a dating device, rollers for the said band or bands, and a frame supporting said rollers, of a supporting-plate, F, for the dating device, said plate being provided with a central opening, and a casing or cover placed over the bands and rollers, said frame being engaged at its lower end with the opening of the plate F, and the casing being constructed to engage the frame, and attached to the said plate F, whereby the frame is held in position upon the latter, substantially as described.



2. The combination, with the frame and flexible type-band of a dating device and two supporting-rollers over which said band is trained, each of said rollers being provided with cogs at one end, of a band-wheel mounted loosely upon the frame and provided with cogs engaging the cogs of both of said rollers, substantially as described.

3. The combination, with a type-band and a supporting-frame and rollers, as I' I^2 I^3 I^3 I^4 I^4, mounted in said frame, two of said rollers, as I' and I^3, being provided with cogs, of a cog-wheel mounted upon the pivot of one of the other rollers and engaged with the cogged rollers, substantially as described.

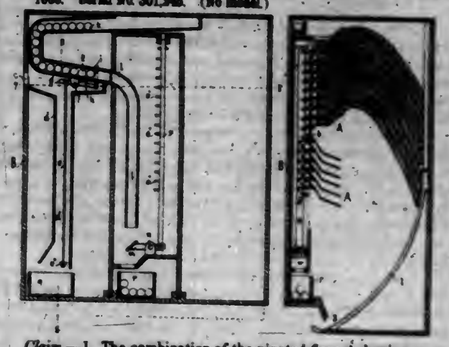
4. The combination, with type-bands and a supporting-frame and rollers, as I' I^2 I^3 I^3 I^4 I^4, mounted in the said frame, one of said rollers, as I', being provided with cogs at each end, and two of said rollers, as I^3 I^3, having cogs at one end, of two cog-wheels mounted upon opposite sides of the frame, and both engaged with the roller having cogs at both ends, and each engaged with the roller having cogs at one end, whereby, when either of said cog-wheels is turned, three of the rollers will be moved, substantially as described.

5. The combination, with a type-band and a supporting-frame, of a spring arm or stop mounted upon the frame and resting in contact with the band, whereby the type may be conveniently placed in position for printing, substantially as described.

402,772. OFFSET MECHANISM FOR PRINTING-MACHINES. WALTER SCOTT, Plainfield, N. J. Filed Apr. 17, 1888. Serial No. 270,995. (No model.)

Claim.—1. The combination, with the type-cylinders R R' and impression-cylinders Q Q', of the winding-cylinder P, a tympan or offset sheet, two rollers for the same, fixed bearings for one of the rollers, arms N' and shaft N^2 for the other roller, and a frictional mechanism upon the shaft N^2 for insuring the proper pressure between the winding-cylinder and the roll as the tympan-sheet is wound up, substantially as set forth.

2. The combination, with the offset-web and the rolls M N, of the brackets 41, having inclines upon which the journals of the roll (M or N) are received and boxes into which the journals are received, and the arms N' or equivalents for moving the full roll to the inclines, substantially as specified.



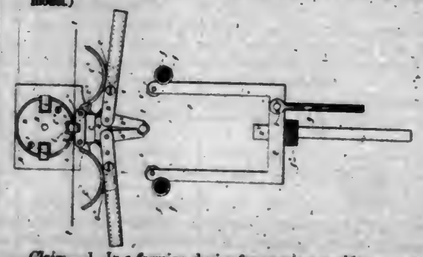
3. The combination, with the printing and impression cylinders, of an offset-web passing around the impression-cylinder, one roll for the offset-web and stationary bearings for the same, a second roll on which the offset-web is wound, and moving bearings for the same that are moved laterally by the accumulation of the offset-web as wound up, so that the roll and its bearings are carried bodily toward the stationary bearings, to be subsequently transferred thereto, as set forth.

4. The combination, with the offset-web and the rolls on which the same is wound, of a roller or cylinder for drawing off the said web and a wind-up cylinder and a frictional connection to the motive power, whereby the wind-up cylinder causes a constant strain to keep the offset-web sufficiently tight, substantially as set forth.

5. The combination, with the printing and impression cylinders, of an offset-web passing in above the impression-cylinder and wind-up mechanism for drawing the web up from below the impression-cylinder, and mechanism for receiving and cutting the web of paper as it falls away from the offset-web, substantially as specified.

6. The combination, with the rolls for the offset-web, and the printing and the impression cylinders, of a winding-cylinder against which the web as it is wound up into a roll rests, and mechanism for rotating the winding-cylinder so that its surface is moved slightly faster than the web for keeping the latter under tension as rolled up, substantially as specified.

402,773. APPARATUS FOR THE AUTOMATIC SALE OF FLEXIBLE ARTICLES. PAUL SIMON, Darmstadt, Germany. Filed Feb. 26, 1889. Serial No. 301,345. (No model.)

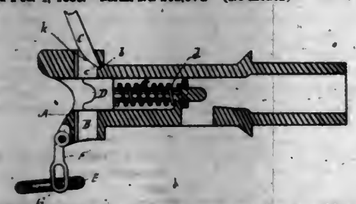


Claim.—1. The combination of the pivoted flaps A, having arms *a*, with cross-pieces *a'* and pins *p*, and arms *b*, forming hooks, the bar *o*, having pins *o'*, and means for imparting vertical motion to the bar *o*, substantially as described.

2. The combination of the pivoted flaps A, having arms *a*, with cross-pieces *a'* and pins *p*, and arms *b*, forming hooks, the bar *o*, having pins *o'*, the lever *m*, the tube *l*, adapted to contain balls, the lever *g*, with fingers *h* and *i*, and means for moving the said lever through the medium of a coin, substantially as specified.

3. The combination of the pivoted flaps A, having arms *a*, with cross-pieces *a'* and pins *p*, and arms *b*, forming hooks, the bar *o*, having pins *o'*, the lever *m*, the tube *l*, adapted to contain balls, the lever *g*, with fingers *h* and *i*, rod *c*, with hook *c'*, and channel *d*, with slit *c*, substantially as set forth.

402,774. DEVICE FOR FORMING TIN CANS. CHARLES W. SLEEPER, Island Pond, Vt. Filed Jan. 4, 1889. Serial No. 295,454. (No model.)



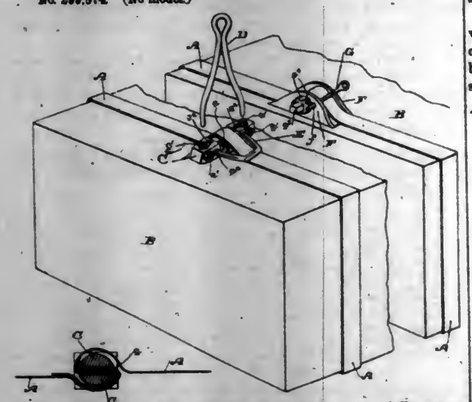
Claim.—1. In a forming device for seaming-machines, a cylinder slightly flattened at its lower side and provided with a false piece, *b*, so arranged in the flattened portion of the cylinder that thin pieces of metal may be inserted between the false piece and the cylinder to increase the size of the said cylinder, and provided with two recesses, *b' b'*, into which the fingers or any convenient instrument may be inserted to remove the can-body from the cylinder after it has been soldered, substantially as described, and for the purpose set forth.

2. In a forming device for seaming-machines, the cylinder B and false piece *b*, combined with the bracket *c*, to which are hinged the clamps *c' c'*, and the false piece *c'*, so arranged in the bracket *c* as to

coincide with the false piece *b*, and a spring, c^2, to press the false piece c^2 against the false piece b^2, or against the can-bodies as they are inserted between the said pieces, substantially as described, and for the purpose set forth.

3. In a forming device for seaming-machines, the cylinder B, the bracket *c*, and clamps c' c^2, combined with the locking-arms a' a^2 and the toggle-joint a^3, and with means for supporting the locking-arms and operating the clamps and toggle-joint, substantially as described, and for the purpose set forth.

402,775. CAR-COUPLING. GEORGE W. SHILLER, Newark, N. J. Filed Feb. 1, 1888. Serial No. 262,674. (No model.)



Claim.—1. The combination, in a car-coupling provided with a draw-head, link, coupling-pin, and a horizontally-arranged lever to which said coupling-pin is connected, provided with arms at each end thereof, of one or more bars or rods pivotally secured to the frame of the car, adapted to be supported by a catch when in a raised position to support said arms, substantially as described.

2. The combination, in a car-coupling provided with a draw-head having a thickened upper face, link, coupling-pin, and a projecting horizontally-arranged lever provided with a fixed arm or projection extending therefrom for connection with said coupling-pin, of an upright arm adapted to be secured to the face of the car, provided with a longitudinal opening through which the fixed arm of said horizontal lever projects, and an adjusting-screw arranged in said upright arm, substantially as described, and for the purpose set forth.

3. In a car-coupling, the combination, with a draw-head provided with a vertical opening or pin-receptacle having a rest or support in one side thereof, a link, coupling-pin, and a horizontally-arranged lever having a fixed arm extending therefrom, of a vertically-arranged arm provided with an opening in which said fixed arm operates, an adjusting-screw, and a spring-catch, substantially as described, and for the purpose set forth.

402,776. STRAP FASTENER AND TIGHTENER FOR TRUNKS, &c. CHARLES SPARKS, Sacramento, Cal. Filed Feb. 14, 1889. Serial No. 299,574. (No model.)

Claim.—1. In a strap fastener and tightener, an axially rotary bar with which the adjacent ends of the strap engage, whereby as said bar is rotated the ends of the strap are wound upon it, in combination with a removable key engaging the bar and holding it in the position to which it is moved, substantially as described.

2. In a strap fastener and tightener, the combination of an axially rotary bar having a longitudinal slot, through which the adjacent ends of the strap pass from opposite directions, whereby as said bar is rotated the ends of the strap are wound upon it, and a key engaging the bar for holding it in the position to which it is moved, substantially as described.

3. In a strap fastener and tightener, the combination of an axially rotary bar with which the adjacent ends of the strap engage, whereby as said bar is rotated the ends of the strap are wound thereon, and a bail-shaped key, the ends of which are adapted to enter keyways in the ends of the bar and the body of which passes over the strap, thereby holding the bar in the position to which it is mounted, substantially as described.

4. In a strap fastener and tightener, the combination of an axially rotary bar having a slot or aperture in its body and keyways in its ends, said slot or aperture receiving the adjacent ends of the strap from opposite directions, whereby as said bar is rotated the strap is wound thereon, and the bail-shaped key, the ends of which fit the keyways in the ends of the bar and the body of which passes across the strap, whereby the bar is held in the position to which it is moved, substantially as described.

5. In a strap fastener and tightener, the combination of an axially rotary bar having its ends perforated and adapted to receive a wrench or spanner by which it may be rotated, keyways in its ends and a slot or aperture in its body for receiving the ends of the strap from opposite directions, whereby as said bar is rotated the strap is wound thereon, and a key for fitting the keyways and holding the bar in the position to which it is moved, substantially as described.

6. In a strap fastener and tightener, the combination of the bracket having keyways, the axially rotary bar mounted in the bracket, and having keyways in its ends and a slot or aperture in its body for receiving the ends of the strap, and a key fitting the keyways of the bracket and bar, whereby the bar is held in the position to which it is adjusted, substantially as described.

7. The axially rotary bar of a strap fastener and tightener, having a slot in its body, grooves in its ends, forming keyways, and holes thereon, also forming keyways, substantially as described.

402,777. RAILWAY-JOINT. JOHN SPRINGER, Jersey City, assignor to Frederick T. Feary, Newark, N. J. Filed Oct. 3, 1888. Serial No. 287,061. (No model.)

Claim.—1. In combination with the rail, plates *b c*, having disconnected overlapping seats *m m*, and bearings *d e*, and suitable bolts, substantially as and for the purposes set forth.

2. In combination, rails *a*, plates *b c*, having seats *m m*, bearings *d e*, and one of said plates having an extension, *g*, bolts *c'*, and packing, *o*, interposed between the rails and said plates, substantially as and for the purposes set forth.

3. In combination, rails *a*, plates *b c*, having seats *m m*, one of which extends over the other, bearings *d e*, and shoulders *f*, and one of said plates having an extension, *g*, and suitable bolts, all said parts being arranged and operating substantially as and for the purposes set forth.

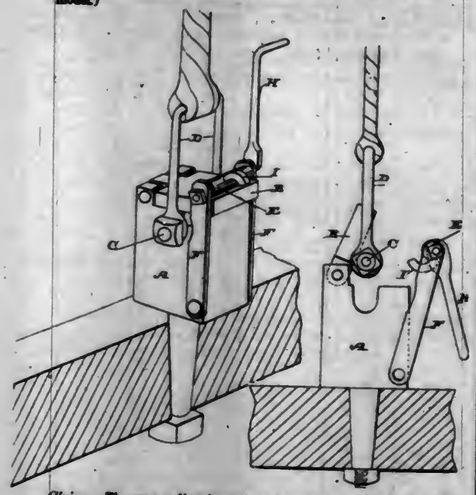
402,778. STOVE-PIPE THIMBLE. ALEXANDER STAUB, Fort Wayne, Ind. Filed July 16, 1888. Serial No. 280,031. (No model.)

Claim.—In a stove-pipe thimble, the combination, with the apertured head 2, provided with the cylinders 9 and 10, of the head 1, consisting of the strip 11, provided with the rib 13, having the horizontal lugs 14, and the annular piece 19, secured to the lugs 14 of the strip 11, and having the apertures 3 and flange 20, the cylinder 22, secured to the rib 13, the cylinder 23, secured to the flange 20, and the wires 24, secured to the inner face of the said heads, substantially as described.

402,779. ELECTRICALLY-CONTROLLED APPARATUS FOR TREATING EMPHYSEMA. ALEXANDER STEINHOFF, Briesnitz, near Dresden, Saxony, Germany. Filed Nov. 21, 1888. Serial No. 291,426. (No model.)

Claim.—1. An apparatus for the treatment of emphysema by compressed air, in which apparatus an intermediate air-vessel "breathing-belt," C, is inserted between the air-accumulator or air-holding

402,779.

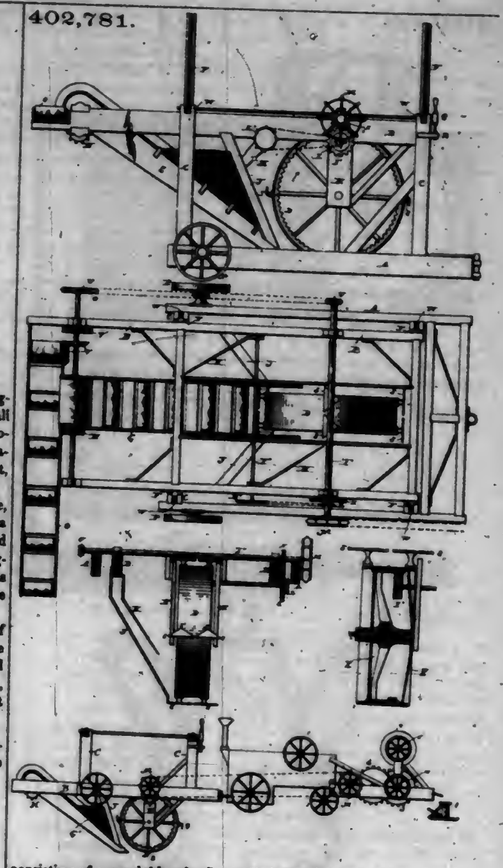


device and the inhalation mouth-piece, the walls of such breathing-belt being different in their expansibility, the most expansible wall being adapted to contact with the thorax of the patient, and an automatic supply of compressed air to expand the belt during the exhalation period of the patient, to act against the thorax of the patient, substantially as specified.

2. The combination, in the apparatus specified, of a mouth-piece, an air-accumulator, the connecting-tubes, and a breathing-belt, and a flap-valve, B, between the accumulator or air-compressing device and the breathing-belt, and a similar flap-valve, D, between the breathing-belt and the mouth-piece, electro-magnets, and circuit-connections acted upon automatically by the inhalation and exhalation of the patient for moving the valves, substantially as specified.

3. The combination, with a mouth-piece and breathing-belt, of a holder for air under pressure, pipes leading from the same to the belt and from the belt to the mouth-piece, valves for opening and closing the respective pipes, electro-magnets for acting on those valves, and a circuit-closing device, and wires to the magnets for closing first one valve and then the other, substantially as set forth.

402,780. SAFETY DEVICE FOR ELEVATORS. PHILIP B. SULLIVAN, Tuscarora, Nev. Filed Oct. 20, 1888. Serial No. 288,696. (No model.)



Claim.—The suspending-bar of an elevator-cage, having its upper end channeled to receive the bolt of the cable-clevis, a hinged plate which shuts down over the bolt to retain it in place, in combination with an eccentric locking-bar journaled in swinging arms, so as to engage the edge of the hinged plate to hold it in place, a lever projecting from the end of the eccentric-shaft, and a spur or stud, which, when the eccentric is rotated, will force the eccentric outward and release the hinged plate, substantially as herein described.

402,781. GRADING AND DITCHING MACHINE. MARTIN SWANSON, Crookston, Minn. Filed June 4, 1888. Serial No. 275,910. (No model.)

Claim.—1. A digger or cutter for ditching and grading machines,

402,781.

consisting of a revoluble wheel or cylinder having hoes on its periphery and closed ends, as set forth.

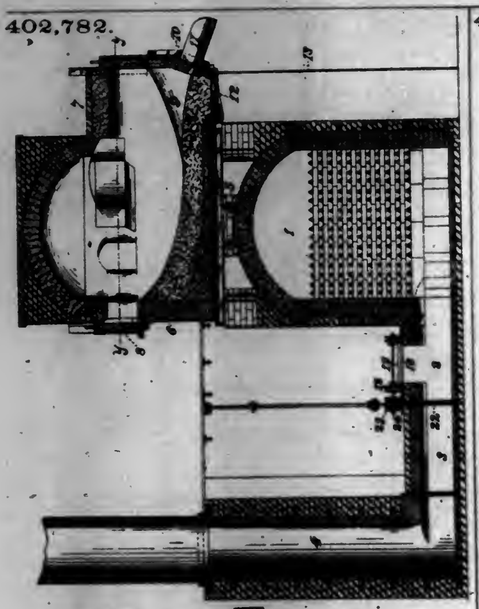
2. A digger or cutter for ditching and grading machines, consisting of a revoluble wheel or cylinder having hoes on its outer periphery and a cogged rim on its inner periphery, and guards, as described, for its ends, in combination with a driving-gear meshing into the cogged rim, as set forth.

3. The combination, with the digger, of the rotating angular knives K, whereby the sides of the ditch are cut into a sloping shape, substantially as specified.

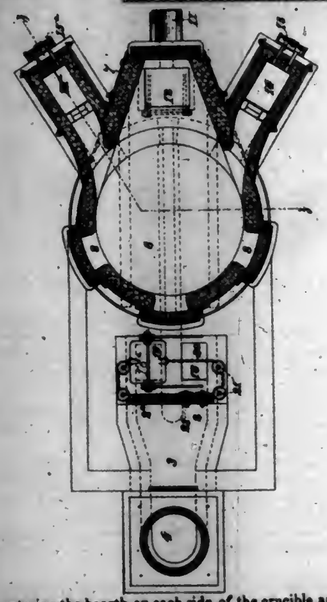
4. The combination, with the digger and the rotating angular knives, of the stationary knives, which serve in conjunction with the rotating knives to slope the walls of the ditch and also to support the lower portion of the elevator, substantially as specified.

5. The combination, with the digger D, of the side-shaping knives K and the inclined stationary finishing-knives J, substantially as set forth.

6. The combination, with rotatable knives, as K, set at an inclination, as described, of the inclined stationary finishing-knives J, as set forth.



7. The combination of a digger, as D, rotatable knives, as K, elevator G, and finishing-knives J, fastened to the lower end of the elevator and serving both as knives and as supports or braces, as set forth.



402,782. OPEN-HEARTH MELTING-FURNACE. WILLIAM SWINDELL, Allegheny, Pa. Filed July 7, 1887. Serial No. 243,906. (No model.)

Claim.—1. An air-furnace for melting metal having, in combination therewith, a crucible for the reception of molten metal located out of the line of flow of the fusing-flame, and combined gas and air flues entering said furnace in each side of the crucible, substantially as set forth.

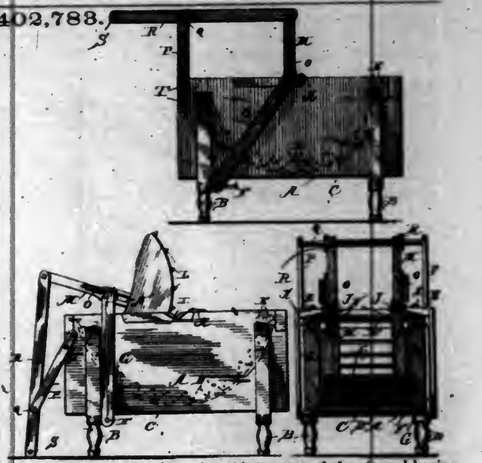
2. The combination, in an air-furnace for melting metal, of a circular melting-hearth, a crucible for the reception of molten metal located at one side of the center of the hearth, and combined gas and

402,782.

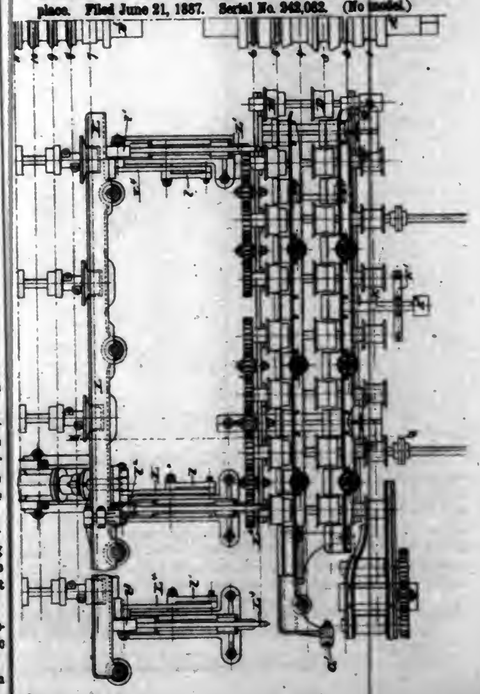
air flues entering the hearth on each side of the crucible and in a line approximately tangential to the wall of the hearth, substantially as set forth.

3. The combination, in an air-furnace for melting metal, of a circular melting-hearth provided with a lateral extension containing the crucible for the reception of molten metal, and combined gas and air flues entering the hearth on each side of said extension and in a line approximately tangential to the wall of the hearth, substantially as set forth.

4. The combination, in an air-furnace for melting metal, of a circular melting-hearth, a lateral extension from said hearth containing the crucible for the reception of molten metal, and a door located in the bottom of said extension under the crucible, substantially as set forth



402,783. WASHING-MACHINE. WILLIAM W. TERRIFF, Moore-field, Ontario, Canada. Filed Dec. 7, 1888. Serial No. 292,866. (No model.)



Claim.—1. The combination of the tub having notches I in the upper edges of its sides, the rubber arranged therein and having the standards M projecting upward from its sides and provided with longitudinal slots N, the supporting-arms having their lower ends pivoted to the bottom part of the tub and provided at their upper ends with lateral projections which rest in the notches I and enter the slots N, the swinging standards P, pivoted on the tub, and the levers supported by said swinging standards and having their inner ends pivoted to the upper ends of the standards M, as set forth.

2. The combination of the tub having the notches I, the rubber arranged therein and provided with the standards M, having the slots N, the transverse rod F, secured to the bottom of the tub, the supporting-arms G, pivotally mounted at their lower ends on the said rod F, and provided at their upper ends with projections H, resting in the notches I and entering the slots N, the springs O, secured to the standards M and the projections H, the buttons K, pivoted on the tub and adapted to be turned over the projections H, the swinging standards P on the tub, and the levers supported thereby and having their inner ends pivoted to the upper ends of the standards M, as set forth.

402,784. ROLLING-MILL. FRANCIS H. TREAT, Joliet, Ill., assignor of two-thirds to Horace S. Smith and Charles Pettigrew, both of same place. Filed June 21, 1887. Serial No. 242,062. (No model.)

402,788.

Claim.—1. The combination, substantially as before set forth, of the rear roughing-table and a movable fence across the line of feed-rollers in front of the first roughing-pass.

2. The combination, substantially as before set forth, of the rear roughing-table, a movable fence across the line of feed-rollers in front of the first roughing-pass, and the dumping-trough on the front roughing-table for moving the fence out of the way of the bloom.

3. The combination, substantially as before set forth, with the first hinged dumping-trough on the front roughing-table and the rock-shaft, arms, and connecting-rods for operating said trough, of a second dumping-trough hinged at its outer end to a sway-bar and pivoted to said connecting-rods.

4. The combination, substantially as before set forth, of the transfer-trough and a movable gate across the inguide of the last roughing-pass.

5. The combination, substantially as before set forth, of the gate across the inguide of the last roughing-pass, the rock-shaft which carries said gate, a weighted arm on said rock-shaft, and the transfer-trough.

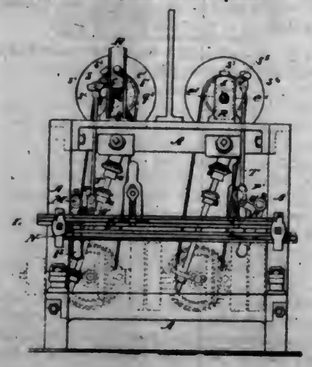
6. The combination, substantially as before set forth, of the transfer-trough supported on tracks and the arms and links which effect its parallel motion and quarter-turning in being moved from one end of its track to the other.

7. The combination, substantially as before set forth, of the transfer-trough supported on tracks, a trunnioned hydraulic jack for moving it, and the arms and links which effect its parallel motion and quarter-turning in being moved from one end of its track to the other.

8. The combination, substantially as before set forth, of the main shaft, the rear finishing-table, the counter-shaft supported on said table near the stand to which the table is connected by a universal joint, and the tumbling-rod for transmitting motion from said main shaft to said counter-shaft.

9. The combination, substantially as before set forth, with the first line of feed-rollers of the rear finishing-table, of the piece-turning socket and link-connections suspending said socket and giving it a quarter-turn in shifting the table from the lower to the upper finishing-passes, or vice versa.

10. The combination, substantially as before set forth, of the piece-turning socket on the rear finishing-table, the elongated rock-shaft for turning the socket, the suspension-bar from which the socket is suspended, and which is supported at one end by a rocker on the rear finishing-table and connected at its other end to one arm of a cross-bar on said rock-shaft, the link for connecting the other arm of the said cross-bar with the socket, and the coupling-rod pivoted at one end to an arm on the said rock-shaft and at the other end to a stand on the foundation.

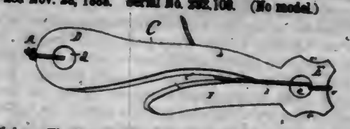


11. The piece-turning socket suspended between buttresses, which sustain it against the chafing action of the piece, substantially as before set forth.

12. The combination, substantially as before set forth, of the piece-turning socket and the diverging guard-plates for guiding the end of the piece into the socket.

13. The combination, with three-high finishing-rolls, of a rising and falling feed-table at one side of the same, said feed-table being hinged and swiveled at its outer end, a device for shifting the inner end of the feed-table, and a device for turning the rail simultaneously with the rising of the feed-table, substantially as described.

402,785. MACHINE FOR SPINNING HEMP, &c. CHARLES H. TRIPP, Boston, Mass. Filed Feb. 20, 1888. Serial No. 300,501. (No model.)

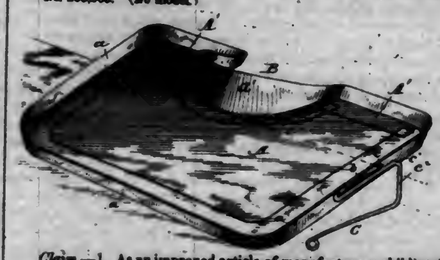


Brief.—The object of the invention is to prevent the running of the machine unless the spindle is in proper position, and to guard against any negligent arrangement of the spindle.

Claim.—1. In a safety-guard mechanism for spindles for hemp-spinning machines, in combination, the box Q, provided with grooves, the latch-plate R, sliding in said grooves, the lock-plate S, pivoted to said box Q, and having a curved arm, s^2, and an arm, s^3, connecting-rod T, pivoted to the said arm s^3, the screw-plate P, pivoted to lever N and adapted to receive the threaded end of said rod T, the lever N, at one end fastened to shipper-bar M, at the other end arranged as described, with the shipper L, shipper-bar M, and shipper L, connected by said lever, as described, all substantially as described, and for the purpose set forth.

2. In a safety-guard mechanism for spindles for hemp-spinning machines, in combination with the frame, a spindle having its outer end bearing in a box on said frame, which box is provided with grooves, a latch-plate sliding in said grooves of said box over the end of said spindle, a lock-plate pivoted to said box and having an arm adapted to rest against the edge of the latch-plate when out of the groove, and an arm pivoted to a rod, said rod being connected by a pivot to a shipper-lever, a shipper-lever fastened at one end to a shipper-bar and at the other end slotted to receive the pin of a shipper, and a shipper-bar and shipper connected by said shipper-lever, as aforesaid, all substantially as described, and for the purpose set forth.

402,786. CORD-FASTENER. THOMAS J. TYLER, Yonkers, N. Y. Filed Nov. 28, 1888. Serial No. 292,109. (No model.)

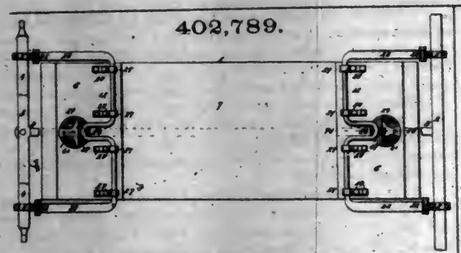


Claim.—The fastener C, consisting of the body portion having the rectangular head E, with grooved sides e' and e^2 and an opening in its center, the arm F, extending out from the head, having a biting-edge, e, on the fastener opposite said arm, substantially as described.

402,787. PROCESS OF PURIFYING GAS. WILLIAM A. M. VALON, Ramsgate, assignor of one-half to the Continental Oxygen Company, (Limited,) Westminster, England. Filed Sept. 10, 1888. Serial No. 285,069. (No model.) Patented in England May 9, 1868, No. 6,980.

Claim.—The process of purifying carbureted-hydrogen or coal gas containing carbonic anhydrides, sulphureted hydrogen, or other sulphur compounds, after removal of the ammonia and tarry matters, by mixing oxygen with such gas, and then passing the mixture through a caustic alkali, whereby the carbonic anhydrides and sulphur compounds are removed, substantially as described.

402,788. CHILD'S TRAY. CHARLES L. WAGANDT, Baltimore, Md., assignor to Koon & Hagerty, same place. Filed Dec. 12, 1888. Serial No. 293,385. (No model.)



Claim.—1. As an improved article of manufacture, a child's table-tray recessed upon its front side, as described, and having upon each side of such recess the forward projections, A', the inner sides of which extend at substantially right angles to the table and are adapted to fit the sides of the child and hold its body from sidewise movement, substantially as set forth.

2. As an improved article of manufacture, a child's table-tray recessed upon its front side, as described, and having upon each side of such recess the forward projections, A', the inner sides of which are situated at and are adapted to fit the sides of the child's body and hold it from lateral movement, the tray being provided around said recess with the protector or apron a', extending upward above the rim of the tray, as shown, and adapted to protect the clothing of the child and deflect into the tray spilled articles of food, substantially as set forth.

402,789. TORSION-SPRING FOR VEHICLES. CHARLES H. WATERHOUSE, St. Louis, Mo. Filed Feb. 28, 1888. Serial No. 301,264. (No model.)

Claim.—1. In a vehicle-spring, the combination of a torsion-spring, the central inwardly-turned crank-head, 26, and the differential eccentric rotary cam 29, that exercises a varied tension on said crank-

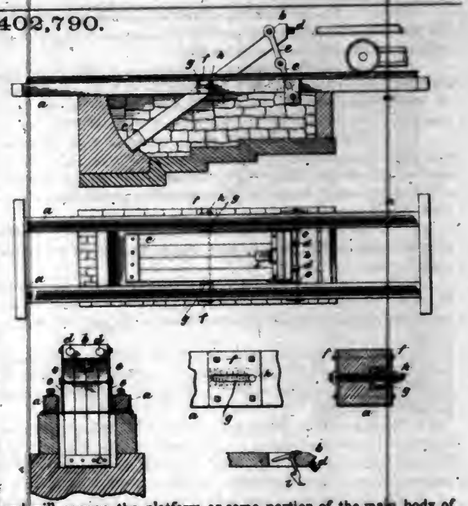
402,789.

bend, and by its leverage on said torsion-spring adjusts the tension and stiffness of the spring, substantially as described, and for the purpose set forth.

2. In a vehicle-spring, the combination of the spring-bar having two longitudinal flat strap sections or parts integral with the connecting transverse torsion section or part, the central inwardly-turned crank-bend, 26, and the differential eccentric rotary cam 29, that exercises a varied tension on said crank-bend and by its leverage of said part adjusts the tension and stiffness of the spring, substantially as described, and for the purpose set forth.

3. In a vehicle-spring, the combination, of the combined strap and torsion spring, constituted of the integral sections or parts 25, 26, and 23, and provided with looped attachment-terminals 24, the hanging swinging sectional shackles 11, that are pivotally secured in the loops 24, the clips 8 on the running-gears of the vehicle, and the perforate lugs 22, that project from said clips and that provide the upper bearings for said shackles, substantially as described, and for the purpose set forth.

4. In a vehicle-spring, the combination of the combined strap and torsion spring constituted of the integral sections of parts 25, 26, and 23, and provided with looped attachment-terminals 24, the swinging sectional shackles 11, that form self-adjusting attachments of the springs to the attachment-clips that are secured to the running-gears of the vehicle, and the eccentric rotary cams 29, that work between the cross-sills and the crank-bend 26 in the middle of the torsion-section of said spring, the said cam being provided with differential seats to adjust the stiffness of the springs, substantially as described, and for the purpose set forth.



5. In a vehicle-spring, the combination of the combined strap and torsion spring, the section 13 of a swinging shackle, which shackle is self-adjusting to the varying position of the springs, the upper end of said section being provided with an open slot, 14, the spindle 15, that projects at a right angle from near the lower end of said section, the journal 16 on said spindle, the key-button 17, the section 18 of said swinging shackle, the lower part of which section is provided with an elongated slotted bearing, 19, through which the button 17 is passed and in which the journal 16 engages when the sections of the shackle are coupled, and the spindle 20, that projects at a right angle from near the upper end of the section 18, the said spindle being provided with a notch, 21, which notched portion of said spindle engages in the open slot 14 near the upper end of section 13 of said swinging shackle when the sections of said shackle are brought into complete operative combination, substantially as described, and for the purpose set forth.

6. In a vehicle-spriag, the combination of the combined strap and torsion spriag, the said spring constituted of the integral sections or parts 25, 26, and 23, and provided with looped attachment-terminals 24, the sectional swinging shackles 11, having bearings in said hooks and that secure and self-adjustingly hold the springs to the running-gears of the vehicle that they support, the eccentric rotary cam 29, the said cam having a differential face with seats of varied thickness that are rotated between the cross-sill of the vehicle and the crank-bend 26 of the spring to adjust the tension and consequent stiffness of said spring, the said eccentric rotary cam having a surmounting stem, 30, with perforate bearings in the cross-sill 6, a square extension, 32, that forms a wrench-seat and that surmounts said stem, and is seated in a key-boxing in said sill and in the floor of the vehicle, the collar-washer 34, that fits around said square extension and on top of the shoulder 35 of the stem 30, and the key 37, that holds said washer to its seat, the said eccentric rotary cam and the square wrench-stem that turns it being arranged as the differential face of said cam is turned to exert a varied tension on the crank-bend 26 of the spring, and thus adjust the stiffness of the same, substantially as described, and for the purpose set forth.

402,790. RAILWAY-BUMPER. JOHN WATERHOUSE, New York, N. Y. Filed Nov. 21, 1888. Serial No. 291,513. (No model.)

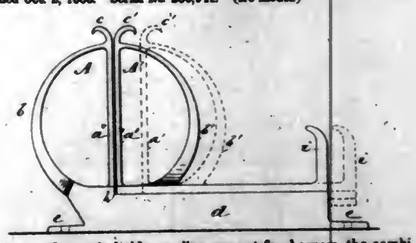
Claim.—1. A stopping device for railroad cars and engines, consisting of a bumper pivoted in such relation to the rails of a railroad track that it can be made to occupy a horizontal position beneath the level of the tracks, or tilted to an inclined position so that the upper

402,790.

end will engage the platform or some portion of the main body of the car or engine, substantially as described.

2. A stopping device for railroad cars or engines, consisting of a bumper pivoted intermediate its ends between the rails of a railroad-track, and an abutment below the track to engage the lower end of the bumper when tilted into operative position to sustain the shock or blow upon the bumper, substantially as described.

3. A stopping device for railroad cars or engines, consisting of a bumper having a pivotal sliding support between the rails of a railroad-track, and an abutment below the track to engage the lower end of the bumper when tilted into operative position to sustain the shock or blow upon the bumper, substantially as described.

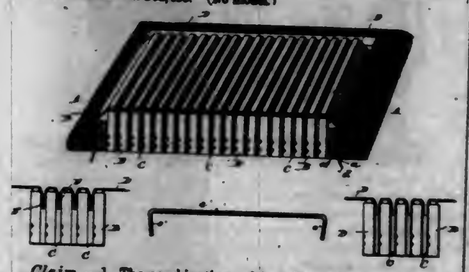


4. A stopping device for railroad cars or engines, consisting of a bumper located between the rails of a railroad-track, pivotally mounted in elongated or slotted bearings, a spring bearing upon the rear of the pivot, and an abutment below the track to engage the lower end of the bumper when tilted into operative position to sustain the shock of blow upon the bumper, substantially as described.

5. A stopping device for railroad cars or engines, consisting of a bumper pivoted intermediate its ends between the rails of a railroad-track, a stop for the upwardly-moving end of the bumper, and an abutment below the track to engage the lower end of the bumper when tilted into operative position to sustain the shock or blow upon the bumper, substantially as described.

6. A stopping device for railroad cars or engines, consisting of a bumper pivoted intermediate its ends between the rails of a railroad-track, eye-bars limiting the movement of said bumper, an abutment below the track to engage the lower end of the bumper when tilted into operative position to sustain the shock or blow upon the bumper, and a foot-latch to hold the bumper in a horizontal position, substantially as described.

7. A stopping device for railroad cars or engines, consisting of a bumper pivoted intermediate its ends between the rails of a railroad-track, and provided with an elastic cushion, a pair of eye-bars limiting the movement of said bumper, a transverse bar connecting the eye-bars, and an abutment below the track to engage the lower end of the bumper when tilted into operative position to sustain the shock or blow upon the bumper, substantially as described.

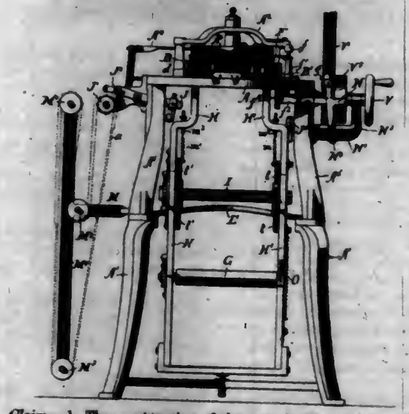


402,791. REIN-HOLDER. WILLIAM B. ADAMS, Greenfield, Ohio. Filed Oct. 2, 1888. Serial No. 286,941. (No model.)

Claim.—In a rein-holder or line-support for harness, the combination of the stationary section A, having a clamping upright or bar, a, and slotted base box part *d*, the movable section A', fitted to slide

on and along or over the slotted base box part *d*, and having a clamping upright or bar, *a'*, and projection *l*, arranged to enter said box part, and the rod *f* and spring *k*, also under cover of the box part, substantially as shown and described.

402,792. APPARATUS FOR PRINTING IN IMITATION OF TYPE-WRITING. CHARLES H. ADAMSON, Muncie, Ind. Filed Jan. 30, 1888. Serial No. 262,415. (No model.)



Claim.—1. The combination, with a form of type, of a sheet, layer, or film of silk or equivalent material placed over the face of the type and secured between the lines of said type, substantially as shown and described, for the purposes set forth.

2. The combination, with a form of type, of an inked ribbon or layer of silk placed over the face of the type and secured between the lines of said type, substantially as shown and described, for the purpose set forth.

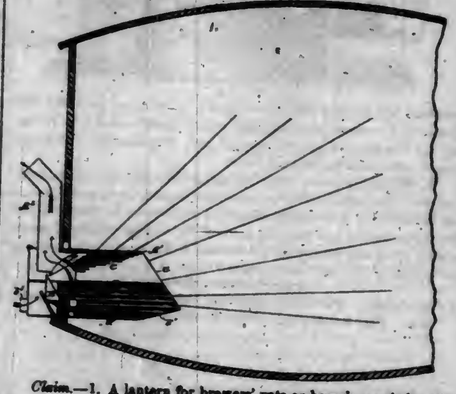
3. The combination, with a form of type, of a layer of silk or equivalent material placed over the form and secured between the lines of type by passing the said layer of silk or equivalent material under the lead between each line of type, substantially as described.

4. The combination, with a form of type, of a sheet, layer, or film of silk or equivalent material, rigidly secured over the face of the type and adapted to receive the ink from an inking-roller when the form is placed in a printing-press, substantially as shown and described, as and for the purpose set forth.

402,793. CIRCULAR RIB-KNITTING MACHINE. HIRAM P. BALLOU, Bristol, Pa., assignor to Lewis Jones, same place. Filed Mar. 5, 1888. Serial No. 266,121. (No model.)

Claim.—1. The combination of the cam-ring having the operating-cams mounted in removable segments with the intermediate segments at the level of the needle-heels, and the guard-pieces mounted above said intermediate segments, substantially as described.

2. The combination of the belt-shifter having a spring which normally tends to throw it toward the loose pulley, the pivoted link and the detent devices for holding the belt-shifter upon the driving-pulley, the drop-stem mounted above said pivoted link, and the pivoted lever engaging said drop-stem to retain it in its upper position maintained in close proximity to the travel of the loops upon the needles, whereby any abnormal prominence of a loop will actuate said lever to release the drop-stem, and thereby disengage the pivoted link and permit the shifting of the belt, substantially as set forth.



3. The combination of the belt-shifter normally held toward the loose pulley by its spring, a pivoted link and the detent devices by which said link is adapted to hold the belt-shifter upon the driving-pulley, and the handle of said belt-shifter provided with an endwise-movable rod for disengaging the link and permitting the belt to be shifted, substantially as set forth.

4. The combination, with the tension-rolls I I', geared together at one end and having a pawl-and-ratchet device at the other end, said pawl being provided with an actuating device, substantially as set forth, of the pair of supports *t t'*, the frames H H', having slots in which said supports are mounted, and the compensating-springs *m m'* and O O', attached to said supports.

5. The combination, with the tension-rolls I I', mounted in vertically-movable supports *t t'*, and having a pawl and ratchet, of an actuating-lever for said pawl, a cam adapted to operate said lever, and a pivoted link arranged above one of said supports and connected with the pawl-actuating lever, whereby the rise of the support beyond a definite point will lift the lever clear of the cam, substantially as set forth.

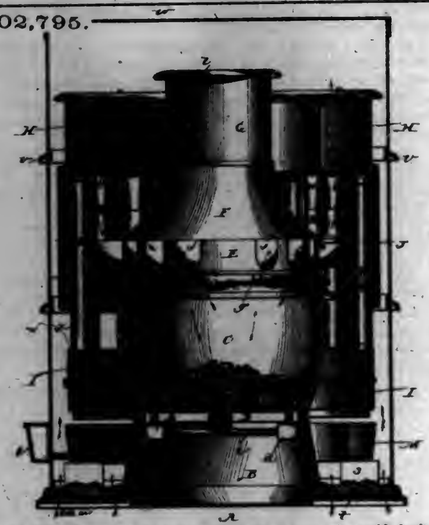
6. The combination, with the tension-rolls, the actuating-lever therefor, and the fabric-roller having a pawl-and-ratchet device for actuating it, of the intermediate link connecting said first-mentioned lever with the pawl of the fabric-roller, whereby said fabric-roller is revolved in conformity with the movements of the tension-rolls, substantially as set forth.

402,794. LANTERN. FERNANDO BARNS, New York, N. Y. Filed Feb. 20, 1888. Serial No. 264,614. (No model.)

Claim.—1. A lantern for brewers' vats or barrels, consisting of a frame-work having glass front and rear upper portion, a suitable air-inlet in its rear and an air-outlet from its rear upper portion, whereby the main portion of the said reflector may be inserted through an opening in said vat or barrel, substantially as described.

2. A lantern for brewers' vats or barrels, consisting of a frame-work having glass front and upper portion, suitable air inlet and outlet, and corrugated glass lining in its bottom, substantially as described.

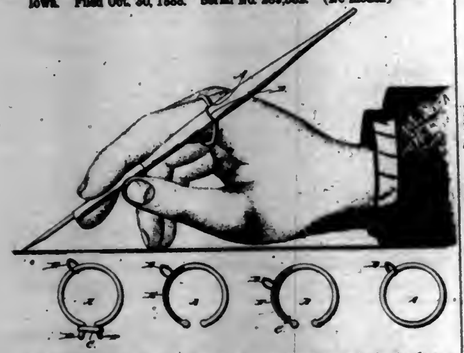
3. A lantern for brewers' vats, consisting of a frame-work having glass front and upper portion, suitable air inlet and outlet, corrugated reflectors in its bottom, the forward portion of which is upwardly inclined, a light-holder, and reflectors behind said light-holder, substantially as described.



402,795. AIR-HEATING FURNACE. JOHN R. BARKER, Chicago, Ill. Filed Nov. 27, 1888. Serial No. 292,099. (No model.)

Claim.—1. In an air-heating furnace, the combination, with fire-pot C and combustion-chamber composed of the parts E and F, the former being provided with elbow-pipes *j* and nozzles *k*, extending upward, of the ring-chamber placed on a higher level than the combustion-chamber and having downwardly-extending nozzles *m*, connecting with nozzles *k* to form communicating flues, and the ring-chamber I, surrounding the fire-pot, and the pipes J, connecting the chambers H and I, as set forth.

2. In an air-heating furnace, the combination, with fire-pot C and combustion-chamber E F, the former being provided with elbow-pipes *j* and nozzles *k*, of ring-chamber H, located above the combustion-



402,795.

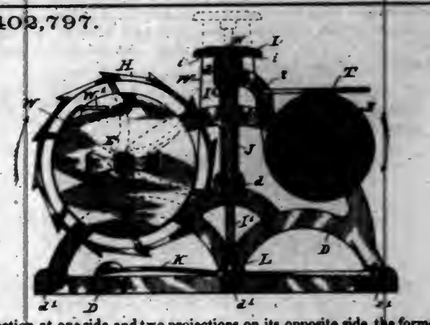
chambers and pierced with air-circulating tubes *r*, and provided with nozzles *m*, to connect with nozzles *k*, and of ring-chamber I, surrounding the fire-pot and communicating with ring-chamber H through pipes J, all substantially as set forth.

3. The combination, with an ash-pit, a fire-box, combustion-chamber, and ring-chambers surrounding said fire-box and combustion-chamber, of a horseshoe-shaped water-receptacle placed below the ring-chambers and partially surrounding the ash-pit, and a spout-casting, Q, on the outside of the furnace-shell, and a pipe connecting the trough M and said casting, as set forth.

402,796. PEN GUIDE OR REST. ISAAS BERGMANN, Fort Madison, Iowa. Filed Oct. 30, 1888. Serial No. 289,532. (No model.)

Claim.—1. In a pen-guide, the ring or band to encircle the finger, and the elastic holder on the ring or band to receive the pen-holder, substantially as set forth.

2. In a pen-guide, the combination of the open-sided ring or band having eyes or knobs on its free ends, and the ring-shaped holder on the ring or band to receive the pen-holder, substantially as specified.



3. In a pen-guide, the combination, with a ring or band to encircle the finger, of an elastic holder loosely connected to and sliding on the ring or band and adapted to receive the pen-holder, substantially as specified.

4. In a pen-guide, the combination of a split ring or band, the elastic loop or ring C, engaging the free ends of the ring or band to draw them together, and the elastic ring-shaped holder connected to the ring or band to receive the pen-holder, substantially as specified.

402,797. RECORDER FOR CASH-DRAWERS. WILLIAM I. BLOOD, Franklin Falls, N. H. Filed Jan. 3, 1889. Serial No. 295,909. (No model.)

Claim.—1. The combination, with the case, detachable mechanism carrying a roll of paper, and a ratchet-wheel for moving the same, of a sliding frame having a vertical and horizontal slots and a pawl for engaging the teeth of said ratchet-wheel, a bell-crank located between said case and cash-drawer and provided with a single projection at one side and two projections on its opposite side, the former engaging with the vertical slot of said sliding frame and the latter with a suitable cam upon the cash-drawer, the said cash-drawer, and its cam, all substantially for the purpose set forth.

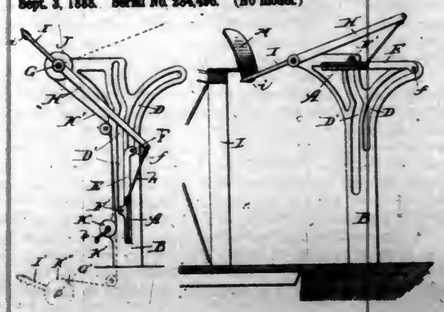
402,797.

2. In an attachment to money-drawers, the combination, with the counter having a slot provided with a spring-cover, of a vertically-movable frame for elevating the paper upon which to record cash transactions, and mechanism whereby said spring-cover will fly open and expose to view the said paper each time the money-drawer is opened.

3. The combination, with the counter provided with an opening, as shown, of a frame in which is mounted a roll of paper, its winding-drum, means for moving said winding-drum in connection with a cash-drawer, and a vertically-adjustable frame adapted to carry the paper (upon which to make a record) upward within said opening in said counter.

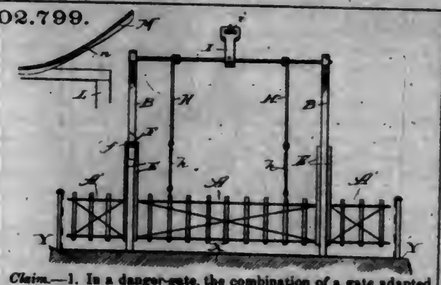
4. The combination of the case and a horizontally-movable frame thereon, the counter having an opening and a latch pivoted therein and operated by said movable frame or a projection thereof, and a suitable spring-cover for said opening in said counter, having on the under part of its free end a slotted lug for engaging said latch when said cover is closed.

402,798. COVERING FOR BOILERS. GEORGE R. BOARDMAN, Chicago, Ill. Filed Jan. 15, 1889. Serial No. 296,443. (No model.)



Claim.—1. A covering for steam boilers, pipes, and the like, comprising a sheet, A, formed of a woven-wire back having non-conducting material secured upon it by strands of the sheet of woven wire, substantially as described.

2. A covering for steam boilers, pipes, and the like, comprising a sheet, A, formed of a woven-wire back having non-conducting material secured upon it by strands of the sheet of woven wire, and the ends of strands extending at opposite extremities of the sheet beyond the superimposed non-conductive material and affording fastening means, substantially as described.

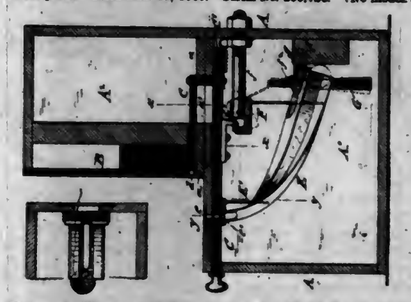


3. A covering for steam boilers, pipes, and the like, comprising a sheet, A, formed of a woven-wire back, B, having mineral wool, C, secured upon it by strands of the woven wire forming the back, substantially as described.

4. A covering for steam boilers, pipes, and the like, comprising a sheet, A, formed of a woven-wire back, B, having sections *r* of mineral wool, C, secured upon it by strands of the woven wire forming the back, substantially as described.

402,799. DANGER-GATE. HENRY BODDIKER, Chicago, Ill. Filed Sept. 3, 1888. Serial No. 284,496. (No model.)

402,799.



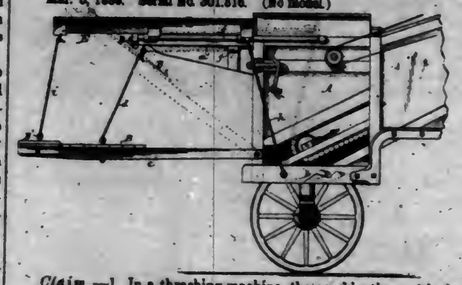
Claim.—1. In a danger-gate, the combination of a gate adapted to be raised and lowered, posts having guides therein, projections on said gate entering said guides and controlled thereby, and a rotatory rod having a lever thereon secured at one end to said rod and connected at the other end thereof to the gate, whereby the rotation of said rod will raise said gate in a path determined by the said guides and projections entering therein, all substantially as described.

2. In a danger-gate, the combination of a gate adapted to be raised and lowered, posts having guides therein projections on said gate controlled by said guides, a rotatory rod having a lever rigidly secured at one end thereof to said rotatory rod and at the other end secured to said gate, and a lever secured to said rotatory rod and adapted to engage with a cam placed on a draw-bridge in the operating of said draw-bridge, whereby, when the said bridge is opened and closed, the said gate is raised and lowered in a path determined by said guides and projections controlled thereby, all substantially as described.

3. In a danger-gate, the combination of a gate, A A', posts B B, having guides D D' therein, projections *f f* on said gate, a rod, G, having lever I thereon adapted to be operated by a cam, M, secured on a draw-bridge, and levers H H, secured at one end to said rod G and at the other end to said gate A A', whereby the opening and closing of the draw-bridge will remove said danger-gate from said roadway or replace the same, all substantially as described.

402,800. AUTOMATIC VENDING APPARATUS. PERCY R. BOSWORTH, Brooklyn, N. Y., assignor of one-half to Christian Baechtold, same place. Filed Feb. 13, 1889. Serial No. 299,736. (No model.)

Claim.—1. The combination of a merchandise-delivery chute, a guided and spring-actuated delivery-slide having a recessed rear part vertically in line with the delivery-chute, a coin-chute attached to the delivery-slide vertically below a coin-slot in the casing, a locking-lever below the delivery-slide, the shank of which is guided in the lower end of the coin-chute, and a fixed lug at the under side of the delivery-slide that is engaged or released by the latch of the locking-lever, substantially as set forth.



2. The combination of a guided and spring-actuated delivery-slide having a slot registering with a coin-slot in the casing of the apparatus, a coin-chute attached to the delivery-slide below the slot of the same, said chute being twisted so that its lower end assumes a vertical position, a fulcrumed locking-lever having a latch, a shank extending into the recessed lower end of the coin-chute, and a lug at the under side of the delivery-slide, substantially as set forth.

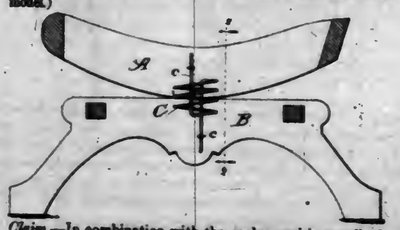
3. The combination, in an automatic vending apparatus, of a guided and spring-actuated delivery-slide having a slot registering with the coin-slot of the casing of the apparatus, a coin-chute attached to the delivery-slide below the slot of the same, said coin-chute being twisted so that its lower end assumes a vertical position, and a pendent gate hinged to the delivery-slide back of the upper transverse part of the coin-chute, so that its lower end forms contact with the same and serves to arrest any coin, wire, or other device introduced for tampering with the releasing mechanism, substantially as set forth.

4. The combination of a casing, a delivery-slide guided in said casing, a twisted coin-chute attached at its upper end to the delivery-slide and having a lower vertical end, a fulcrumed locking-latch engaging a fixed lug of the delivery-slide and having a wire shank extending into the lower vertical end of the coin-chute, and a pivoted guard-arm that prevents the shank of the locking-lever from passing to the outside of the coin-chute, substantially as set forth.

5. The combination of a casing having a merchandise-delivery chute in its upper part and a coin-slot, a guided and spring-actuated delivery-slide having a U-shaped and recessed rear part and a corresponding coin-slot, a twisted coin-chute attached to the delivery-slide, a locking-lever having a latch at its upper end and a wire shank at its lower end, said wire shank engaging the recessed lower end of the coin-chute, and a lug at the under side of the delivery-slide for locking or releasing the slide, substantially as set forth.

402,801. THRASHING-MACHINE. LEVI BROWNSON, Buffalo, N. Y., assignor of one-half to the Pitts Agricultural Works, same place. Filed Mar. 5, 1888. Serial No. 301,316. (No model.)

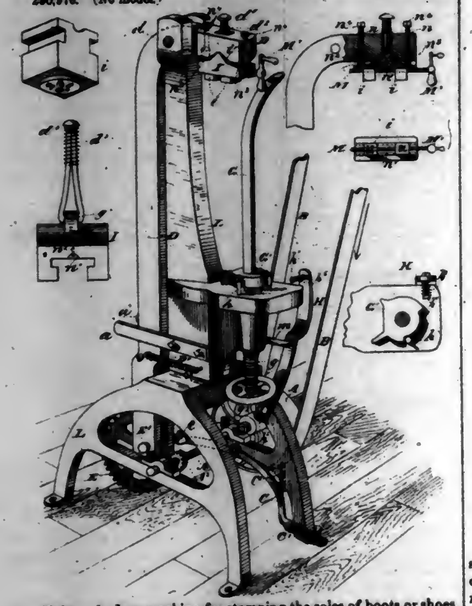
Claim.—1. In a thrashing-machine, the combination, with the frame and the thrashing-cylinder, of a feed-table arranged adjacent to the thrashing-cylinder and made movable lengthwise of said frame, substantially as set forth.



2. In a thrashing-machine, the combination, with the main frame and a platform pivoted thereto and capable of swinging upwardly, of a feed-table arranged above said platform and made lengthwise movable on the frame, whereby the table may be shifted out of the way to permit the platform to be raised, substantially as set forth.

3. In a thrashing-machine, the combination, with the main frame and a platform pivoted thereto and capable of swinging upwardly, of a feed-table arranged above said platform and capable of sliding lengthwise of the machine, horizontal rods attached to the frame of the machine upon which said table slides, and a support whereby the table is held in a horizontal position, substantially as set forth.

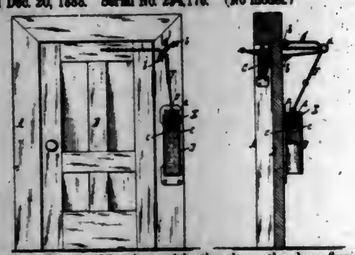
4. In a thrashing-machine, the combination, with the main frame and a platform pivoted thereto and capable of swinging upwardly, of a feed-table composed of hinged sections and capable of sliding lengthwise of the machine, horizontal rods attached to the platform of the machine upon which said table slides, and a support whereby the table is held in a horizontal position, substantially as set forth.



5. In a thrashing-machine, the combination, with the main frame and a platform pivoted thereto, of a feed-table, E, arranged above said platform and capable of sliding lengthwise of the machine, and an inclined supporting-rod, *k*, attached at its upper end to the feed-table and pivoted at its lower end to the frame of the machine, substantially as set forth.

402,802. ROCKING-CHAIR ATTACHMENT. WILLIAM I. BUNKER, Chicago, Ill. Original application filed June 28, 1887, Serial No. 242,797. Divided and this application filed Oct. 2, 1888. Serial No. 287,087. (No model.)

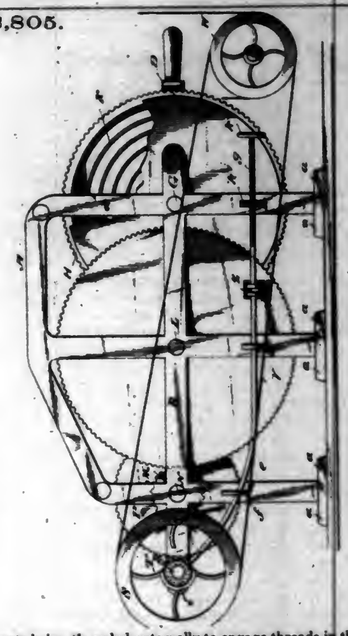
Claim.—In combination with the rocker and base-rail of a platform rocking-chair, a compressible connecting spiral spring having the end portion of its wire at the bottom extending upwardly and the end portion of its wire at the top extending downwardly, and the extending end portions bent at right angles to and inserted in the rocker and base-rail and held by staples or similar fasteners, substantially as described.



402,803. MACHINE FOR STAMPING SOLES OF BOOTS OR SHOES. MICHELLE E. BYRON, Pepperell, Mass., assignor of one-half to Alcide Provencher, Manchester, N. H. Filed Nov. 15, 1888. Serial No. 290,976. (No model.)

Claim.—1. In a machine for stamping the soles of boots or shoes, the main block I, oscillating in the slot *i'* and provided with the adjustable equalizing-springs n^3 n^3, the die-blocks *i i*, moved by means of the screw M, which is provided with a right and left thread upon each half of the screw, respectively, in combination with the arm D, and the standard G, constructed and arranged substantially as described and shown, and for the purposes set forth.

2. In a machine for stamping the soles of boots or shoes, in combination, the arm D and eccentric gear E, both attached to the shaft E', the shifter C, provided with the spring C', the gear A^3, attached to the shaft A', the spring D', the rod H, equipped with the arm *h'* and connected with the arm D by the adjustable rod *m*, the cam G', made fast to the standard G, said standard being provided with the adjustable screw *g* and with the cushioning-spring *g'*, the whole constructed and arranged substantially as described and shown, and for the purposes set forth.



402,804. DOOR-CHECK. ROBERT H. CHERRY, Jersey City, N. J. Filed Dec. 20, 1888. Serial No. 294,176. (No model.)

Claim.—The combination, with the door, the door-frame, the fluid-containing cylinder on the door-frame, and the plunger in the cylinder, of the laterally-swinging bracket pivoted to the door-frame and having an eye at its outer extremity, and the guide-chain secured about centrally between its two extremities to the eye of the bracket and having its said extremities connected, respectively, with the door and the plunger, substantially as described.

402,805. SEWING-MACHINE MOTOR. WILLIAM H. CLAYTON and CHARLES A. LOUDD, Atlanta, Ga. Filed June 20, 1888. Serial No. 277,616. (No model.)

Claim.—In a sewing-machine motor, substantially as described, the combination, with the main frame for supporting the driving-gear, having an internally-threaded bearing, of the band-pulley shaft and the brake-rod composed of two parts united by a swivel, one of the said parts being threaded externally to engage threads in the bearing on the main frame and the other part provided with a friction-eye to receive the said band-pulley shaft, substantially as specified.

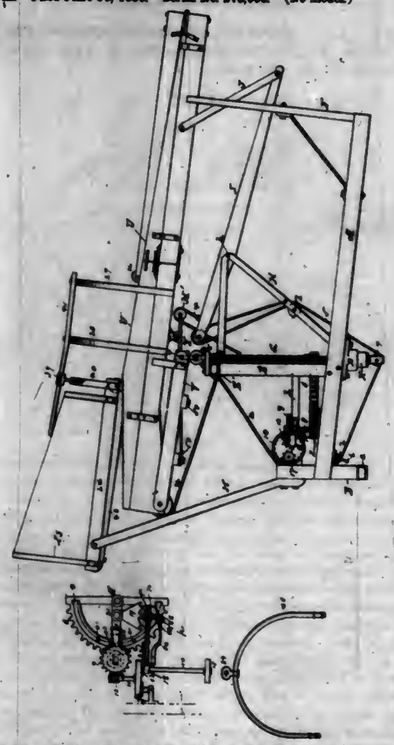
402,806. SHUTTER FOR PHOTOGRAPHIC CAMERAS. RALPH D. CLEVELAND and CHARLES A. HOFFMAN, Minneapolis, Minn. Filed May 23, 1888. Serial No. 274,771. (No model.)

Claim.—1. In a photographic-camera shutter, the combination of the two shutters arranged one over the other and provided with openings adapted to register with each other, pivots arranged at unequal distances from said openings and supporting said shutters, and a pin engaging both of said shutters at a point between said pivots, whereby as the pin is moved in either direction the said shutters are moved upon their pivots in opposite directions, substantially as described.

2. In a photographic-camera shutter, the combination, with the pivoted shutters, of the cylinder 3, the follower 19, arranged within said cylinder and provided with a pin, 15, engaging both of said shutters at a point between their pivots, a spring, 31, connected with said follower, and the adjustable brace 37, adapted to be engaged with said spring, for the purpose specified.

3. The combination, in a photographic-camera shutter, of a pneumatic cylinder controlling the operating mechanism of said shutter, a bulb connected with said cylinder, and a cut-off valve between said cylinder and said bulb, whereby communication between said bulb and said cylinder may be cut off and the air confined in said cylinder, for the purpose set forth.

4. The combination, in a photographic-camera shutter, with the movable shutters, of the cylinder 3, the follower 19, arranged therein and connected with said shutters, the dog 27, arranged to engage said follower, and the piston 22, arranged within said follower and provided with the finger 32, adapted to release the dog 27 as the piston is moved within the follower, substantially as described.



5. The combination, in a photographic-camera shutter, with the pivoted shutters, of the cylinder 3, the air-bulb connected therewith, the follower arranged within said cylinder and connected with said shutters, and the pivoted stop 34, adapted to be arranged in line with said follower, substantially as described.

6. The combination, in a photographic-camera shutter, with the movable shutters, of the cylinder 3, the air-bulb connected therewith, a follower in said cylinder and connected with said shutters, and a lock holding said follower when it is drawn back or forced out in said cylinder.

7. The combination, in a photographic-camera shutter, with the pivoted shutters, of the cylinder 3, the air-bulb connected therewith, the follower 19, arranged within said cylinder and connected with both of said shutters, and the pivoted dog 27, adapted to engage said follower and lock it either when it is forced outward in said cylinder or retracted therein, substantially as described.

8. The combination, in a photographic-camera shutter, with the movable shutters, of the cylinder 3, the follower 19, arranged therein and connected with said shutters, the spring 31, connected with said follower, a locking device engaging said follower and holding it in its retracted position against the tension of the spring, the piston 22, arranged within said follower and adapted to move therein, and provided with a releasing device engaging the lock which holds said follower, substantially as described.

402,807. STRAW-STACKER. HENRY M. COFFER, Bunker Hill, Ill. Filed June 30, 1888. Serial No. 278,008. (No model.)

Claim.—1. In a straw-stacker, the combination, with a frame, of a stacking-elevator, a straw-transferring attachment, the forward end of which is supported on the stacking-elevator, and levers and flexible connections whereby these parts are operated simultaneously, substantially as set forth.

2. In a straw-stacker, the combination, with a frame, of a stacking-elevator, a transferring attachment having a sliding pivotal connection therewith, and levers and cables connecting these parts, whereby they are operated simultaneously, substantially as set forth.

3. In a straw-stacker, the combination, with a frame, of a stacking-elevator and a transferring attachment, both being pivoted to the frame and having a sliding pivotal connection with each other, and arms, levers, and cables whereby the elevator and transferring attachment are operated simultaneously, substantially as set forth.

4. In a straw-stacker, the combination, with a frame and a rocking shaft supported therein, of a stacking-elevator supported on said rocking shaft, and levers, arms, and cables connected with this elevator, whereby its inclination is regulated, said levers and arms also being supported by the rocking shaft, substantially as set forth.

5. In a straw-stacker, the combination, with a frame and a stacking-elevator having pivotal connection therewith, of a transferring attachment consisting, essentially, of sides, wind-sheet, and elevating-belt, substantially as set forth.

6. In a straw-stacker, the combination, with a frame and a stacking-elevator having pivotal connection therewith, of a transferring attachment having a swivel-block therein, bows secured to the elevator, and a rod secured to these bows, said rod having a sliding connection with the swivel-block, substantially as set forth.

7. In a straw-stacker, the combination, with a frame, of a stacking-elevator having a swinging axial connection with the frame and a pivoted connection with its axis, and a transferring attachment having a sliding pivotal connection with the stacking-elevator, substantially as set forth.

8. In a straw-stacker, the combination, with a frame, a rocking shaft supported therein, and a cross-piece secured to this shaft, of a stacking-elevator pivotally supported upon the cross-piece, and levers connected with the elevator and with the rocking shaft, whereby the inclination of the former is regulated, substantially as set forth.

9. In a straw-stacker, the combination, with a frame and a rocking shaft supported therein, said shaft having a brace secured thereto and also a cross-piece secured to its upper end, of a stacking-elevator, arms pivotally connecting the elevator at one end to the cross-piece, a lever pivoted in the brace, a cable loosely connecting the arms with the lever, and a cable whereby the lever is operated, substantially as set forth.

10. In a straw-stacker, the combination, with a frame, a rocking shaft, the latter having a cross-piece on its upper end and a brace projecting from the rocking shaft, of a stacking-elevator, arms pivotally connecting the forward end of this elevator with the cross-piece on the rocking shaft, an arm projecting from these pivotal arms and provided with a pulley, a lever pivoted in the brace, this lever having a pulley in one end and a pivotal connection at the opposite end with the elevator, a cable secured to the rocking shaft and the lever and passed over the pulley in the end of the projecting arm, also a cable secured at one end to the brace, passed over the pulley in the lever, then over a pulley in the brace, a swivel-pulley in the lower end of the frame, and finally to a drum, where it is wound or unwound to regulate the inclination of the elevator, substantially as set forth.

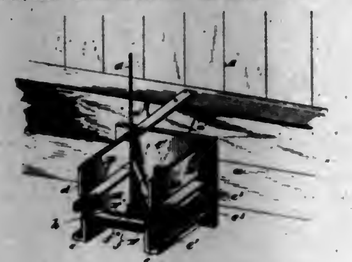
11. In a straw-stacker, the combination, with a frame, a rocking shaft supported therein, and a stacking-elevator pivotally supported on said shaft, of automatically-swinging gear for periodically turning the elevator in opposite directions, substantially as set forth.

12. In a straw-stacker, the combination, with a frame and a rock-shaft supported therein, the latter having a segment or half-wheel thereon, of a gear-wheel meshed therewith and a shifting-lever arranged to receive motion from the segment, whereby the motion of the gear-wheel is changed, substantially as set forth.

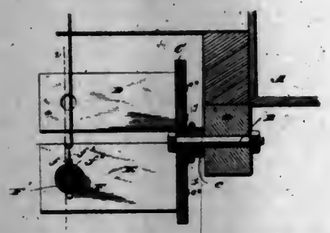
13. In a straw-stacker, the combination, with a frame, a rocking shaft supported therein, said shaft having a segment thereon, of a transverse shaft having a worm-gear connection with the rocking shaft, said transverse shaft having an internal toothed gear-wheel on one end and a gear-wheel, 17, meshed with the teeth of this wheel, and a second transverse shaft having a gear-wheel on one end and an arm operated by the segment adapted to automatically slide this gear-wheel back and forth in engagement with the gear-wheel 17 or the teeth of the internal gear-wheel, substantially as set forth.

14. In a straw-stacker, the combination, with a frame, a rocking shaft supported therein, said shaft having a segment keyed thereon, and a transverse shaft having a worm through which motion is communicated to the rocking shaft, of an arm operated by the segment and connected gearing for periodically changing the motion of the rocking shaft, substantially as set forth.

15. The combination, with a shaft having an internal toothed gear-wheel thereon and a gear-wheel, 17, the teeth of which are meshed with the teeth of the internal toothed gear-wheel, of a sliding gear-wheel, an arm for moving said wheel into engagement with the teeth of the internal toothed gear-wheel or the gear-wheel 17, and means for oscillating this arm at predetermined intervals, substantially as set forth.



16. The combination, with a shaft having an internal toothed gear-wheel thereon and a gear-wheel, 17, the teeth of which are meshed with these teeth, of a sliding gear-wheel, an integral segment and arm adapted to operate the sliding gear-wheel, and means for oscillating this segment and arm, substantially as set forth.

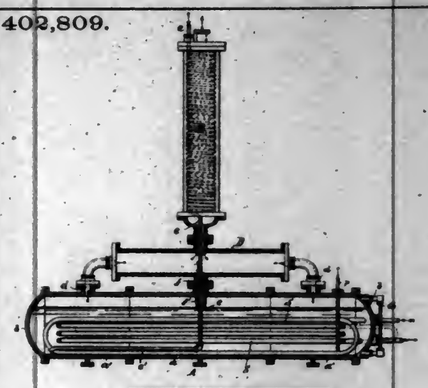


17. In a straw-stacker, the combination, with a frame, a rocking shaft supported therein, this shaft having a toothed segment keyed thereon, a spindle having a gear-wheel keyed thereon, the teeth of which are meshed with the teeth of the segment, and a worm-wheel also keyed to this spindle, of a transverse shaft having an internal toothed gear-wheel keyed to one end and a worm at the other end meshed with the spindle worm-wheel, a gear-wheel, 17, the teeth of which are meshed with the teeth of the internal toothed

gear-wheel, a sliding gear-wheel, a crank-wheel connected therewith, a spindle journaled in close proximity to the toothed segment, a combined segment and arm thereon at right angles to each other, and bolts adjustably secured in the toothed segment adapted by their abutment against the arm to change the motion of the stacking apparatus, substantially as set forth.

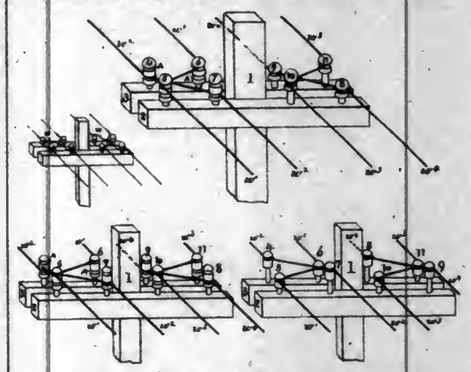
18. In a straw-stacker, the combination, with a frame, a rocking shaft supported therein, this shaft having a segment keyed thereon, a spindle having a gear-wheel keyed thereon, the teeth of which are meshed with the teeth of the segment, and a worm-wheel also keyed to this spindle, of a transverse shaft having an internal toothed gear-wheel keyed to one end and a worm at the other end meshed with the spindle worm-wheel, a gear-wheel, 17, the teeth of which are meshed with the teeth of the internal toothed gear-wheel, a sliding gear-wheel, a crank-wheel having notches in its periphery at diametrically-opposite points, a pawl for engaging said notches, a link connecting the crank-wheel with the sliding gear-wheel, a pinion keyed on the shaft with the crank-wheel, and a combined toothed segment and arm, the former having teeth meshed with the teeth of the pinion and the latter having laterally-projecting springs and bolts adjustably secured in the toothed segment on the main rocking shaft, substantially as set forth.

402,808. CAR-COUPLING. ELLERY F. COFFIN, Muirkirk, Md. Filed Mar. 14, 1888. Serial No. 303,243. (No model.)



Claim.—1. The combination, substantially as described, of a car, a draft bar or bolt secured thereto, a cross-head adapted to rotate on said bolt and provided at its ends with link-plates and grooved arms, spring-pressed coupling-pins adapted to protrude through said arms, and spring-pressed followers arranged to hold the pins normally in their retracted position.

2. The combination, with a car and its draft-bolt, of a cross-head mounted to rotate on said bolt, means to lock the cross-head against rotation, link-plates and grooved arms projecting forward from the outer ends of the cross-head, a slotted cylinder secured between the outer ends of the grooved arms, spring-pressed coupling-pins seated within said cylinder and connected at their inner ends to a pull-rod, and spring-pressed followers adapted to close the outer ends of the cylinder or to be moved therefrom.

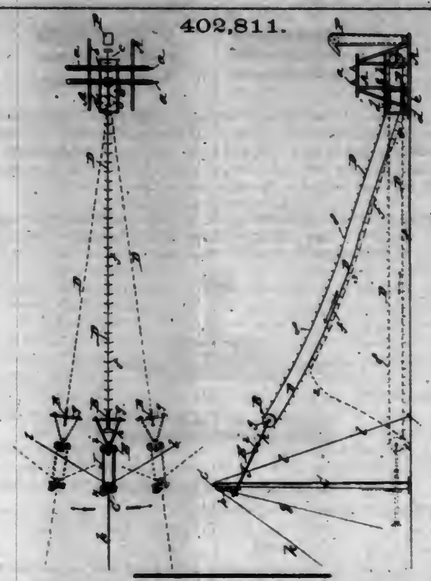


3. The combination, with a car, of a coupling-head provided with grooved parallel arms, a slotted cylinder having its ends seated in openings in said arms, spring-pressed coupling-pins seated in the outer ends of said cylinder, a pull-rod, chains connecting the inner ends of the pins with the pull-rod, and latches secured to the cylinder and adapted to engage shoulders on the pins to hold them against the outward pressure of their springs, substantially as described.

402,809. REFRIGERATING APPARATUS. NATHAN W. CONDICT, Jr., Jersey City, N. J. Filed July 23, 1888. Serial No. 280,848. (No model.)

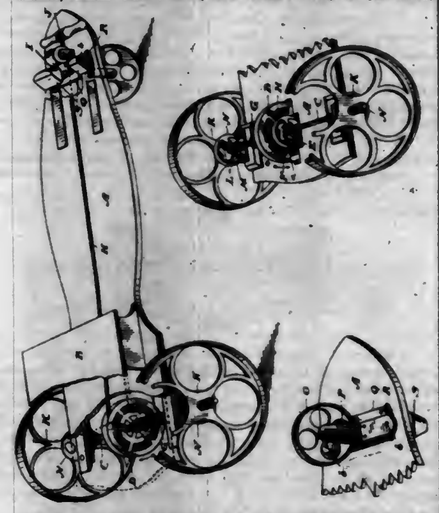
Claim.—In an apparatus for refrigerating, the combination of a still composed of a single horizontal cylinder with a gas-reservoir having a hollow leg supporting the reservoir and resting on the top of the said cylinder and communicating therewith, and passages forming communications between the ends of the cylinder and the ends of the reservoir, substantially as described.

402,810. SUPPORTING AND CROSS-CONNECTING ELECTRIC WIRES. WILLIAM J. DENVER, Boston, Mass. Filed Nov. 24, 1888. Serial No. 291,739. (No model.)



Claim.—1. In a system of electric pole lines, the combination of two line-wires stretched parallel to each other, and crossed so as to exchange places at suitable intervals, with means at the said crossing-places for effecting the said crossing without breaking the continuity of the wire, said means comprising a double cross-arm, insulating-supports for each wire and to which each wire is fastened on both cross-arms, the said supports being constructed, as shown, so that those in the same line of continuity are at different levels, while those diagonal to one another are at the same level, the said line-wires being each respectively attached to the two supports, which are diagonal to each other, substantially as and for the purposes described.

2. The combination, substantially as hereinbefore described, in a system of electric line-wires mounted on poles, of the two wires of a metallic circuit, w' and w^2, the cross-arms 2 and 3 opposite one another to a pole, 1, a support consisting of a pin and insulator on each of the said cross-arms for each of the said wires, two of the said supports having long and the remaining two having short pins, and being so disposed that one of the long pins and one of the short pins shall be fixed to each cross-arm and that in each case a long pin on one arm shall be opposite a short pin on the other, but diagonal to the pin of like length with itself, and the two wires being attached one to the two short-pin supports and the other to the two long-pin supports, and being thereby crossed on different horizontal planes and caused to exchange places without impairing their continuity and without danger of contact, for the purposes specified.

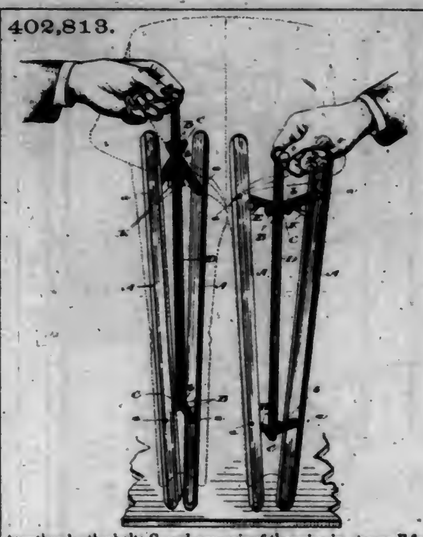


402,811. REVERSIBLE LOADING AND UNLOADING CONVEYER. JAMES M. DODGE, Philadelphia, Pa., assignor to the Dodge Coal Storage Company, Naugatuck, Conn. Filed Oct. 15, 1887. Renewed Mar. 20, 1889. Serial No. 304,053. (No model.)

Claim.—In an apparatus or contrivance for conveying coal and other material from a given source of supply and forming the same into an extensive heap or pile, and for also reconveying such matter from the pile or heap back to a given point or locality for transportation, the reversible chain conveyer, in combination with means whereby said conveyer may be bodily reversed, substantially in the manner and for the purpose hereinbefore set forth.

402,811.

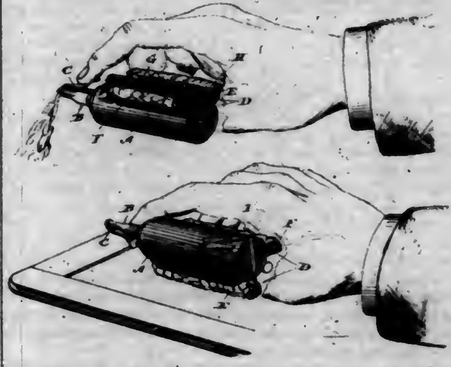
402,812. HAND-PROPELLED VEHICLE. JOHN DRAPER, Whitby, Ontario, Canada. Filed Feb. 27, 1888. Serial No. 265,392. (No model.)



Claim.—1. A body, A, having a seat, B, fixed to it on one end, and a bracket, P, carrying the guide-wheel O, pivoted on the bottom side of its other end, the foot-blocks S, fixed to the bracket P, in combination with the rubbing-block Q, attached to the bottom of the body, a cord, H, carried around the pulley I and wound around the pulley D, loosely journaled on the axle C, and connected to the said axle by a pawl and ratchet, and operated by a spring, G, connected at one end to the pulley D and at its other end to the body A, substantially as and for the purpose specified.

2. The combination, with the body and the rubbing-block Q, attached to the bottom thereof, of the bracket P, pivoted on the bottom of the body and carrying the guide-wheel and having its head in contact with the rubbing-block, the pins *b*, fastened to the bracket and passed through slots in said body, and the foot-blocks S, attached to said pins, substantially as shown and described.

402,813. TROUSERS-STRETCHER. JOHN DRAPER, Whitby, Ontario, Canada. Filed Sept. 27, 1888. Serial No. 286,564. (No model.)



Claim.—A pair of bars, A, connected together by toggle-jointed links formed by two pairs of plates, B, pivoted at *a* and connected

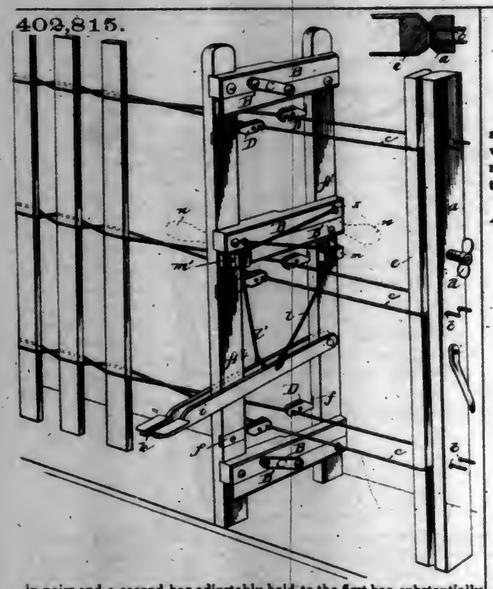
402,813.

together by the bolts C, and one pair of them having horns E formed on them, as described, in combination with the rod D, pivoted on the bolt C, arranged to operate the bars A, substantially as and for the purpose specified.

402,814. CHILD'S SLATE-CLEANER AND PENCIL HOLDER AND SHARPENER. JOHN DRAPER, Whitby, Ontario, Canada. Filed Feb. 23, 1889. Serial No. 300,891. (No model.)

Claim.—1. A slate-cleaner consisting of a bottle, A, provided with a plug, B, having a small opening in it protected by the spring-cap C, and one or more wings, D, designed to hold a sponge, substantially as and for the purpose specified.

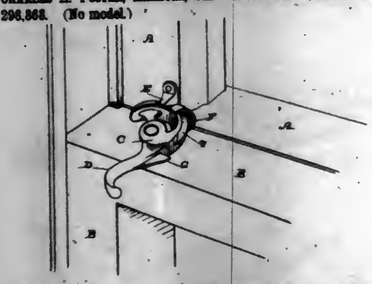
2. A slate-cleaner and pencil-sharpener consisting of a bottle, A, provided with a plug, B, having a small opening in it protected by the spring-cap C, one or more wings, D, designed to hold sponges, the pencil-holder G, and sharpening-plate I, attached to the bottle, substantially as and for the purpose specified.



402,815. APPARATUS FOR MAKING WOOD-AND-WIRE FENCE. MILLARD F. PINE, Middletown, Md. Filed Mar. 23, 1888. Serial No. 304,442. (No model.)

Claim.—1. In combination, parallel bars moving toward and from each other, shuttle-arms projecting inwardly from each bar, coupling-connections for securing the bars together, and operating-treadles connected to the said bars for giving them movement, substantially as described.

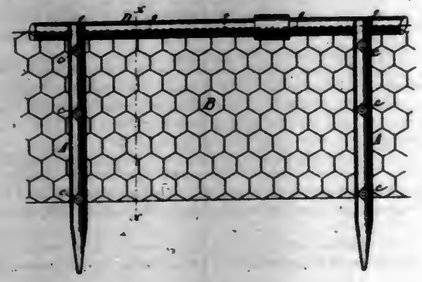
2. In combination, parallel bars A A', shuttle-arms extending from said bars inwardly, laterally-extending arms B, connected to said bars A, couplings connecting said arms, and means for operating the bars A to move them from and toward each other, substantially as described.



3. In combination with the described weaving device, a tension device for the wires, consisting of a bar having perforations arranged

402,815.

in pairs and a second bar adjustably held to the first bar, substantially as described.

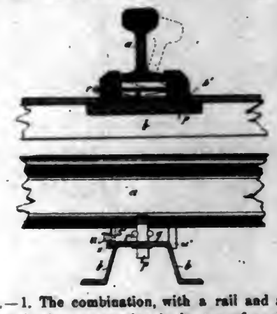


402,816. FASTENER FOR THE MEETING-RAILS OF SASHES. CHARLES H. FOSTER, Alameda, Cal. Filed Feb. 6, 1889. Serial No. 298,868. (No model.)

Claim.—1. The cam or eccentric pivoted horizontally upon the top and at one side of the lower sash and having the double-inclined V-shaped periphery, in combination with the plates secured to the upper sash and having the wide V-shaped notches which are engaged by the cam, substantially as described.

2. The cam pivoted horizontally upon the top of the lower sash and having the inclined V-shaped periphery, the correspondingly grooved or notched locking-plates secured to the upper sash, the inclosing guard or plate F, and the lug or projection from the handle of the cam, adapted to arrest the cam by contact with the guard-plate, substantially as herein described.

402,817. FENCE. EDWIN GILBERT, Georgetown, Conn., assignor to the Gilbert & Bennett Manufacturing Company, same place. Filed Feb. 25, 1889. Serial No. 301,044. (No model.)



402,817.

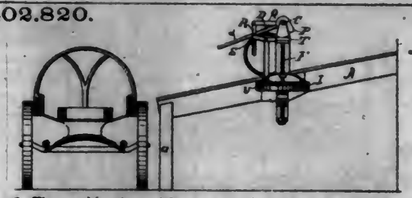
Claim.—A fence comprising tubular posts slotted longitudinally and having hollowed-out portions at their upper ends, a wire-fence web arranged in said slots, and a top rail slotted longitudinally to receive the wire web and arranged in said hollowed-out portions of the posts and secured to the posts, substantially as specified.

402,818. SECURING RAILS TO IRON SLEEPERS WITH IRON CRAMPS. KARL L. GOEHT, Chemnitz, Saxony, Germany. Filed Sept. 29, 1888. Serial No. 286,750. (No model.)

Claim.—1. The combination, with a rail and an inverted-U-shaped sleeper, having an opening in its top, of a chair projecting through the said opening beneath, a frame beneath the rail, and means for locking the frame to the chair, substantially as described.

2. The combination, with the rail *a* and the sleeper *b*, having the opening *b'*, of the chair *p*, fitted in said opening and adapted to embrace the base of the rail, the frame *q*, intervening the chair and the base of the rail, and having the projections *u u'*, the latter engaging one side of the sleeper, the split pin *s*, entering the projection *u* and preventing displacement of the frame, and the pin *r*, for securing the frame in the chair, substantially as shown and described.

402,819. AXLE BOX AND SPINDLE. FRANK P. GORDON, Robinsonville, Pa. Filed Jan. 17, 1889. Serial No. 296,621. (No model.)



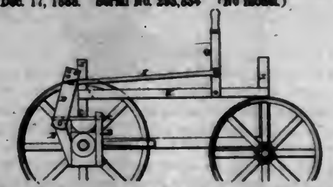
Claim.—1. The combination, substantially as described, of the outwardly-tapered axle-box provided at its inner end with a shouldered recess and on its outer end with a thread and nut, the spindle tapered to fit the box and provided on its inner end with an adjustable shouldered collar and on its outer end with an adjustable collar tapered to correspond with the taper of the spindle and with a threaded stud, and a nut fitting the threaded stud of the spindle and provided on its inner face with a circular inturned flange bearing against the nut of the axle-box, but of greater internal diameter than the external diameter of the outer threaded end of said box.

2. In combination with a hub, A, an axle-box, B, having shoulders *b* and *b'*, said box being externally screw-threaded at its outer end, and a nut for securing said box within the hub, the spindle made up with a tapered portion, D, the outer end thereof being reduced for the reception of a conical collar, E, and threaded so that the securing-nut can be attached thereto, a collar, H, having shoulders G' and *h*, formed thereon and secured to the spindle by internal screw-threads, the parts being organized substantially as shown, and for the purpose set forth.

402,820. APPARATUS FOR COUNTING PACKAGES. MATHEW GOTTFRIED, Chicago, Ill. Original application filed Jan. 24, 1885, Serial No. 153,818. Divided and this application filed Mar. 19, 1888. Serial No. 267,610. (No model.)

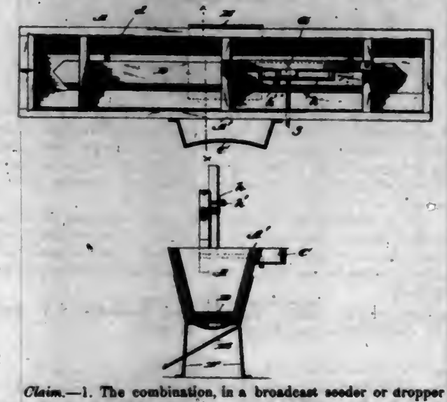
Claim.—1. The combination, with a way or chute for vessels or packages, of a rock-shaft adapted to be operated by the size or weight of the passing vessel, cam devices adapted to be operated from said rock-shaft, markers adapted to be operated by said cam devices, a rotating stand or table, and means for rotating the same, substantially as described.

402,820.



2. The combination, with a way or chute for vessels or packages, of a rock-shaft adapted to be operated by the size or weight of the passing vessel, cam devices adapted to be operated from said rock-shaft, markers adapted to be operated by said cam devices, a rotating stand or table and means for rotating the same, and a card adapted to receive the imprint from said markers, substantially as described.

3. The combination, with a way or chute for vessels or packages, of a rock-shaft adapted to be rocked by the passage of the vessel, and a recording device comprising an oscillating arm, markers carried thereby, a rotating stand or table and means for rotating the same, and a movable card to receive the imprint of the markers, substantially as described, and for the purpose set forth.

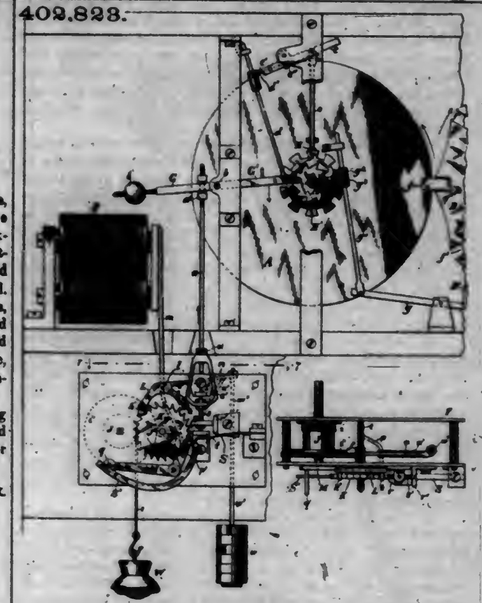


4. In an apparatus for counting vessels or packages, a recording device comprising markers, a cam for operating the markers, a card to receive the imprint, a rotating stand or table, and mechanism for rotating the stand or table, substantially as described.

402,821. WAGON-BRAKE. WILLIAM S. GRIFFIN, Atlanta, Tex. Filed Dec. 17, 1888. Serial No. 293,534. (No model.)

Claim.—The combination of the rear axle, the support B, secured thereto, the brake D, pivoted upon the support, the rod F, lever G, the standards, and the supporting-rod H, upon which the lever G is pivoted, substantially as shown.

402,822. BROADCAST SEED-SOWER. WILLIAM D. GOSEHAN, Morgantown, W. Va. Filed Feb. 23, 1889. Serial No. 301,469. (No model.)



Claim.—1. The combination, in a broadcast seeder or dropper adapted to be carried by the operator, a plate, E, secured to the seed-box, said plate being bent to project the forward end thereof in front of the hopper, substantially as shown, and for the purpose set forth.

2. The combination, in a seed-dropper, of a seed box or hopper and means for operating the seed-slide, a bail, C, attached near the upper end of the seed-box, an inclined plate, E, attached to the seed-box beneath the bail C, said plate E being bent to project the forward end thereof in front of the seed-box, and legs F F, attached near the ends of the seed-box, said legs having outwardly-turned feet, the parts being organized substantially as shown, and for the purpose set forth.

402,828. ELECTRIC CLOCK. EMIL G. HAMMER, Brooklyn, N. Y. Filed Sept. 11, 1883. Serial No. 285,116. (No model.)

Brief.—Operated by an ordinary motor and the escapement controlled by an electro-magnet.

402,828.

Claim.—1. In a clock-work mechanism, the combination, with an escape-wheel, its motor, and a vibrating anchor for controlling its movement, of an impulse-tooth (distinct from said anchor) mounted to move tangentially, or approximately so, to said escape-wheel and to be displaced and released by the successive teeth thereof in their passage, whereby successive impulses are communicated to said impulse-tooth from said escape-wheel.

2. In a clock-work mechanism, the combination, with an escape-wheel, a motor imparting to said wheel a tendency to revolve, a vibrating anchor having pallets alternately engaging with the escape-teeth and serving as a stop to check the rotation of the escape-wheel, and an electro-magnet or equivalent controlling device for vibrating said anchor and thereby determining the movements of the escape-wheel, of an impulse-tooth mounted to move tangentially, or approximately so, to said escape-wheel, and to be displaced and released by the successive teeth thereof in their passage, whereby successive impulses are communicated to said impulse-tooth from said escape-wheel.

3. In a clock-work mechanism, the combination, with an escape-wheel, its motor, and a vibrating anchor for controlling its movement, of a sliding staff and an impulse-tooth carried thereby and arranged to be successively engaged and lifted by the teeth of said escape-wheel.

4. In a clock-work mechanism, the combination, with an escape-wheel, its motor, and a vibrating anchor for controlling its movement, of a sliding staff, an impulse-tooth carried thereby and arranged to be successively engaged and lifted by the teeth of said escape-wheel, and a push-rod arranged to receive the motion of said staff.

5. In a clock-work mechanism, the combination, with an escape-wheel, its motor, and a vibrating anchor for controlling its movement, of a sliding staff, an impulse-tooth carried thereby, and consisting of a plate having a flat side and a parallel guiding-face engaging said flat side for preventing the rotative displacement of the impulse-tooth.

6. In a clock-work mechanism, the combination, with an escape-wheel, its motor, and a vibrating anchor for controlling its movement, of an impulse-tooth arranged to be displaced successively by the teeth of said escape-wheel, and a spring arranged to exert a tension against said impulse-tooth in the direction of the impulse or displacement effected by the escape-wheel.

7. In a clock-work mechanism, the combination, with an escape-wheel, its motor, its restraining-anchor, and a controlling device for vibrating said anchor, of an impulse-tooth acted on by the escape-teeth, a spring arranged to exert a tension against said impulse-tooth in the direction of the impulse imparted to it by the escape-wheel, and a movable pin or shoulder connected to and moving coincidently with said anchor and arranged to press against said spring and thereby reduce its effective tension when the escape-wheel is inactive and to release the spring at the instant when the escape-wheel imparts its impulse to said impulse-tooth.

8. In a clock-work mechanism, the combination, with an escape-wheel, its motor, its restraining-anchor, and a controlling device for

vibrating the anchor, of an impulse-tooth acted on by the escape-teeth, a spring arranged to exert a tension against said impulse-tooth in the direction of the impulse, an arm forming an extension of said spring, and a movable pin or shoulder connected to and moving coincidently with said anchor and arranged to press against said arm and reduce the tension of the spring when the escape-wheel is inactive and to release the spring at the instant when the escape-wheel imparts its impulse.

9. In a clock-work mechanism, the combination, with an escape-wheel, its motor, its restraining-anchor, and a controlling device for vibrating said anchor, of an impulse-tooth acted on by the escape-teeth, a spring arranged to exert a tension against the impulse-tooth in the direction of the impulse, and a movable pin or shoulder connected to and moving coincidently with said anchor, and arranged to press against said spring and reduce its effective tension when the escape-wheel is inactive, and to release said spring upon the releasing vibration of the anchor and to partially release the spring before the release of the escape-wheel, whereby the spring commences to exert its effective tension before the impulse is given.

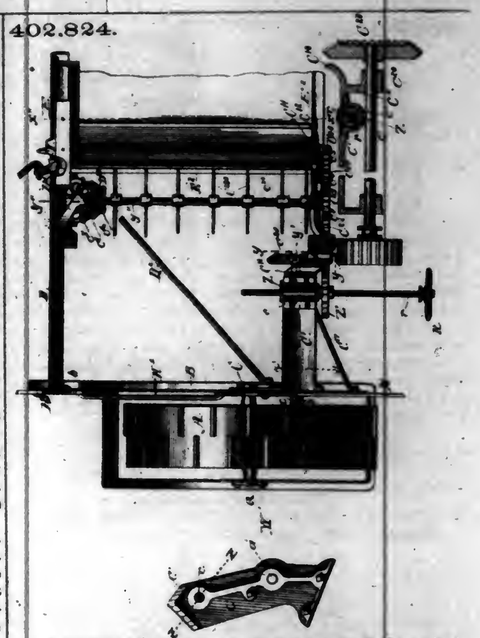
10. In a clock-work mechanism, the combination, with an escape-wheel, its motor, its restraining-anchor, and an impulse-tooth acted on by the escape-wheel, of a spring arranged to exert a tension against the impulse-tooth in the direction of the impulse, a retractile weight connected to said spring and acting to reduce its effective tension, and an electro-magnet or equivalent controlling device connected to said anchor and adapted when operated to vibrate the latter, and thereby release the escape-wheel, and to relieve the tension of said weight upon said spring, and thereby enable the spring to exert its tension upon the impulse-tooth at the time of the impulse.

11. The combination, with an escape-wheel, its motor, its restraining-anchor, an impulse-tooth acted on by the escape-wheel, and a spring arranged to exert a tension against the impulse-tooth in the direction of the impulse, of an electro-magnet, a retracting-weight acting against said magnet upon said anchor, a movable pin or shoulder arranged to act upon said spring and connected to said retractile weight, whereby it communicates the tension of said weight to said spring in opposition to the tension of the latter, and a connection between the magnet and said spring, whereby upon the action of the magnet the pin is retracted from said spring.

12. The combination, with an escape-wheel, its motor, its restraining-anchor, and an impulse-tooth acted on by the escape-wheel, of a spring, S, and its arm S', a pin or shoulder, q, a retractile weight arranged to press down said pin or shoulder against the tension of said spring, and an electro-magnet with its armature connected to said anchor, pin, and weight.

13. The combination, with a dial, of a ratchet-wheel connected thereto, an actuating-pawl mounted to reciprocate against the teeth of said wheel, and a lock entering notches and adapted to hold said dial stationary, with a mechanism for withdrawing said lock during the actuating-stroke of said pawl, consisting of a coacting tooth and pawl, the one connected to said actuating-pawl and the other to said lock and arranged so that the tooth shall displace and pass and release said pawl during the actuating-stroke.

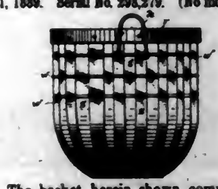
14. The combination, with a dial, of a ratchet-wheel, A', a lever, G, a pawl, G', for acting on said ratchet-wheel, a locking-bolt, H, entering notches connected with said dial, a rock-lever, *e*, connected to said bolt, and a tooth, *d'*, connected to said lever G and adapted during the actuating movement to displace said lever *e* and thereby withdraw said bolt, and subsequently to release said lever *e* and thereby leave the bolt free to enter the succeeding notch.



15. The combination of a unit-dial, a clock-work mechanism for imparting a step-by-step rotation thereto, a second dial for indicating higher numbers, a tooth carried by the first dial and adapted to enter notches in and thereby to turn the second dial, and a lock adapted to hold said second dial stationary with a tooth carried by the first dial and a tooth connected to said lock and adapted to be displaced by said dial-tooth to release said lock.

402,824. HARVESTING-MACHINE. PAUL HAMSON, St. Paul, Minn. Filed Sept. 5, 1887. Serial No. 248,903. (No model.)

Claim.—1. In combination with the drive-wheel, the wheel-frame, the finger-bar secured to said frame below the level of the drive-wheel axle and extended rigidly grainward, the bracket C, secured to the wheel-frame and extended first upward and then grainward, the platform-frame having the front sill on the finger-bar and the rear sill secured to the elevated and horizontally-extended part of the bracket C considerably higher than the axle, substantially as set forth.



2. In combination with the wheel-frame, the finger-bar and the bracket C, both secured to the wheel-frame, and the latter having a horizontal extension grainward, the braces C' and D' extending from the inner side of the wheel-frame, the former upward and grainward to the horizontal extension of the bracket, and the latter forward and grainward to the finger-bar to constitute said parts a unitary rigid structure, substantially as set forth.

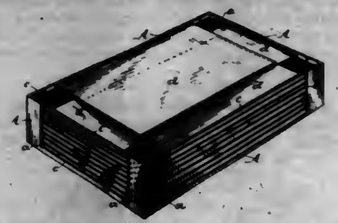
402,824.

3. In combination with the frame which encircles the drive-wheel, a bracket secured to such frame and extended upward and grainward therefrom, having a bearing for the drive-wheel axle and for the main driving-pinion shaft, and the conveyer-platform frame having its rear sill secured to the grainward end of said bracket, substantially as set forth.

402,825. BASKET. GEORGE B. HIGGINS, North Indianapolis, Ind. Filed Jan. 31, 1889. Serial No. 298,279. (No model.)

Claim.—1. The basket herein shown, composed of a series of vertical splints, *s*, interwoven with wires *w* passing under one splint and over the next about the body of the basket, the ends of the splints turned inward at the bottom and secured between the outer and inner bottom pieces, *b b'*, by nails or rivets, substantially as shown and described.

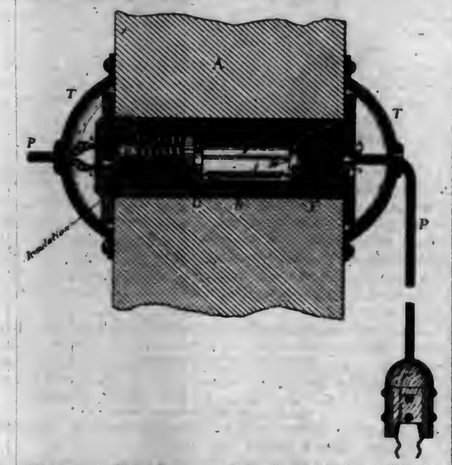
2. A basket composed of vertical splints *s*, forming the body thereof, wires *w*, interwoven with such splints, the tops secured to an outer rim, *r*, and the lower ends of the splints curved together and secured to one or more bottom pieces, substantially as shown and described.



402,826. CRATE. MARBLE B. HOAG, Mecklenburg, N. Y. Filed Jan. 25, 1889. Serial No. 297,581. (No model.)

Claim.—1. A packing-crate composed of two end frames, each comprising one horizontal and two vertical cleats beveled on their inner faces and having their adjacent ends mitered together, in combination with the side, end, and bottom slats nailed to the outer faces of said cleats and thereby connected to form the body of the crate, substantially as set forth.

2. A nest of three packing-crates of equal size and constructed of longitudinal side and bottom and transverse end slats secured to substantially V-shaped end frames, one of said crates being placed between or within the two others, with the ends of the inner crate bearing against the bottoms of the outer crates and the bottom and top edge of the inner crate bearing against the sides of the outer crates, which are thereby braced and strengthened, substantially as set forth.



402,827. PACKAGE FOR PHOTOGRAPHIC PLATES. DE WITT C. HOOVER, Buffalo, N. Y., assignor of one-half to Reubin J. Getz, same place. Filed Sept. 26, 1888. Serial No. 286,302. (No model.)

Claim.—1. The combination, with a box having slits or openings, of a piece of twine or other flexible material passing through said slits or openings alternately inside and outside of the box, forming a series of layers within the box, one above the other, on opposite sides of which the photographic plates are arranged, substantially as set forth.

2. The combination, with a packing-box having slits or openings at or near its corners, of a piece of twine or other flexible material passing through said slits or openings alternately around the outside of the packing-box between the corner portions thereof and inside of the box at or near its corners, forming a series of layers within the box, one above the other, on opposite sides of which the photographic plates are arranged, substantially as set forth.

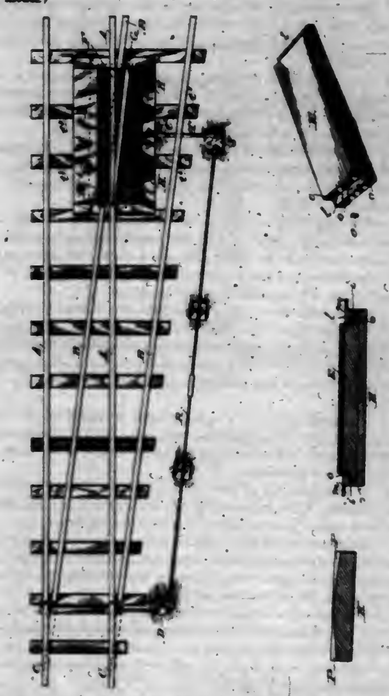
402,828. CIRCUIT-CLOSER FOR RAILWAY-CAR TELEGRAPHS. GEORGE I. HOPKINS, Manchester, N. H. Filed Jan. 11, 1887. Renewed Oct. 19, 1888. Serial No. 288,614. (No model.)

Claim.—1. In a railway-car-telegraph system, the combination, with a pair of insulated electrical conductors united in a single cord, of contact-springs joined to the said conductors, and a fixed conductor located in the path of the said springs, the latter being adapted, when the conductors are moved longitudinally, to be brought into contact with the said fixed conductor, as and for the purpose set forth.

2. The combination, with the plug E, rods *i i*, springs *e e*, and cap C, of the coiled wires *j j* and the spring *k*, as and for the purpose set forth.

3. The combination, with the tube B, of the movable insulating-block E and the fixed insulating-block F, the rods *i i*, the springs *e e*, the cap C, and the coiled wires *j j*, as and for the purpose set forth.

4. The combination, with the cord P and its contained conductors, the tube B, caps C and D, and insulating-plugs E and F, connected by the coiled wires *j j*, the said plugs supporting the rods *i i* and the springs *e e*, of the caps T T, for protecting the parts from dust.



402,829. COUPLER FOR ELECTRIC CONDUCTORS. GEORGE I. HOPKINS, Manchester, N. H. Filed Jan. 11, 1887. Renewed Oct. 31, 1887. Again renewed Oct. 19, 1888. Serial No. 288,613. (No model.)

Claim.—1. In a coupler for electrical conductors, the combination, with the halves A A', of the springs H H', rectangular pieces G, with which the springs H are normally connected, and the conductors *o o'*, the former being joined to the rectangular pieces G and the latter to both the springs H and H', together with means operated by the joining of the halves for breaking the connection between springs H and rectangular pieces G, substantially as set forth.

2. The combination, with the coupling-halves A A', springs H H', and rectangular pieces G, of insulating-blocks I, adapted to be moved by the springs H H' when the halves are coupled, the said blocks being secured to extensions of the springs H, as and for the purpose set forth.

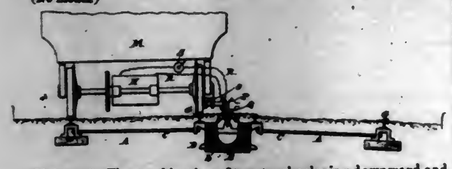
402,830. SLIDING RAILROAD-FROG. FRED J. HOTZ, Chicago, Ill., assignor, by mesne assignments, to the Hoyt Frog and Crossing Company, same place. Filed July 31, 1888. Serial No. 281,528. (No model.)

Claim.—1. In combination with the rails of a main and side track, a sliding frog consisting of a tongued plate provided with a main and a side rail section, the ends of said sections beveled to form an oblique joint with the rails, a case to hold said plate having grooves and flanges, friction-rollers between said plate and case, and a switch mechanism, substantially as described.

2. The tongued plate provided with the main and side rail sections and friction-rollers, in combination with the case to hold the said plate, and provided with the flanges and grooves, substantially as and for the purpose described.

3. The tongued plate provided with the rail-sections and friction-rollers, in combination with the grooved case provided with corrugations, substantially as and for the purpose described.

402,831. ATOMIZER-NOZZLE. WILLIAM HOSENBOOT, Brooklyn, N. Y. Filed Dec. 8, 1888. Serial No. 292,961. (No model.)



Claim.—A nozzle for atomizers provided with a central longi-

402,831.

tudinal channel, and one or more inclined air-channels communicating with said longitudinal channel, substantially as set forth.

402,832. ELECTRIC RAILWAY. RUDOLPH M. HUNTER, Philadelphia, Pa. Original application filed Dec. 15, 1888, Serial No. 293,665. Divided and this application filed Mar. 21, 1889. Serial No. 304,167. (No model.)

Claim.—1. The combination of two tracks sloping downward and away from each other, with a slotted conduit arranged between them at the highest part, and one or more electrical conductors arranged within the conduit.

2. The combination of a slotted conduit, having iron yokes and slot-irons, with two tracks in which the adjacent rails of each track are secured to the conduit-yokes, and ties between the slot-irons and yokes or rails.

3. The combination of a slotted conduit, having iron yokes, with two tracks in which the adjacent rails of each track are secured to the conduit-yokes, and ties connecting the outer rails of the respective tracks with the yokes or inner rails supported thereby.

4. The combination of two railway-tracks with a conduit arranged between them, having two slots and a single drainage-compartment at the lower parts, and an insulated electrical conductor corresponding to each slot.

5. The combination of two railway-tracks with a conduit arranged between the adjacent rails, said conduit having two slots and two compartments in its upper part and a single drainage-compartment in its lower part, and a bared electric conductor in each of said compartments and insulated from the conduit.

6. The combination of two railway-tracks, a slotted conduit arranged between them, an electric conductor within said conduit, a traveling vehicle, and a current-collecting device carried by the vehicle upon the axles or their boxes independent of the car-body and outside of its wheel-base and making contact with the conductor within the conduit.

7. The combination of a railway-track arranged on an incline, so as to bring one rail higher than the other, with a slotted conduit having an electric conductor arranged to the outside of the track and adjacent to the highest rail.

8. The combination of two railway-tracks, a slotted conduit arranged between them and mechanically connected to the said tracks, and one or more electric conductors within the conduit.

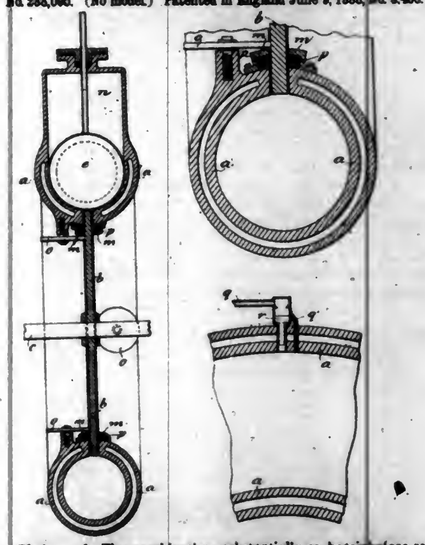
9. In an electric-railway conduit, the combination of two upper compartments having slots, and a single lower drainage-compartment common to both upper compartments, and an electric conductor within each of said upper compartments.

10. An electric-railway conduit formed of a series of yokes united by side slot-irons, E, and a central slot-iron, F, and having the lower part formed of concrete or its equivalent, and an electric conductor within the conduit and located within the space bounded by each of the slot-irons E and F.

11. An electric-railway conduit formed of a series of yokes united by side slot-irons, E, and a central slot-iron, F, and having the lower part formed of concrete or its equivalent, an electric conductor within the conduit and located within the space bounded by each of the slot-irons E and F, in which the central slot-iron, F, forms an electric conductor.

12. An electric-railway conduit formed of the yokes having united side slot-irons, E, and central slot-iron, F, which also forms an electric conductor, and two separate insulated conductors connected to the side slot-irons.

13. An electric-railway conduit formed of the yokes combined with uniting side slot-irons, E, and central slot-iron, F, which also forms an electric conductor.

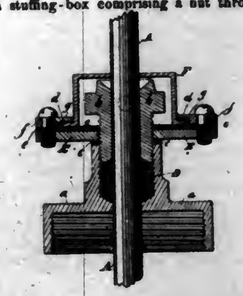


402,833. VEHICLE-SPRING. EDWARD HUTCHINSON, New York, N. Y. Filed Sept. 26, 1888. Serial No. 286,306. (No model.)

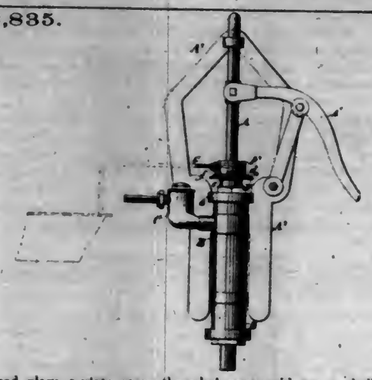
Claim.—1. A spring consisting of two leaves, the lower leaf shorter than the upper leaf, the lower leaf provided with upwardly and inwardly curved recessed ends, and the upper leaf provided with a concaved central portion and horizontal ends, and a guide secured at one end beneath the extremities of the upper leaf, the free end of the guide-plates sliding in the recess of the lower leaf, substantially as shown and described.

2. In a vehicle-spring, the combination, with the lower leaf having upwardly and inwardly curved approaching recessed ends, of an upper leaf of greater length provided with a central concaved portion and horizontal end portions, and a guide-plate secured at one end to the under face of the upper leaf at the extremities, the free end of said guide-plates sliding in the recesses of the lower leaf, substantially as shown and described.

402,834. ROTARY ENGINE. WILLIAM H. HUTCHINSON, Silverdale, Eastbourne, County of Sussex, England. Filed Oct. 15, 1888. Serial No. 288,095. (No model.) Patented in England June 9, 1888, No. 8,466.



Claim.—1. The combination, substantially as hereinbefore set forth, of the annular chamber *a*, the thin disk *b*, projecting through a slot in the annular chamber *a*, the piston *d*, secured to the disk and located within the annular chamber, the valve-chamber *n*, the slide-valve *e*, steam entrance and exit ports on each side of the valve *e*, the packing around the slot in the annular chamber, through which the disk *b* extends, and the steadying-wheels *o*, arranged on opposite sides of the disk outside of the annular chamber and near the edge or periphery of the disk.



2. The combination, substantially as hereinbefore set forth, of the annular chamber *a*, the disk *b*, the piston *d*, secured thereon, the oil-supply pipes *q q'*, and the piston *r*, adapted to close the pipe *q'* to stop the flow of oil to the annular chamber when it is filled with steam, but to allow the flow of oil thereto when the steam is exhausted.

402,835. PUMP. THOMAS J. IVANS, New York, N. Y. Filed Feb. 11, 1889. Serial No. 299,374. (No model.)

Claim.—1. In a pump, the combination, with a chamber and a piston-rod, of a stuffing-box comprising a nut through which said

402,835.

piston-rod plays, a plate screw-threaded upon said nut, a shell detachably secured to said plate, said shell constituting a chamber into which the upper portion of said nut extends, and a waste-pipe leading from said chamber, substantially as specified.

2. In a pump, the combination, with a chamber and a piston-rod, of a stuffing-box comprising a nut through which said piston-rod plays, the plate E, screw-threaded upon said nut, the shell F, the washer *e* between said shell and the plate, the securing device *f*, and the waste-pipe G, substantially as specified.

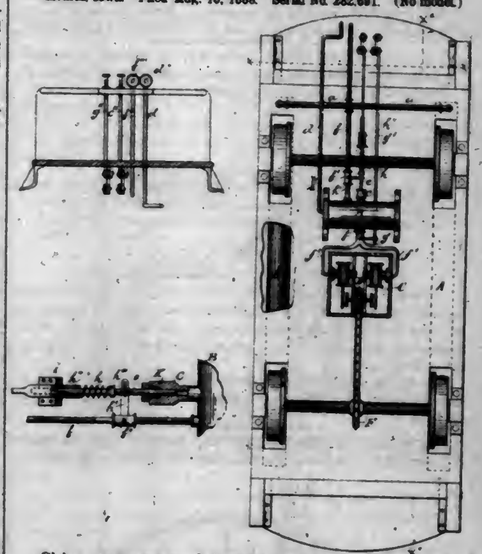
402,836. INSULATOR AND HOLDER FOR ELECTRIC RAILWAYS. BYRON JENNINGS, San José, Cal. Filed Feb. 1, 1889. Serial No. 298,357. (No model.)

Claim.—1. The hood formed to fit against the yokes or supports to which it is attached, having a channel or opening longitudinally through it, with inwardly-turned flanges at the bottom, in combination with the channeled two-part insulators having the lugs or stops G at one end, substantially as described.

2. The hood channeled longitudinally and having the inwardly-turned flanges, the two-part insulators fitting within said channel and having the grooves adapted to clasp the flange of the rail, which is held by them, and lugs I, formed transversely upon the top of the insulators, in combination with the bolt passing through the side of the hood and the plate which lies between the lugs upon the insulators, substantially as described.

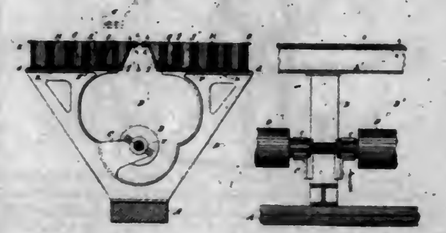
3. The hood having one side adapted to fit against the yokes or supports to which it is bolted, a longitudinal channel through the hood having inwardly-turned flanges at the bottom, the two-part insulators fitting said channels and having grooves in their adjacent faces, into which the flange of the rail fits, and the intermediate elastic lining fitted into the channels between the rail and the insulator, the transverse lugs I upon the top of the insulator, and the bolt, with an extension or plate which lies between these lugs when the bolt is in place to secure the hood to the yoke, substantially as described.

402,837. INKSTAND. GEORGE R. G. JONES, Louisville, Ky. Filed July 31, 1886. Renewed Sept. 6, 1888. Serial No. 284,770. (No model.)



Claim.—1. As a new article of manufacture, an inkstand consisting, essentially, of a cylindrical inclosing-shell having a series of angular integral beads on its inner face, formed by indenting or creasing said shell at suitable intervals, and the observation-slots formed between each pair of beads, a series of endless belts, each of which is fitted between two adjoining beads and adapted to be independently turned therein to expose the inscription on its face through one of the observation-slots, and one or more ink-wells suspended within the shell from the cover thereof, substantially as described.

2. As a new article of manufacture, an inkstand consisting of a cylindrical inclosing-shell having a series of annular beads on its inner face, and the observation-slots formed at points between the beads, a series of endless belts, each having its edges fitted between two adjoining beads to be capable of turning therein independently of the other belts of the series, the bottom plate united to the lower open end of the shell, a top plate secured to the upper end of the shell and having an integral perforated flange, b^3, and a series of ink-wells suspended within the shell from the top plate thereof, substantially as described.



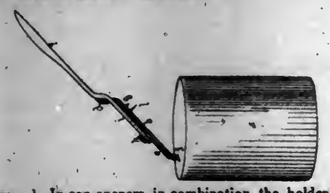
3. As a new article of manufacture, an inkstand having a top plate provided with three openings, arranged as described, the ink-wells inserted in said openings, and a cover having three integral sections or members arranged at the angles of an equilateral triangle and each conforming substantially in external contour to the ink-wells, whereby the cover is adapted to be removed bodily from the ink-wells or to be adjusted over all or any two of the ink-wells, substantially as described.

402,838. COMPRESSED-AIR MOTOR. AXEL JORGENSEN, Des Moines, Iowa. Filed Aug. 13, 1888. Serial No. 282,691. (No model.)

Claim.—In a compressed-air motor, reservoir A, auxiliary reservoir B, engine C, governor K, provided with the spring, collar p^3, sleeve p^4, and piston-rod *e*, sprocket-wheels D and F, chain connecting the sprocket-wheel on the engine with the sprocket-wheel on the axle of the car, gage d', gage b^{rr}, valve b', valve *g*, lever g', with ratchet and spring-pawl operating said lever, and lever e^r, with ratchet and spring-pawl for operating the same, and the air-pipes connected with said main and auxiliary reservoirs, gages, and the platform for the purpose of operating a street-car and the propelling machinery, all substantially as herein described.

402,839. CONDUIT FOR DRIVING MECHANISM OF STREET-RAILWAYS. WHITCOMB L. JUDSON, Minneapolis, Minn., assignor to the Judson Pneumatic Railway Company, same place. Filed Nov. 17, 1888. Serial No. 291,174. (No model.)

Claim.—1. In underground power-conduits for surface street-railways, the combination, with supporting-yokes provided with slot-spaces, of girders secured to said yokes on the opposite sides of said slot-spaces and a combined slot-rail and paving-block support detachably connected to said girders, substantially as described.

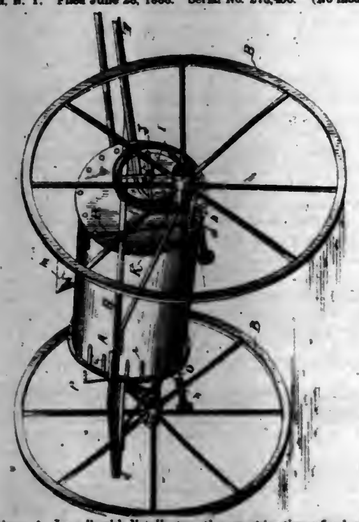


2. In underground power-conduits for surface street-railways, the combination, with supporting-yokes provided with slot-spaces, of girders secured to the top plates of the yokes on the opposite sides and slightly removed from said slot-spaces, provided with vertical flanges, and removable combined slot-rails and paving-block troughs resting upon said yokes on the opposite sides of said slot-space and provided with hook-shaped flanges engaging with the vertical flanges of said girders, substantially as described.

3. The combination, with the supporting conduit-yokes B, having slot-spaces, of the L-shaped girders F, secured to said yokes on the opposite sides of said slot-spaces, and the combined slot-rail and paving-block supports G, provided with the hook-like flange g^6, engaging with the vertical flanges of the girders F.

4. In power-conduits for street-railways, provided with a longitudinal slot, a protecting-brush mounted in the walls of said slot and spanning the same for the exclusion of snow, dirt, and dust, substantially as described.

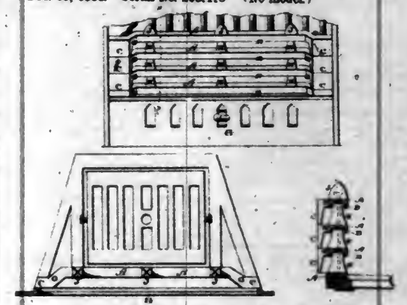
5. In power-conduits for street-railways, provided with longitudinal slots, the combination, with slot-rails provided with brush-seats on their inner opposing faces, of brushes mounted in said seats, having their filaments interlacing across said slot, substantially as described.



402,840. CAN-OPENER. JOHN KAYLOR, Decatur, Ill., assignor to Geo. W. Lehman and Arthur O. Bolen, same place. Filed Sept. 29, 1888. Serial No. 286,731. (No model.)

Claim.—1. In can-openers, in combination, the holder comprising the circular bearing *b*, having handle *d* and penetrating-points on its under surface, and the arm *i*, pivoted to the bearing at the center thereof and having the cutter *l*, adapted to swing inside the bearing, as set forth.

2. In combination with the holder having the pivot-pin with an elongated head, the cutter-arm having slots adapted to the head, as set forth.

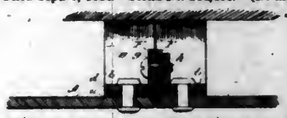


402,841. LIQUID-DISTRIBUTER. FESTUS W. KENDALL, Swartwood, N. Y. Filed June 28, 1888. Serial No. 278,456. (No model.)

Claim.—1. In a liquid-distributer, the combination of a horizontal tank carried by suitable supporting-wheels and provided with one or more discharge-pipes, a horizontal agitator-shaft extending through the interior of the tank, gearing to drive the shaft, and a series of paddles secured to and extending radially from said shaft, the outer ends of said paddles being beveled laterally on both sides and in opposite directions, and every alternate paddle in the line of rotation being beveled in the same direction and the intervening paddles beveled in the opposite direction, for the purpose set forth.

2. In a liquid-distributer, the combination, with supporting-wheels, of a cylindrical tank horizontally located between said wheels and composed of a metallic cylindrical shell, and wooden heads secured to the cylinder by bolts passed through the head and riveted to the face of the cylinder, a discharge-pipe, a horizontal shaft extending through the tank and provided with paddles, and gearing whereby the same is driven from one of the supporting-wheels, substantially as described.

402,842. GRATE. HENRY C. KERSTING, Cleveland, Ohio. Filed Dec. 13, 1888. Serial No. 293,418. (No model.)



Claim.—1. The grate or basket front composed of the bars A, provided with the flanges B upon their lower edges, in combination with the headed rods and the blocks which separate the bars, substantially as set forth.

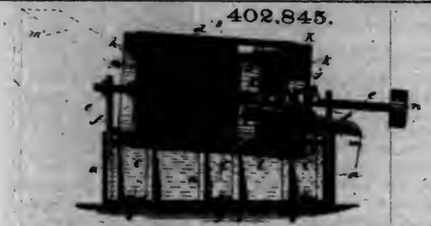
2. A grate or basket front composed of the bars A, provided with the flanges B upon their lower edges, and having their ends turned outward, as shown at O, and provided with the lips C at their turned-out ends, substantially as described.

3. A grate or basket front composed of the bars A, provided with the flanges B upon their lower edges, in combination with the rods which connect the bars together, and which bars are provided with the turned-out ends O and lips C, substantially as specified.

402,843. DOOR-HANGER TRACK. JOHN G. LANE, Poughkeepsie, N. Y. Filed Sept. 3, 1888. Serial No. 284,461. (No model.)

Claim.—Combined with the rail and bracket, both having non-circular holes, the soft-iron round rivet, fitted, after its insertion in the holes, by the upsetting action to the same, substantially as described.

402,844. CORDED OR ELASTIC FABRIC. WILLIAM LAPWORTH, Hopedale, Mass., assignor to the Hopedale Elastic Fabric Company, same place. Filed Dec. 8, 1888. Serial No. 293,002. (Specimens.)

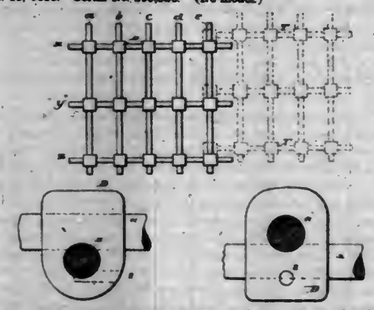


Claim.—A fabric composed of double and of single fabric extended parallel to the length thereof, the double portions of the fabric containing between its two woven plies a cord or rubber warp to aid in constituting a rib, the longitudinal single portion of the fabric between adjacent double portions containing also a cord or rubber warp, as described, which is covered at bottom and top by only the weft employed to unite the threads constituting both the double and the single portions of the fabric, substantially as described.

402,845. GRAVEL-SCREEN. JOHN D. LOUGHRAN, Neosho Falls, Kans. Filed Oct. 12, 1888. Serial No. 287,901. (No model.)

Claim.—1. In a sand and gravel screen, the combination, with a tank, of a revolving screen mounted within the same upon the slanting shaft *e*, the strengthening-ring *k'* near the lower end of the screen, the flanged ring K at the lower end of the screen, divided to form the buckets *k*, the longitudinal ribs *i i*, uniting the rings *k'* and K, and screen receptacle or chute *m*, secured to the slanting shaft *e* within the revolving screen, and a chute for feeding the material to the screen, substantially as shown and described.

402,845.



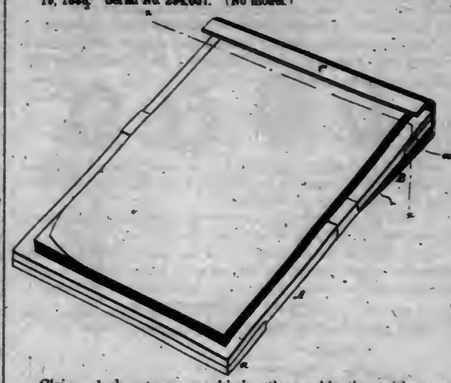
2. In a sand and gravel screen, the combination, with a tank, of a revolving screen mounted within the same upon the slanting shaft *e*, the strengthening-ring *k'* near the lower end of the screen, flanged ring K at the lower end of the screen and divided to form the buckets *k*, the longitudinal ribs *i i*, uniting the rings *k'* and K, the screen receptacle or chute *m*, secured to the slanting driving-shaft *e*, the worm conveyer *l*, secured to the lower end of shaft *e*, directly over the screen-chute *m*, and a chute for supplying the material to the screen, substantially as shown and described.

402,846. BURIAL-CASKET LID. GEORGE W. MOORMAN, Edinburg, assignor of one-half to Milton F. Maddox, Indianapolis, Ind. Filed Aug. 4, 1888. Serial No. 281,937. (No model.)

Claim.—The combination, with the body of a casket, of a casket-lid consisting of two sections, one of which is connected to the body of the casket by folding supports which are arranged to support the lid above the body of the casket and the other of which is arranged to slide longitudinally beneath the first section when raised, substantially as and for the purpose specified.

402,847. GRATING. DONALD MCDONALD, Louisville, Ky. Filed Dec. 13, 1888. Serial No. 293,528. (No model.)

Claim.—1. A grating composed of round bars of metal gained and intersecting each other, and couplings D covering the joint, substantially as shown and described.

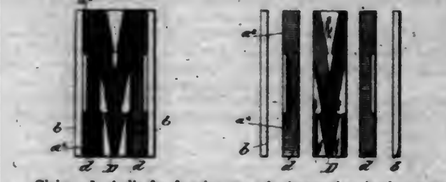


2. A grating composed of round bars of metal, one of which is cut or gained and intersected by the other, a coupling, D, covering the joint, and a key, S, locking the uncut bar, substantially as shown and described.

3. A grating composed of the vertical bars *a c e*, horizontal bars *x* and *z*, the vertical bars *b* and *d* alternating with *a c e*, and the horizontal bar *y* alternating with *x* and *z*, and couplings D, the said bars being gained and put together in the order of their mention, substantially as described.

402,848. PROCESS OF PRECIPITATING NITROGENOUS COMPOUNDS FROM IMPURE WATERS. MARTIN MARMIER, Schoenebeck-on-the-Elbe, Prussia, Germany. Filed Mar. 18, 1886. Renewed Mar. 1, 1889. Serial No. 301,723. (No specimens.) Patented in Germany May 24, 1884, No. 31,864; in England Oct. 14, 1884, No. 13,588; in Belgium Mar. 2, 1885, No. 68,046; in France Aug. 3, 1885, No. 167,840, and in Austria-Hungary Aug. 8, 1885, No. 13,826 and No. 41,572.

Claim.—The process of precipitating nitrogenous compounds in solution from the drainage-waters of towns, waste waters of manufactures, and deleterious potable water, by mixing with the said impure water lime, soluble salts of aluminium, and hydrate of silicic acid, substantially as described.

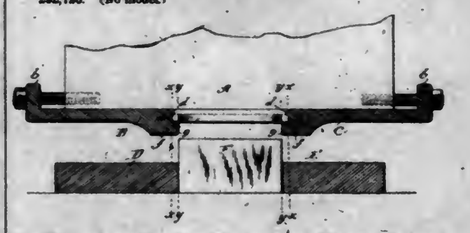


402,849. BINDER. ASA K. OWEN, Lake Geneva, Wis. Filed Dec. 19, 1888. Serial No. 294,037. (No model.)

Claim.—1. In a temporary binder, the combination, with a support, of a spring-clasp extending from the back of the support over the edge thereof and parallel with the face of the support, substantially as specified.

2. In a binder, the combination, with the board A, of the clasp B, formed of a plate bent at right angles, returned parallel with itself, and hinged to the back of the board A, and the spring D, secured to the back of the board A and arranged to press the clasp B rearwardly, thereby drawing the lip C toward the face of the board A, substantially as specified.

402,850. DIE FOR FORMING WOOD TYPE. WILLIAM H. PAGE and GEORGE C. SETCHELL, Norwich, Conn., assignors to the William H. Page Wood Type Company, same place. Filed Dec. 5, 1888. Serial No. 292,719. (No model.)

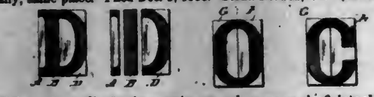


Claim.—1. A die for forming type by impression, having parts of its sides raised and parts depressed and open, substantially as described.

2. A die for forming type by impression, having parts of its sides raised and parts depressed and open, in combination with the strip *b*, adapted to close the open side.

3. Combined with the die having parts of its sides raised and parts depressed, the strip *b*, for closing the open side, of a width greater than the required distance between the type, substantially as described.

4. A die for forming type by impression, formed in sections and with portions of the depressed surface of the outer sections extending to the sides, combined with the strip *b*, for closing the open side, substantially as described.

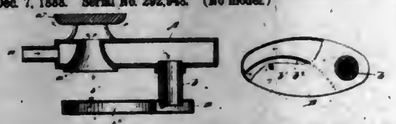


402,851. DIE FOR FORMING WOOD TYPE. WILLIAM H. PAGE and GEORGE C. SETCHELL, Norwich, Conn., assignors to the William H. Page Wood Type Company, same place. Filed Dec. 5, 1888. Serial No. 292,720. (No model.)

Claim.—In combination with means for holding the block to be operated upon in position, a plunger, a removable die having its end portions grooved, adjustable holding-jaws for the die, having inclined

lips *d*, corresponding to the grooved ends of the die, and lips *f f*, projecting under the face of the die, substantially as described.

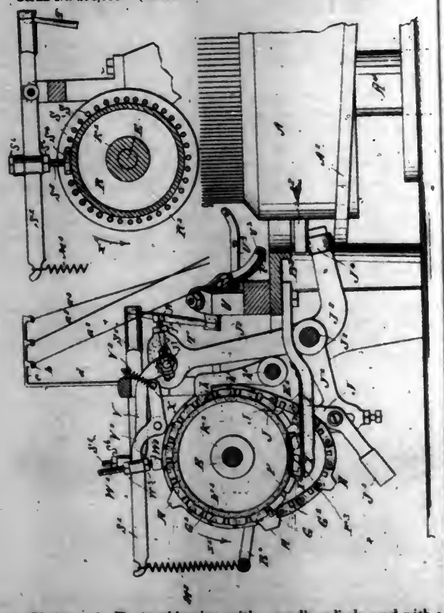
402,852. DIE FOR FORMING WOODEN TYPE. WILLIAM H PAGE, Norwich, Conn., assignor to the William H. Page Wood Type Company, same place. Filed Dec. 5, 1888. Serial No. 292,734. (No model.)



Claim.—1. A die for impressing wood, composed of detachably-connected sections, each section forming a part of the working-face of the die, substantially as described.

2. A group or set of dies for forming characters by impression with interchangeable parts, substantially as described.

3. A group of dies for letters of the alphabet, formed in sections and having one part special to each letter of the group and another part common to all letters of the group, substantially as described.



402,853. OIL-BURNER. WILLIAM R. PARKS, Palmer, Mass. Filed Dec. 7, 1888. Serial No. 292,948. (No model.)

Claim.—1. The oil-burner herein described, consisting of retort A, having flue *a'*, passing therethrough and feed-pipe *a* entering the same at one end thereof, receiver B, having vent *b'*, and provided with the diaphragm b^2, arranged therein substantially as described, and pipe *b*, connecting said receiver with said retort, combined and operating substantially as set forth.

2. In an oil-burner of the kind herein described, the combination, with the retort having a combustion-flue passing therethrough, of a receiver located beneath said retort and connected therewith by a pipe, said receiver having a vent located beneath said combustion-flue, having an interior diaphragm located between said vent and the mouth of the connecting-pipe, said diaphragm being so arranged that the oil or vapor in its passage from said pipe to said vent will be compelled to traverse the greater portion of the length of said receiver, substantially as and for the purpose described.

402,854. STRIPING ATTACHMENT FOR CIRCULAR-KNITTING MACHINES. JAMES A. PARR, Amsterdam, N. Y. Filed Mar. 21, 1887. Serial No. 231,683. (Model.)

Claim.—1. The combination, with a needle-cylinder and with a loop or stitch wheel, of thread-guides movable on a support, a cutting device composed of a fixed jaw, a pivoted jaw, and a lever pivoted on the fixed jaw and having a tongue or prong, the pivoted jaw having a spring-strip, O^2, and the tongue or prong having a spring, O^4, the levers N N', connected to the pivoted jaw, and the lever having the prong, said levers having the screws M', provided with beveled lugs M, a thread-cutter-operating wheel having a circumferential rib with apertures to receive pins on which the beveled lugs M rest, a thread-guide-operating wheel having a ratchet and mounted on the same shaft with the cutter-operating wheel, spring-actuated levers connected at one end to the thread-guides and having screws provided with beveled lugs resting on pins carried by circumferential flanges on the thread-guide-operating wheel, and a pawl-carrying lever operated by a cam-track on the cylinder, its pawl engaging the ratchet of the thread-guide-operating wheel, substantially as described.

2. The combination, with a needle-cylinder and a loop or stitch wheel, of a cam-track on the needle-cylinder, an elbow-lever operated by the cam-track, a pawl on said elbow-lever, a ratchet-wheel operated by the pawl, a pattern-wheel connected with the ratchet-wheel, a chain passed over the pattern-wheel and having lugs, a pivoted lever acted upon by said lugs, a dog resting on said lever and connected with the elbow-lever, a ratchet-wheel operated by the dog, a thread-guide-operating wheel, and a cutter-operating wheel connected with the said ratchet-wheel at opposite sides thereof and carrying pins, levers provided with beveled pieces acted upon by the pins, springs acting upon the levers, and pivoted thread-guides and thread-cutting devices connected with the said levers, substantially as herein shown and described.

3. The combination, with a needle-cylinder, a loop or stitch wheel, and a cam-track on the needle-cylinder, of an elbow-lever operated by the cam and provided with a pawl, the ratchet-wheel F revolved by said pawl, the pattern-wheel F', connected with said ratchet-wheel, the chain G, passed over the pattern-wheel and provided with the lugs H and the laterally-projecting lugs *g*, the pivoted lever V', having a beveled head on which the lugs H can act, the pin X at the other end of the said lever, the dog V, pivoted on the upper end of said elbow-lever and resting on the pin X, the ratchet-wheel W, with which the dog V engages, the wheels R and K at opposite sides of the ratchet-wheel W and connected to revolve with the same, pins in ribs on said wheels R and K, pivoted levers, beveled heads connected with said levers and pressed on the pins on said wheels R and K, thread-guides and thread-cutting devices connected with the said levers, the rocking shaft A^3, provided with arm A', having a head, *h*, on which the lugs *g* can act, the pawl *i* on the arm *w* of the shaft A^3, the auxiliary pattern-wheel *j*, on which the pawl *i* acts, the pins *l* in said ratchet-wheel, the pawl *m*, the rocking shaft *o*, on the end of which said pawl is mounted, and the pin *r* on the crank at the opposite end of said shaft, which pin *r* is below the dog V and can keep the same raised, substantially as herein shown and described.

4. The combination, with a needle-cylinder, of a lever operated by a cam on said cylinder, a series of thread-guides movable on a suitable support, a thread-guide-operating wheel having a ratchet, a pawl carried by the cam-actuated lever and engaging said ratchet, levers connected at one end to the thread-guides and having screws provided with beveled lugs resting on pins inserted in circumferential flanges on the thread-guide-operating wheel, a cutter-operating wheel connected to the thread-guide-operating wheel, levers having screws provided with beveled lugs resting on pins mounted in a flange on the cutter-operating wheel, cutting devices consisting of a fixed blade, P', a blade, O, pivoted thereon, and a lever having an intermediate prong, O^4, pivoted on the fixed blade, said lever and blade O connected to the levers supported by the pins of the thread-guide-operating wheel, and a loop or stitch wheel upon one side of which the cutting devices are arranged, substantially as described.

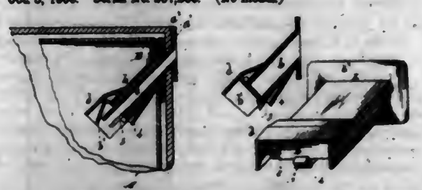
5. A thread-cutter for knitting-machines, consisting of the fixed blade P', the blade O, pivoted on the same, and the lever O', pivoted on the blade P' and having its front end terminating in a prong which is located above the edge of the fixed blade and at the side of the pivoted blade O, all combined substantially as herein shown and described.

6. A thread-cutter for knitting-machines, consisting of the fixed blade P', the blade O, pivoted to the same and having the spring O^2 secured to its side, the lever O', pivoted to the blade P' and having its front end terminating in the prong O^3, and the spring O^4, secured to the bottom edge of said prong, all combined substantially as herein shown and described.

7. The combination, with a needle-cylinder, a loop or stitch wheel, and a cam-track on the needle-cylinder, of an elbow-lever operated by said cam-track, a series of pivoted thread-guides at one side of the loop or stitch wheel, a thread-guide-operating wheel, mechanism, substantially as described, operating said wheel from said lever, levers connected with said thread-guide and actuated by said wheel, a fixed blade at the other side of the loop or stitch wheel, a cutting-blade pivoted on the fixed blade, an additional lever also pivoted on the fixed blade, levers connected with the pivoted blade and the additional lever, and a cutter-operating wheel connected with the thread-guide-operating wheel, substantially as described.

8. The combination, with a needle-cylinder, a loop or stitch wheel, and a cam-track on the needle-cylinder, of the elbow-lever J^3, operated by said cam-track, the pawl J^3 on said rocking lever, the ratchet-wheel F, the grooved pattern-wheel F', connected with the same, the arm I, projecting from the frame of the machine, the spring I' on the same, the lug I^3 on the spring passing into a groove, F^2, in the pattern-wheel F', the chain G, passed over the sprocket-wheel and provided with lugs, the lever V', carrying the screw W', having beveled head W^3, the dog V on the upper end of the rocking lever J^3, the ratchet-wheel W, the wheels R and K, connected with the same and carrying pins, the levers N N' and S' S^2 S^3, operated by the pins on said wheels, and of thread-cutting devices and thread-guides connected with the said levers N N' S' S^2 S^3, substantially as herein shown and described.

9. The combination, in a striping attachment for knitting-machines, of a pattern-wheel, F', having a circumferential groove, F^2, a pattern-chain, G, provided with lugs H and laterally-projecting lugs *g*, an auxiliary pattern-wheel, *j*, having pins *l* and provided with a ratchet, a lever having a prong, *k*, lying in the path of the laterally-projecting lugs *g*, the shaft of said lever having an arm carrying a pawl, *i*, taking into the ratchet on the auxiliary pattern-wheel, a rock-shaft, *o*, having an arm, *m*, provided with a hook and beveled head, *m'*, engaging the pins *l* on wheel *j*, an elbow-lever actuated by a cam-track on the needle-cylinder, a pawl, V, carried by said lever, a ratchet on the thread-guide-operating wheel with which said pawl engages, a pivoted dog having a pin in its spring-supported end, which underlies and supports the pawl V, a screw in the other end of said dog, said screw having a beveled head lying in the path of the lugs H on the pattern-chain, a crank, *p*, on the rock-shaft *o*, said crank having a pin, *r*, lying under the pawl V, and a pawl, J, having a weighted tail and actuated by an arm mounted on the rock-shaft which carries the elbow-lever, said pawl J taking into a ratchet, F, on the pattern-wheel F', substantially as described.



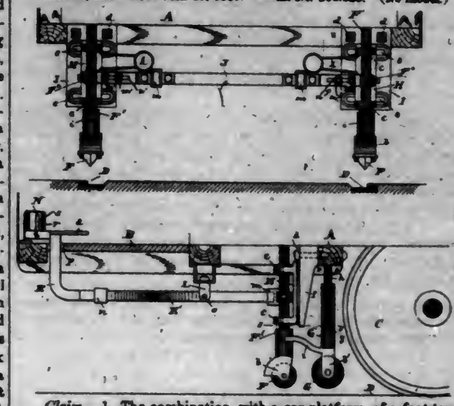
10. The combination, with the rotary pattern-wheel, its chain, a lever operated thereby, means for operating the pattern-wheel, the connected thread guide and cutter operating wheels having a common ratchet and a dog for rotating the same, and mechanism for operating said dog, of an auxiliary pattern-wheel, a pawl-and-ratchet mechanism therefor acted upon by said main pattern-chain, and a rock-shaft acted upon by said auxiliary pattern-wheel and having a connected part extending under the operating-dog of the thread-guide and thread-cutter operating wheels, substantially as set forth.

11. The combination, with the rotary needle-cylinder, the thread cutter, the thread-guides, the loop or stitch wheel, and the presser wheel D, of the plate Q^2 between the said wheel D and the thread cutter, substantially as set forth.

12. The combination, with the rotary needle-cylinder, the thread-guides, the thread-cutter, the loop or stitch wheel, and the presser-wheel D, of the plate Q^2 between the cutter and the wheel D and provided with a tongue, Q^3, curved downward at its front end to a point in front of the said thread-cutter, substantially as set forth.

13. The combination, with the pattern-wheel having a circumferential groove, the chain on said wheel, an operating ratchet-wheel, and means for operating the ratchet-wheel, of the arm I, curved under the pattern-wheel between its lower side and the chain, and provided with a spring, I', having a lug, I^3, entering the groove and the pattern-wheel and in frictional contact with the periphery of the wheel, substantially as set forth.

402,855. LETTER-BOX. WILLIAM A. PAULSEN, Chicago, Ill. Filed Oct. 5, 1888. Serial No. 287,280. (No model.)



Claim.—1. In combination with a portable receptacle, B, a hollow neck, *b*, secured to and leading into the receptacle, a spring-lid, *b'*, and an automatic lock for the lid, substantially as described.

2. In combination with a portable receptacle, B, a hollow neck, *b*, secured to and leading into the receptacle, a lid, *b'*, connected with the neck by a spring-hinge, and a spring-catch on the neck in position to engage the lid when closed, substantially as described.

3. In combination with a portable receptacle, B, a hollow neck, *b*, secured to and leading into the receptacle, a lid, *b'*, connected with the neck by a spring-hinge, a spring-catch on the neck in position to engage the lid when closed, and a pivotal stop, 2, substantially as described.

4. In combination, a stationary or public mail or other receptacle, A, having an internally-flanged inlet-opening or chute, *a*, and a receptacle, B, having a hollow neck, *b*, to fit the chute *a*, and provided with an automatic lock for closing it, and accessible when in locked condition only from the interior of the receptacle B, substantially as described.

402,856. TRACK-SWITCH SHIFTER. LOUIS W. QUEITSCH, Baltimore, Md. Filed Jan. 19, 1889. Serial No. 296,825. (No model.)

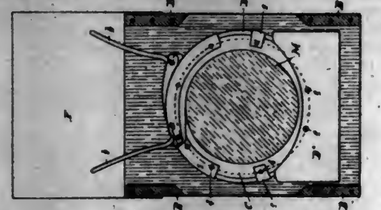
Claim.—1. The combination, with a car-platform, of a foot-lever pivoted to have an up-and-down and also a lateral movement, a vertical shaft, F', carrying at its lower end a roller and movable both up and down and laterally, a second vertical shaft, G', carrying on its lower end a roller and movable up and down and also oscillating, and a lateral arm rigidly attached to the second or oscillating shaft and pivoted to the first shaft.

2. The combination, with a car-platform, of two sets of switch-shifting rollers, one set above each of the two track-rails, a horizontal bar, J, connecting the two sets of rollers, and a pivoted foot-lever connected with the said horizontal bar.

3. The combination, with a car-platform, of two sets of switch-shifting rollers, one set above each of the two track-rails, a horizontal bar, J, connecting the two sets of rollers, a pivoted foot-lever connected with the said horizontal bar, and a holder plate or frame, N, to retain the foot-lever wherever placed.

4. The combination, with a car-platform having a cross-slot, *p*, of a swiveled hanger, L, a foot-lever pivoted to said hanger and projecting up through said cross-slot, a laterally-movable holder, H, a vertical shaft, F', movable up and down on the holder, a second vertical shaft pivoted to partly turn or oscillate, and also movable up and down, and a lateral arm, *i*, connecting the two vertical shafts.

5. The combination, with a car-platform, of an up-and-down and laterally-movable switch-shifting roller, F, an oscillating and up-and-down movable roller, G, a foot-lever for moving said two rollers, and connections between the rollers and foot-lever.



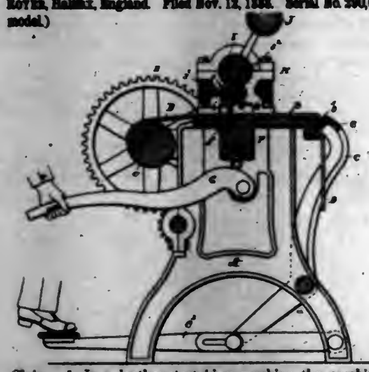
402,857. WALL-PROTECTOR. ROLDIN S. ROBBINS and ALPHONSO H. BROAD, Berkeley, Cal. Filed July 26, 1888. Serial No. 281,100. (No model.)

Claim.—1. As an improved article of manufacture, a wall-protector consisting of the globe-shaped roller D, provided with the journals *d*, and a bracket formed of a brace-plate, B, provided with apertures *b* in its ends, and the approximately-semicircular arms C, projecting from and integral with the base and provided with apertures *c'* in their extreme outer ends, *c*, for the reception of the journals of the roller, as set forth.

2. The blank for forming wall-protector brackets, consisting, essentially, of a metal plate formed with opposite U-shaped slots dividing the blank into inner and outer members united at the center of the blank, the said inner and outer members being apertured, substantially as shown and described.

402,858. DUST-GUARD FOR CAR-AXLE BOXES. FABIAN J. ROBERTS, Detroit, Mich., assignor to the F. J. Roberts R. R. Dust Guard Manufacturing Company, same place. Filed Mar. 10, 1887. Serial No. 230,329. (No model.)

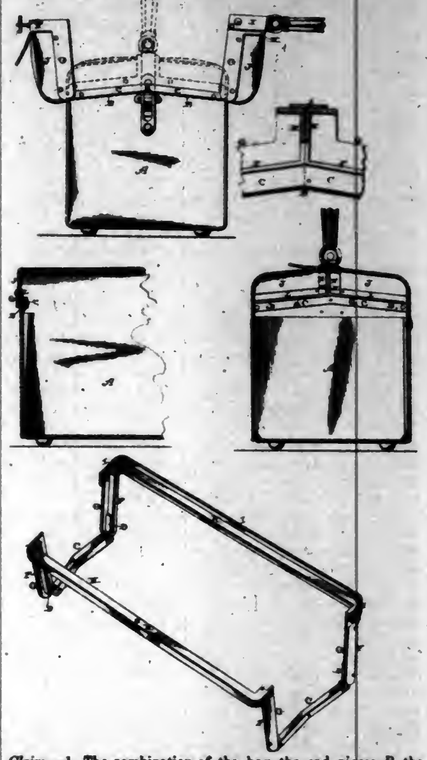
Claim.—1. In a dust-guard for car-axle boxes, the combination of the following elements: an open-ended ring of a single thickness of leather, a wire spring surrounding the periphery of said ring and secured thereto by metallic clips and rivets, and a sheet-metal cap embracing the lower portion of such spring and ring, secured to the latter by rivets, substantially as and for the purposes described.



2. The combination, in a dust-guard constructed substantially as described, of the leather ring, surrounding spring, metallic cap secured to the lower portion of the ring, and the inclosing-case, substantially as and for the purposes specified.

402,859. SAMPLE OF PAINTS, &c. FRANK H. ROSE, Syracuse, assignor to Valentine & Company, New York, N. Y. Filed Feb. 18, 1889. Serial No. 300,239. (No specimens.)

Claim.—Color samples consisting of concavo-convex glass plates A, having colors applied to the concave surfaces thereof, and the textile backings B, covering the colors and conforming to the adjacent surfaces of the plates, the colors being visible through the convex faces of the plates, said samples being uniformly constructed as to size and curvature of surfaces, thus permitting the convex surface of each plate, when the samples are placed in a stack, to fit snugly within the concave surface of the packing of the plate next above it, substantially as and for the purpose described.



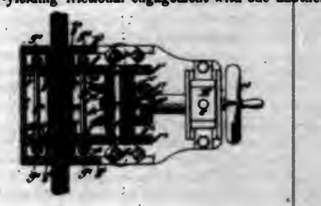
402,860. MACHINE FOR STRETCHING LEATHER. CHARLES L. ROTER, Halifax, England. Filed Nov. 12, 1888. Serial No. 290,654. (No model.)

Claim.—1. In a leather-stretching machine, the combination of the drawing mechanism with the table B, convex from the operator upon its outer edge, with the knife-edge *c*, concave toward the operator upon its edge and adapted to engage with the leather, D, below the surface of the table B and put the same in tension, substantially as and for the purpose described.

2. The combination of the adjustable beam F, provided with the groove *f*, and the round-edged knives *i k*, placed above said beam, one of which, *i*, is adjusted to press the leather into the groove *f*, and the other of which, *k*, is adjusted to press the leather upon the upper surface of the beam F, substantially as and for the purpose described.

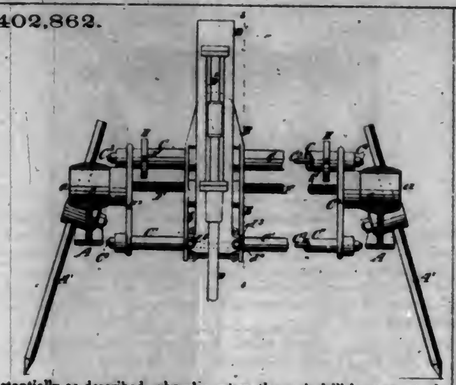
402,861. TRAVELING-BAG. MORRIS SCHWERIN, Newark, N. J. Filed Feb. 6, 1888. Serial No. 263,810. (No model.)

Claim.—1. The combination of the bag, the end pieces, B, the T-shaped pieces in cross-section at the ends and pivoted to the end pieces, and the L-shaped pieces in cross-section at their centers, substantially as shown.



2. The combination of the body of the bag, the bag-frame attached thereto, the cover of the bag which is attached to the frame, and the end pieces, J, which are inserted between the ends of the cover and the ends of the frame, substantially as set forth.

3. The combination of the two parts of the bag-frame made T-shaped at their ends and L-shaped in cross-section at their centers, the body of the bag, the inlays, and the end pieces at the ends of the cover, substantially as specified.



4. The combination of the L-shaped portion in cross-section of the frame, having vertical openings made through the horizontal portion, with the plate to which the catches are secured, and which plate is provided with prongs to pass down through the openings, substantially as shown.

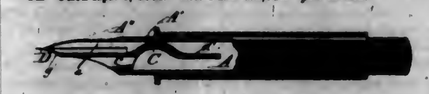
402,862. CHANNELING-MACHINE. HENRY C. SERGEANT, New York, N. Y., assignor to the Ingersoll-Sergeant Rock Drill Company, of New York. Filed July 5, 1888. Serial No. 279,025. (No model.)

Claim.—1. The combination, with a horizontal way or track, of a carriage fitted to travel thereon, a rock-drill, a motor for operating the rock-drill supported by said carriage, another motor mounted upon the carriage, and gearing operated by the last-named motor, for moving the carriage along said way, and comprising surfaces held in automatically-yielding frictional engagement with one another, substantially as described, whereby, when the rock-drill becomes stuck, said surfaces will yield, and thus automatically stop the said movement of the carriage, substantially as specified.

402,862.

2. The combination, with a stationary frame having a horizontal way or track, of a screw fixed in the frame and parallel with the said way or track, a carriage fitted to slide on the way or track and provided with a nut engaging said screw, a drill, a drill-motor on said carriage, another motor for rotating the nut to move said carriage along, and gearing intermediate of the second-named motor, and said nut comprising frictional surfaces having an automatically-yielding frictional engagement with said nut, substantially as specified.

3. The combination, with a stationary frame comprising a horizontal way or track, and a screw also parallel with the way, of a drill-carriage fitted to slide on the way, a motor on the drill-carriage, a nut fitting the screw and held against end movement on the carriage, a gear-wheel held in frictional engagement with the end of the nut by spring-pressure, and other gear-wheels through which said wheel on the nut is driven from the motor, substantially as herein described.



4. The combination, with a stationary frame and its track or way, of a drill-carriage mounted thereon, a screw in the frame parallel with said track or way, and a nut fitting the screw and held against endwise movement independently of the carriage, the wheels *f* in frictional engagement with the ends of the nut, and the bolts and springs for binding them against the nut, the shaft f^2 and the wheels f' f'' fast thereon, and the reversely-set bevel-wheels f^3 f^4, loose thereon, the clutch f^5 and its shifting-lever f^6, and the motor having upon its shaft the bevel-pinion f^7, engaging the wheels f' f^4, substantially as herein described.

402,863. DIE FOR FORMING WOOD TYPE. GEORGE C. SETCHELL, Norwich, Conn., assignor to the William H. Page Wood Type Company, same place. Filed Dec. 5, 1888. Serial No. 292,735. (No model.)

Claim.—A die for forming wood type by impression, having the thinnest portions of its raised parts reduced in height below the level of the other raised portions, substantially as described.

402,864. FOUNTAIN-PEN. LAFORREST A. SHATTUCK, Bloomsburg, Pa. Filed Apr. 6, 1888. Serial No. 269,949. (No model.)

Claim.—1. In a fountain-pen, the combination, with the tubular ink-reservoir A, of the nozzle F, the combination-lock B, fitted therein and having the two parallel ink-conductors *d d*, the shoulders *l l*, the central ink-flowing medium or perforation *e*, the capillary ink-slot *p*, the integral superior transmitter or long upper lip, g^4, in contact at its converging sides and point with the back of the pen, the slot *q*, carrying a pen, D, which divides the central longitudinal perforation, *e*, into an upper space, *a*, for the superior ink-channel over the pen, and a lower space, *b*, beneath the pen for an air-vent communicating with the reservoir, substantially as and for the purpose described.

2. In a fountain-pen, the combination, with an ink-reservoir, of a nozzle, F', having its under lip diagonally incised, so as to form the long finger-shielding upper lip, the combination-lock B', fitted in the nozzle, having the slot *q*, in which is fitted the pen D, and *e* groove, *l*, into which the shank of the separable transmitter E' is fitted and locked between it and the upper wall of the nozzle, with its free end, at sides and point, in contact with the pen and a space beneath the pen, with the adjustable key C, having a central body or movable ink-stopper fitted therein, and serving for purposes of adjustment, and filling the reservoir without removing the nozzle, said key also having a central longitudinal perforation or air-vent, lateral ink-channels, a curved ink-conducting spring, and lever-acting and adaptable under-feed bar *g*, which can be adjusted to different grades of ink or so as to transform a double-feed to a single upper-feed pen, substantially as and for the purpose described.

3. In a fountain-pen, the combination, with the ink-reservoir, of the nozzle F, the combination-lock B'', fitted therein, having the slot *q* across the axis of the central perforation, *e*, a pen, D, fitted therein, a groove, *l*, in the upper surface of the lock for the shank *w* of the separable transmitter E' to be locked therein, the said transmitter having a free point in contact with the pen, and an ink-conductor extending into the reservoir, substantially as and for the purpose described.

4. In a fountain-pen, the combination, with the reservoir, of a nozzle having a long upper lip containing a longitudinal perforation or mortise and having the shank *w* of the transmitter E'' fitted therein, while said transmitter is in contact at its free point with the pen D, which is held by friction in the nozzle and supported by the adjustable key C beneath, substantially as and for the purpose described.

5. In a fountain-pen, the combination, with the ink-reservoir, of a nozzle having its under lip slightly shortened and holding by friction a pen, D, supported by the adjustable key beneath, substantially as and for the purpose described.

6. In a fountain-pen, the combination, with the ink-reservoir, of a separable nozzle, F, the combination-lock B'', fitted therein, having the slot *g* across the end of its central perforation, into which a pen, D, is fitted, a groove, *l*, in the upper surface, in which is locked the shank of the separable transmitter E, which has its free point in contact with the pen, and an inner ink-conductor, substantially as described.

7. In a fountain-pen, the combination of a separable nozzle, F', carrying a pen, D, which is supported by the adjustable key C, the upper side of the nozzle being longer than the under side and narrowed to a point, A''', forming the finger-shield and superior transmitter, which is slit or divided at its point to form nibs like a pen for quill-writing and has its under surface describing the same degree of concavity as the inner surface of the nozzle, so as to form the upper wall of the crescentic-channel extension of the ink-channel over the pen and in contact at its edges and free point with the pen, substantially as described.

8. In a fountain-pen, the combination, with the ink-supply reservoir, of the separable nozzle F, the combination-lock B'', fitted therein and having the slot *q*, holding a pen, D, and the space *b* below the pen for an air-vent, and provided on its upper surface with the longitudinal groove *l*, into which is locked the superior transmitter E, which has its free point in contact with the pen and is provided with an ink-conductor, d''', and an intermediary transmitter, g''', substantially as described.

9. In a fountain-pen, the combination, with an ink-reservoir, of the separable nozzle F, the combination-lock B'', fitted therein, its outer end having the slot *q*, the pen D, with the long narrow shank-extension inserted therein, a curved ink-conductor, the groove *l*, holding the shank *w* of the superior transmitter E', while said transmitter is in contact at its free point with the pen, substantially as and for the purpose described.

10. In a fountain-pen, the combination, with the ink-reservoir, of a nozzle, the combination-lock B, fitted therein, having the transverse slot *q*, holding a pen, D, supported by an adjustable key, C, beneath, and having the superior transmitter g'' integral with the upper lip of the lock and its edges and free point in contact with the pen, substantially as and for the purpose described.

11. In a fountain-pen, the combination, with the ink-reservoir, of a nozzle, the combination-lock fitted therein and having the slot *q*, holding the pen D, beneath which is a space for the air-vent and above the pen the upper ink-channel, the superior transmitter E'', with its shank locked in the longitudinal groove *l* and its free point in contact with the pen, and the separable ink-conductor, substantially as and the purpose described.

12. In a fountain-pen, the combination, with the ink-reservoir, of a separable nozzle, F, the combination-lock B', fitted therein and having the parallel ink-conductors *d d*, the upper ink-slot, *p*, the lower surface-groove, *b'*, for an air-vent, the transverse slot *q*, in which the pen D binds and lies across the upper side of the longitudinal central perforation, and under-feed bar g', in contact with its converging sides and point with the under surface of the pen, substantially as and for the purpose described.

13. In a fountain-pen, the combination, with the ink-reservoir, of a separable nozzle, the combination-lock B', inserted therein and having

the parallel ink-conductors *d d*, the capillary slot *p*, the transverse slot *q* across the central axis of the longitudinal perforation, and in which a pen, D, binds, the groove or air-vent *b'* on its under surface, the under-feed bar *g'*, in contact with the pen at its sides and point, and the superior transmitter E", inserted into and locked in the groove *l*, with its free outer end in contact with the pen, substantially as and for the purpose described.

14. In a fountain-pen, the combination, with the ink-reservoir, of a separable nozzle, the combination-lock B", inserted therein and having its under portion cut away to form an air-vent, *b"*, the slot *q*, in which a pen is held on the lower side of the central perforation, a groove, *l*, in its upper surface, and the superior separable transmitter fitted therein and having its free end in contact at its point with the pen, substantially as and for the purpose described.

15. In a fountain-pen, the combination, with the ink-reservoir, of a separable nozzle, the combination-lock fitted therein and having the slot *q*, carrying pen *d*, which divides the forward end of the lock through the axis of the central perforation into an upper and lower lip, the upper lip longer than the lower one and narrowed to a point, and forming the superior transmitter, which is flat on its under surface and convex or flat on its upper surface and in contact at its point with the pen, the pen being connected with the ink-supply by the ink-conductor, and an air-vent being beneath the pen, substantially as described.

16. A fountain-pen comprising, in combination, but three main separable parts, to wit: an ink-reservoir, A, having a nozzle and superior ink-transmitter, an adjustable key having an adaptable under-feed bar, ink-stopper, ink-conductor, and an air-vent, and a pen, substantially as and for the purpose described.

17. In a fountain-pen, the combination, with the ink-reservoir A, of a nozzle, F, the combination-lock B', fitted therein and having a long feeding portion, *g'*, arranged above and in contact at its sides and point with the back of a pen, the two parallel ink-conductors *d d*, the capillary ink-slot *p*, the shoulders *t t*, the central perforation or ink-flowing medium, *o*, the slot *q*, holding the pen D, and the surface air-vent groove *b'*, arranged above the ink-flowing medium and pen, substantially as described.

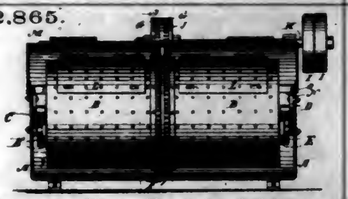
18. In a fountain-pen, the combination, with an ink-reservoir, of a separable nozzle, the combination-lock B', fitted in the reservoir end of the nozzle and locking in the groove *l*, the superior separable ink-transmitter E", in contact at its point with a pen, D, which is held in the nozzle by friction, and an adjustable key having an adjustable under-feed bar and a movable ink-stopper section with a central perforation, substantially as described.

19. A fountain-pen having an ink-conductor in the form of two parallel bars arranged laterally, as *d d*, and extending from shoulders *t t*, substantially as and for the purpose described.

20. The fountain-pen having the ink-conducting medium in the form of two parallel bars arranged horizontally, as *d d*, and constructed integrally with the body of the combination-lock, substantially as and for the purpose described.

21. A fountain-pen having the parallel bars *d d*, arranged horizontally, and the ink-slot *p*, extending from the pen-slot to and through a portion of one of the ink-conducting bars, substantially as and for the purpose described.

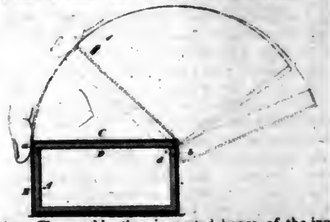
22. A fountain-pen having a tabular feeder, constructed with a locking-groove along a portion of its length and across its ink-channel and an air-vent groove in its periphery, substantially as described.



23. A fountain-pen having a longitudinally-sliding combined key and feed-bar, as C, the same being adjustable inwardly and outwardly for different kinds of writing and for use alone or with an upper-feed bar, substantially as described.

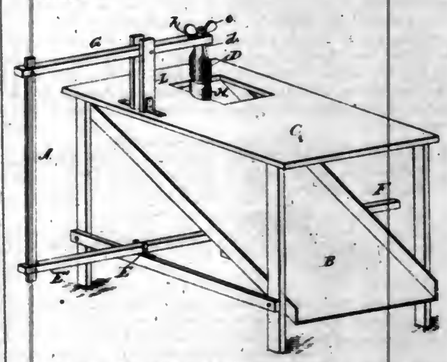
24. In a fountain-pen, the combination, with the ink-reservoir A, formed with an integral nozzle, A' A", of a pen, D, fitted and held in position by friction and supported beneath by an adjustable key, C, and borne upon at top by the tapered pointed wall portion A^3 of the integral nozzle A' in such manner that said wall portion, while forming a finger-shield above the pen and serving as an ink-transmitter by coming in contact at its converging sides and point with the pen, also serves for forming the walled extension of the ink-channel over the back of the pen, substantially as and for the purpose described.

25. In a fountain-pen, the combination, with the reservoir, of the nozzle, the combination-lock fitted therein and provided with the peripheral air-vent groove *b'*, arranged laterally, the parallel ink-conductors *d d*, arranged horizontally, and the superior ink-transmitter in contact at its sides and point with a pen, D, substantially as described.



26. In a fountain-pen, the pen D, formed with a reduced integral extension from its heel for conducting ink from the ink-supply to the pen-point, substantially as described.

402,865. WASHING-MACHINE. Hamilton E. Smith, New York, N. Y. Filed Sept. 29, 1887. Renewed Feb. 13, 1889. Serial No. 300,200. (No model.)



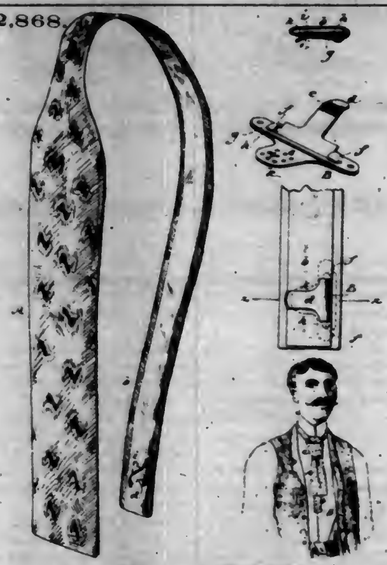
Claim.—A washing-machine composed of the case A, having a cover, M, and cap J, the bearings D, located within the said case at each end thereof, and having anti-friction rollers E E, the cylinder B, having gudgeons C C, engaging said anti-friction rollers, the spur-gear F, surrounding the central portion of the cylinder, and the driving-gear G, meshing therewith and located beneath the cap J, substantially as described.

402,866. NESTED BOXES. Reinhold Steinbock, New York, N.Y. Filed Mar. 13, 1889. Serial No. 303,149. (No model.)

Claim.—The combination, in nested boxes, of the inner box, A, and its hinged lid D with the outer box, B, and its hinged lid C, said hinged lid C having the dependent flange *a*, the hinge *b* of the lid C being lower than the hinge *d* of the lid D, substantially as herein shown and described.

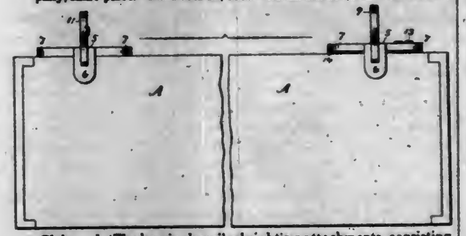
402,867. OYSTER-OPENER. William F. Steuart, Blackbanks, St. Simon's Island, Ga. Filed Jan. 24, 1887. Serial No. 225,401. (No model.)

Claim.—1. The combination, with the table having an opening in the top and a chute below, of the stationary curved knife secured to the table, the oscillating lever carrying a curved knife directly over the stationary knife, the connecting-rod, and the pedal connected to the lever by means of said rod, substantially as specified.



2. The combination, with the lower stationary knife, of the upper knife adjustably secured to an oscillating lever, whereby said upper knife may be adjusted with respect to the lower knife, substantially as and for the purpose set forth.

3. The combination, with the oscillating lever having a slot at its forward end, of the curved knife having a screw-threaded shank passing through the slot, and a thumb-nut whereby the knife may be adjusted with respect to the lower knife, substantially as shown and described.

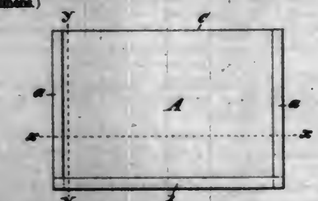


402,868. SCARF-FASTENER. Carl Strauss, New York, N. Y. Filed Jan. 7, 1889. Serial No. 295,867. (No model.)

Claim.—The spring-clamp B, consisting of the pivoted tongue *d*, slotted spring-plate *g*, and the base-plate *h*, having a spread flat portion, *k*, provided with stitching-perforations *s*, in combination with the scarf to which it is attached, substantially as herein shown and described, and for the purpose specified.

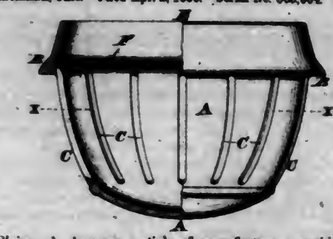
402,868.

402,869. SIGHTING ATTACHMENT FOR LEVELS. Justus A. Traut, New Britain, Conn., assignor to the Stanley Rule and Level Company, same place. Filed Jan. 22, 1889. Serial No. 297,204. (No model.)



Claim.—1. The herein-described sighting attachments, consisting of the uprights 9 and 11, having, respectively, the near and farther sights, and each provided with a cross-base, from the middle portion of which said uprights project, and downwardly-projecting lugs at opposite ends of said base adapted to embrace the sides of the stock, and provided with a fastening device, whereby the upper edge of a level-stock may be clamped between said lugs, substantially as described, and for the purpose specified.

2. A sighting attachment made attachable and detachable to and from the level-stock, consisting of an upright containing a sight, a cross-base, 5, clamping-lugs 6 6, and lateral lugs 7 7, for forming an extended bearing-surface longitudinally with the level-stock, substantially as described, and for the purpose specified.

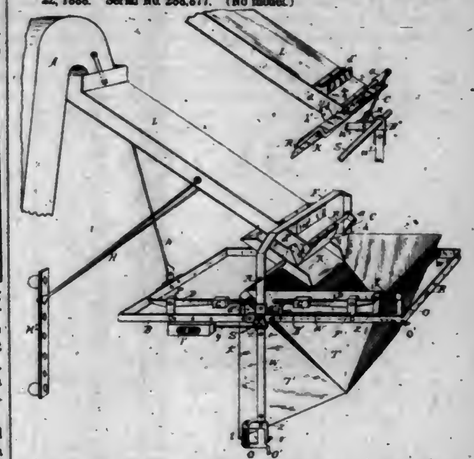


3. A sighting attachment consisting of an upright containing a sight, a cross-base, 5, clamping-lugs 6 6, lateral lugs 7 7, and an adjusting-screw in one of said lateral lugs, substantially as described, and for the purpose specified.

402,870. METHOD OF PREPARING FLY-PAPER. Alfred R. Trenner, Cincinnati, Ohio. Filed Nov. 30, 1888. Serial No. 292,267. (Specimens.)

Claim.—The herein-described method of preparing sticky fly-paper so as to prevent the oozing out or escaping of the adhesive substance with which the paper is covered during transportation or storage, which consists in coating the field of the sheet or backing with adhesive material, so as to leave a margin surrounding said field which shall be free of the adhesive compound, folding the sheet once through the center thereof, and then turning over the free margin so as to form a seal.

402,871. MOLDER'S LADLE OR CRUCIBLE. Charles Truesdale, Cincinnati, Ohio. Filed Apr. 2, 1888. Serial No. 305,064. (No model.)



Claim.—1. As a new article of manufacture, a molder's ladle or crucible having its sides pierced with a series of slots, for the purpose specified.

2. A molder's ladle or crucible consisting of an upper portion having an inwardly-converging top and a lower portion having slotted sides, substantially as herein described.

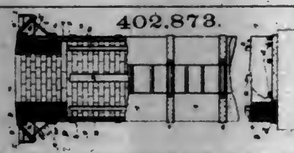
3. A molder's ladle or crucible having an internal annular groove, an inwardly-converging top, and slotted sides, substantially as herein described.

402,872. GRAIN-WEIGHING MACHINE. Le Roy C. Tryon, Marseilles, assignor of one-half to Clarence E. Tryon, Ottawa, Ill. Filed Oct. 22, 1888. Serial No. 288,877. (No model.)

Claim.—1. In the grain-weighing machine shown and described, the combination of the oscillating chute K and connected aprons J J, arranged to oscillate in the same direction as said chute, substantially as and for the purpose set forth.

2. In the grain-weighing machine shown and described, the combination of the oscillating buckets T T, oscillating chute K, and oscillating aprons J J, substantially as and for the purpose set forth.

3. In the grain-weighing machine shown and described, in combination with the oscillating chute K, the oscillating aprons J J, and the mechanism, substantially as shown, for operating said aprons, as and for the purpose set forth.



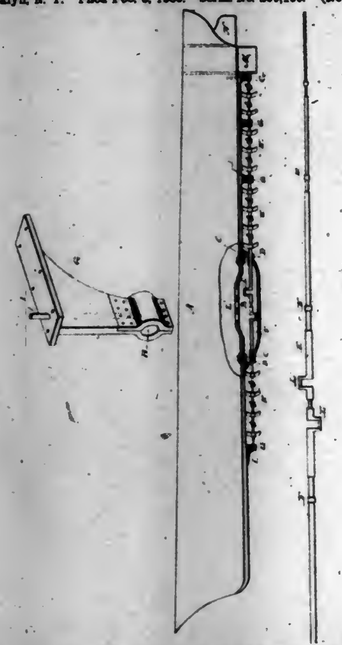
4. In the grain-weighing machine shown and described, the grooved rest *d*, in combination with the bail F and the grain-weighing mechanism, and the spout L, having the stop *h*, for closing its outer end, substantially as and for the purpose set forth.

402,873. SMOKE-STACK. Baptiste Vitalis, Pittsburg, Pa. Filed Oct. 6, 1888. Serial No. 287,490. (No model.)

Claim.—1. In a smoke-stack, the combination, with sheet-metal casing consisting of cylindrical sections adapted to abut each other endwise, substantially as indicated, of embracing-bands at the joints for securing contiguous sections, a lining located within the casing, and the longitudinal metal strips located between the casing and lining and bracing both, substantially as set forth.

2. The combination, with smoke-stack consisting of a casing and

402,873.

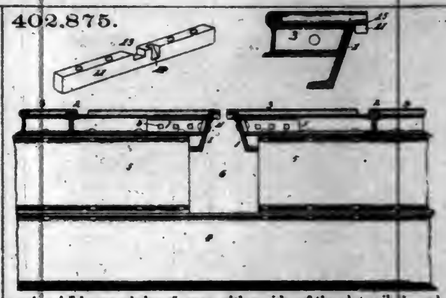


lining, of a series of metal bars secured against the outer face of the lining and blocks interposed between the bars and casing, substantially as set forth.

3. In a smoke-stack, the combination, with a metal casing, of a lining composed of bricks having concave inner faces and a central projection on its outer face and bricks having concave inner faces and end projections on its outer face, the said bricks being arranged in alternate layers to break joints, substantially as set forth.

4. The combination, with metal casing and longitudinal bars secured to the casing, substantially as indicated, of lining-bricks having angular projections, substantially as indicated, such projections abutting the longitudinal bars for forming air-ducts between the lining and casing, substantially as set forth.

402,874. SCREW-PROPELLER FOR VESSELS. CLIFTON VOSE, Brooklyn, N. Y. Filed Feb. 8, 1889. Serial No. 299,109. (No model.)



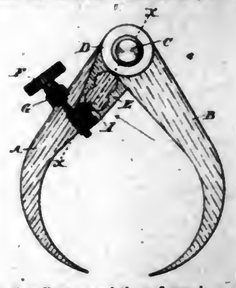
Claim.—1. The combination, with the propeller-shaft centrally located beneath the vessel, of the hangers in which said shaft has bearings, the said hangers being provided with passages extending from the interior of the vessel, whereby lubricant can be applied to said bearings, as set forth.

2. The combination, with a vessel, a propeller-shaft centrally located and extending longitudinally beneath the same, a water-tight chamber attached to the bottom of the vessel and surrounding the crank-arms of said shaft, and openings from the interior of the vessel into said chamber, of two or more screw-propellers on each side of said chamber, and hangers attached to the bottom of the vessel outside of said chamber and provided with bearings for the shaft and with passages extending from the interior of the vessel through said hangers to the shaft-bearings, whereby lubricant can be applied to said bearings, substantially as described.

402,875. CABLE AND RAILWAY CROSSING. FREDERIC C. WEIR and NATHANIEL O. GOLDSMITH, Cincinnati, Ohio, assignors to The Weir Frog Company, same place. Original application filed May 24, 1888, Serial No. 274,912. Divided and this application filed Oct. 18, 1888. Serial No. 288,477. (No model.)

Claim.—1. A railway-cable crossing composed of the steam rails cut in sections and fitting the slot and tram rails and supported by the

402,875.



sectional I-beam girders 3 upon either side of the slot-rails 1, and a continuous girder, 4, having the cable-grip space 6, substantially as herein specified.

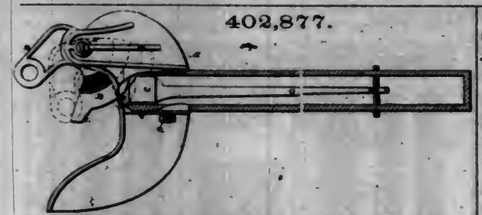
2. A cable-railway crossing composed of the steam rails cut in sections and fitting the slot and tram rails and supported by sectional I-beam girders 5, and a continuous girder, 4, rigidly connected to the sectional girders 5, substantially as herein specified.

3. A cable-railway crossing composed of the crossing-rail cut in sections abutting and fitting the edges of the slot-rails and lying between the girder-rails which abut the same upon either side, said sections being firmly connected to the girder-rails at the crossing angles and supported by a continuous girder forming a substructure under the crossing, substantially as specified.

4. A cable-railway crossing composed of the crossing-rails cut in sections abutting and fitting the slot and tram rails, to which they are firmly connected at the crossing angles by knee-braces, the said crossings being supported by sectional girders divided under the slot-rails to form a grip-space and supported by a continuous under girder, substantially as herein specified.

402,876. CALIPERS OR DIVIDERS. FRED A. WELLS, Milwaukee, Wis. Filed Jan. 11, 1889. Serial No. 296,071. (No model.)

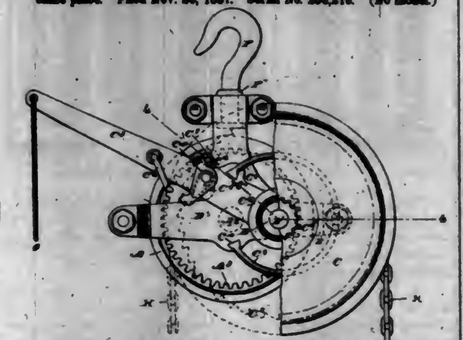
Claim.—1. A calipers consisting of two legs, A and B, formed of single flat plates pivoted together by a rivet, C, in combination with a friction-arm, E, formed of a single flat plate of metal interposed between the legs A and B, which arm is pivoted on the rivet C and extends from the rivet in the same direction as the legs of the calipers, and a thumb-screw, F, having its shank journaled in a bracket, G, formed integral with one leg of the calipers, in which bracket the thumb-screw has rotary motion, but no endwise motion, the thumb-screw turning into a screw-threaded enlarged nut end of the friction-arm E, substantially as described.



2. A calipers consisting of two legs, A and B, pivoted together, in combination with a single flat-plate friction-arm interposed between the two legs, a thumb-screw, F, journaled in one leg of the calipers and turning into the friction-arm, and a pin, I, inserted in the inner side of one leg of the calipers, which pin projects into a slot or aperture therefor in the friction-arm, whereby the relative movements of the friction-arm and the leg of the calipers, in which the thumb-screw is journaled, are limited, substantially as described.

402,877. CAR-COUPLING. FRANK A. WESTBROOK, Port Jervis, and WINFIELD S. COOK, Middletown, N. Y. Filed July 18, 1888. Serial No. 280,276. (No model.)

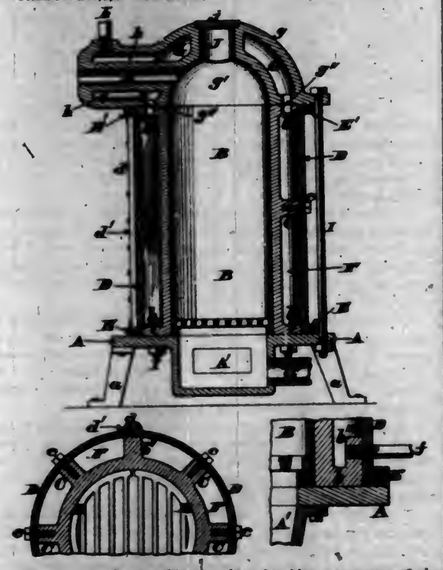
Claim.—1. The combination of the draw-head, the coupling-head placed therein and provided with the point or extension L, and the shoulder N, with a locking-lever pivoted at its rear end in the draw-head, and which has its front end to rest upon the shoulder N when the coupling-head is opened, substantially as described.



2. The combination of the draw-head provided with an opening, I, shaped as shown, through its front end, the coupling-head, the pin

402,877.

F, having flattened sides, and the spring which is applied to the end of the pin, substantially as set forth.



402,878. HOISTING MECHANISM. THOMAS A. WESTON, Stamford, Conn., assignor to The Yale & Towne Manufacturing Company, same place. Filed Nov. 26, 1887. Serial No. 256,216. (No model.)

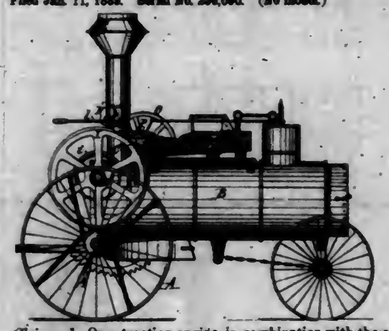
Claim.—1. The combination of a toothed differential chain-pulley with a ratcheted sprocket driving-wheel and a self-releasing ratchet-lever, as and for the purposes set forth.

2. The combination of the double-grooved toothed differential chain-sheave A, provided with deep side recesses, A^4 A^4, and secured to or made integral with its shaft A^3, the divided frame D E, provided with the guide-arms D^2 E^2, and with internal bearings, D^2 E', occupying the recesses A^4 A^4 of the sheave A, the hook F, the endless chain A^5, and the lower block, G, as and for the purposes set forth.

402,879. BARREL-HEATER. MAX WOLF, Cincinnati, Ohio, assignor of one-half to Joseph Huber, same place. Filed June 21, 1888. Serial No. 277,909. (No model.)

Claim.—1. The combination, in a hot-blast apparatus of the class specified, of a furnace having a hollow hood mounted thereon, which hood is provided with a discharge-nozzle for the heated air, said furnace, hood, and nozzle being surrounded by communicating jackets through which water circulates freely, as herein described, and for the purpose stated.

2. The combination, in a hot-blast apparatus of the class specified, of the flanged furnace B b b', vertical rib b'', outer shell, D, having its edges attached to said rib, and hoops E E', which hoops clamp said shell against the edges of said flanges b b', for the purpose described.

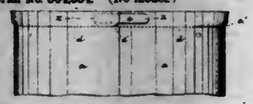


3. The combination, in a hot-blast apparatus of the class specified, of the furnace B, having outwardly-projecting lugs C, to which the outer shell, D, is secured by the fasteners c, as herein described.

402,880. CORSET-CLASP. MAX ADLER, New Haven, Conn., assignor to Mayer, Strouse & Co., same place. Filed Feb. 18, 1889. Serial No. 300,232. (No model.)

Claim.—A corset-clasp consisting of the two plates A B, secured to the busk upon opposite sides and projecting from the engaging edge of the busk, so as to leave a space between the projecting ends of the said two plates, combined with the jaws c d, hung upon pivots between the projecting ends of said plates, and so as to swing in the plane of the busk, the adjacent faces of the said jaws outside the plates constructed with a recess corresponding to the body of the stud with which the clasp is to engage, the noses of the said jaws outside the recess diverging to form a flaring mouth, the jaws extended from the pivots and turned outward to form handles h h, and a spring, as l, between the tails of the jaws, which operates to yieldingly hold the jaws in their closed position, substantially as and for the purpose described.

402,881. GEARING FOR TRACTION-ENGINES. LEONARD AMES, Jr., and JAMES H. ABERNETHIE, Oswego, N. Y., assignors to said Leonard Ames, Jr., Leonard Ames, and Arthur L. Merriam, same place. Filed Jan. 11, 1889. Serial No. 296,090. (No model.)

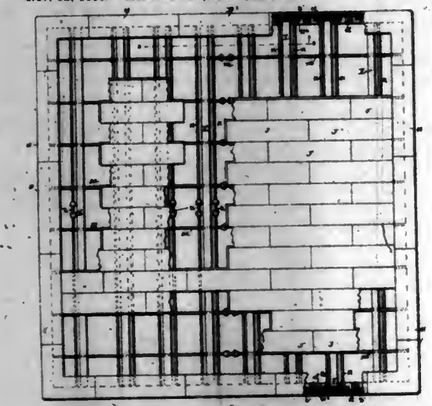


Claim.—1. On a traction-engine, in combination with the engine-shaft and propelling-axle, the counter-shaft between said engine-shaft and axle and sustained parallel therewith, meshing propelling-gears on said counter-shaft and axle, a gear-wheel fixed to said counter-shaft, and a pinion sliding longitudinally on the engine-shaft and confined circumferentially thereon, and a lever pivoted to a fixed support on the engine and connected with the sliding pinion to throw the same into and out of mesh with the gear-wheel of the counter-shaft, all combined to allow the engine to be operated to either transmit power to other engines or propel the engine on its traction-wheels, substantially as set forth and shown.

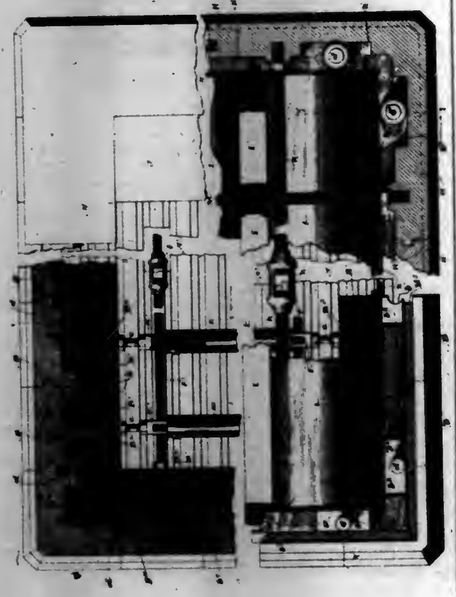
2. In combination with the engine-shaft C and the pinion P, sliding longitudinally on said shaft and confined circumferentially thereon and provided with the circumferential rabbet a in the end of its hub, the ring b, seated in the aforesaid rabbet, the cap c, attached to the end of the aforesaid hub and abutting against the end of the ring b, and the lever l, pivoted to a support on the engine and coupled to the aforesaid ring, substantially as described and shown.

3. On a traction-engine, in combination with the engine-shaft C, counter-shaft D, and gear-wheel I, fixed to the latter shaft, the box L, secured to the boiler and supporting the shaft C, the arm N, extending from the cap of said box, the pinion P, sliding longitudinally on the engine-shaft and confined circumferentially thereon, and the lever l, pivoted to the arm N, and connected with the sliding pinion P, substantially as and for the purpose set forth.

402,882. **METAL CAN.** MAX ARB, New York, N. Y. Filed Mar. 22, 1889. Serial No. 304,354. (No model.)

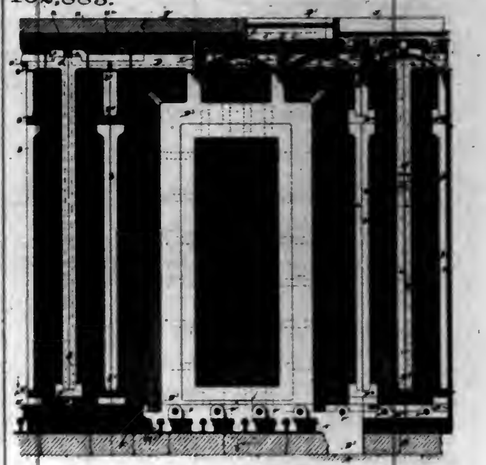


Claim.—1. The combination of a can-body having overlapping upright ends, with a strip placed between such ends and projecting outwardly from the same, the ends being soldered to each other and to the strip, substantially as specified.



2. The combination of a can-body having overlapping upright ends, with a strip, *c*, placed between such ends and projecting partly outwardly and partly inwardly from the same, the ends being soldered to each other and to the strip, substantially as specified.

3. The combination of a can-body having overlapping ends, with cover *b*, having flange *b'*, that is received by the can-body, and with a strip, *c*, placed between the overlapping ends, the strip *c* being soldered to flange *b'* and to the overlapping ends of the can-body, substantially as specified.



4. The combination of can-body *a*, having offset *a'*, and indented line *d*, with the cover *b*, having flange *b'*, and with the strip *c*, secured partly to the can-body and partly to flange *b'*, substantially as specified.

402,883. **BANK-VAULT.** NOAH S. ARMUTZ, Cleveland, Ohio. Filed Nov. 12, 1888. Serial No. 290,595. (No model.)

402,883.

Claim.—1. In bank-vaults, the combination, with upright slabs tongued and grooved together at their edges and constituting the outer walls of the vault, of a flooring of railroad-rails and tie-bars, substantially as indicated, for drawing and holding the wall slabs against such flooring, substantially as set forth.

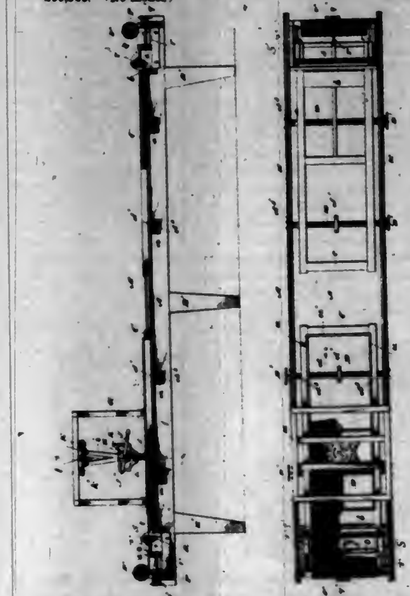
2. The combination, with a foundation of mason-work and a flooring of railroad-rails laid thereon, of upright slabs tongued and grooved together, and constituting the outside walls of the vault, said slabs resting on the mason-work and having inwardly-projecting toes that overlap and rest on the flooring-rails, substantially as set forth.

3. The combination, with upright slabs and cornice-blocks resting on such slabs, these members being tongued and grooved together, substantially as indicated, of upwardly-projecting lugs integral with such upright slabs, such lugs being arranged in pairs at the edges of the slabs, with corresponding recesses in the cornice-blocks for receiving such lugs, whereby the slabs are held together edgewise, substantially as set forth.

4. The combination, with upright slabs having inwardly-projecting ribs abutting each other, of tie-blocks D^2, the latter having shoulders for embracing the ends of such pairs of abutting ribs for holding the upright slabs together edgewise, substantially as set forth.

5. The combination, with upright slabs and cornice-blocks resting thereon, substantially as indicated, of I-beams for supporting the roof, recesses in the upright slabs for receiving the ends of these I-beams, and tie-rods connected with the cornice-slabs for drawing and holding the latter against the ends of the I-beams, substantially as set forth.

6. In a bank-vault, slabs constituting the sides of the vault, provided with pockets in their contiguous edges and projecting portions extending into said pockets, in combination with tie-blocks inserted in such pockets and engaging the projecting portions of the slabs, said tie-blocks being provided with holes for the passage of tie-rods, substantially as set forth.



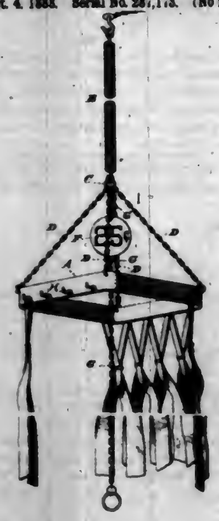
7. The combination, with flanged beams and slabs secured to said beams, of projecting lugs of the slabs for embracing the beams, with grooved abutting faces in said lugs, pairs of grooves forming holes, and plugs inserted in such holes, the ends of the plugs engaging the beam flanges for holding the slabs against said beams, substantially as set forth.

8. The combination, with upright slabs tongued and grooved together and constituting the outer wall of the vault, such slabs having grooves at the upper ends thereof, of cornice-blocks resting on such upright slabs, such cornice-blocks having tongues adapted to fit the grooves of the slabs, and tie-rods lying in grooves formed in contiguous faces of the slabs, substantially as set forth.

9. The combination, with upright slabs and cornice-blocks resting thereon, substantially as indicated, of vertical tie-rods for securing the cornice-blocks, such tie-rods extending through and being concealed in grooves formed in the meeting-faces of the upright slabs, substantially as set forth.

10. The combination, with cornice-blocks, substantially as indicated, of I-beams, a series of roofing-slabs, the same being tongued and grooved together and tongued and grooved with the cornice-slabs, and tie-rods at right angles to the I-beams engaging the cornice-slabs for holding the latter against the ends of the roofing-slabs, substantially as set forth.

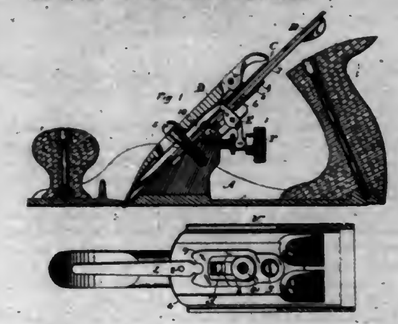
402,884. **DOOR OR WINDOW SCREEN WIRING MACHINE.** JOHN H. AUTHOUSE, Ottumwa, Iowa. Filed Feb. 12, 1889. Serial No. 299,589. (No model.)



Claim.—1. In a machine for the purpose described, a table, combined with a carriage movable lengthwise of the table, and a driver carried by said carriage and movable on guides transversely thereof, substantially as described.

2. In a machine for the purpose described, a table and a carriage movable thereon, combined with a vertically-adjustable driver on said carriage and movable transversely thereof in guides, substantially as and for the purpose specified.

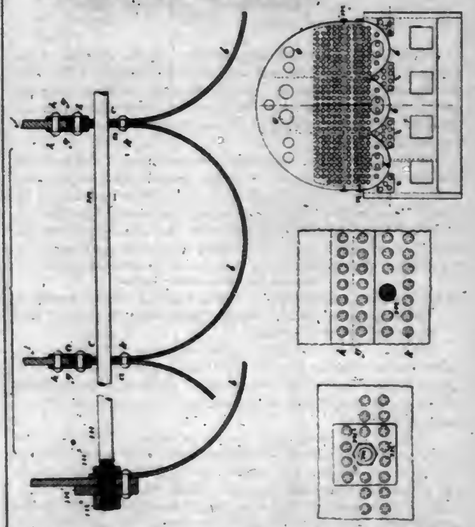
3. In a machine for the purpose described, the combination, with the table, of the block O, the sliding plate Q, the sliding frame S', and the screw P, the bars R and S of the clamp, and the cam-levers T, substantially as shown and described.



4. The combination, with the driver, of the finger-plate M, provided with pins extended through the lower portion of the driver, the staple-guide, and the spring N, attached to the driver, with its ends bearing on said pins, substantially as shown and described.

402,885. **DISPLAY-RACK.** EDWARD G. BABCOCK, New Britain, Conn. Filed Oct. 4, 1888. Serial No. 287,173. (No model.)

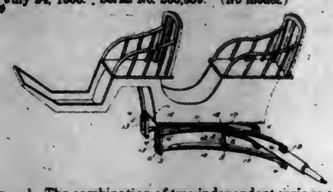
Claim.—The display-rack described, composed of the frame A, to which the goods to be displayed are attached, the chains connecting said frame to a ring, C, the elongated spring B, connected to said ring and extending upward for attachment to the ceiling, and the steady-chain E G, bearing the price-disk F and extending down from said ring, as specified.



402,886. **BENCH-PLANE.** FRANK M. BAILEY, New Britain, Conn., assignor to the Stanley Rule and Level Company, same place. Filed Dec. 11, 1888. Serial No. 293,248. (No model.)

Claim.—1. The combination of the plane-stock provided with the frog 4, the cutting-bit, and the laterally-adjusting compound lever consisting of the lower and upper members pivoted on axes perpendicular to the face of said frog, substantially as described, and for the purpose specified.

2. The combination of the plane-stock provided with the frog 4, the compound lever consisting of the lower member, 6, having the opening 9 and upper member, 7, both pivoted to said frog, the cutting-bit B, cap-iron C, and the cap-screw 10, the head of which screw rests within the opening 9 of said lower member of the compound lever, substantially as described, and for the purpose specified.

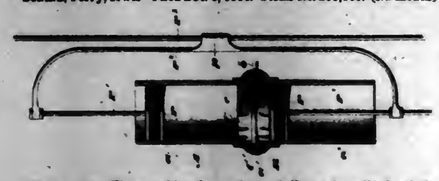


402,887. **STEAM-BOILER.** JOHN BAIRD, New York, N. Y. Filed Apr. 26, 1888. Serial No. 271,783. (No model.)

Claim.—1. Two or more inverted arches formed in that part of a boiler which overlies the furnace, said arches being constructed of sheets of metal with their adjoining edges secured by rivets, as described, and having such adjoining edges braced to the upper part of the shell by sheets of boiler-iron or steel secured to the adjoining edges of the arches and to the shell, substantially as specified.

2. One or more inverted arches formed in that part of a boiler which overlies the furnace, and constructed substantially as described, in combination with horizontal bracing extending from outside to outside of the shell and secured by nuts, as described.

402,888. VEHICLE-SPRING. GEORGE E. BARTHOLOMEW, New Haven, Conn., assignor of one-third to E. R. Edwards, Cincinnati, Ohio. Filed July 24, 1888. Serial No. 280,859. (No model.)



Claim.—1. The combination of two independent springs arranged one above the other and an equalizing-link arranged between and pivoted to the said springs, substantially as described.

2. The combination, with a spring cross-bar adapted for connection with a vehicle-body, of springs 11, connected to said bar, links 12, springs 10, held by said links, shackles to which the forward ends of the springs 10 and 11 are connected, and clips to which the rear ends of the springs are connected, substantially as described.

3. The combination, with springs 10 and 11, of a link, 12, centrally placed between said springs, shackles to which the forward ends of the springs are connected, said shackles being adapted for connection with the vehicle-body, and clips to which the rear ends of the springs are connected, said clips being adapted for connection with the rear axle of the vehicle, substantially as described.

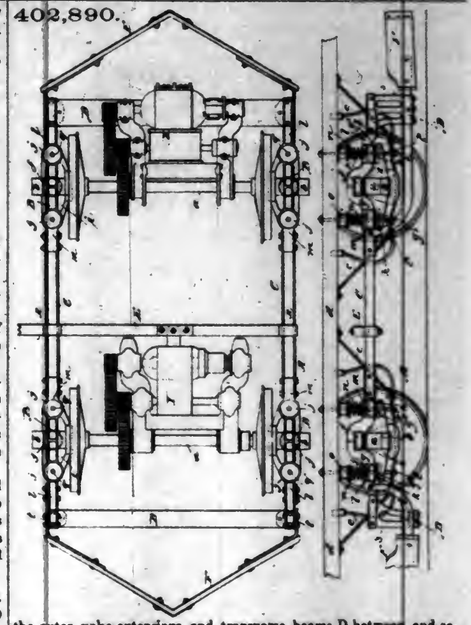
4. The combination, with a vehicle-body, of shackles 13, connected thereto, springs connected to said shackles, a cross-piece arranged to the rear of the shackles and to which the springs are connected, links 12, arranged between the springs, and clips 19, to which the rear ends of the springs are connected, said clips being connected to the hind axle, substantially as described.

402,889. STEAM-ENGINE. VOLNEY W. BEMIS and WALTER R. BOEHM, Perry, Iowa. Filed Dec. 8, 1888. Serial No. 293,003. (No model.)

Claim.—1. The combination, substantially as described, of the two-part cylinder provided with exit-ports and centrally with a constantly-open ingress-port, two pistons connected to move together, and the centrally-flanged valve loosely seated between the pistons and provided with extended ends which project into the path of the advancing piston.

2. The combination, substantially as described, of the sectional cylinder having exit-ports and connected centrally by a bulged union having a constantly-open ingress-port, a loose disk-valve having an annular flange seated loosely between the inner ends of the cylinder-sections, and provided with extended ends adapted to project into the path of an advancing piston, the pistons mounted in each section of the cylinder, the piston-rods, and the yoke to connect the pistons.

402,890. ELECTRIC OR CABLE RAILWAY CAR. BUSHROD A. BEMIS, Springfield, and LOUIS PFINGST, Boston, Mass. Filed Feb. 15, 1889. Serial No. 300,043. (No model.)



Claim.—1. In a car-truck, the combination, with the journal-boxes and the cushions *g* on the tops thereof, of the yoke-frame consisting of the arched yokes resting on said cushions *g*, the longitudinal yoke-connecting beams, and transverse connecting-beams, substantially as described.

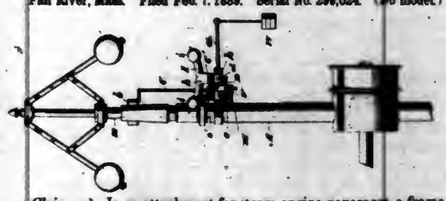
2. The truck comprising the journal-boxes, yielding cushions thereon, and the yoke-frame consisting of the arched yokes to rest on the top of each journal-box cushion, the longitudinal yoke-connecting beams, and transverse connecting-beams, combined with a car-body spring supported from said yoke-frame, substantially as described.

3. In a car-truck, the combination, with the journal-boxes and their extension-frames *i* and the cushions *g g' g'* for each journal supported thereon, of the yoke-frame consisting of two pairs of yokes, B, each having a central arched portion and inner and outer extensions resting on said cushions, a pair of longitudinal beams, C, uniting the side pairs of yokes, and cross-beams uniting the compound yokes at each side of the truck, substantially as described.

4. A yoke-frame consisting of two pairs of yokes having arched intermediate portions and inner and outer extensions, longitudinal beams C, uniting said inner yoke-extensions, hangers *s*, supported on

402,890.

the outer yoke-extensions, and transverse beams D between and secured to said hangers, substantially as and for the purpose described.

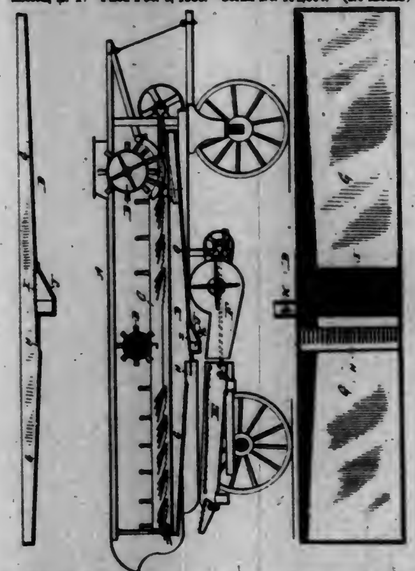


5. A yoke-frame consisting of two pairs of yokes having arched intermediate portions and inner and outer extensions, longitudinal beams C, uniting said inner yoke-extensions, hangers *s*, supported on the outer yoke-extensions, transverse beams D between and secured to said hangers, and the braces *t*, substantially as described.

402,891. END-GATE. HOLLAND C. BENNETT, Raymond, Ill. Filed Nov. 27, 1888. Serial No. 291,947. (No model.)

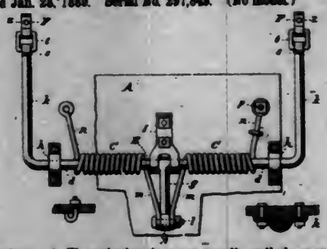
Claim.—The combination, with a wagon having the retaining-screws F in its sides, of the described end-gate cut away on each side at G to rest upon some supporting portion of the wagon—such as the axle or a transverse bar—and provided in its sides with suitably-curved slots E, each slot having both ends enlarged, as at *e*, substantially as and for the purposes described.

402,892. GOVERNOR FOR STEAM-ENGINES. WILLIAM BERWICK, Fall River, Mass. Filed Feb. 7, 1889. Serial No. 299,024. (No model.)



Claim.—1. In an attachment for steam-engine governors, a frame adapted to be connected to the standard thereof, said frame having an opening through which passes a rack-bar which engages with the segment attached to a horizontal shaft, said shaft carrying an arc-shaped chamber containing a shifting weight, said toothed rack also being connected to a rod having a spring, and an arm carrying a roller which engages with a pivoted lever, substantially as shown.

2. In combination with a governor for steam-engines, a rod connected to a vertically-moving part of the governor, the lower end of said bar having a rack-bar, an upwardly-extending rod embraced by a spring, and an arm carrying a roller connected to the depending rod C, a toothed segment mounted on a horizontal shaft to engage with the rack-bar, said shaft also carrying a weight which extends beyond each side of the center of the shaft *d*, and a pivoted lever, the short end of which is adapted to engage with a roller on the arm F, a suitable stop for said pivoted arm, and a weight attached to the long end thereof, substantially as shown, and for the purpose set forth.

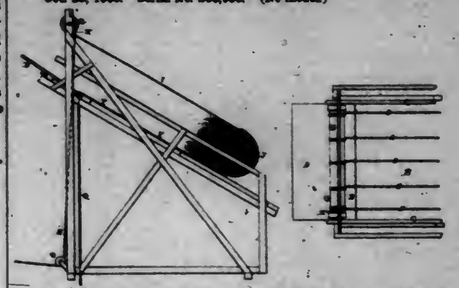


3. In a steam-engine governor, the combination of the rod C, connected to and actuated by a governor, a suitable supporting-frame carrying a horizontal shaft, a toothed segment secured upon said shaft, so that the horizontal shaft will move in unison with the governor, a single weight or mercury-chamber secured to the horizontal shaft above its center, an arm, F, provided with a roller and a bar, said arm and bar being connected to the rack-shaft, a lever or pivoted arm, G, mounted on the horizontal shaft, the short arm thereof extending beneath the roller, the upward movement of said lever being limited by the frame, the long end of said lever being provided with a weight, the parts being constructed and arranged substantially as shown, whereby the governor in its fluctuations up and down is counteracted.

402,893. BEAN-THRASHING MACHINE. CHARLES H. BIDWELL, Albion, N. Y. Filed Feb. 6, 1886. Serial No. 191,067. (No model.)

Claim.—The combination, with the conveyer-pan having a transverse opening, H, in its bottom, the portions of the bottom on each side of this opening converging toward the same, of a screen stretched over an opening in the bottom of the pan, in front of the said opening H, and a receptacle attached to the conveyer-pan beneath the said screen, substantially as described.

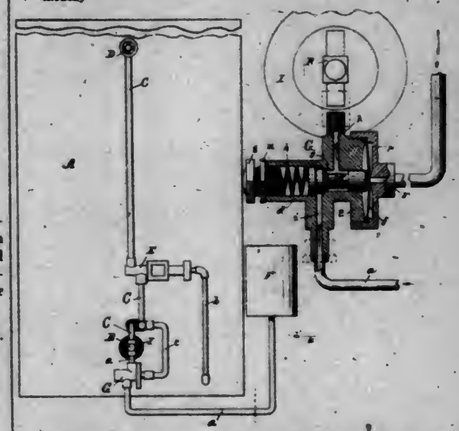
402,894. VEHICLE-SPRING. REMEMBER H. BOOTH, Kirkwood, N. Y. Filed Jan. 28, 1889. Serial No. 297,849. (No model.)



Claim.—1. The spiral springs outwardly coiled around an equalizing-lever and having the inner arms connected to a middle projection of said lever and the outer arms secured to the vehicle-body, substantially as specified.

2. The equalizing-lever having the lateral pivoted branches, the side arms at right angles thereto, and the middle projecting arm provided with an eye or bearing at its end, whereby it is connected to the inner arms of the spiral springs around said lateral branches, substantially as specified.

3. The combination of the equalizing-lever having its lateral branches pivoted to the vehicle-body, its side arms provided with end links or shackles, and its middle projecting arm, the double-prong bearing connecting said lever to the vehicle-body, and the spiral springs around said branches, their inner arms connected to the projecting arm of the equalizing-lever and the outer arms secured to the vehicle-body, substantially as shown and described.



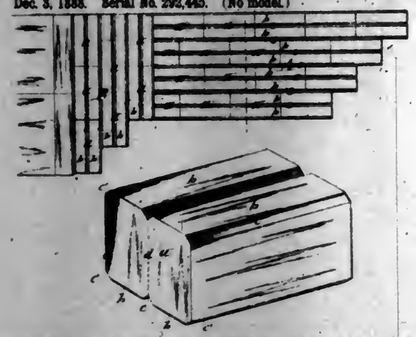
402,895. HAY-STACKER. DAVID W. BOYER, Tama, Iowa. Filed Oct. 23, 1888. Serial No. 288,986. (No model.)

Claim.—1. In a hay-stacker, a tilting platform connected to the upper end of the frame, elevating-ropes connected thereto at its lower edge, a drum, and elevating-ropes connected to the drum, substantially as shown.

2. In a hay-stacker, the combination of a suitable frame-work having an inclined top, a pivoted platform connected to its upper end, ropes connected to the lower end of the platform, ropes which are placed under the hay, a drum, and ropes connected to the drum both for operating the drum and raising the hay, substantially as set forth.

402,896. MEANS FOR CONTROLLING THE FLOW OF OIL TO INJECTOR-BURNERS FOR STEAM-BOILER FURNACES. SETH BRAGGIN, Rochester, N. Y. Filed June 4, 1888. Serial No. 275,987. (No model.)

Claim.—1. In combination with a device for atomizing oil, an oil-reservoir, an oil-pipe connecting said atomizing device and reservoir, a valve in said oil-pipe, a spring within the valve-chamber to close the valve, and a diaphragm adapted to be pressed against a part of the valve to open the same, a steam-conduit to admit steam to the side of the diaphragm opposite the valve, and the steam-boiler, substantially as shown and described.

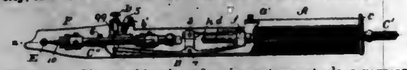


2. In combination with a device for atomizing oil, an oil-reservoir, a pipe connecting said atomizing device and the reservoir, a valve in said pipe, a spring within the valve-chamber to close the valve, and a diaphragm adapted to be pressed against the valve to open the same, a steam-conduit to convey steam to the side of the diaphragm opposite the valve, and the steam-generator, the axes of

the valve, the spring, and the diaphragm being in a straight line, substantially as shown.

3. In combination with a device for atomizing oil, a valve to control the flow of liquid fuel to the device for atomizing oil, connected with the steam-generator by a steam-pipe and diaphragm, and a valve in said steam-pipe to control the flow of steam therein, said latter valve being adapted to be closed by a diaphragm located in a diaphragm-chamber in a steam-inlet pipe, and said fuel-regulating valve being acted upon by a spring tending to close the same, substantially as described.

4. In combination with a steam-generator and an oil-reservoir, an atomizing device for the oil, a conduit for the oil connecting said reservoir and device for atomizing the oil, and a valve in said conduit to control the flow of oil therein, said valve being acted upon by a steam-pressed diaphragm in a direction tending to raise it off its seat, and pressed by a spring in the opposite direction to close it, substantially as set forth.



402,897. PAVING-BLOCK. JAMES L. BREED, Syracuse, N.Y. Filed Dec. 3, 1888. Serial No. 292,445. (No model.)

Claim.—1. The improved paving-block composed of vitrified clay and formed rectangular, and with grooves and beveled edges all formed in the top and bottom faces of the block and extending lengthwise thereof, and the end faces of said block being each in a uniform plane throughout at right angles to the top and bottom faces of the block, substantially as described and shown.

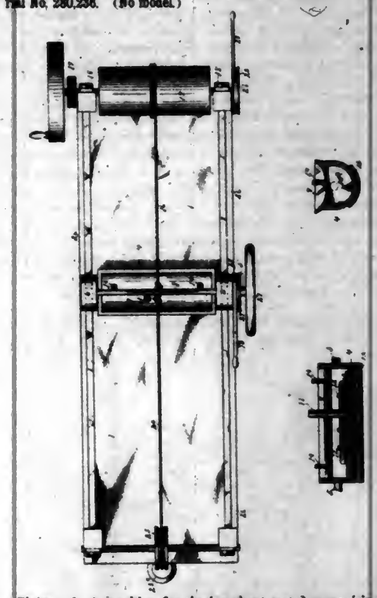
2. A street-pavement composed of rectangular blocks of vitrified clay, each of said blocks being formed with grooves and beveled edges all in the top and bottom faces of the block and lengthwise thereof, and having plain end faces in uniform planes throughout at right angles to the top and bottom faces, the blocks in the main or central portion of the street being laid with the grooves of the blocks transversely of the line of the street, and the blocks in the gutters laid with the grooves of the blocks lengthwise of the street, substantially as described and shown.

402,898. PAINT-DISTRIBUTER. CHARLES L. BURDICK, Kansas City, Mo. Filed Mar. 13, 1888. Serial No. 267,096. (No model.)

Claim.—1. The combination of a pigment-receptacle, a pigment-conducting point, and an air-blast nozzle adjustable in relation to said point, substantially as described.

2. In a paint-distributer, a bifurcated pigment-conducting point, in combination with an adjustable blast-nozzle arranged to discharge between the blades of the point, whereby the pigment is blown from between them, in the manner and for the purpose substantially as described.

3. In a paint-distributer, a bifurcated pigment-conducting point provided with mechanism for adjusting the blades thereof, in combination with an oscillating air-blast nozzle arranged to discharge between said blades, in the manner and for the purpose described.



4. In a paint-distributer, a pigment-conducting point, in combination with an oscillating blast-nozzle, and mechanism, substantially as described, for adjusting said nozzle toward and from said point, in the manner and for the purpose set forth.

5. In a paint-distributer, a bifurcated pigment-conducting point having adjustable blades provided with a set-screw, in combination with an adjustable air-blast nozzle, substantially as described.

6. In a paint-distributer, a pigment-receptacle having a conducting-point removably secured therein and provided with a set-screw, in combination with an air-blast nozzle, substantially as described.

7. The combination of an air-supply tube, an adjustable air-blast nozzle, a valve to control the air-supply to said tube, and a finger-piece connected with the valve and nozzle, whereby both are simultaneously operated, in the manner and substantially as described.

402,899. MACHINE FOR TINNING METALS. DAVID CAIRD, Ansonia, and GEORGE LARKINS, Seymour, Conn. Filed July 17, 1888. Serial No. 280,236. (No model.)

Claim.—1. A machine for tinning sheet metal, comprising a rigid bed, a tilting carrier and spreader for laying and spreading the melted tin upon the surface of the sheets, a heater for said carrier and spreader, and means, substantially as described, for moving the carrying and spreading device over the surface of the sheets.

2. A machine for tinning sheet metal, comprising a rigid bed, and a tilting carrier and spreader for holding the melted tin and for spreading it upon the surface of the sheets, said carrier and spreader being vertically adjustable relatively to the bed, so as to regulate the thickness of the coating of tin, substantially as described.

3. A machine for tinning sheet metal, comprising a rigid bed lying at an incline, a tilting carrier and spreader for the melted tin, a heater for keeping the melted tin in that condition and for heating the spreading device, and a rope, windlog-drum, and weight for moving the carrying and spreading device, substantially as described.

4. The combination, with the bed, side rails, and hangers sliding thereon, of a carrying and spreading device journaled in said hangers, means, substantially as described, for locking said device in position, and means for moving said device backward and forward upon the bed.

5. The combination, with the bed, the hangers, and the carrier and spreader journaled in said hangers, of a winding-drum, a brake for controlling its movement, and a weight for moving the carrier and spreader forward in use.

6. The combination, with the bed, side rails, and hangers, of the carrier for the molten tin having a shoe, 15, secured to the bottom thereof, as and for the purpose set forth.

7. The combination, with the bed, side rails, and hangers, of a spreader journaled in said hangers and having a receptacle for the molten tin, and a heating-chamber, substantially as described.

8. The combination, with the bed, side rails, and hangers, of a spreader journaled in said hangers and having a receptacle for the melted tin, a heating-chamber, gas-connections, and a thermometer for indicating the temperature of the chamber.

402,900. HOSE-CARRYING STRAP. HIRAM M. CAMPBELL, Bridgeport, Conn. Filed Sept. 14, 1888. Serial No. 285,405. (No model.)

Claim.—1. In a hose carrying or supporting device, the combination, with the strap having the upper shoulder-loop and the lower and smaller loop, of the grapple-tongs, whose handles are secured about and are adapted to be operated by said loop, substantially as set forth.

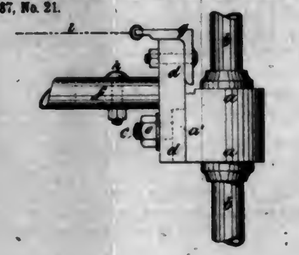
2. In a hose carrying or supporting device, the combination, with the double-looped strap and the grapple-tongs secured thereon and operated thereby, of the hook secured about and vertically adjustable upon the shoulder-loop, substantially as specified.

402,900.

3. In a fireman's hose-carrying strap, the combination, with the grapple, of the shoulder-loop and the adjustably-securable hook arranged about the strap comprising said shoulder-loop, as described.

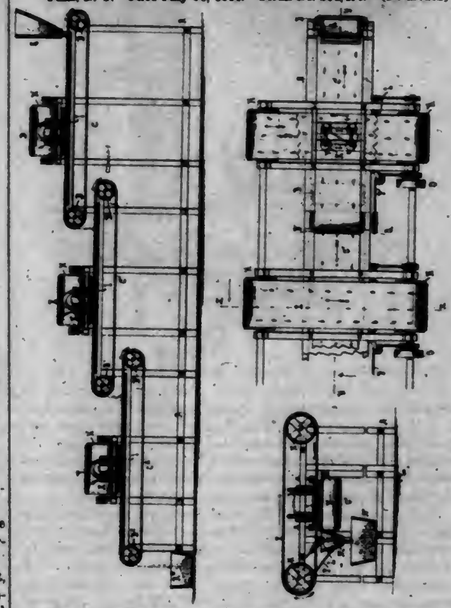
4. The combination, with the grapple, the loop for operating it, and the shoulder-loop, of the casing arranged about the strap comprising said shoulder-loop and movable thereon, and the hook pivoted to the casing and provided with a clamping-extension for the binding of the strap against the casing, substantially as set forth.

5. A fireman's hose-carrying strap comprising the following: the grapple-tongs and the loop whereby they are held and operated, the shoulder-loop, the adjustable clamping-hook arranged upon the shoulder-loop, and the snap secured at or near the lower end of said shoulder-loop, all arranged as described, and for the purpose specified.



402,901. WITHDRAWN.

402,902. CATHETER. CHARLES A. CHAPMAN, No. 8 Stock Orchard Street, Caledonian Road, London, County of Middlesex, England, assignor to Sardy, Coles & Co., New York, N. Y. Filed Apr. 7, 1888. Serial No. 269,971. (No model.) Patented in England Sept. 16, 1887, No. 12,577.



Claim.—In combination with a flexible catheter, substantially as hereinbefore described, a rigid former located in the end of the catheter and contiguous to the eye or opening of the same, for the purposes set forth.

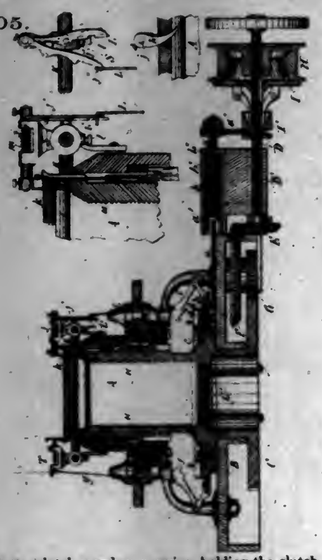
402,903. BED-FRAME AND BEDSTEAD. ISAAC CHORLTON and GEORGE L. SCOTT, Manchester, County of Lancaster, England. Filed Oct. 24, 1888. Serial No. 288,995. (No model.) Patented in England Jan. 1, 1887, No. 21.

Claim.—In iron bedsteads, the brackets *d*, carrying the tubular side members, *f*, and angle-iron ends *g*, said brackets *d* being formed with a recess, in combination with the corner-brackets *a*, formed with a projection, *a'*, which fits the recess in the brackets *d*, and a screwed stud, *c*, passing through the bracket *d*, and secured by a nut, *e*, substantially as described and shown.

402,904. MAGNETIC SEPARATOR. GORDON CONKLING, Glens Falls, N. Y. Filed July 31, 1888. Serial No. 281,496. (No model.)

Claim.—1. The combination, with a series of conveying-aprons running in the same direction, one above the next, as shown, of a series of transverse aprons, magnets secured in proximity to each of the transverse aprons, and suitable driving mechanism for actuating the aprons, substantially as described.

2. The combination, with a series of conveying-aprons running in the same direction, one above the next, as shown, of a like series of transverse aprons, a magnet secured in proximity to each of the transverse aprons, the magnets of the different transverse aprons being of different intensities, and suitable driving mechanism for actuating the aprons, substantially as described.



402,905. STOPPING MECHANISM FOR KNITTING-MACHINES. HENRY CURTIS, Little Falls, N. Y. Filed Jan. 21, 1889. Serial No. 296,959. (No model.)

Claim.—1. In combination with the needle-cylinder, an automatic stop-motion comprising a shifter adapted to throw the driving mechanism of the machine out of gear, a spring actuating said shifter, a tripper connected to the machine and adapted to actuate the shifter in opposition to the force of the spring, an auxiliary tripper arranged to rotate with the needle-cylinder, and a latch connected to said auxiliary tripper and adapted to lock the two trippers to each other and supported out of its locking position by the yarn passing to the machine.

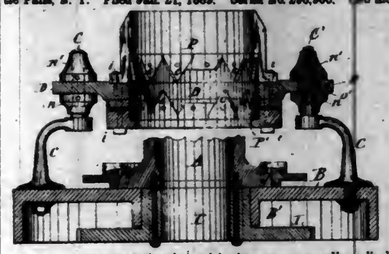
2. The combination, with the needle-cylinder and its driving-shaft, of the driving-pulley mounted loosely on said shaft, a clutch member adapted to lock said pulley to the shaft, a spring holding the clutch member out of engagement, an annular ratchet surrounding the base of the needle-cylinder and rigidly attached thereto, a plate surrounding said part of the needle-cylinder and movable independently thereof, a clutch-shifting arm or rod actuated by said plate in opposition to the force of the aforesaid spring, latches connected to said plate and adapted to lock the same to the aforesaid ratchet, and links hung on the yarns passing to the machine and holding the aforesaid latches out of engagement with the ratchet, as set forth.

3. In combination with the needle-cylinder, thread-guides, driving-shaft, and loosely-mounted driving-pulley, a clutch member adapted to lock said pulley to its shaft, an annular ratchet surrounding the base of the needle-cylinder and rigidly attached thereto, an annular plate surrounding said part of the needle-cylinder, movable independently thereof, and provided with notches, a push-bar con-

402,905.

nected with the clutch member, a spring holding the clutch member out of engagement with the driving-pulley, a cam on the aforesaid annular plate adapted to actuate the push-bar in opposition to the aforesaid spring, latches adapted to enter the notches of the annular plate and ratchet, and links connected to the latches and suspended from the yarns passing to the machine, as set forth.

4. In combination with the rotary needle-cylinder, its driving-shaft, and pulley mounted loosely thereon, a clutch member adapted to lock said pulley to its shaft, the push-bar *a*, connected with said clutch, the spring *b*, arranged to press the push-bar toward the needle-cylinder, the ratchet *c*, rigidly secured to the base of said cylinder, the annular plate *d*, loosely surrounding said cylinder and ratchet and provided with notches *d'* and with the cam *e*, the latches *f f*, hinged to the plate *d*, the links *g*, connected to said latches and hung on the yarns passing to the machine, and the ring *h*, loosely surrounding the plate *d* and formed with cams *h'* under the aforesaid latches, substantially as described and shown, for the purpose set forth.



5. The combination of the needle-cylinder provided with a circumferential recess over which the knitted fabric passes, a feeler sustained yieldingly in position to bear on the fabric over the aforesaid recess, a shifter adapted to throw the driving mechanism of the machine out of gear, a spring actuating the shifter in one direction, a tripper connected to the machine and adapted to actuate the aforesaid shifter in opposition to the force of the spring, an auxiliary tripper arranged to rotate with the needle-cylinder, and a latch connected to said auxiliary tripper and adapted to lock the two trippers to each other, and supported by the feeler bearing on the fabric, as aforesaid.

6. The combination of the needle-cylinder provided with the circumferential recess *i*, the pivoted spindle *j*, feeler *k*, attached to said spindle and having its free end normally in the aforesaid recess, the arm *j'*, extending laterally from the spindle and provided with a shoulder, *j''*, a shifter adapted to throw the driving mechanism of the machine out of gear, a spring actuating the shifter in one direction, a tripper connected to the machine and adapted to actuate the aforesaid shifter in opposition to the force of the spring, an auxiliary tripper arranged to rotate with the needle-cylinder, a latch connected to said auxiliary tripper and adapted to lock the two trippers to each other, and a link connected to the said latch and removably hung on the shoulder *j''* of the arm *j'*, substantially as and for the purpose set forth.

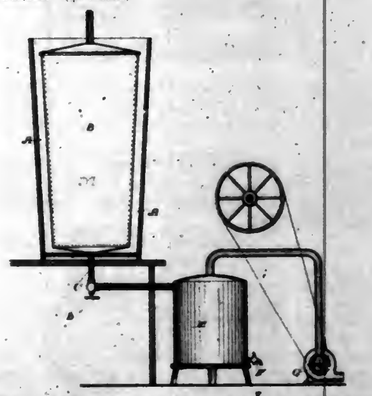
7. In combination with a shifter adapted to throw the driving mechanism of the machine out of gear and a spring actuating said shifter in one direction, a tripper connected to the machine and adapted to actuate the aforesaid shifter in opposition to the force of the spring, an auxiliary tripper arranged to rotate with the needle-cylinder, and a latch adapted to lock said trippers to each other, the needle-cylinder A, provided with the circumferential recess *i*, the spindle *j*, pivoted to a stationary support outside of the needle-cylinder, the feeler K, attached to the inner end of said spindle, the arm *j'*, extending laterally from the outer end of the spindle, the link L, connected to the aforesaid latch and hung removably on the arm *j'*, and the knock-off L' on the support of the spindle *j*, arranged in position to throw the link L from the arm *j'*, substantially as described and shown.

8. In combination with the needle-cylinder provided with the circumferential recess *i*, the rod R of circular form in cross-section, sustained horizontally stationary at the outside of the needle-cylinder, the bracket S, mounted adjustably on said rod, the set-screw *l*, connected to the bracket and engaging the aforesaid rod, the spindle *j*, pivoted to the bracket, and the feeler *k*, attached to the inner end of said spindle, substantially as described and shown.

402,906. CIRCULAR-KNITTING MACHINE. HENRY CURTIS, Little Falls, N. Y. Filed Jan. 21, 1889. Serial No. 296,960. (No model.)

Claim.—1. In combination with the rotary needle-cylinder, a plate arranged stationary around the exterior of said needle-cylinder, and the lower cam-ring, P', hung on said plate.

2. In combination with the rotary needle-cylinder, a plate arranged stationary around the exterior of said needle-cylinder, and the lower cam-ring, P', divided transversely and hung on the aforesaid plate, as and for the purpose set forth.

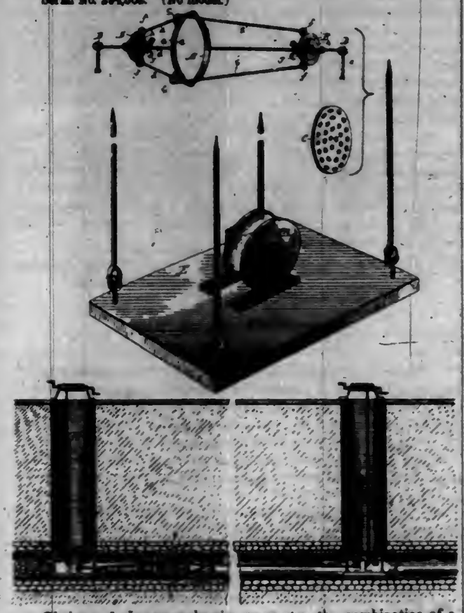


3. In combination with the bed-plate and needle-cylinder, standards rising from the bed-plate, a plate surrounding the needle-cylinder and supported on the standards, and the cam-rings P P', secured, respectively, to the top and bottom of the aforesaid plate, as and for the purpose set forth.

4. In combination with the bed-plate and needle-cylinder, the standards C C, rising from the bed-plate, the screw-threaded posts C' C', attached to the standards, nuts *n n'* on said posts, the plate D, supported between said nuts, and the cam-rings P P', secured, respectively, to the top and bottom of the plate D, substantially as described and shown.

5. In combination with the bed-plate and needle-cylinder, the standards C C, rising from the bed-plate, the screw-threaded posts C' C', attached to said standards, the nuts *n*, provided with the cylindrical necks *o* and shoulders *o'*, the plate D, provided with eyes *e*, closely embracing the necks *o* and seated upon the aforesaid shoulders, the nuts *n'*, applied to the posts C' C' above the plate D, and the cam-rings P P', secured, respectively, to the top and bottom of said plate, substantially as described and shown.

6. In combination with the bed-plate and needle-cylinder, standards rising from the bed-plate, the plate D, surrounding the needle-cylinder and supported on the aforesaid standards, and the cam-rings P P', composed of segmental sections secured to the top and bottom of the plate D, substantially as described and shown.



402,907. APPARATUS FOR MAKING MENTHOL CRYSTALS. HENRY D. CUSHMAN, Three Rivers, Mich. Filed June 13, 1887. Serial No. 241,216. (No model.)

Claim.—1. The combination of the vessel B, having openings in the top and bottom for the ingress and egress of air, the removable basket M, adapted to closely fit within the vessel B, and the vessel A that incloses the vessel B and contains the cooling agent, substantially as set forth.

2. The combination of the vessel B, having openings in the top and bottom for the ingress and egress of air, the removable basket M, adapted to closely fit within the vessel B, the vessel A, that incloses the vessel B and contains the cooling agent, and an exhaust fan or pump connected by a pipe with the bottom of vessel B, substantially as set forth.

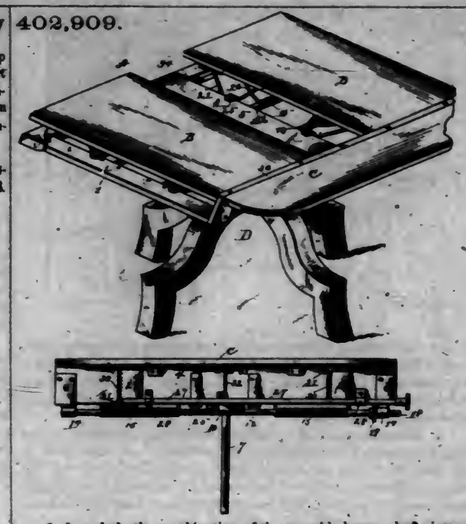
402,908. APPARATUS FOR CLEANING SEWERS. OWEN DONNELLY and COTTER T. BRIDE, Washington, D. C. Filed Dec. 21, 1888. Serial No. 294,202. (No model.)

Claim.—1. In sewer-cleaning apparatus, the combination of a circular knife and a series of spring rods or arms extending therefrom in opposite directions, the same being compressible or collapsible and designed to move against the walls of the sewer, substantially as and for the purpose described.

2. In sewer-cleaning apparatus, the combination of a circular knife having opposite cutting-edges, compressible or collapsible spring-rods extending from the same in opposite directions, and a removable gate fitting within the said knife, substantially as described.

3. In sewer-cleaning apparatus, the combination of a circular or ring-shaped knife having opposite cutting-edges and formed with openings, and a series of arms projecting from said ring in opposite directions, the same having their inner ends turned to enter said openings and their outer ends brought together and secured, and a draw-chain or rope, substantially as described.

4. In sewer-cleaning apparatus, the circular or ring-shaped knife, in combination with the spring rods or arms and the plates B B, the said rods or arms having their outer ends passing through the plates and secured by nuts and washers, and the plate having its edge bent over outwardly to protect the ends of the rods, substantially as described.



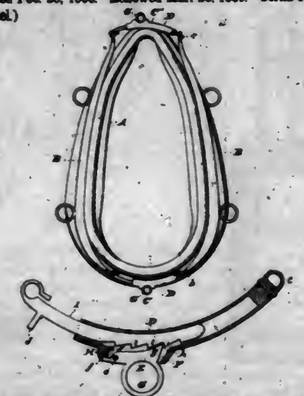
5. In sewer-cleaning apparatus, the circular or ring-shaped knife provided with openings and having opposite cutting-edges, in combination with spring-arms fitting in said openings from opposite directions, substantially as described.

6. In sewer-cleaning apparatus, the platform E, having mounted thereon the grooved wheel or pulley and provided with the hinged arms *e*, substantially as described.

402,909. DESK. JOHN W. DUNCAN, Butler, Mo., assignor of one fourth to Robert G. West, same place. Filed Nov. 17, 1888. Serial No. 291,151. (No model.)

Claim.—1. In a desk, the combination of the frame, the vertically-movable leaves, shafts journaled beneath the leaves, coiled springs secured to the shafts having arms bearing against the under side of the leaves, ratchet-wheels on the shafts, a pawl engaging the ratchet-wheels, and means for turning the shafts to regulate the tension of the spring, substantially as described.

402,909.

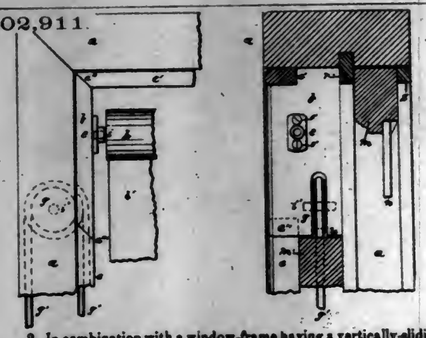


2. In a desk, the combination of the movable leaves, shafts journaled beneath the same, coiled springs secured to the shafts, having arms, and rollers on the arms bearing against the under side of the leaves, substantially as described.

3. In a desk, the combination of the movable leaves, shafts journaled beneath the same, coiled springs secured to the shafts, having arms, rollers on the arms bearing against the under side of the leaves, guides on the leaves, and arms journaled in the supporting-frame and moving in the guides, substantially as and for the purpose specified.

4. The combination, with the desk, of a slide-rod, vertical rack-plates secured thereto, movable leaves, and pins secured to the leaves and designed to engage the rack-plates, substantially as and for the purpose specified.

402,910. HAME-CONNECTION. ROBERT C. ELLIOTT, Prairie Creek, Ind. Filed Feb. 25, 1888. Renewed Mar. 20, 1889. Serial No. 304,050. (No model.)

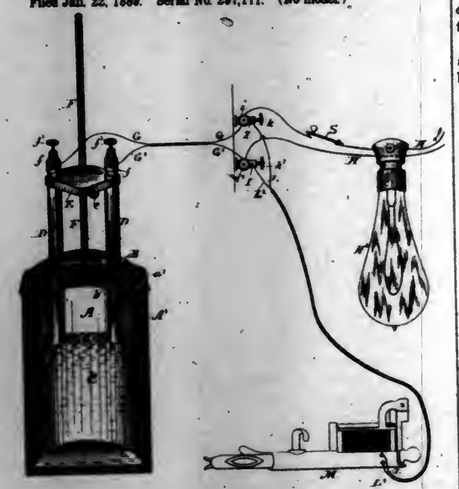


Claim.—The hame-fastening device composed of the curved tubular section D, rectangular in cross-section and having the closed end, the loop *c*, pivoted to the closed end of the section D, the detent E, pivoted through its lug *e* in a recess, F, in a projection, *f*, on the side of the section D, the said detent having the pawl-point *g*, the projection *f*, the coiled spring H in the recess F and bearing against the lug *e*, the curved section I, having the loop on its outer end and a handle, J, and provided with the teeth *i* for engaging the detent, substantially as specified.

402,911. WINDOW-FIXTURE. WILLIAM H. ELLIOT, Brooklyn, N. Y. Filed Nov. 28, 1888. Serial No. 291,944. (No model.)

Claim.—1. In combination with a window-frame having a vertically-sliding sash, a balancing-cord and pulley pivoted thereto and constructed in the usual way, and a fixture-block, *b*, for supporting the shade-roller bracket, provided with slot or recess *d* to make room for said cord and pulley, substantially as specified.

402,911.



2. In combination with a window-frame having a vertically-sliding sash, a balancing-cord and pulley pivoted thereto and constructed in the usual way, a fixture-block, *b*, provided with a stop, *u*, on its lower end to limit the upward movement of the same, and a bracket, *c*, all substantially as specified.

3. In combination with a window-frame having a vertically-sliding sash, a balancing-cord and pulley pivoted thereto and constructed in the usual way, a fixture-block, *b*, provided with a slot or recess, *d*, a stop, *u*, for the sash, and a bracket, *c*, fixed by suitable means upon said block, which is in turn supported by said frame, substantially as specified.

4. As an article of manufacture, the fixture-block *b*, shaped and constructed substantially as described, to be placed in the inner upper corner of a window-frame in line with the guide-sash stop independently thereof, and forming a continuous finish therewith, and to have its lower edges across the sashway to serve as a stop, and provided with a window-shade bracket fixed to its face.

402,912. RHEOSTAT. JOSEPH B. RETTRIKIN, Des Moines, Iowa. Filed Jan. 22, 1889. Serial No. 297,171. (No model.)

Claim.—1. The electric-current regulator consisting of a vessel containing an acid solution, its lid having two vertical perforations, a central post secured to said lid, an insulating-platform adjustably secured to said post, two parallel carbons suspended from said platform and passing through the perforations in the lid, and binding-posts upon said carbons, substantially as described.

2. The combination of an electric-current regulator consisting of a vessel containing a chemical solution, its lid having two vertical perforations, a central post secured to said lid, an insulating-platform adjustably secured to said post, two parallel carbons suspended from said platform and passing through the perforations in the lid, and binding-posts upon said carbons, with electric wires connected to said carbons, binding-posts I upon said wires, a mechanical electric tool, and wires connecting it with said posts I, substantially as described.

402,913. THILL-COUPLING. BURRIS A. FARR, Galesburg, Ill. Filed Jan. 17, 1889. Serial No. 296,662. (No model.)

Claim.—1. In an anti-rattler thill-coupling, the combination, with

402,913.

a coupling-box and a thill-iron provided with adjustable journal stub ends, of an elastic block, a clip, a presser-shoe, and a set-bolt, substantially as set forth.

2. In an anti-rattler thill-coupling, the combination, with a coupling-box provided with a slotted end and socket-boxes that are adapted to receive the journal stub ends of a thill-iron, a thill-iron supporting opposite journal stub ends, and two endwise-adjustable journaled stub ends, of a presser-shoe that has half-boxes formed on its depending parallel flanged walls, which are adapted to engage the journal stub ends, a removable axle-clip, an elastic block, and a set-bolt, substantially as set forth.

3. In an anti-rattler thill-coupling, the combination, with a coupling-box, a journaled thill-iron, and adjustable stub ends that are rounded to afford journals for the thill-iron and are oppositely inserted in a threaded hole in this thill-iron, of an elastic block which is located between the flanged walls of a presser-shoe, a flanged presser-shoe, an axle-clip having an inclined rib on its face, and a threaded set-bolt, substantially as set forth.

402,914. PENCIL-SHARPENER. JONAS R. FOSTER, Stoneham, Mass. Filed Jan. 18, 1888. Serial No. 261,105. (No model.)

Claim.—1. A pencil-sharpener composed of the block provided with a handle and with a recess in its under side, and a blade attached to the block above the recess and with its cutting-edge adjacent and parallel to one wall of the recess and beyond the under surface of the block, substantially as and for the purposes set forth.

2. A pencil-sharpener composed of the recessed block *a*, the blade *c*, having the hooked end c^3, and the handle *d*, all substantially as and for the purposes set forth.

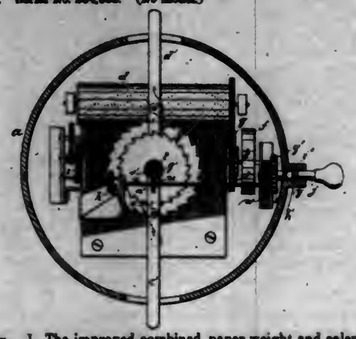
3. A pencil-sharpener composed of the block *a*, blade *c*, adjustably attached thereto, and the handle *d*, secured to one end of the said block, all substantially as and for the purposes set forth.

402,915. PORTABLE GALVANIC BATTERY. ALBERT FRIEDLANDER, Berlin, Germany. Filed Apr. 30, 1888. Serial No. 272,361. (No model.) Patented in England Mar. 21, 1887, No. 4,213; in France Oct. 25, 1887, No. 186,500; in Belgium Oct. 31, 1887, No. 79,575, and in Austria-Hungary Mar. 12, 1888, No. 40,817 and No. 6,157.

Claim.—1. An improved compendious galvanic battery for strong currents and especially for producing electric light in portable lamps in which the electrodes are attached by means of clamping-rings to a hollow rotary shaft, said shaft being rotated by operating a thumb-piece outside of the battery and connected to the rotary shaft in such manner that the electrodes can be immersed into or raised out of the exciting-fluid, substantially as and for the purpose described and shown.

2. In a portable galvanic battery for strong currents, the combination of the receptacle A and cover B with the hollow shaft *e*, clamps *d*, electrodes *c c'*, and thumb-piece *l*, substantially as and for the purpose described and shown.

3. In a portable galvanic battery, the combination of the receptacle A and partitions *a* with the frame *b*, electrodes *c c'*, clamps *d*, shaft *e*, caps or boxes *h*, segment *i*, worm *k*, and thumb-piece *l*, substantially as and for the purpose described and shown.



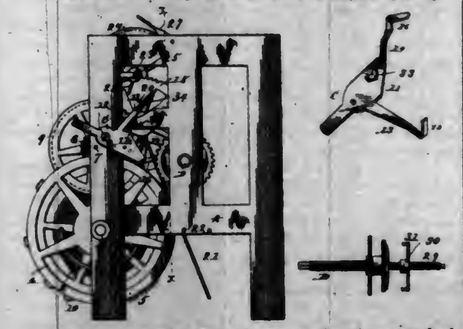
4. In a portable galvanic battery, the combination of the receptacle A, partitions *a*, frame *b*, electrodes *c c'*, clamps *d*, and shaft *e* with the caps or boxes *h*, segment *i*, worm *k*, thumb-piece *l*, and the split pins *f* and contacts *g*, substantially as and for the purpose described and shown.

5. In a portable galvanic battery, the combination of the receptacle A, partitions *a*, cover B, frame *b*, electrodes *c c'*, clamps *d*, shaft *e*, thumb-piece *l*, with the tooth or spur on said thumb-piece *b*, and the indicator I, for showing the depth of immersion of the elements

in the exciting-fluid, substantially as and for the purpose described and shown.

6. In a portable galvanic battery for strong currents, the combination of the receptacle A, cover B, electrodes *c c'*, clamps *d*, shaft *e*, thumb-piece *l*, indicator I, and frame *b* with the screws *m*, for receiving the electric lamp and connecting the same with the frame *b* and thus with the battery, substantially as and for the purpose described and shown.

402,916. COMBINED PAPER-WEIGHT, CALENDAR, AND MUSICAL WATCH. ELIA H. GAILLARD, New York, N. Y. Filed Sept. 8, 1883. Serial No. 284,902. (No model.)

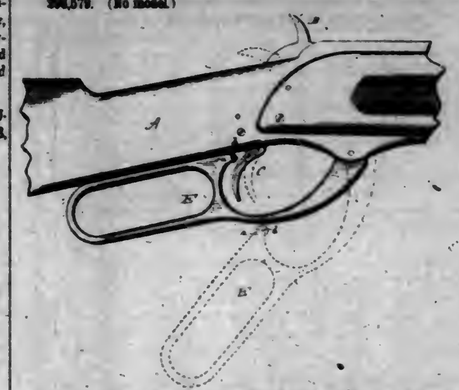


Claim.—1. The improved combined paper-weight and calendar, comprising, in combination, the stem-winder-watch case, the dial, the calendar-indices, the index-indicators, winding-stem geared with one of the index-indicators, and ratchet mechanism geared with one or more other index-indicators, substantially as described.

2. The improved combined paper-weight and calendar, comprising, in combination, the stem-winder-watch case, inclosed music-works geared with the winding-stem, the calendar-indices, the index-indicator geared with the winding-stem, and one or more index-indicators having ratchet-shifting mechanism, substantially as described.

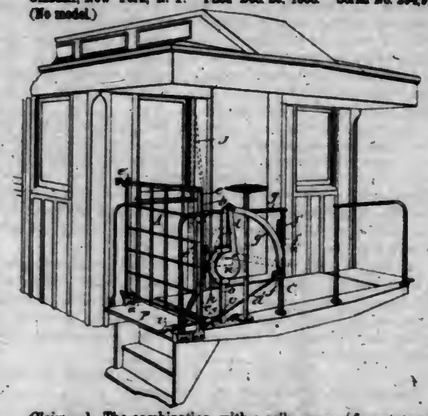
3. The combined stem-winding calendar and paper-weight, winding-stem, and gripping-stem-knob pen-extractor, substantially as described.

402,917. CLOCK STRIKING MECHANISM. DANIEL J. GALE, Forestville, Conn. Filed Sept. 10, 1888. Serial No. 285,051. (Model.)



Claim.—1. In a striking-train, the combination of a count-wheel, a locking-plate operated thereby to release the train to strike the hours, a collar on the minute-arbor engaging the locking-plate to release the train to strike the half-hours, and a pin on the frame to keep the collar in contact with the said locking-plate, substantially as described.

2. In a striking-train, the combination of the minute-arbor threaded for a portion of its length, an armed collar engaging the said threaded portion, a locking-plate having a finger engaging the said arms to cause the collar to be drawn out of contact with the said locking-plate when the hands are turned in the direction opposite their rotation, and a pin on the frame engaging the said arms to cause the collar to resume its normal position when the hands move in their proper direction, substantially as described.



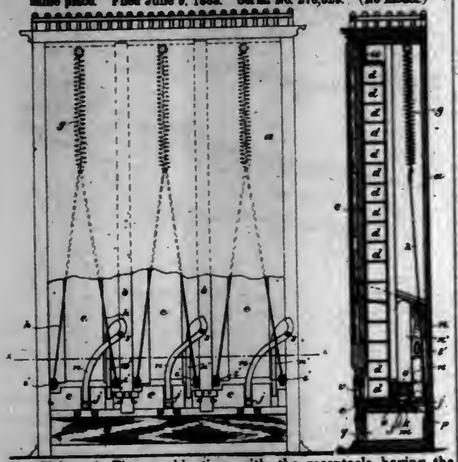
3. In a striking-train, the combination, with the minute-arbor, of an armed collar moving thereon, a locking-plate having a finger engaging the arms to throw the said collar out of contact with the locking-plate, and a pin on the frame for throwing the collar in contact with the locking-plate, substantially as described.

402,918. TRIGGER-SETTING MECHANISM FOR FIRE-ARMS. LODOWICK W. GAY, Wardner, Idaho. Filed Jan. 17, 1889. Serial No. 296,579. (No model.)

Claim.—In a fire-arm, the combination, with a gun provided with a hammer and trigger, of a pivoted lever, E, provided with an integral forwardly-projecting arm, *a*, and a roller journaled upon the forward end of the said arm and resting immediately behind the curved back of the trigger, whereby, when the said pivoted lever is thrown down, the said roller will impinge against the curved back of the trigger and press the same forward, as and for the purpose set forth.

402,919. PLATFORM-GATE FOR RAILWAY-CARS. FRANK M. GILBERT, New York, N. Y. Filed Dec. 29, 1888. Serial No. 294,978. (No model.)

Claim.—1. The combination, with a railway-car, of a gate made of vertical and horizontal bars and hinged to a supporting-bar at the end of the car-platform, substantially as described, and arranged to be raised close up to the supporting-bar, and mechanism whereby it can be operated by a person standing at the opening in the guard-railing at the end of the car-platform, substantially as and for the purpose set forth.



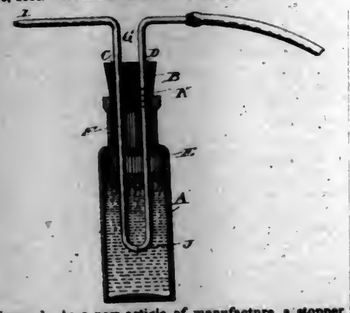
2. The combination, with a railway-car and a platform-gate made with vertical and horizontal bars and hinged to a supporting-bar at the end of the car-platform, substantially as described, said gate being jointed and arranged to be raised up close to the supporting-bar, of the sliding clasp A, cam *u*, clasp *t*, lever-arm *l*, and connecting-rod *c'*, substantially as described, and for the purpose set forth.

3. The combination, with a car-platform gate arranged to be raised up to one side, substantially as described, of a bridge to cover the car-steps, connected to the said gate, so that it will be raised with it in the same direction, substantially as and for the purpose set forth.

4. The combination, with a car-platform gate jointed and arranged to rise up to one side, substantially as described, of a bridge hinged to the car-platform to cover the car-steps, and devices whereby the bridge may be connected to the said gate, so as to be raised with it when necessary, substantially as and for the purpose specified.

5. The combination, with a car-platform gate, of the bridge *p*, rod *b'*, hook *a'*, arm *s'*, pulleys *f f'*, and chain *d'*, substantially as specified, and for the purpose set forth.

402,920. COIN-OPERATED MERCHANDISE-HOLDER. WILLARD H. GILMAN, Boston, Mass., assignor to the Gilman Confectionery Company, same place. Filed June 9, 1888. Serial No. 276,629. (No model.)

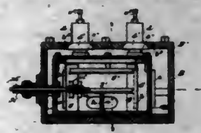


Claim.—1. The combination, with the receptacle having the series of front columns, of the sliding drawers having each a front hollow portion and a rear rest or support, the springs secured in rear of said columns, the cords connected to said drawers and to said springs, and the rollers around which said cords are passed, substantially as described.

2. In a coin-operated package-holder, the combination, with the receptacle having a series of front columns and recesses in its lower portion, of the spring-held drawers having cavities in their lower rear ends, the short horizontally-disposed levers fulcrumed in said cavities and having their rear ends projecting beyond said drawers, each lever being provided with a dog to engage in one of said recesses, and the chutes, substantially as described.

3. As an improvement in coin-operated package-holders, the combination, with the receptacle having recesses in its lower portion, of the series of spring-held drawers having cavities in their lower portion, the levers fulcrumed in said cavities and having their rear ends projecting beyond said drawers, and the narrow chutes opening over the ends of said levers, substantially as described, whereby a coin placed in either of said chutes will hold one of said levers tilted until the drawer is opened, as set forth.

4. The combination, with the receptacle having a money-receiving drawer provided with an aperture therein, of the series of spring-held drawers having cavities in their rear ends, the levers pivoted therein and engaging recesses in said receptacle, and the chutes opening over said levers above the aperture of the money-drawer, substantially as described.



402,921. ATOMIZER. NOEL R. GORDON, Springfield, Ill. Filed Dec. 10, 1888. Serial No. 293,154. (No model.)

Claim.—1. As a new article of manufacture, a stopper for an atomizer provided with a packing and a bent tube through the same, one of the legs of which is provided with a series of holes or apertures below the stopper and adjacent thereto, substantially as set forth.

2. In an atomizer, the combination of a vessel the stopper of which is provided with two vertical holes, a bent tube, the legs of which pass through the holes, one of which legs is provided with a series of holes below the stopper and adjacent thereto, a bulb, and a nozzle, substantially as set forth.

402,922. VALVE FOR ENGINES. JAMES T. HALSEY, Paterson, N. J. Filed May 15, 1888. Serial No. 273,957. (No model.)

Claim.—1. The combination of a wedge-shaped valve-chamber open to the exhaust at its bottom and at both ends, and forming a part of the way or passage for the same, and a box-like wedge-shaped valve arranged to play in said valve-chamber, said valve being constantly open to the live steam through a port in the wall of the valve-chamber, and being provided with the usual steam-ports for admitting steam alternately to the ends of the engine-cylinder, as set forth.

2. The combination of a wedge-shaped valve-chamber open to the exhaust at its bottom and at both ends, and forming a part of the way or passage for the same, and a box-like wedge-shaped valve arranged to play in said valve-chamber, said valve being constantly open to the live steam through a port in its lateral face opposite to the engine-cylinder only, said port coinciding with a port in the outer wall of the valve-chamber, and said valve being provided with the usual steam-ports in its opposite lateral face only for admitting steam alternately to the ends of the engine-cylinder, as set forth.

3. The combination of a wedge-shaped valve-chamber open to the exhaust at its bottom and at both ends, a box-like wedge-shaped ported valve arranged to play in said valve-chamber and always open to the live steam, and means, substantially as described, for applying a proportionate or differential pressure upon said valve to hold it down to its seat.

4. The combination, with the wedge-shaped valve-chamber open to the exhaust and having ports leading direct into the ends of the cylinder, of the wedge-shaped main valve constructed to fit and play in said chamber, said valve having a port always open to the live-steam inlet, and ports for the admission of steam to the cylinder from said valve, and a cut-off valve mounted in the wedge-shaped main valve and controlling the passage of steam from the latter valve to the cylinder, substantially as set forth.

5. The combination, with the valve-chamber and its box-like wedge-shaped valve, of a pressure-regulator arranged over said valve and comprising a foot resting on the crown of the valve, and a steam-chamber behind said foot open to the live steam, whereby the pressure of the foot on the valve is regulated by and proportioned to the pressure of the live steam within the valve at all times, as set forth.

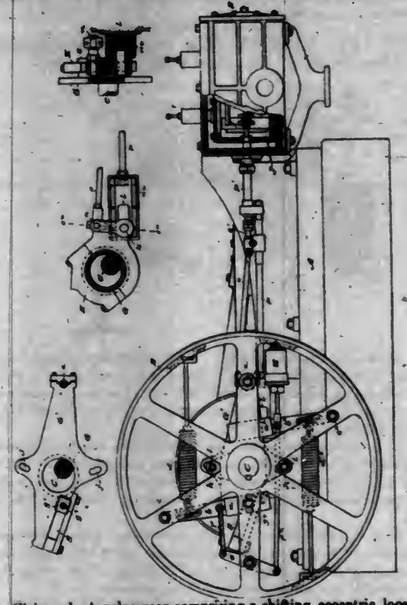
6. The combination, with the valve-chamber open to the exhaust at its bottom and at both ends, of the wedge-shaped valve therein, open at one side only to the live steam, and having ports in its opposite face only for communication with the cylinder, said chamber having recesses b^3 in the inner face of its outer wall connected by steam-passages with the respective steam-ports in the cylinder, whereby the pressure on the one face of the valve is balanced by the pressure on the opposite face thereof.

7. The combination, with the valve-chamber, of the wedge-shaped valve therein always open to the live steam, said valve having steam-ports in its wall adjacent to the cylinder, and having also recesses in the outer face of its opposite wall, said ports and recesses being connected, respectively, by steam-passages, whereby the pressure is approximately balanced on the opposite faces of valve.

8. The combination, with the wedge-shaped valve-chamber, constantly open to the exhaust and provided with ports opening into the cylinder, of the wedge-shaped main valve, always open to the live-steam inlet and provided with ports *b b* to admit steam to the cylinder in one of its faces, recesses $b^\times$ $b^\times$, substantially equal in area to said ports in the outer face of its opposite wall, and steam-passages *b'*, connecting said ports *b* and recesses $b^\times$, substantially as set forth.

9. The combination of the valve-chamber B, open to the exhaust and provided with a steam-inlet, *a'*, ports *c c*, opening into the cylinder, and recesses b^3 b^3 in the inner face of its outer wall opposite to and substantially equal in area to the ports *c c*, and connected with said ports, respectively, by closed steam-passages, and the wedge-shaped main valve C, having openings *a* $a^\times$ in its opposite walls of substantially equal area, ports *b b* in its inner wall, recesses $b^\times$ $b^\times$ in the outer face of its outer wall equal in area to said ports, and closed steam-passages connecting recesses $b^\times$ with ports *b*, substantially as set forth.

10. The combination, with the valve-chamber and the wedge-shaped main valve therein, of the cylinder *d*, mounted in said chamber over said valve, and the piston *e* in said cylinder seated on said valve, said piston *e* having a recess, *e'*, always open to the interior of the valve, and a longitudinal passage, e^3, connecting the recess *e'* with cylinder *d* above said piston, substantially as set forth.



11. The combination, with the valve-chamber and the wedge-shaped main valve therein, of a cylinder, as *d*, mounted on said valve-chamber and always open at its upper part to the boiler-steam, and the piston, as *e*, in said cylinder, its lower end seated on said main valve, said piston having a recess, as *e'*, in its lower face, always open to the live steam, the area of the recess *e'* being less than the area of the upper end of the piston, substantially as and for the purpose set forth.

12. The combination, with the valve-chamber and the wedge-shaped main valve therein, of the cylinder *d*, provided with a part-spherical base, $d^\times$, seated in a recess in the top plate of said chamber, and the piston *e* in said cylinder and seated on said valve, said piston having a recess, *e'*, always open to the steam in the valve, and a passage, e^3, connecting said recess with the cylinder *d* above said piston, substantially as set forth.

13. The combination, with the valve-chamber and the wedge-shaped main valve therein, of the cylinder *d* on said chamber, the piston *e* therein, provided with a recess, *e'*, and passage e^3, and seated on said valve over aperture e^3, the spring e^4 in said cylinder behind the piston, and the screw for varying the tension of the spring, substantially as set forth.

14. The combination, with the cylinder *d* and the hollow or tubular piston *e* therein, said piston being coned at the top, as described, of the packing-ring e^5, mounted on the coned part of said piston and bearing outwardly against the cylinder-wall, as set forth.

402,923. VALVE-GEAR. JAMES T. HALSEY, Paterson, N. J. Filed June 15, 1888. Serial No. 277,281. (No model.)

Claim.—1. A valve-gear comprising a shifting eccentric loosely embracing and carried by the engine-shaft, a governor connected with and controlling the shifting movements of said eccentric, the yoke of said eccentric, and the rods of the main valve and cut-off valve of the engine, both coupled to and actuated by said yoke, whereby the movements of both of said valves are controlled simultaneously by the governor.

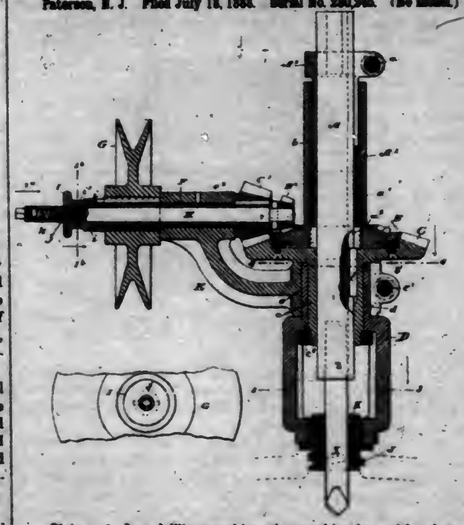
2. The combination, with a shaft driven by an engine and a wheel thereon, of an eccentric loosely embracing said shaft, a carrier-plate which bears said eccentric, said carrier-plate being pivotally mounted on said wheel and provided with a slot, the governor-weight carried around by said shaft and provided with a stud which engages said slot, and the spring attached to said governor-weight, said slot having its axis arranged obliquely to the path in which the governor weight moves.

3. The combination, with a shaft driven by an engine and a wheel thereon, of a ring-like eccentric loosely embracing said shaft, a plate carrying said eccentric, said plate being pivoted to the said wheel, as described, a governor-weight pivotally mounted on said wheel and provided with a stud engaging a slot in said plate, the spring attached to said weight, the yoke of the eccentric, and the valve-rods coupled to said yoke, substantially as set forth.

4. In a valve-gear wherein the main and cut-off valves are both actuated by one eccentric and its yoke, the combination, with said eccentric and yoke and the valve-rods and valves, of a rock-lever arranged intermediate between one of said valves and the yoke of the eccentric which actuates said valve.

5. In a valve-gear, the combination, with an eccentric carried by the engine-shaft and its yoke, of a carrier to which said yoke is coupled, the main-valve rod coupled to said carrier, and the cut-off-valve rod coupled to said yoke, the axis of the path in which said coupling plays being arranged to pass, if prolonged, to one side of the axis of the shaft carrying the eccentric, substantially as and for the purposes set forth.

6. In a valve-gear, the combination, with an eccentric carried by the engine-shaft and its yoke, of the main-valve rod operated by said eccentric, the stem and rod of the cut-off valve, and intermediate levers between the said yoke and the stem of the cut-off valve, substantially as set forth.



7. In a valve-gear, the combination, with an eccentric carried by the engine-shaft and its yoke, of a carrier coupled to the yoke, the main-valve rod coupled to said carrier, a rock-lever fulcrumed on and carried by the main-valve rod, the cut-off-valve stem coupled to one end of said rock-lever, and the cut-off-valve rod coupling the other end of said rock-lever with the yoke of the eccentric, substantially as set forth.

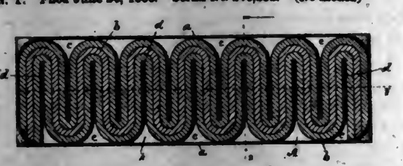
8. In a valve-gear, the combination, with an eccentric carried by the engine-shaft and its yoke, of a carrier to which said yoke is coupled, the main-valve rod coupled to said carrier, the vibrating elbow-lever, the link coupling one arm of said elbow-lever to the yoke, and the cut-off-valve rod coupled to the other arm of said elbow-lever, substantially as set forth.

9. In a valve-gear, the combination, with an eccentric carried by the engine-shaft and its yoke, of a carrier to which said yoke is coupled, the main-valve rod coupled to said carrier, the rock-lever, as *u*, fulcrumed on and carried by said valve-rod, the cut-off-valve stem, as *v'*, coupled to one end of said rock-lever, an elbow-lever, as *v*, a link coupling one arm of said lever to the eccentric-yoke, and the rod *e*, coupling the other arm of said elbow-lever with the other arm of the rock-lever *u*, substantially as set forth.

10. In a valve-gear wherein the main and cut-off valves are both driven from the same eccentric and its yoke, the combination, with said eccentric and yoke, of a rock-arm to which the said yoke is coupled, the main-valve rod coupled to said rock-arm, a rock-lever pivotally mounted on the yoke and coupled at its upper end to the upper end of said rock-arm, and the cut-off-valve stem coupled to the other end of said rock-lever, substantially as set forth.

402,924. PORTABLE DRILLING-MACHINE. JAMES T. HALSEY, Paterson, N. J. Filed July 18, 1888. Serial No. 280,245. (No model.)

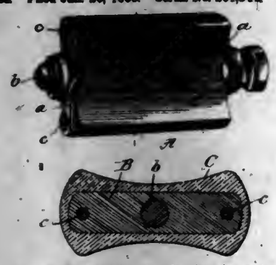
Claim.—1. In a drilling-machine, the combination, with a base-piece, as D, and a driver for the drill-holder mounted rotatively therein, of the said holder, as A, mounted in the driver, as described, and provided with a feed-screw, a feed-nut embracing said screw, and gears, substantially as described, driven from a common source for rotating said driver and nut simultaneously in the same direction but at different rates of speed.



2. In a portable drilling-machine, the combination, with the base-piece, as D, having a cylindrical neck, as *d*, of the bearing-bracket, as E, for the driving-shaft, provided with a band, as *e*, which embraces the said neck on the base-piece, and with a securing-screw, as *d'*, substantially as set forth.

3. In a drilling-machine, the combination, with a base-piece, as D, and a driver for the drill-holder rotatively mounted therein, of the said holder, as A, provided with a feed-screw, the feed-nut embracing said screw, the toothed wheel B, forming a part of said nut, the toothed wheel C, forming a part of said driver, the driving-pinions, as B' and C', in mesh with said wheels, respectively, and the shafts, as H and F, of said pinions arranged one within the other, the driving-sheave, as G, on the exterior shaft, and the clutch connecting said shafts, whereby they may be driven in unison or independently, all arranged to operate substantially as set forth.

4. A portable drilling-machine having its base-piece, as D, provided with an aperture for the passage of the drill, and provided also with a tubular male screw, as J, for securing the drill in the proper position for drilling, said tubular attaching-screw being adapted to embrace the drill, as set forth.

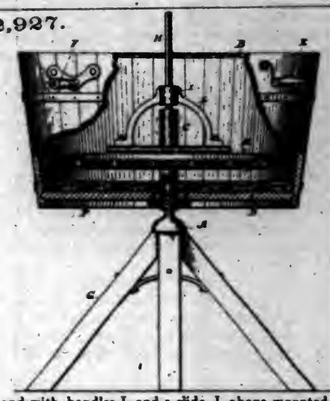


5. The combination, with a portable drilling-machine having its base-piece or stock provided with a tubular male screw, J, for securing the drill to a templet, of a templet provided with a female screw to receive the said male screw on the drilling-machine, which latter screw embraces the drill and centers it, as set forth.

402,925. BLACKBOARD-ERASER. FRANK HANNER, Seneca Falls, N. Y. Filed June 26, 1888. Serial No. 278,232. (No model.)

Claim.—A blackboard-eraser consisting of a block having strips of erasing material placed side by side and in contact, secured in continuous folds extending across its face, forming alternate curves or bends at the sides of the block, and a band secured to the periphery of the block tangent to the bends of the strips, forming therewith a series of triangular pockets, and transverse channels between the folds of the strips opening in alternate directions into said pockets, the strips adjacent to the channels bending at their free edges over the channels, substantially as shown.

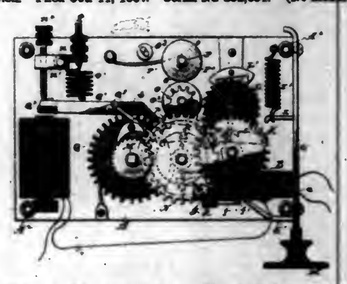
402,926. TREADLE FOR BICYCLES. GIDEON HAYNES, Jr., Hingham, assignor to The Springfield Bicycle Manufacturing Company, Boston, Mass. Filed Jan. 20, 1888. Serial No. 261,344. (No model.)



Claim.—1. A treadle for bicycles, having its exterior bearing-surfaces curved to conform to the ball of the foot, substantially as described.

2. A treadle for bicycles, consisting of a core of wood or equivalent light material inclosed in an envelope of rubber dished or hollowed out on its tread-surfaces to conform to the shape of the ball of the foot, substantially as described.

3. A treadle for bicycles, consisting of a core of wood or equivalent light material inclosed by an envelope of rubber dished or hollowed out on its tread-surfaces, the said core being formed with a central opening for the passage of the crank-spindle, and having at each end a like opening for the reception of the bolts *c*, substantially as described.



402,927. WASHING-MACHINE. JOHN G. HENDERSON, Keokuk, Iowa. Filed Dec. 10, 1888. Serial No. 293,152. (No model.)

Claim.—1. The tub B, provided with a projecting handle, F, a series of ribs on its bottom, and a central tube, C, in combination with a support, A, having a shaft, H, squared along its upper part to prevent a slide turning thereon, and a rubber head, K, provided with ribs below and with handles L and a slide, I, above mounted on shaft H, so as to slide without turning.

2. The tub B, provided with a central vertical tube, C, and having handle F, in combination with a support and shaft, H, to fit in said tube, and with a floating rubber, K, held by said shaft and adapted to hold it while the tub is rotated to wash clothing under said rubber, substantially as set forth.

402,928. TELEPHONE SYSTEM. FRED A. HOLCOMB, Grand Rapids, Mich. Filed Oct. 11, 1887. Serial No. 252,051. (No model.)

Claim.—1. The combination, with a telephone system, of a recorder for recording a signal at a distant station and a device at the sender's station adapted to be operated by the sender for automatically recording at the distant station the number of the call of the sender, substantially as set forth.

2. In a telephone system, the combination, with a recording mechanism, of make-and-break mechanism and a device for throwing the make-and-break mechanism into electrical circuit and simultaneously releasing the recording mechanism, substantially as set forth.

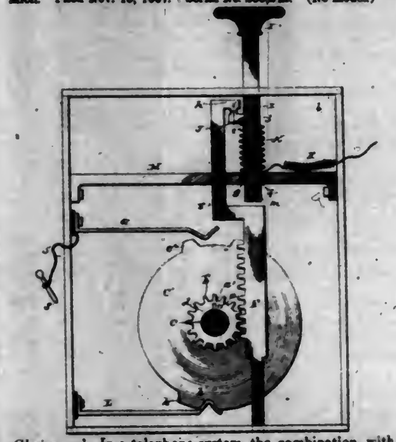
3. In a telephone system, the combination, with a recording mechanism, of a make-and-break mechanism and a device for throwing the same into electrical circuit and at the same time setting free the recording mechanism, substantially as set forth.

4. In a telephone system, the combination, with a device for recording signals, of a make-and-break mechanism, means for throwing the same into electrical circuit, and a spring-motor for automatically throwing the make-and-break mechanism out of circuit after the signal has been recorded, substantially as set forth.

5. In a telephone system, the combination, with a device for recording signals, of a make-and-break mechanism, means for throwing the same into electrical circuit, an electro-magnet in the main circuit, recording mechanism controlled by said electro-magnet, and spring-actuating mechanism to operate said device, substantially as set forth.

6. In a telephone system, the combination, with a device for recording signals, of a make-and-break mechanism, an electro-magnet in the main circuit, a pivoted lever secured to the armature of the electro-magnet and provided with a pin at its free end, paper-feeding drums, and suitable mechanism for operating the latter and the make-and-break mechanism, substantially as set forth.

7. In a telephone system, the combination, with a device for recording signals, of a block of non-conducting material, a spring secured at one end thereto, a notched wheel upon which this spring is adapted to rest, and mechanism for throwing said spring into electrical circuit and for releasing the actuating mechanism of the notched wheel, substantially as set forth.



8. In a telephone system, the combination, with a device for recording signals, of an insulated block, spring-plates attached thereto and adapted to normally complete a ground-connection, an angle-plate pivoted to the block, a pin projecting from the angle-plate at each side, one adapted to raise a plate to break the ground-connection and the other to make contact with a make-and-break spring, which is also attached to the block, a notched wheel with which said spring makes and breaks contact, and actuating mechanism to operate the apparatus, substantially as set forth.

9. In a telephone system, the combination, with a device to record signals, of a make-and-break mechanism and means for throwing the same into electrical circuit, a disk journaled in the device and provided with non-electrical pins at opposite sides, which are adapted to strike an angle-plate at each half-revolution of the disk to automatically throw the make-and-break mechanism out of the electric circuit, a device for rotating said parts, and an electrically-acuated recording mechanism, substantially as set forth.

10. In a telephone system, the combination, with a device for recording signals, of a make-and-break mechanism, means for throwing the same into and out of electrical circuit, a lever pivoted in the device provided at each side of its pivot with a pin, one adapted to ride upon the periphery of a disk journaled in the device and drop into a recess of the disk and the other pin adapted to engage a detent-arm secured to an arbor pivoted in the device to retain the mechanism at a standstill, and spring-actuating mechanism to operate the apparatus, substantially as set forth.

11. In a telephone system, the combination, with a device for recording signals, of a make-and-break mechanism, means for throwing the same into and out of circuit, a lever having a pin adapted to engage a detent-arm on an arbor of the device to retain the parts at rest, an electro-magnet, a lever pivoted in the device and secured to the armature of said magnet to record a signal when the magnet is energized by the completion of the circuit through the make-and-break mechanism, and an arm secured to this lever and adapted to make contact with a weighted lever and thus free the actuating mechanism when the magnet is energized, and spring-actuating mechanism to operate the device, substantially as set forth.

402,929. TELEPHONE SYSTEM. FRED A. HOLCOMB, Grand Rapids, Mich. Filed Nov. 15, 1887. Serial No. 255,242. (No model.)

Claim.—1. In a telephone system, the combination, with a recording-instrument at a subscriber's station, of a device at the central office for causing any desired number to be intelligibly recorded in or at the instrument at the subscriber's station, substantially as set forth.

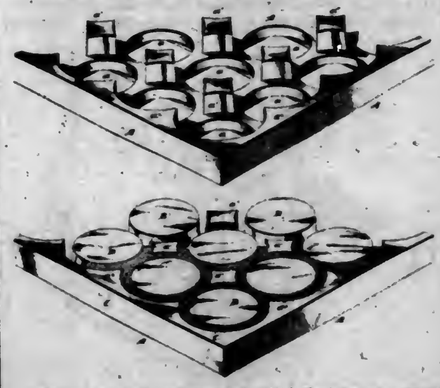
2. In a telephone system, the combination, with a device for recording intelligible signals at a subscriber's station, of an instrument at the central office for operating said recording device to produce any desired number therein, and a battery introduced into the circuit of said instrument, substantially as set forth.

3. In a telephone system, the combination, with a device for intelligibly recording signals at a subscriber's station, of an instrument at the central office provided with a shaft, a series of disks having toes mounted on said shaft, make-and-break springs with which the toes of the disk engage to make and break the current, and mechanism for operating said disks, substantially as set forth.

4. In a telephone system, the combination, with an instrument for intelligibly recording signals at a subscriber's station, of an instrument at the central office provided with a shaft, a series of disks having toes mounted upon this shaft, springs with which said toes engage, a pinion secured to each disk, rack-bars to engage said pinions, and mechanism to operate said rack-bars, substantially as set forth.

5. In a telephone system, the combination, with an instrument at a subscriber's station for recording intelligible signals, of a device at the central office having a shaft journaled therein, a series of disks loosely mounted on said shaft, each disk having a different number of toes on its periphery to represent designating-numerals from one to ten, inclusive, a disk having a wide abutment to represent the number "10" or a cipher, spring-fingers to engage said toes, and mechanism to operate the disks, substantially as and for the purpose set forth.

6. In a telephone system, the combination, with an instrument at a subscriber's station to intelligibly record a signal, of a device at the central office having a shaft journaled therein, a series of disks having toes on their periphery loosely mounted upon this shaft, a pinion upon each disk, a pin upon each disk, a series of pins on the shaft to engage the pins on the disks, a series of rack-bars to mesh with the pinions to rotate the disks, and mechanism for operating said rack-bars, substantially as set forth.



7. In a telephone system, the combination, with an instrument at a subscriber's station for intelligibly recording a signal, of a device at the central office having a shaft journaled therein, a series of disks having toes on their peripheries mounted on said shaft, a pinion on each disk, a series of spring-arms with which the toes of the disks engage, a series of rack-bars to mesh with the pinions, upwardly-extending arms integral with said rack-bars and carrying contact-points, spring-sustained rods adapted to have a sliding movement and furnished with arms to make contact with an arm of the rack-bars, and a button upon the end of each sliding rod, substantially as set forth.

8. In a telephone system, the combination, with an instrument for intelligibly recording a signal at a subscriber's station, of a device at the central office having a shaft journaled therein, a series of disks furnished with toes mounted on this shaft, a series of springs to engage said toes, mechanism for rotating the disks, a spring secured to the shaft and to the frame-work of the device to cause the shaft and disks to rotate, and a ratchet mechanism mounted on the shaft to regulate the action of the spring, substantially as set forth.

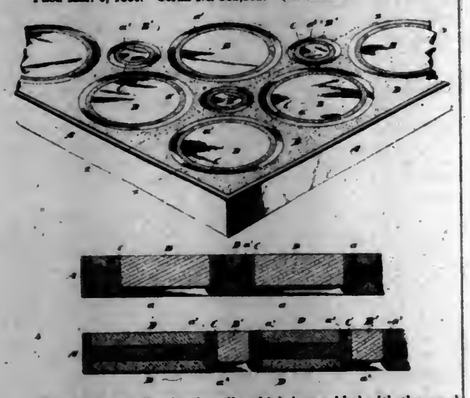
9. In a telephone system, the combination, with an instrument at a subscriber's station for recording intelligible signals, of a device at the central office having a shaft journaled therein, a series of disks having toes on its periphery loosely mounted on said shaft, a series of spring-arms to engage said toes to make and break the current, a pinion on each disk, a series of rack-bars to operate the disks, a series of rods to operate the rack-bars in one direction, a spring on the shaft to rotate the same and the disks in the opposite direction and cause the rack-bars to rise, and an escapement mechanism to regulate the action of the spring, substantially as set forth.

10. In a telephone system, the combination, with a device for intelligibly recording a signal at a subscriber's station, of a device at the central office having a shaft journaled therein, a series of disks furnished with toes on their periphery mounted on said shaft, mechanism, substantially such as described, for operating said disks to rotate them, a series of spring-arms with which the toes of the disks engage, a pin on each disk, a series of pins on the shaft to engage the pins on the disks, and spring-arms secured to the frame-work and bearing against a projection on the disks to prevent the same from turning when not positively operated, substantially as set forth.

402,930. ILLUMINATING-TILE. JACOB JACOBS, New York, N. Y. Filed Mar. 9, 1889. Serial No. 302,691. (No model.)

Claim.—1. An illuminating-tile in which the lenses are separated and located solely by means of lugs that are formed upon and project

upward from the body of the tile at points midway between the contiguous light-openings, substantially as and for the purpose specified.



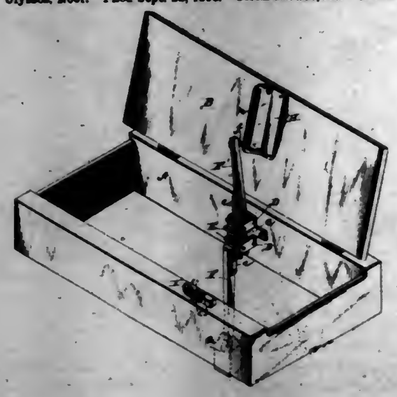
2. An illuminating-tile in which is combined a metal body that is provided with light-openings which have no surrounding curbs and between such light-openings is provided with upwardly-projecting lugs, glass lenses which are placed over the light-openings, and cement or other like material that is placed within and caused to fill the spaces between the lenses, substantially as and for the purpose shown.

3. An illuminating-tile in which is combined a metal body that is provided with light-openings and upwardly-projecting lugs between the same, glass lenses which are placed over the light-openings, a cement that is placed within and caused to fill the spaces between said lenses, and encaustic tiles which are embedded within the cement over each of the lugs, substantially as and for the purpose set forth.

4. An illuminating-tile in which the metal body is provided upon its lower face with a series of straight intersecting ribs that are located in each space between the contiguous light-openings, substantially as and for the purpose shown and described.

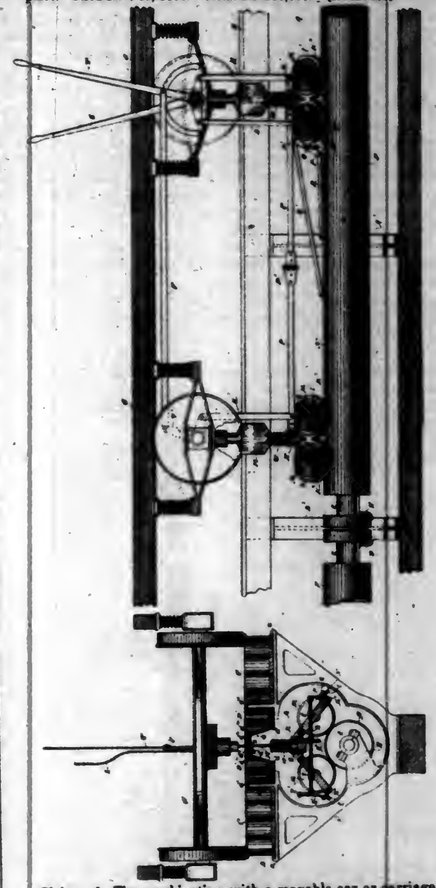
5. An illuminating-tile in which the metal body is provided with light-openings that are without curbs, and upon its upper face has upwardly-projecting lugs between such openings, and upon its lower face is provided with straight intersecting ribs that are located between said openings, substantially as and for the purpose specified.

402,931. ILLUMINATING-TILE. JACOB JACOBS, New York, N. Y. Filed Mar. 9, 1889. Serial No. 302,592. (No model.)



Claim.—1. An illuminating-tile which is provided with the usual glazed light-openings and between the same has other and smaller glazed light-openings, substantially as and for the purpose shown.

2. An illuminating-tile which is provided with glazed lights that are arranged in parallel lines, and at points midway between each group of adjacent light-openings is provided with other and smaller glazed light-openings, substantially as and for the purpose set forth.



3. An illuminating-tile which is provided with the usual glazed light-openings, and between the same has other and smaller glazed light-openings, and between such openings has a filling of concrete, substantially as and for the purpose shown and described.

402,932. DEVICE FOR OPENING TRAP-DOORS. THOMAS J. JOLLY, Ulysses, Nebr. Filed Sept. 22, 1888. Serial No. 286,073. (No model.)

Claim.—The combination, with the hinged door B, the L-shaped flange H, secured to said door and provided with the slot *h* and the pivoted retaining-cleat I, of the standard C, provided with the two pairs of arms D, the intermeshing gear-wheels E, respectively journaled between said pairs of arms and provided with the arms *e*, the depending arm F, secured to the arm *e* of the lower gear-wheel, the weight G, hung to the arm F, the arm F', secured to the arm *e* of the upper gear-wheel, and the projection *f* in the outer end of the arm F' and entering the slot *h*, substantially as specified.

402,933. STREET-RAILWAY. WHITCOMB L. JUDSON, Minneapolis, Minn., assignor to the Judson Pneumatic Railway Company, same place. Filed Nov. 15, 1888. Serial No. 290,880. (No model.)

Claim.—1. The combination, with a movable car or carriage, of one or more revoluble driving drums or shafts extending along the line of travel and one or more friction-wheels adjustable to different angles with respect to the axis of said drum and adapted to engage therewith, substantially as described.

2. The combination, with a movable car or carriage, of one or more revoluble driving drums or shafts extending along the line of travel and one or more friction-wheels connected with said car mounted in bearings both vertically and angularly adjustable in respect to said drum or drums and adapted to engage therewith, substantially as described.

3. The combination, with a movable car or carriage, of one or more revoluble driving drums or shafts extending along the line of travel and one or more friction-wheels connected with the car mounted in bearings revoluble in the planes of their axes, substantially as described.

4. The combination, with a movable car, of one or more revoluble driving drums or shafts extending along the line of travel, a friction-wheel-supporting frame connected to said car, and one or more friction-wheels on said frame, mounted in bearings revoluble in the planes of their axes, substantially as described.

5. The combination, with a movable car, of friction-wheels connected therewith and driving-drums extending along the line of travel, there being of said drums and friction-wheels one device of one kind opposed to and engaging two of the other kind, whereby a wedging or crowding action is secured between them, substantially as described.

6. The combination, with a movable car, of a revoluble driving drum or shaft extending along the line of travel, one or more friction-wheels adjustable in the planes of their axes adapted to engage with said drum at different angles to its axis and connections extending from said wheel or wheels to the car for changing the angle of the friction-wheels to the driving-drum, substantially as described.

7. The combination, with a movable car, of a revoluble driving drum or shaft extending along the line of travel, a vertically-movable friction-wheel-supporting frame connected with said car, one or more friction-wheels mounted on said frame and adapted to engage said driving-drum at different angles, a connection from the car to said frame for raising and lowering the same, and a connection from the car to the friction-wheels for varying their angle to the driving-drum, substantially as described.

8. The combination, with a movable car or carriage, of a revoluble sectional drum or shaft extending along the line of travel and two or more friction-wheels connected with the car at different points of the same longitudinally, each adapted to engage said drum at an angle to its axis, whereby there will be engagement of one or more wheels with the drum while one of the wheels is at the point of connection of the sections, substantially as described.

9. The combination, with a movable car, of a revoluble drum or shaft extending along the line of travel, a truck-frame or spider having friction-wheels therein engaging, the said shaft or drum at an angle to its axis, and a bar or standard connecting the car with said truck-frame, having a sliding and a swiveled engagement therewith, substantially as described.

10. The combination, with a movable car, of a revoluble drum or shaft extending along the line of travel, a truck or spider having friction-wheels therein engaging the said shaft or drum at an angle to its axis, and a bar connecting the car with said truck, the said bar having a sliding and swiveled engagement with said truck, and a spring interposed between the truck and bar, substantially as described.

11. The combination, with a movable car, of a revoluble drum or shaft extending along the line of travel, two or more friction-wheels connected to different parts of the car longitudinally, adapted to engage said drum at an angle to its axis, and a laterally-yielding connection between said wheels, substantially as described.

12. The combination, with a movable car, of a slotted conduit along the line of travel, a revoluble drum mounted in said conduit, and one or more friction-wheels connected to the car through the slot in the conduit adapted to engage said drum at an angle to its axis, substantially as described.

13. The combination, with a movable car, of a slotted conduit extending along the line of travel, a revoluble drum or shaft within said conduit, a truck within said conduit provided with friction-wheels adapted to engage said drum at an angle to its axis, and a bar or standard extending from the car to the truck through the slot in the conduit and having swiveled connections with both, substantially as described.

14. The combination, with a movable car, of a revoluble drum or shaft extending along the line of travel, and one or more sets of friction-wheels, in couples, connected to the car, adapted to engage opposite sides of the drum at like angles to its axis, substantially as described.

15. The combination, with a movable car, of a revoluble drum or shaft extending along the line of travel, and one or more sets of friction-wheels, in couples, connected to the car, mounted in bearings, revoluble in the planes of their axes, adapted to engage opposite sides of said drums at any desired like angles to its axis, substantially as described.

16. The combination, with a movable car, of a revoluble drum or shaft extending along the line of travel, one or more sets of friction-wheels, in couples, connected to the car, mounted in bearings revoluble in the planes of their axes, adapted to engage the opposite sides of said drum at any desired like angles to its axis, and a connection from said wheels to within reach of the operator adapted to turn the wheels of each couple in opposite directions for effecting their adjustment to different like angles to the drum, substantially as described.

17. The combination, with a movable car, of a revoluble drum or shaft extending along the line of travel, two or more sets of friction-wheels, in couples, connected to the car, mounted in bearings, revoluble in the planes of their axes, adapted to engage opposite sides of the drum at any desired like angles, and a common connection from all of said wheels to within reach of the car-operator for effecting like angular adjustment thereof, substantially as described.

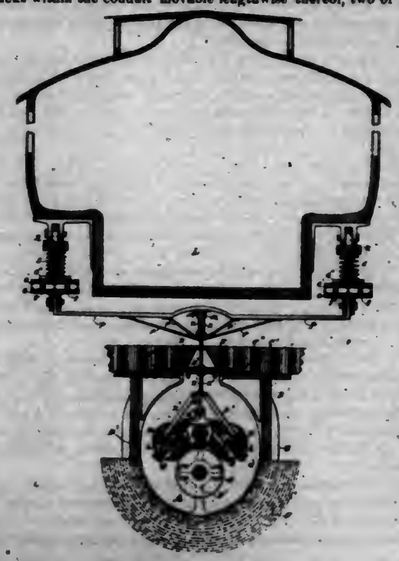
18. The combination, with a movable car, of a revoluble drum extending along the line of travel, two or more friction-wheel-supporting frames or spiders connected to different parts of the car longitudinally, friction-wheels mounted on said frames adapted to engage the drum at right angles to its axis, and pivotal connections coupling together said frames, substantially as described.

19. The combination, with a movable car, of a slotted conduit extending along the line of travel, a revoluble drum mounted in said conduit, sets of friction-wheel-supporting spiders or frames, bars or standards connecting said frames with the car through the slot in the conduit, having a swiveled connection with each, friction-wheels mounted on said frames in couples, adapted to engage opposite sides of said drum at like angles to its axis, and pivotal connections coupling together said frames, substantially as described.

20. The combination, with a movable car or carriage, of a driving drum or shaft extending along the line of travel and variable-speed gearing between the drum or shaft and the car, substantially as described.

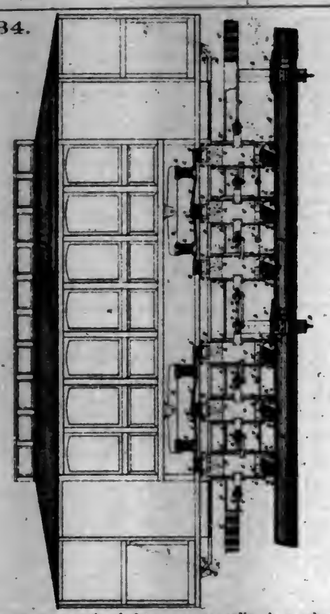
402,934. STREET-RAILWAY. WHITCOMB L. JUDSON, Minneapolis, Minn., assignor to the Judson Pneumatic Railway Company, same place. Filed Jan. 7, 1889. Serial No. 296,021. (No model.)

Claim.—1. The combination, with a slotted underground conduit, of a car-body above the street-surface, a car-supporting truck within the conduit movable lengthwise thereof, and a swiveled supporting-connection from the truck to the car through the conduit-slot, substantially as described.



2. The combination, with a slotted underground conduit, of one or more longitudinal truck-guides within said conduit, a car-body above the street-surface, a car-supporting truck within the conduit movable lengthwise of said guides, and a swiveled supporting-connection from the truck to the car, substantially as described.

3. The combination, with a slotted underground conduit, of a car-body above the street-surface, a truck within the conduit movable lengthwise thereof, a car-supporting bolster having a rigid connection with the truck through the conduit-slot, and ball-bearings uniting the bolster and car-body, substantially as described, for the better traversing of curves.



4. The combination, with a slotted underground conduit, of one or more longitudinal truck-guides within the conduit, a car-body above the street-surface, a car-supporting truck within the conduit movable lengthwise of said guides, a car-supporting bolster having a rigid connection with said truck through the conduit-slot, and ball-bearings uniting the bolster and car-body, substantially as described.

5. The combination, with a slotted underground conduit, of a car-body above the street-surface, two or more independent trucks within the conduit movable lengthwise thereof, corresponding independent supporting-bolsters, each having a rigid connection through the conduit-slot with its respective truck, and ball-bearings uniting the bolsters and the car-body, substantially as described.

6. The combination, with a slotted underground conduit, of a car-body above the street-surface, two or more independent car-trucks within the conduit movable lengthwise thereof, two or more

402,934.

independent car-supporting bolsters corresponding in number to the number of trucks, each having a rigid connection through the conduit-slot with its respective truck, ball-bearings uniting the bolsters and the car-body, and pivoted couplings connecting the trucks, substantially as described.

7. The combination, with a movable car, of a combined supporting and propelling drum extending the entire line of the car's travel, adapted of itself to sustain the car and propel the same, substantially as described.

8. The combination, with a movable car, of a combined car supporting and propelling drum and one or more lateral-pressure rails or guides for limiting the oscillation of the car, substantially as described.

9. The combination, with a revoluble car supporting and driving drum, of a movable car provided with friction-wheels mounted on said drum and engageable therewith at an angle to its axis, and one or more lateral-pressure rails or guides for limiting the oscillation of the car, substantially as described.

10. The combination, with a revoluble car supporting and driving drum, of a movable car having friction-wheels adjustable to different angles mounted on said drum and engageable therewith by frictional contact, substantially as described.

11. The combination, with a revoluble car supporting and driving drum, of a movable car provided with friction-wheels adjustable to different angles mounted on said drum, engageable therewith by frictional contact at variable angles, and one or more lateral-pressure guides or rails for limiting the oscillation of the car, substantially as described.

12. The combination, with a revoluble car-supporting and car-driving drum, of a movable car provided with friction-wheels mounted on said drum, engageable therewith at an angle to its axis, one or more lateral-pressure rails or guides for limiting the oscillation, and one or more lateral-pressure rollers adapted to engage said guides, substantially as described.

13. The combination, with a revoluble car-driving drum made up of sections coupled together, of a movable car provided with friction-wheels engageable with said drum at an angle to its axis and coupling-space bridges for carrying the friction-wheels over the coupling-spaces, substantially as described.

14. The combination, with a revoluble car-driving drum made up of sections coupled together, of a movable car provided with a friction-wheel truck having friction-wheels engageable with said drums at an angle to its axis, coupling-space bridges, and carrying or bridging rollers on the friction-wheel truck for engaging said bridges and carrying the friction-wheel truck over the coupling-spaces, substantially as described.

15. The combination, with a slotted underground conduit, of a revoluble car supporting and propelling drum within said conduit, a car-body above the street-surface, a friction-wheel truck provided with friction-wheels mounted on said drum and engageable therewith at an angle to its axis, and a supporting-connection from the truck to the car through the conduit-slot, substantially as described.

16. The combination, with a slotted underground conduit, of a revoluble car supporting and propelling drum within the conduit, a car-body above the street-surface, a friction-wheel truck having friction-wheels mounted on said drum engageable therewith at an angle to its axis, a supporting-connection from the truck to the car through the conduit-slot, one or more lateral-pressure rails or guides within the conduit, and one or more lateral-pressure rollers on the trucks or supporting-connection for engaging with said rails or guides, substantially as described.

17. The combination, with a slotted underground conduit, of a revoluble car supporting and driving drum within the conduit, a car-body above the street-surface, a friction-wheel truck having friction-wheels mounted on said drum engageable therewith at an angle to its axis, a car-supporting bolster having a rigid connection through the conduit-slot with the truck, and ball-bearings uniting the bolster and car-body, substantially as described.

18. The combination, with a slotted conduit, of a car supporting and driving drum therein, a car-body, independent trucks having angularly-adjustable friction-wheels mounted on said drum, independent bolsters rigidly connected to the trucks, extending through the slot in the conduit, and provided with laterally-extending arms, spanning-bars coupling the bolsters into sets of two or more, and ball-bearings between the spanning-bars and bolster-arms, substantially as described.

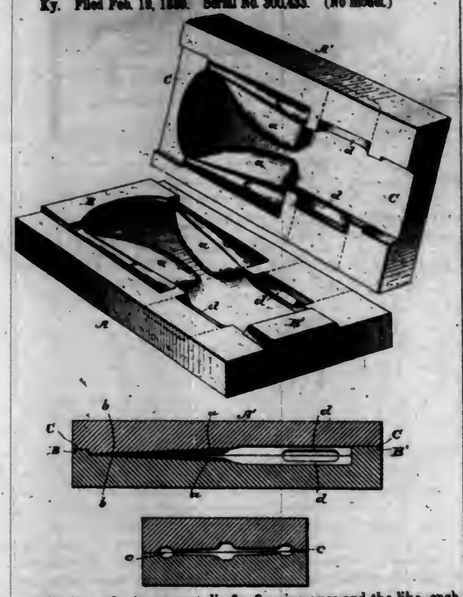
19. The combination, with a slotted underground conduit, of a revoluble car supporting and driving drum within the conduit, a car-body above the street-surface, a friction-wheel truck having swiveled friction-wheels mounted on said drum engageable therewith at variable angles to its axis, a car-supporting bolster having a rigid connection with said truck through the conduit-slot, ball-bearings uniting said bolster and car-body, one or more lateral-pressure rails within the conduit, and one or more lateral-pressure rollers on said trucks or rigid car-connections, substantially as described.

20. The combination, with the slotted conduit, of the car supporting and driving drum, the car-body, the independent trucks with angularly-adjustable friction-wheels, the rigid bolsters extending from the trucks and having lateral arms, the pivotally-connected sectional spanning-bars coupling the bolster into sets of two or more, the ball-bearings between the spanning-bars and bolster-arms, the equalizers and springs between the spanning-bars and the car-body, the lateral-pressure rails within the conduit, and the lateral-pressure rollers on the truck-frame, substantially as described.

21. The combination, with a car-driving drum, of a car-body, a truck having friction-wheels engageable with said drum at an angle to its axis, a bolster provided with laterally-extended arms connecting the truck and the car-body, and ball-bearings between the car-body and the bolster-arms, substantially as described.

22. The combination, with a car-driving drum, of a car-body, two or more independent trucks having friction-wheels engageable with said drum at an angle to its axis, corresponding independent bolsters provided with laterally-extended arms connecting the respective trucks with the car-body, and ball-bearings interposed between the bolster-arms and the car-body, substantially as described.

23. The combination, with a car-body, of a car-driving drum, two or more independent trucks having friction-wheels engageable with said drum at an angle to its axis, corresponding independent bolsters provided with laterally-extended arms, each bolster connecting its respective truck with the car-body, ball-bearings interposed between the bolster-arms and the car-body, and pivotal connections coupling together said independent trucks, substantially as described.



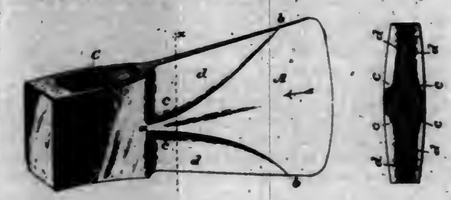
24. The combination, with a car-body, of a car-driving drum, two or more independent trucks, each having friction-wheels engageable with said drum at an angle to its axis, corresponding independent bolsters provided with laterally-extended arms, each bolster adapted to support the car-body therefrom, spanning-bars interposed between the bolster-arms and the car-body and connecting the same together in sets of two or more, and ball-bearings interposed between the bolster-arms and spanning-bars, substantially as described.

25. The combination, with a car-body, of a car-driving drum, two or more independent trucks, each having friction-wheels engageable with said car at an angle to its axis, corresponding independent bolsters provided with laterally-extending arms, each bolster being connected with its respective truck and adapted to support the car-body therefrom, spanning-bars composed of sections pivotally connected interposed between the bolster-arms and the car-body, and ball-bearings between the bolster-arms and the spanning-bars, substantially as described.

26. The combination, with a car-body, of a car-driving drum, two or more independent trucks having friction-wheels engageable with said drum at an angle to its axis, corresponding independent bolsters provided with laterally-extended arms, each bolster being connected to its respective truck and adapted to support the car-body therefrom, spanning-bars connecting the bolster-arms into sets of two or more, ball-bearings between the spanning-bars and bolster-arms, and equalizers between the spanning-bars and the car-body, substantially as described.

27. The combination, with a car-body, of a car-driving drum, two or more independent trucks having friction-wheels engageable with said drum at an angle to its axis, corresponding independent bolsters having laterally-extended arms, each bolster connected to its respective truck and adapted to support the car-body therefrom, spanning-bars connecting the bolster-arms into sets of two or more, ball-bearings between the bolster-arms and spanning-bars, equalizers pivotally connected to the car-body, and springs between the spanning-bars and the equalizers, substantially as described.

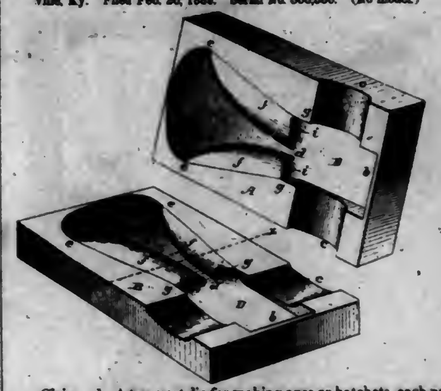
402,935. DIE FOR MAKING AXES. JAMES P. KELLY, Louisville, Ky. Filed Feb. 19, 1889. Serial No. 300,433. (No model.)



Claim.—1. A two-part die for forming axes and the like, each part provided with a cavity corresponding with the general design of the tool to be made, and one part provided with the anvils B B' and the other with cavities C C', substantially as and for the purposes set forth.

2. A two-part die for forming axes and the like, each part provided with a cavity corresponding with the general design of the tool to be made, and provided also with recesses *c* to receive the excess of metal, substantially as hereinbefore set forth.

3. A two-part die for forming axes and the like, each part provided with a cavity corresponding with the general design of the tool to be made, and with recesses *c* to receive the excess of metal, and cavities *d* for the eye-pin, one part being also formed with anvils B B', and the other part with corresponding cavities, C C', substantially as and for the purposes set forth.



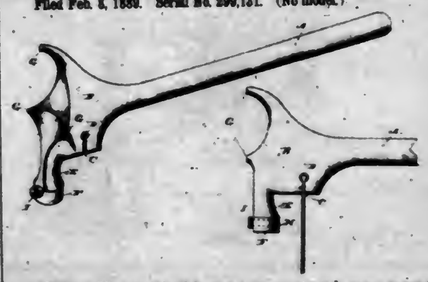
4. A two-part die for forming axes and the like, provided with a cavity corresponding with the general design of the tool to be made, and with recesses *c*, said cavity and recesses being entirely surrounded by the stock of the die, substantially as shown, whereby a closed die is formed, as hereinbefore described.

402,936. AX. WILLIAM C. KELLY, Louisville, Ky. Filed Feb. 19, 1889. Serial No. 300,440. (No model.)

Claim.—As a new article of manufacture, an ax having the blade tapering from the eye to the cutting-edge, and having its body compressed or cut away each side of the center comparatively abruptly, as shown at *c*, to form a well-defined step terminating in or joining the inclined depressed surface *d*, substantially as and for the purpose set forth.

402,937. DIE FOR MAKING AXES. WILLIAM C. KELLY, Louisville, Ky. Filed Feb. 20, 1889. Serial No. 300,530. (No model.)

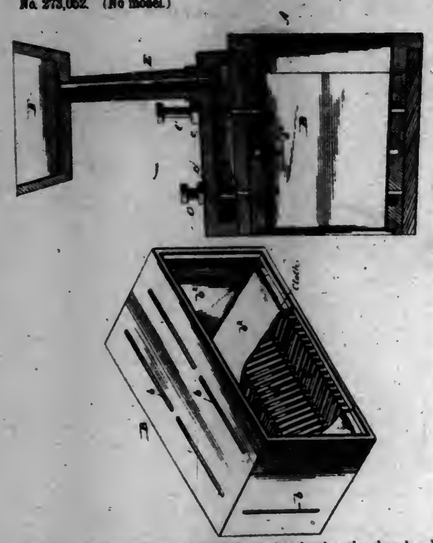
Claim.—1. A two-part die for making axes or hatchets, each part having in its working-face a cavity corresponding with the general shape of the implement to be formed, and provided with raised portions *f*, such as shown and described.



2. A two-part die for making axes or hatchets, each part having in its working-face a cavity corresponding with the general shape of the implement to be formed, and provided with the raised portions *f* and eye-pin recess *e*, such as shown and described.

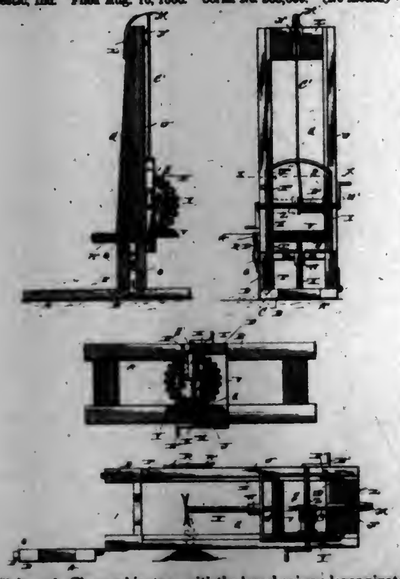
402,938. SPRING-VEHICLE. JOHN H. KENNEDY, Oneida, N. Y., assignor to J. L. Spencer & Co., same place. Filed Nov. 8, 1886. Serial No. 218,276. (No model.)

Claim.—In combination with the front and rear running-gears, the body of the vehicle extending over the front running-gear, the cross-spring C, mounted on the said running-gear and arranged completely under the body, the spring-support *b*, rising from the rear axle and formed with trunnions on its ends, and the short side springs, D D, terminating with their front ends at the under side of the central portion of the body and attached directly thereto and having their rear ends extending under the ends of the spring-support *b* and rearward therefrom, and thence curved upward and forward and terminating with eyes by which they are connected directly to the trunnions of the spring-support, substantially as described and shown.



402,939. COMBINATION-TOOL. HENRY L. KINCAID, Stella, Wash. Filed Feb. 8, 1889. Serial No. 299,131. (No model.)

Claim.—The combined hammer, saw set and gage, comprising the handle, the head B, having the slot C, the legs G, formed on the



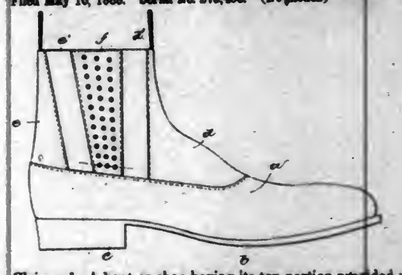
outer end of the head, and the hammer-head projecting from the head B, said hammer-head having the gage stud or screw I engaging a threaded opening therein, substantially as described.

402,940. DIE FOR BRICK OR TILE MACHINES. ANDREW P. KNUDSEN, Sycamore, Ill., assignor of one-half to Mattie Hoyt, Oscar Russell, and Henry H. Hoyt, same place. Filed May 7, 1888. Serial No. 273,052. (No model.)

Claim.—The combination, with the casing having the chamber D, provided with the openings *d* in its floor and the openings *e*, vertically above the corresponding openings *d*, in its roof, the plug-valves C, the stand-pipe E, rising from the chamber D, and the tank on top of the stand-pipe, of the die provided with the longitudinal slots *b* in its sides and the series of oblique grooves *b'*, connecting said slots, and the cloth lining of the die converting said grooves into channels, substantially as specified.

402,941. POST-HOLE-BORING MACHINE. JOHN F. LACEY, Domestic, Ind. Filed Aug. 18, 1888. Serial No. 283,069. (No model.)

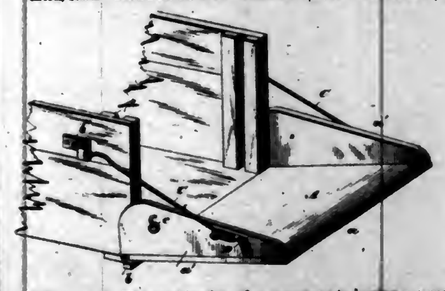
Claim.—1. The combination, with the base having a lever pivoted thereto, of a vertical frame hinged to said base with one of its standards and provided upon the side of its opposite standard with a metallic strip formed with a seat, and a lever pivoted to said strip, substantially as set forth.



2. The combination, with the hinged vertical frame provided with guideways, and provided, further, with a curved standard and a hook at its upper end, of an open frame provided with boot ears upon its sides which slide in the said guideways, a transverse shaft journaled in said open frame and formed with a square portion, a winding-drum and a beveled cog-wheel mounted on said shaft, a vertical shaft also journaled in said open frame, and a similar cog-wheel mounted on one end and an auger-holder secured to the other, and a chain or rope wound with one end around the said drum and the other end secured to said curved standard and operating-cranks, substantially as and for the purpose set forth.

402,942. CONFECTION-BOX. JOHN B. LANGAN, Chicago, Ill. Filed June 18, 1888. Serial No. 277,476. (No model.)

Claim.—In a box designed as a vehicle for confection and for similar purposes, a supplementary chamber on the interior of the box, a drawer, D, adapted to enter said chamber, an opening in the side of said box, and a flap, C, for closing said opening, substantially as and for the purpose set forth.



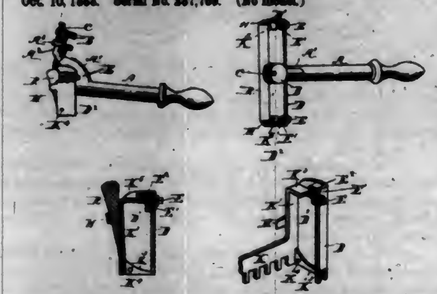
402,943. BOOT OR SHOE. WILLIAM LAPWORTH, Hopedale, Mass. Filed May 10, 1888. Serial No. 273,408. (No model.)

Claim.—1. A boot or shoe having its top portion provided with an inelastic eyeleted piece or ply, *f*, stitched to an elastic gore-piece, substantially as described.

2. A boot or shoe provided at its top portion with an inelastic eyeleted piece or ply, *f*, connected at its side edges to separate gore-pieces, substantially as described.

402,944. END-GATE FOR WAGONS. HENRY A. LARSEN, Hawthorn, Iowa. Filed Feb. 14, 1889. Serial No. 299,832. (No model.)

Claim.—1. The combination of a wagon-body having a cross-rail, *b*, projecting to rear of its rear end, a hingeless scoop-board resting on said cross-rail, angle-plates *b'*, secured to the sides of the body near the rear upper edge, loops D, secured to the sides of the scoop near their outer ends, catches C, secured near the inner ends of the sides of the scoop, and lever-bars removably connected at one end to the angle-plates *b'* and engaging the loop D, or the loop and catch *c*, according to the position of the scoop, substantially as described.



2. The combination, with a wagon-body having a cross-rail, *b*, with extended ends, an angle-plate, *b'*, permanently attached near the upper edge of the sides of the wagon-body, a scoop having side pieces, *a'*, which extend beyond the bottom board of the scoop, as shown, a catch, *c*, attached to said side pieces, a loop, D, and rods C C, said rods having one end bent to engage with a perforation in the angle-plate *b'*, the opposite end being hooked to engage with the loop D, the parts being combined and organized substantially as shown, and for the purpose set forth.

402,945. LAMP-WICK LIFTER. LYMAN T. LAWTON, Meriden, Conn., assignor to the Meriden Malleable Iron Company, same place. Filed Nov. 21, 1888. Serial No. 291,515. (No model.)

Claim.—A lamp having a headed stud and a catch on the wick-tube, in combination with a lifting-stem, on the inner upturned end of which is a horizontally-disposed slotted spring-yoke, substantially as herein set forth.

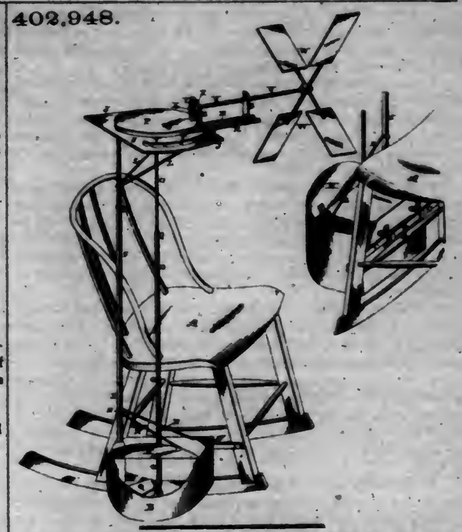
402,946. SAFETY-RAZOR. HENRY B. LEACH, Boston, Mass. Filed Oct. 10, 1888. Serial No. 287,769. (No model.)

Claim.—1. In a safety-razor, the combination of the frame D D' D^2, the holding-clips H H, located as shown, the razor-blade, a clamping device operating upon the top of the blade, the swinging front plate, K, and adjusting-screws E E, substantially as described.

2. In a safety-razor, the combination of the razor-frame D, having end pieces, D' D^2, and clips H H, the guard K, having arms K' K^3, and the rearwardly-projecting arms K^4, by means of which the guard-plate is pivoted at K^4 K^4 within the frame, and the adjusting-screws in the frame bearing upon the back of the guard-plate, so as to move the same against the razor-blade held between the clips and the guard-plate, substantially as described.

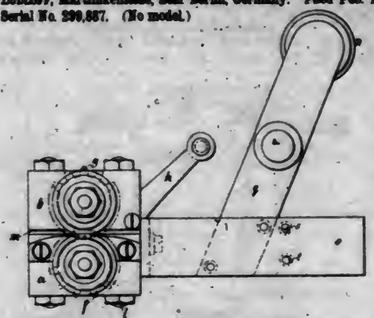
3. In a safety-razor, the combination of the frame, having back B and end pieces, D' D^2, the guard K, having the two arms K' K^3 bent at K^2 to form seats for the ends of the adjusting-screws, and having also rearwardly-projecting arms K^4 pivoted at K^4 K^4 within the frame, the razor-blade located between the clips and swinging guard-plate, and the adjusting-screw E E, arranged to bear upon the guard-plate, substantially as described.

402,947. ART OF WELDING. WILLIAM W. LEE, Northampton, Mass. Filed Oct. 20, 1888. Serial No. 288,004. (No specimens.)



Claim.—The herein-described improvement in the art of welding, which consists in applying borax in solution to metal to be welded.

402,948. FAN FOR ROCKING-CHAIRS. GEORGE R. LEIBENSPERGER and GEORGE W. BAILEY, Saegerstown, Pa. Filed Sept. 24, 1888. Serial No. 286,228. (Model.)

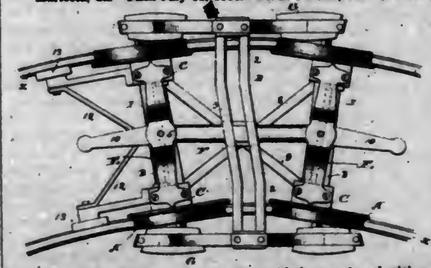


Claim.—1. The combination, with a rocking-chair, of a supporting-rod having a table or platform secured to its upper end, a shaft having a weight secured to one side and having a friction-disk secured to its upper end, suitable supports, a shaft journaled in the supports, a fan secured to the outer end of the shaft, and a wheel secured to the inner end of the shaft and operating in connection with the disk, substantially as shown.

2. The combination, with a rocking-chair, of a vertical shaft connected thereto, a weight secured to one side of the rod, a fan, and an intermediate mechanism, substantially as described, between the shaft and the fan, whereby as the chair is rocked the shaft is automatically made to revolve for the purpose of operating the fan, substantially as set forth.

402,948.

402,949. TOOL FOR CUTTING SHEET METAL, &c. FRIEDRICH LUDLOFF, Martinikenfelde, near Berlin, Germany. Filed Feb. 14, 1889. Serial No. 299,857. (No model.)



Claim.—1. The cutting-disks mounted in bearings, one of which is adjustable with respect to the other, in combination with an adjustable guide, *o*, and handle *p*, substantially as described.

2. The cutting-disks mounted in bearings, one of which is adjustable with respect to the other, in combination with an adjustable guide, *o*, handle *p*, and leg *w*, substantially as described.

3. The cutting-disks mounted in bearings, one of which is adjustable with respect to the other, in combination with an adjustable guide, *o*, handle *p*, and studs *s t*, substantially as described.

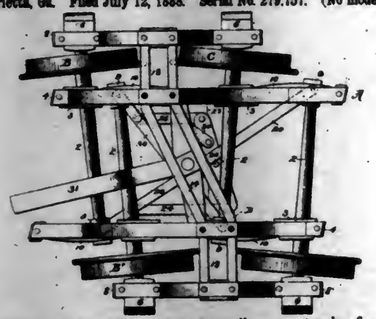
402,950. TRUCK FOR RAILWAY-CARS. JAMES W. MALOY, Marietta, Ga. Filed July 12, 1888. Serial No. 279,756. (No model.)

Claim.—1. A railway-car truck provided at each end with a pair of wheels secured to a pair of axles arranged in proximity, the inner end of each axle turning in a box at the inner side of the adjacent wheel, and a cross-bar or girder, D, connecting the side girders, G G, of the frame extending diagonally with each end midway between the adjacent wheels, substantially as set forth.

2. The combination, in a railway-car truck, of supporting-wheels,

an axle for each wheel, a box for the inner end of each axle arranged adjacent to the inner face of the adjacent wheel, and an external journal for each wheel, having its bearing in a box supported by the frame of the truck, substantially as set forth.

3. The combination, with a railway-car truck, of pairs of wheels, each having a separate axle, the axles of each pair of wheels arranged parallel to and overlapping each other and supported by a frame pivoted centrally to the truck, the opposite ends of the opposite frames being connected by diagonally-pivoted cross connecting-rods 8 9, substantially as set forth.



4. The combination, with the frame of a railway-car truck, of a pair of wheels at each end, each secured to a separate axle and each axle bearing with its inner end in a box adjacent to the inner face of one of the wheels, a frame, I, supported upon each pair of axles and pivoted to the truck-frame, and cross connecting-rods 8 9, extending between the opposite ends of the opposite frames I, substantially as set forth.

5. The combination, with the frame of a railway-car truck, of frames I I, pivoted thereto and supported each upon one of the pairs of wheels of the truck, and pilot-wheels 13, supported by the extensions of the frames, substantially as and for the purpose set forth.

6. The combination, in a car-truck, of frames I I, each supported at one end of the truck upon wheels having independent overlapping axles, as described, boxes C, each receiving the external journal of one of the axles, and sliding between curved guides upon the frame, and cross-rods 8 9, connecting the opposite frames, substantially as set forth.

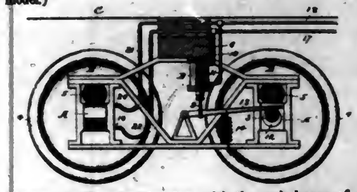
7. The combination, in a car-truck, of a frame, a pair of wheels at each end, each supported by an independent axle, a box supporting the inner end of each axle adjacent to the inner face of one of the wheels, a box sliding between curved guides upon the frame receiving the external journal of each wheel, and cross connecting-rods 8 9, substantially as set forth.

402,951. TRUCK FOR RAILWAY-CARS. JAMES W. MALOY, Marietta, Ga. Filed July 12, 1888. Serial No. 279,757. (No model.)

Claim.—1. The combination, with a railway-car truck, of separate wheels secured to separate overlapping axles extending from side to side of the truck and mounted in independent movable bearings, said axles being adapted to be moved to and from each other, substantially as described.

2. The combination, with a railway-car truck, of supporting-wheels secured to separate overlapping axles, the outer ends of the axles being mounted in swiveling boxes at one side of the truck, and their inner ends mounted in sliding boxes at the opposite side thereof, substantially as described.

3. The combination, with a railway-car truck, of a pair of supporting-wheels secured to separate parallel overlapping axles, the outer ends of the axles being mounted in swiveling boxes and their inner ends in horizontal sliding boxes, and a connecting-rod connecting the latter boxes together, whereby the axles are swung in unison, substantially as described.



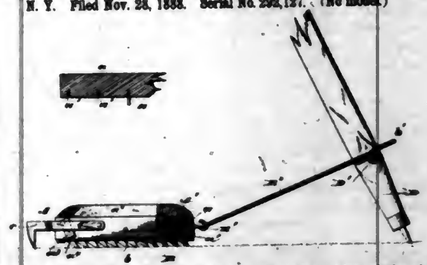
4. The combination, with a railway-car truck, of two pairs of supporting-wheels, each wheel carried by a separate axle, the outer ends of the axles being mounted in swiveling boxes and their inner ends mounted in sliding boxes, and connecting-rods 20 30, connecting the boxes at the outer ends of each pair of axles together, whereby the axles of each pair are swung in unison, substantially as described.

5. The combination, with a railway-car truck, of two pairs of supporting-wheels, each wheel carried by a separate axle, the outer ends of the axles being mounted in swiveling boxes and their inner ends free to swing horizontally, connecting-rods connecting the outer ends of the axle of each pair together, and a lever and links connecting the said rods together, whereby they are moved in unison, substantially as described.

6. The combination, with a railway-car truck, of supporting-wheels secured to separate axles, the outer ends of the axles being mounted in swiveling boxes and their inner ends mounted in sliding boxes, connecting-rods connecting the inner ends of two axles together, a lever and links connecting the connecting-rods together to move in unison, an arm, 31, and connections between the latter and said lever for simultaneously adjusting the position of the axles, substantially as described

7. The combination, with a railway-car truck having outer side bars, 8, and inner side bars, 4, of supporting-wheels secured to separate axles, the outer ends of the axles supported in swiveling boxes carried by the outer side bars, the inner portion of the axles extending through bearings in one of the inner side bars, and the extreme inner end of the axles mounted in sliding boxes in the other side bar, substantially as set forth.

402,952. LUBRICATING DEVICE FOR RAILWAY-CARS. JAMES W. MALOY, Marietta, Ga. Filed July 18, 1888. Serial No. 280,293. (No model.)



Claim.—1. The combination, with the axle-boxes of a railway-car, of a single pump communicating with each box of the car at its upper and lower parts to maintain a circulation of oil through the pump and through each box, the pump being connected with one of the axles to be operated positively by the rotation thereof, substantially as set forth.

2. The combination, in a railway-car, of a pump communicating with pipes 17 and 18, carried by the car, and a communication between the pipe 17 and the lower end of each axle-box of the car and between the pipe 18 and the upper end of each axle-box of the car, substantially as set forth.

3. The combination of a car-body, one or more swinging trucks supporting the same, and pipes 17 and 18, carried by the body, a pump communicating through flexible pipes with the pipes 17 and 18, and a flexible pipe connecting the lower portion of each car-axle box and the pipe 17, and another flexible pipe connecting the upper portion of each car-axle box and the pipe 18, substantially as set forth.

402,953. CARPET-STRETCHER. CHARLES M. MALLORY, Albion, N. Y. Filed Nov. 26, 1888. Serial No. 292,127. (No model.)

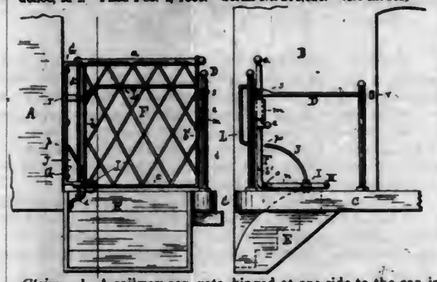
Claim.—1. In a carpet-stretcher, the combination of the drag having transverse slots in the bottom thereof and a cushion on the top side, metallic strips mounted in said slots having blunt-pointed serrations, metallic strips secured to the sides of the drag bent over the ends of said serrated strip to secure the same, the rear yoke pivotally attached to the drag, having a central spike-hook, and the bail removably attached to the rear side of the drag and of itself secured to a handspike, substantially as described.

2. In a carpet-stretcher, the combination of the drag, the handspike, and the bail attached to said spike removably connected to said drag, and having a loop, *b'*, beyond its pivotal point to limit the movement of the handspike, substantially as described.

402,954. RUNNER FOR BOB-SLEDS. TABER G. MANDT, Stoughton, Wis. Filed Jan. 19, 1889. Serial No. 296,890. (No model.)

Claim.—1. A runner for sleds having a knee formed integral therewith, provided with a curved bearing for the cross-beam, and standards rising from said knee provided with supporting-ears for the rave, substantially as described.

2. A runner for sleds having a knee provided with a curved bearing for the cross-beam, and supporting-ears for the rave, the knee, and end of the runner, substantially as described.



3. The combination, with the knee having the curved projection or ridge, of the cross-beam having a depression in which said projection or ridge fits, substantially as and for the purpose described.

402,955. PISTON FOR HYDRAULIC PRESSES. LEWIS MILLER, Philadelphia, Pa. Filed Jan. 17, 1889. Serial No. 296,577. (No model.)

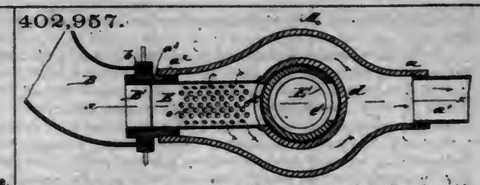
Claim.—The combination of a piston, A, provided with an annular abutment, *a*, independent packing-rings B, surrounding the said piston, expanding-rings inserted between the said packing-rings, a removable ring, D, secured on the end of the piston, a series of set-screws, C, tapped in the ring D near its outer edge, a hard-metal ring, E, inserted between the ends of the set-screws and the packing-rings, and binding-nuts C' upon the said set-screws, substantially as and for the purpose set sorth.

402,956. RAILWAY-CAR GATE. NATHAN F. MATHEWSON, Providence, R. I. Filed Feb. 4, 1889. Serial No. 298,630. (No model.)

Claim.—1. A railway-car gate hinged at one side to the car, in combination with a folding platform hinged to the gate at its bottom, adapted to lie horizontally when the gate is closed and to fold up against said gate when the gate is open, substantially as specified.

2. The railway-car gate hinged at one side to the car, in combination with the folding platform hinged to the gate at its bottom, and having the wheel and the inclined track for the travel of said wheel, substantially as described.

3. In a railway-car having a platform and steps, the combination of the hinged gate F, the latch *e*, the platform H, hinged at the bottom of said gate, the wheel I, the inclined track J, and the catch *r*, substantially as specified.



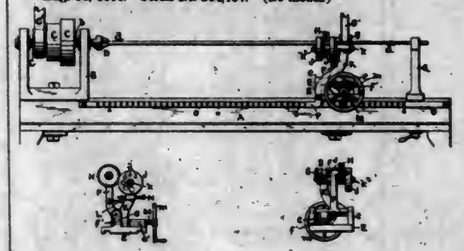
4. In a railway-car having a platform and steps, the combination of the hinged gate F, the latch *e*, the platform H, hinged at the bottom of said gate, the wheel I, the inclined track J, the guard D, and the catch *r*, substantially as specified.

5. In a railway-car having a platform and steps, the combination of the hinged gate F, the latch *e*, the catches *r s*, the platform H, hinged at the bottom of the gate, the wheel I, the inclined track J, and the guard D, substantially as specified.

6. In a railway-car having a platform and steps, the combination of the hinged gate F, the latch *e*, the catches *r s*, the platform H, hinged at the bottom of said gate, the wheel I, the inclined track J, the guard D, and the hand-rail L, substantially as specified.

402,957. FEED-WATER COCK. HENRY D. MEDRICK, Port Jervis, N. Y. Filed July 25, 1888. Serial No. 281,133. (No model.)

Claim.—1. The combination, with a shell having a longitudinally-extending strainer-tube at its inlet end, of a transverse valve-seat in the shell having a side or lateral opening into which the inner end of the strainer leads, and a cock having an open bottom or end and a side opening to register with that of the seat, whereby when the said openings register the water will flow longitudinally through the strainer and out through the cock, and when the cock closes the seat-opening the water will flow laterally through the strainer and through the shell, substantially as set forth.



2. The combination, with the shell having its sides outwardly bowed near the center and a vertical plug-seat secured in said shell between the curved sides, provided with an inlet-opening, of a horizontal perforated straining-tube connected with the inlet of the shell and the inlet of the plug-seat, and a hollow plug provided with an inlet in the side and an exit-opening in the bottom, substantially as shown and described.

3. The combination, with an essentially elliptical shell and a tapering plug-seat extending vertically through the shell from top to bottom and provided with an inlet-aperture, of a tubular perforated strainer attached to the plug-seat around the aperture therein and to the inlet extremity of the shell, and a hollow plug provided with an inlet in the side and an outlet in the bottom, substantially as shown and described.

4. The combination, with an essentially elliptical shell, a tapering plug-seat extending vertically through the shell from top to bottom, provided with an inlet-aperture in the side, of a tubular perforated strainer attached to the plug-seat around the aperture therein, a hollow plug provided with a side inlet and a bottom outlet, and a thimble abutting with the outer end of the strainer, substantially as shown and described.

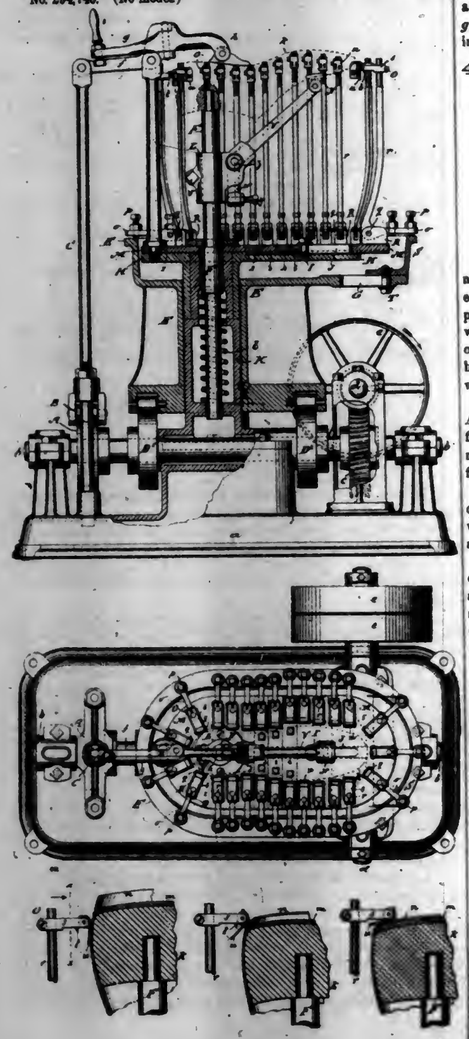
402,958. LATHE. GEORGE E. MERRY, Port Chester, N. Y. Filed Aug. 30, 1888. Serial No. 284,157. (No model.)

Claim.—1. The combination, with the lathe-bed, a stationary head mounted thereon and having a spindle provided with a chuck or device for holding a stick to be turned, of a movable head having an arm pivoted thereon to swing transversely of the lathe, a rotary tool or cutter mounted on said arm, a lever for bringing the tool or cutter up to its work, and a support for the stick, substantially as set forth.

2. The combination, with the lathe-bed, a stationary head mounted thereon and having a spindle provided with a chuck or device for holding a stick to be turned, of a movable head having an arm pivoted thereon to swing transversely of the lathe, a rotary tool or cutter mounted on said arm, a lever for bringing the cutter up to its work, means, substantially as described, for returning the cutter to normal position, and a support for the stick, substantially as set forth.

3. The combination, with the lathe-bed, a stationary head mounted thereon and having a spindle provided with a chuck or device for holding a stick to be turned, of a movable head having an arm pivoted thereon to swing transversely of the lathe, a rotary tool or cutter mounted on said arm and composed of two or more disks having notched or serrated peripheries, a lever for bringing the tool or cutter up to its work, means for returning the cutter to normal position, and a support for the stick, substantially as set forth.

4. The combination, with the lathe-bed, a stationary head mounted thereon and having a spindle provided with a chuck or device for holding a stick to be turned, of a movable head having an arm pivoted thereon to swing transversely of the lathe, a rotary tool or cutter mounted on said arm, a lever for bringing the tool or cutter up to its work, means for returning the cutter to normal position, a support for the stick, and a scale upon the lathe-bed for determining or gaging the positions of the movable head on the bed from time to time



for the proper spacing of the pattern being turned, substantially as set forth.

5. The combination, with the lathe-bed, a stationary head mounted thereon and having a spindle provided with a chuck or device for holding a stick to be turned, of a movable head having an arm pivoted thereon to swing transversely of the lathe, a rotary tool or cutter mounted on said arm, a lever for bringing the tool or cutter up to its work, means for returning the cutter to normal position, a support for the stick, a scale upon the lathe-bed, and a spring catch or latch upon the movable head for engaging the scale and gaging the proper position of the movable head on the bed, substantially as set forth.

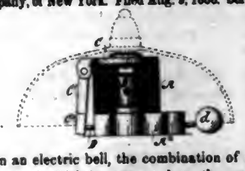
6. The combination, with the movable head, of an arm, F, pivoted thereon to swing transversely of the head, a rotary cutter mounted on said arm, an arm, K, fixed to the head and having a plate or plates for supporting the stick to be turned, and a lever for bringing the cutter up to its work, substantially as set forth.

7. The combination, with the movable head, of an arm, F, pivoted thereon, a rotary cutter mounted on said arm, an arm, K, fixed to the head and having an adjustable plate or plates provided with holes of different diameters for supporting sticks of different sizes, and a lever for bringing the cutter up to its work, substantially as set forth.

402,959. LASTING-MACHINE. JOHN W. MILLET, Dolgeville, assignor to Alfred Doige, New York, N. Y. Filed Dec. 27, 1888. Serial No. 294,746. (No model.)

Claim.—1. In a lasting-machine, the combination of a support carrying a last, a series of swinging levers having friction-shoes to press the upper inward upon the insole, arms *o*, for swinging the levers, and a reciprocating flange, E, for actuating said arms, substantially as described.

2. In a lasting-machine, the combination, with a last-support, of a series of swinging levers, *r*, carrying friction-shoes, arms *o*, for swinging the levers, a movable flange, E, for actuating the arms, and a rotary cam for operating the flange, substantially as described.



3. In a lasting-machine, the combination, with a last and mechanism for lasting the upper, of a yielding last-supporting spindle, F, and a sleeve, L, secured directly to the spindle and adjustable along the same, and having a last toe-support pivoted to said sleeve, substantially as described.

4. In a lasting-machine, the combination, with a last and mechanism for lasting the upper, of a yielding last-supporting spindle, F, and a sleeve, L, secured directly to the spindle and adjustable along the same, and having a pivoted arm, V, provided with a last toe-support, N, substantially as described.

5. In a lasting-machine, the combination, with a last and levers having friction-pieces, of an under plate, H, and a supporting-plate, M, for the levers, arranged on the under plate and composed of an adjustable section and a removable and replaceable section or sections, substantially as described.

6. In a lasting-machine, the combination, with a vertically-movable last, of a reciprocating arm, *f*, provided with an adjustable lever, *g h*, for holding down said last, and a connecting-rod, C, and actuating-cam A, connected to said arm *f*, substantially as described.

402,960. ELECTRIC BELL. RICHARD R. MOFFATT, New York, N.Y., assignor, by direct and mesne assignments, to the Moffatt Electric Construction Company, of New York. Filed Aug. 9, 1888. Serial No. 282,368. (No model.)

Claim.—1. In an electric bell, the combination of a single magnet-core, A', one end of which is connected to the gong, the other end being connected with the chambered base A^2, which serves as one pole of the magnet A, the armature C^2 having magnetic connection with the other end of the core A', arranged to act as the other pole of the magnet A, the hammer-rod D, supported within the chambered base A^2, the actuating-spring *e*, and a circuit opening and closing device, arranged substantially as herein specified.

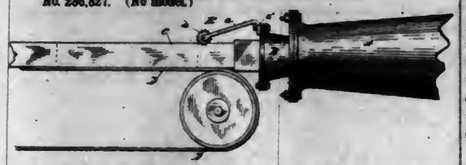
2. In an electric-bell, the combination of a single magnet-core, A', one end of which supports the gong, the chambered base A^2, the flange C, oscillating armature C^2, rod D, spring *e*, and means for automatically opening and closing the circuit, substantially as herein specified.

3. In an electric bell, a single magnet-core, one end of which is connected with a gong, the other end with a chambered base, in which chamber is located the actuating-springs, combined with the armature C^2 and the striker *d*, substantially as herein specified.

4. In an electric bell, the combination of a single magnet-core, one end of which supports the gong, the other end being attached to a chambered base of magnetic metal which serves as one pole of the magnet, the automatic circuit-breaking device located within said chambered base, the armature C^2 and the striker *d*, arranged substantially as herein specified.

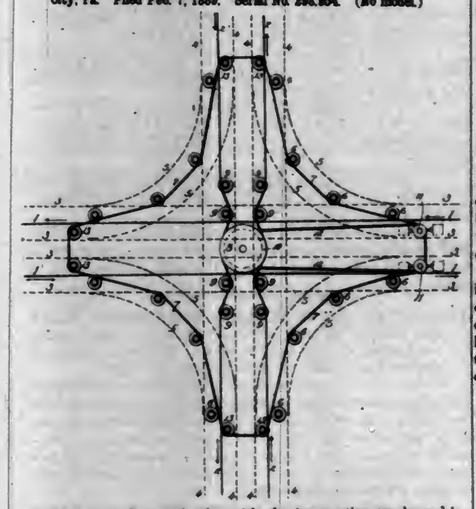
5. In an electric bell, the combination of a single magnet-core, one end of which supports the gong, the other end being attached to a chambered base of magnetic metal which serves as one pole of the magnet, the automatic circuit-breaking device, and the actuating-spring located within said chambered base, the armature C^2, and the striker *d*, arranged substantially as herein specified.

402,961. PHOTOGRAPHIC-PLATE HANDLE OR HOLDER. WILLIAM K. MOODY, Boston, Mass. Filed Nov. 30, 1888. Serial No. 292,228. (No model.)



Claim.—1. A photographic-plate holder consisting of spring-arms provided on their ends with broad hooks or jaws formed to embrace the edge of a plate, the lower portion of each hook or jaw being constructed with a substantially rounded or sharp edge, as described, whereby it is adapted to readily pass under the edge of the plate, substantially as set forth.

2. A photographic-plate holder consisting of the spring-arms *c*, provided on their ends with the hooks or jaws *d*, formed to embrace the edge of a plate, the lower lip or portion of each hook or jaw being constructed with a substantially rounded or sharp edge, *g*, whereby it is adapted to readily pass under the edge of the plate, and the loop or bow *b*, substantially as set forth.



3. A photographic-plate holder or handle consisting of arms or supports provided with broad hooks, jaws, or clasps, the lower lip of each of which is constructed with a substantially rounded or sharp edge, as described, whereby it is adapted to pass under the plate, and the upper lips of which jaws are inclined with respect to the surface of the plate or film, as set forth.

402,962. DEVICE FOR MARKING BRICKS. ALVAH O. MORGAN and ROBERT H. BAIRD, Burlingame, Kans. Filed Oct. 1, 1888. Serial No. 286,827. (No model.)

Claim.—The combination of a former of a brick-machine, a conveyer arranged beneath the said former, a pair of arms, *a a*, bolted to the face of the former, these arms being provided with vertically-slotted ears for the passage of the securing-bolts, and an impression-roller journaled in the forward ends of the said rigid arms, as and for the purpose herein set forth.

402,963. CABLE RAILWAY. ALLEN R. PARKHOM, Monongahela City, Pa. Filed Feb. 7, 1889. Serial No. 299,264. (No model.)

Claim.—1. In combination with the intersecting tracks and intersecting propelling-cables of a cable railway, a central driving-pulley arranged between the intersecting cables and engaged and driven by one or more of said cables, and a transferring-cable carried around curves between said intersecting tracks and formed into a loop carried around said central pulley, substantially as described.

2. In combination with the crossing or intersecting tracks and intersecting propelling-cables of a cable railway, a pulley arranged between the said intersecting propelling-cables and driven by one or more of the latter, and a single transferring-cable carried around the said central pulley and from thence by a series of pulleys in curves between and across the angles or corners corresponding with said intersecting tracks, and deriving its motion from said central pulley, whereby the latter and a single transferring-cable co-operate to transfer a car from one track to another at such intersection.

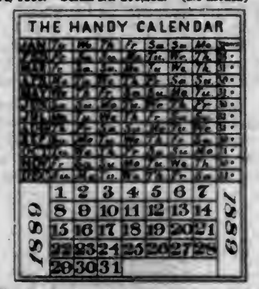
3. In combination with the crossing or intersecting tracks and propelling-cables of a cable railway and curved tracks crossing the angles between said tracks and connected to them by switches, a driving-pulley driven by one or more of said main cables, guide-rolls arranged around the curves corresponding with said curved tracks, and a transferring-cable carried over said guide-rolls so as to terminate in the line of each propelling-cable, and deriving its motion from said driving-pulley, substantially as described.

4. In a cable railway, the combination, with the crossing or intersecting tracks 3 3 and 4 4, the propelling intersecting cables 1 1 and 2 2, and the curved tracks 5, of the pulley 8 and smaller pulley, 10, deriving motion from one or more of said propelling-cables, the guide-rolls 6, 11, and 13, and the transferring-cable 7, carried over said guide-rolls and around said pulley 10, substantially as described.

5. In a cable railway, the combination, with the crossing or intersecting tracks 3 3 and 4 4, the propelling intersecting cables 1 1 and 2 2, and the curved tracks 5, of the pulley 8, deriving motion from one or more of said propelling-cables, and the smaller pulley, 10, the guide-rolls 6 and 13, the adjustable tightening guide-rolls 11, and the transferring-cable carried in a loop around said pulley 10 and tightening guide-rolls 11 and over the guide-rolls 13 and 6, substantially as described.

6. In a cable railway, the combination of the intersecting tracks and propelling-cables, the pulley 8, journaled in the center of said intersecting propelling-cables, the curved tracks, the guide-rolls 9, arranged in a line tangential to the pulley 8 and in a line with one of the propelling-cables and guiding said cable into frictional driving contact with a portion of the periphery of said pulley 8, and the transferring-cable passed around guide-rolls and deriving motion from said driven pulley 8, substantially as described.

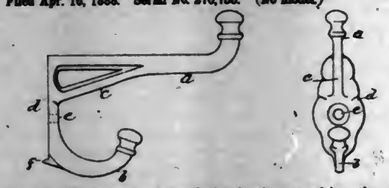
7. In a cable railway, the combination of the intersecting double tracks 3 3 and 4 4, propelling intersecting cables 1 1 and 2 2, curved tracks 5, pulley 8, guide-rolls 9 in a tangential line to the periphery of said pulley and guiding one or more of the main cables into frictional driving contact with said pulley 8, the smaller pulley, 10, secured to said pulley 8, the guide-rolls 6 and 13, the adjustable tightening-rolls 11, and the transferring-cable 7, carried in a loop, 12, around said pulley 10 and tightening guide-rolls 11 and carried over the guide-rolls 6 and 13, substantially as described.



402,964. DEVICE FOR CASE-HARDENING AXLE-BOXES. JOHN W. FARMELEE, Wilkes-Barré, Pa. Filed Mar. 5, 1888. Serial No. 266,573. (No model.)

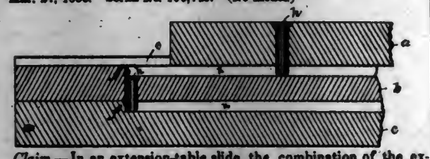
Claim.—1. In combination with an axle-box or the like, the recessed caps adapted to fit over and close the ends thereof, the caps having their recesses tapered so as not to come directly in contact with the ends of the box, for the purpose set forth, substantially as described.

2. In combination with an axle-box or the like, the cap E, having the tapered recess in its inner side adapted to fit over the enlarged end of the axle-box, and thereby prevented from coming directly in contact with the extreme inner end of the axle-box, and the cap F, having the recess G on its inner side adapted to fit snugly on the tapered outer end of the axle-box, said cap being provided with the openings H, substantially as described.



402,965. CALENDAR. EDWARD A. PARSONS, New Haven, Conn. Filed Jan. 14, 1889. Serial No. 296,232. (No model.)

Claim.—The herein-described calendar, consisting of a series of names representing the months, a line of names or abbreviations extending from each month, each line representing seven successive days of a week, the first day represented being the day of the week on which the first day of the month occurs, combined with a single series



of figures, from 1 to 31, arranged in lines corresponding to the said days of the week, the figure 1 being in line with the representation of the day of the week on which the month begins, and the successive figures arranged accordingly, substantially as described.

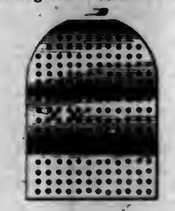
402,966. WARDROBE-HOOK. CHARLES W. PIERCE, Oak Hill, N.Y. Filed Apr. 16, 1888. Serial No. 270,753. (No model.)

Claim.—The improved wardrobe-hook, comprising the upper arm or hook, *a*, brace *c*, lower hook, *b*, and base-plate *d*, and having the attaching screw-hole *e* of the base-plate between the brace and the lower hook, but above or out of interfering range of the point of said hook with the driving of the screw.

402,967. TABLE-SLIDE. SMITH PRATT, Granville, Ohio. Filed Mar. 27, 1886. Serial No. 196,749. (No model.)

Claim.—In an extension-table slide, the combination of the extension-bars having on one side thereof the longitudinal dovetailed projections adapted to slide within the corresponding grooves, *c*, of the adjoining bars, with vertical projecting stop-pins adapted to slide in the smaller grooves, *k*, substantially as and for the purpose specified.

402,968. MACHINE FOR MAKING ICE. LAFAYETTE D. RAILSBACK, Indianapolis, Ind., assignor of three-fourths to Augustus M. De Souchet, same place, and W. Irving Williamson and George W. Mitchell, Bowling Green, Mo. Filed Apr. 6, 1889. Serial No. 306,175. (No model.)



Claim.—1. The combination of the freezing-cylinder, the feeding-apron at one side of the cylinder, and the breaking roll or knife and scraper at the other side, whereby material fed upon one side of the cylinder is frozen and delivered at the other side.

2. The combination, in a machine for making ice, ice-cream, &c., of the revolving freezing-cylinder, a tank or supply-vessel to contain the liquid to be frozen, an apron-like conduit leading from said supply-vessel to said cylinder, a crushing roll or knife for dividing the film of ice as it is frozen, and a scraper for removing said ice.

402,969. COFFEE OR TEA POT. GEORGE R. RAYMOND, Chicago, Ill. Filed June 28, 1888. Serial No. 278,406. (No model.)

Claim.—As an improvement in tea-pots, the approximately V-shaped division-plate having its vertex resting on the bottom of the pot, its rear portion extending to the upper end of said pot, and the

402,969.

front portion to the inner end of the spout, substantially as shown and described.

402,970. FIRE-EXTINGUISHER. THOMAS C. RICE, Worcester Mass. Filed Jan. 23, 1889. Serial No. 297,228. (No model.)

Claim.—1. A portable fire-extinguishing pail or vessel provided with a frangible cover and with a pocket in said cover.

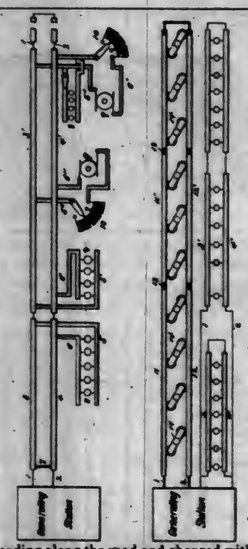
2. As an improved article of manufacture, a portable fire-extinguishing pail or vessel provided with an internal protecting-coating and a frangible cover provided with a pocket.

3. In a fire-extinguisher, the combination, with a pail or vessel coated on its interior, of a paper cover coated on its under side for protection against the contents of the vessel, and a pocket formed in said cover.

4. In combination with a portable pail or vessel, a frangible cover for the same provided with a pocket and with an opening, and a valve adapted to close the opening.

5. In combination with a pail or vessel having a bituminous internal coating, a paper cover for said pail or vessel, also coated on its under face, and a pocket formed in said cover, all substantially as shown.

402,971. SYSTEM OF LINEAR TRANSFORMERS. ELIAS E. RIES, Baltimore, Md., assignor to Ries & Henderson. Original application filed Aug. 31, 1887, Serial No. 248,405. Divided and this application filed Feb. 11, 1889. Serial No. 299,474. (No model.)



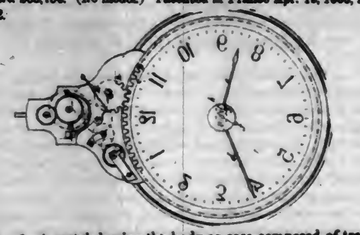
Claim.—1. A system of electrical distribution and conversion, consisting of line-conductors extending from the generating station to the farthest point of consumption, charged by intermittent or alternating currents of high tension, one or more sections of conductors parallel and in inductive proximity to the line-conductors, and one or more working-circuits bridging said conductors at any desired point or points, substantially as described.

2. In a system of electrical distribution and conversion, the combination of a round metallic primary circuit extending from a generating-station to the farthest point of consumption, charged by intermittent or alternating currents of high tension, with a secondary circuit or circuits composed of conductors extending along each branch of the primary circuit, insulated therefrom and covering and protecting the same, and one or more working-circuits bridging the secondary conductors, and translating devices therein, substantially as described.

3. In a system of electrical distribution and conversion, a primary circuit charged with high-tension currents and extending from the generating-station to the farthest point of consumption, with one or more sections of secondary conductors in inductive relation with the primary circuit and proportionate in length to the potential required in the secondary circuit, and one or more working-circuits bridging each section of secondary conductors, and translating devices therein, substantially as described.

4. In a system of electric railways, a round metallic line of paral-

402,971.



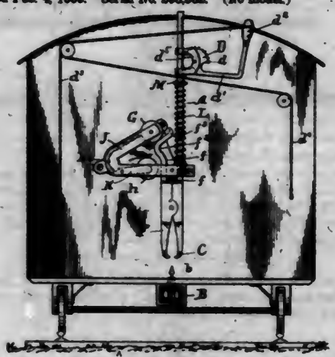
lel conductors extending along the road and charged with intermittent or alternating currents of high tension, with conducting-rails insulated from and covering the line-conductors, and contact wheels or trucks for bridging the rails and conveying current to the traveling electric motor, substantially as described.

5. A system of electrical distribution and conversion, comprising a generator of alternating or intermittent currents, primary line-conductors extending from said generator to one or more distant points of consumption, one or more secondary line-conductors parallel with and in inductive proximity to the primary line-conductor and arranged to be inductively charged therefrom with currents of a different tension, and translating devices fed by the current or currents so induced in the secondary conductors, substantially as described.

6. A system of electrical distribution and conversion, comprising a primary line of conductors extending from a generating-station to distant points of consumption and charged with intermittent or alternating currents of a given tension, secondary line-conductors parallel with and in inductive proximity to the primary line-conductors, and consumption-circuits tapping the secondary conductors at any point or points on the line, substantially as described.

402,972. TIME-PIECE. HUGUES RIBE, Paris, France, assignor to the Société Armand Schwab et Frère, same place. Filed Aug. 25, 1888. Serial No. 283,758. (No model.) Patented in France Apr. 19, 1888, No. 190,092.

Claim.—1. A watch having the body or case composed of transparent materials, the hands of said watch and the operating movement thereof exterior to the watch body or case, in combination with a transparent wheel communicating motion from said operating movement to said hands, substantially as set forth.



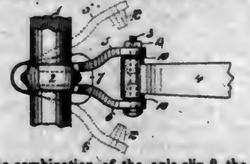
2. A watch having its body or case composed of transparent materials, the hands of said watch and the operating movement thereof exterior to the watch body or case, in combination with a transparent wheel concentric with said hands and communicating motion from said operating movement to said hands, substantially as set forth.

3. A watch having its body or case composed of transparent materials, the hour and minute hands of said watch and the operating movement thereof exterior to the watch body or case, in combination with a transparent wheel concentric with the hands of said watch, said wheel being rotated by said operating movement and said minute-hand rotating with said transparent wheel, and a train of gear concealed behind the central portions of the hour and minute hands, which transmits motion from said minute-hand to said hour-hand, substantially as set forth.

4. A watch having its body or case composed of transparent materials, the hour and minute hands of said watch and an operating movement concealed in the pendant of the watch, in combination with a transparent wheel communicating motion from said operating movement to said hands, substantially as set forth.

5. A watch having its body or case composed of transparent materials, the hands of said watch and the operating movement thereof exterior to the watch, in combination with a transparent wheel concentric with said hands and operating the same, and a toothed ring on the periphery of said wheel, which is concealed by the rim of the watch and which meshes with said operating movement, substantially as set forth.

402,973. CAR-COUPLING. WILLIAM W. ROGERS, Clarksville, Ark. Filed Feb. 4, 1889. Serial No. 298,582. (No model.)

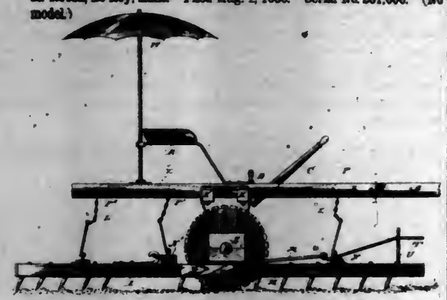


Claim.—1. The combination of the bar A, provided at its upper end with cogs *a*, cog-wheel D, properly secured and provided with cogs *d*, arm *d'*, handle d^3, cords d^3 d^4, to operate the same, coil-spring L, adapted to raise said bar, bar F, constructed as described, to form, in conjunction with said bar A, nippers C, coil-spring *f'*, adapted to close said nippers, the upper end of said bar being curved, as described, wheel G, pivoted in slotted frame J, wheel H, pivoted in bar K, and bar K, pivoted in said frame J, substantially as shown and described, and for the purposes set forth.

2. The combination of the draw-head having, in addition to the usual mouth, the slot s' and depression s^3, spring N, its flat end secured to the upper face of said draw-head, its bent end passing down through said slot s' and provided with the table s and the shoe s^2, link E, adapted to work in said draw-head and operate said spring, and pin *b*, adapted to operate in said draw-head and to be extracted by said nippers C, all substantially as shown and described, and for the purposes set forth.

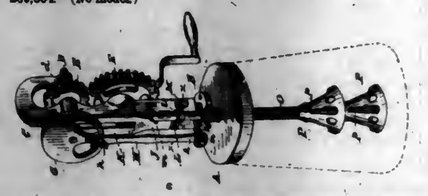
3. The combination of the nippers C, provided with the cogs and operating-wheel D, large coil-spring L, small coil-spring *f'*, and curves on the bar F, and wheels G H in suitable bearings, all as described, with a draw-head provided with the slot s', recess s^3, spring N, provided with the table s and shoe s^2, and the double-headed pin *b*, substantially as shown and described, and for the purposes set forth.

4. In a car-coupler, substantially as above described, the combination of the draw-head having, in addition to its mouth, the slot s' and recess s^3, spring N, having one end secured to the upper face of said draw-head, the other passing down through the slot s' and into the mouth of the said draw-head and being provided with a table, s, and shoe s^2, and the double-headed coupling-pin *b*, which may be drawn up by means of a cord and branches, all substantially as shown and described, and for the purposes set forth.



402,974. THILL-COUPLING. WALTER T. ROSS, Quebec, Quebec, Canada. Filed Aug. 30, 1888. Serial No. 284,205. (No model.)

Claim.—The combination of the axle-clip 2, the movable jaws 5 6, having inwardly-facing coniform projections 10 at the forward end and hinged together at the rear by one leg of the clip, the other leg intervening the jaws, the plate 7, supporting said jaws and bear-



ing on the clip-nuts, the thill-iron 4, having a bore conically enlarged at both ends, and the coupling-bolt 3, passing through the bore of the coniform projections and thill-iron and provided with a nut, 13, at the end, as set forth.

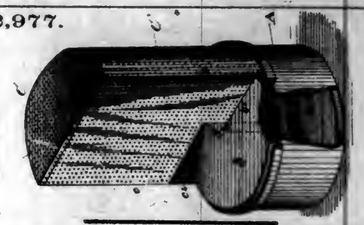
402,975. COMBINED RIDING HARROW AND ROLLER. CASPER M. ROUSE, Le Roy, Kans. Filed Aug. 1, 1888. Serial No. 281,666. (No model.)

Claim.—In a combined riding harrow and roller, the combination of the roller E, having bearings in wooden boxes S S' in the wrought-iron side frames, F F', with the arms M M' hinged to the cross-bar N, the harrows H and I, the harrow 1 having its horseshoe attachment with two hooks forming a hinge, the lever C, the chains L, the hook and ratchet D, and the forked guide-pin U, all substantially as and for the purposes set forth.

402,976. CHURN. ELI A. RUDASILL, Shelby, N. C., assignor of one-half to John C. Beam, same place. Filed Nov. 2, 1888. Serial No. 289,804. (No model.)

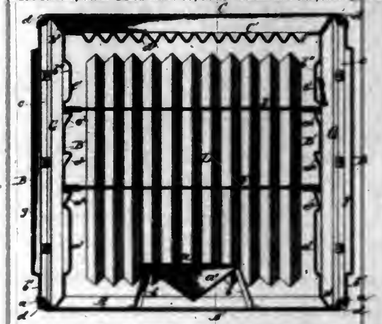
Claim.—1. The combination, with the adjustable standard having its upper end turned to one side to form bearings for each end of the upper journal, and provided with a dovetailed projection on its opposite side, of a vertically-sliding guide-bar slotted in its upper end and secured to the standard by holding-clips on the inclined surfaces, the upper or forked ends of the guide-bar being held in position by the upper journal and the driving-gear, as set forth.

2. The combination, with an adjustable standard having a dovetailed projection on one side, of a vertically-sliding guide-bar slotted in its upper part and confined to the inclined surfaces of the standard by clips, the arms of the slotted part of the bar being held upon each side of the upper journal and between the collar of the standard and hub of the fly-wheel on said journal, as set forth.



3. The combination, with a standard having a dovetailed projection thereon, and a vertically-sliding guide-bar secured thereto, said bar being slotted in its upper part and its arms passing on each side of the upper journal, of a two-part tubular dasher secured to the guide-bar and having conical beaters on its lower end, one above the other, as set forth.

4. The combination, with an adjustable standard having a dovetailed projection on one side, a vertically-sliding slotted guide-bar having its forked ends extending on each side of a journal above, and between the collar of the standard and hub of the fly-wheel on said journal, said fly-wheel having a pitman connected thereto and to the lower end of the guide-bar, of a coupling-arm secured to the guide-bar, having a socket therein holding a two-part tubular dasher-rod having conical slotted beaters one above the other on its lower portion, said upper dasher-rod being adjustable within the lower and having an air-valve on its inclosed end, as and for the purpose set forth



402,977. FLY-TRAP. GEORGE W. RUSSELL, Mobeetie, Tex. Filed Dec. 22, 1888. Serial No. 294,361. (No model.)

Claim.—In a fly-trap, the combination, with the base portion provided with clock-work mechanism for operating the horizontally-rotating bait-plate *b*, of the semi-cylindrical perforated or foraminated cage C, detachably connected to said base and having the recess at c^2 for the admission of insects to the trap, substantially as described.

402,977.

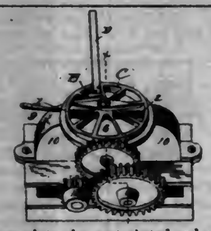
402,978. KNOCKDOWN OVEN. MARCUS S. SAGER, Washington Court-House, Ohio. Filed Nov. 13, 1884. Serial No. 147,856. (No model.)

Claim.—1. In an oven of the class described, having the outer walls thereof secured to each other at their abutting points by removable fastening devices, the detachable inner walls, held in position by frictional contact with the outer walls and with each other, the outer wall of the bottom having a central opening and a doorway formed in one of the outer walls, the parts being combined substantially as shown, and for the purpose set forth.

2. In combination with an oven of the class described, irrespective of specific construction, and provided with a bottom having a central opening, a hollow conical deflector having a flat top or covering plate, so as to form a dead-air space within the deflector, substantially as shown, and for the purpose set forth.

3. In an oven, an outer casing formed with separable or detachable walls, a doorway formed in one of the outer walls, heat induction and eduction orifices, the removable plates forming the inner walls having bent edges which engage with the inner portion of the outer casing, so as to support the inner walls within the outer casing, the parts being combined substantially as shown.

4. In combination with the outer casing of a portable oven, the inner vertical side plates, B' B', provided centrally with transverse corrugations for the reception of trays and vertical corrugations for stiffening the plates, said plates being adapted to be maintained in position by frictional contact with the outer casing, substantially as shown.



5. In a knockdown oven, the vertical walls having their edges bent to overlap the vertical edges of the walls adjacent thereto, top and bottom plates provided with downwardly and upwardly bent edges which overlap the longitudinal edges of the front, back, and side walls, the edges of the overlapping plates having perforations which register, and bolts and nuts for securing the walls to each other, the perforations being so located that one or more sides of the nuts will engage with the bent portion of the plate to prevent rotation of the nuts when the bolts are turned, the parts being adapted to be combined substantially as shown, and for the purpose set forth.

6. The combination, in a knockdown oven, of the outer walls, the edges of which are bent to overlap each other and are provided with corresponding perforations, bolts and nuts for securing the edges of the outer walls to each other, the inner walls having their edges bent to be supported by contact with the outer walls at their edges and provide air-spaces between the inner and outer walls, substantially as shown.

402,979. FEED-REGULATOR. NEWELL SANDERS and JUDSON BUCHANAN, Chattanooga, Tenn. Filed Aug. 4, 1888. Serial No. 281,946. (No model.)

Claim.—1. In combination, the hopper, the feed-wheel located at the bottom thereof and having spokes to form a series of pockets for the reception of the grain, said pockets being in free communication with the hopper, a plate having a stud for supporting the wheel, said plate also having openings 1 2 for the egress of the grain, a stationary cut-off plate secured to the central stud and extending over the openings 1 2, and a stirrer secured to the feed-wheel at such a point as will permit its passing by the cut-off plate, substantially as described.

402,979.

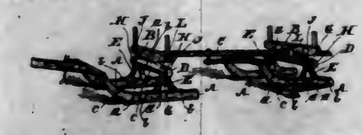
2. In combination, the hopper, a feed-wheel at the bottom thereof having pockets, a plate for supporting the feed-wheel, having discharge-openings, a stationary cut-off plate extending over said openings, and a stirrer secured to the feed-wheel at a point out of line with the cut-off, substantially as described.

402,980. AZO DYE. JAKOB SCHMID, Basle, Switzerland, assignor to the Society of Chemical Industry, same place. Filed Sept. 24, 1888. Serial No. 286,239. (No specimens.)

Claim.—The production of azo bodies by the combination of alphadiazonaphthaline with metaamidophenol or its dialkylized derivatives, substantially as described.

402,981. BRIDLE. JOHN SCHNEIDER, Pontoon, Ill. Filed Nov. 24, 1888. Serial No. 291,806. (No model.)

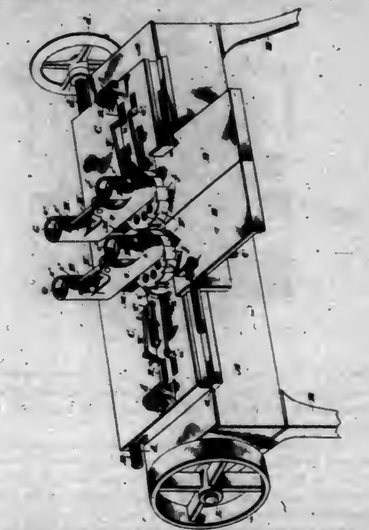
Claim.—As an improved article of manufacture, the buckle C, provided with a recess, C^3, to receive the end of the throat-latch, and a rivet, c^3, to secure the same therein, and having cross-bar *c* and pivoted tongue C' to receive the crown-piece extension, transverse loop C^3, arranged at right angles to the body of the buckle, to receive the end of the crown-piece extension, apertured lug *d* at its lower end, and the metallic loop D, swiveled in said apertured lug and adapted to receive and support the bearing-rein, substantially as and for the purposes specified.



402,982. HAND-WARMER. FRANK SCHOFF, New York, N.Y. Filed Feb. 23, 1889. Serial No. 301,521. (No model.)

Claim.—1. A hand-warmer consisting of a perforated sheet-metal box, an outer covering, a cover to close the open end of the box, and a tubular grate, of substantially the length of the box, fixed in the box with one end left open and arranged in the box with a space between its exterior surface and the interior of the sides of the box, substantially as described.

2. A hand-warmer consisting of a perforated sheet-metal box, a cover, and a tubular grate consisting of a spiral coil fixed in the casing, substantially as described.



402,983. BOB-SLEIGH. DAVID W. SCOBIE, Cambridge, Wis. Filed Feb. 26, 1889. Serial No. 301,221. (No model.)

Claim.—1. In a bob-sleigh, the combination, with the runners of the respective bobs, of the knees E E, provided with concave bearings or seats G, for the reception of the ends of the cross-beams, and bolt-retaining slots I, for the reception of the beam-retaining bolts J, cross-beams D D, having rounded or cylindrical bearing-surfaces H at their respective ends conforming in shape to the concave surface of said knees, and beam-retaining bolts J J, rigidly affixed at their upper ends to the ends of said cross-beams and at their lower ends within the retaining-slots I of said knees, substantially as and for the purpose specified.

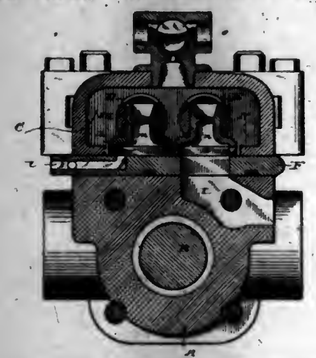
2. In a bob-sleigh, the combination of the knees E E, provided at their upper ends with concave bearing-surfaces for the reception of the ends of the cross-beams and at their lower ends with diverging arms *a a*, secured to the runners by retaining bolts or rivets, cross-beams D D, having cylindrical bearing-surfaces conforming in shape to the bearing-surfaces of said knees, and beam-retaining bolts J, rigidly secured at their upper ends in the ends of said cross-beams and operating at their lower ends within the slots I of the beam-supporting knees, all substantially as and for the purpose specified.

402,984. BOOK-STAPLING MACHINE. JOHN W. SCULL, Philadelphia, Pa., assignor of one-half to Andrew Scull, same place; Andrew Scull administrator of said John W. Scull, deceased. Filed July 30, 1887. Serial No. 245,719. (No model.)

Claim.—1. In a book-stapling machine, the combination, with two or more wire-feeders, two or more wire-cutters, and two or more staple-formers, of two or more staple holders and carriers and two or more staple-drivers, constructed and arranged to operate successively in the order named for simultaneously forming and setting two or more staples, substantially as and for the purpose shown.

2. In a book-stapling machine, the combination, with an intermittingly-rotating disk provided with a series of equidistant openings for the reception of staples, of a former for forcing a series of blanks into said openings in the shape of staples, and a driver for successively forcing said staples out of said openings and into a book, substantially as and for the purpose set forth.

3. As an improvement in mechanism for stapling books, the combination of a support for books which is adapted to hold a book upward with a yielding pressure and a staple-holding plate that is adapted to furnish a bearing for the upper side of the book, substantially as and for the purpose shown and described.



4. As a means for feeding wire to the blank-cutting devices, the combination of a block which is adapted to slide back and forth within or upon a track beneath the wire, an L-shaped dog that is pivoted within or upon said block, and a bar which has one of its ends pivoted to the vertical arm of said dog and its opposite end pivoted upon a reciprocating part of the machine, whereby whep said parts are moved forward the horizontal arm of said dog is pressed downward upon and caused to engage with and move said wire forward, substantially as and for the purpose specified.

5. In combination with mechanism, substantially as shown, whereby wire is intermittingly fed from a reel, a stationary block which is provided with an opening for the passage of the wire and an intersecting opening that has a right angle thereto, and a cutter-bar that is adapted to slide longitudinally within the last-named opening and is provided with a wire-opening which by the motions of said cutter-bar is alternately moved into and out of coincidence with the wire-opening of said block, substantially as and for the purpose described.

6. The combination, with an intermittingly-rotating disk which is provided with a series of staple forming and holding openings, of a feeder for presenting blanks to said openings as they successively reach a predetermined position and a former which is adapted to be moved upward into the openings of said disk to form staples within the same for the interposed blanks, substantially as and for the purpose described.

7. In combination with a disk which is provided with equidistant staple-holding openings and by a step-by-step rotation is adapted to bring such openings successively over a book-supporting mechanism, a plunger that is adapted to be moved downward through each staple-containing opening as it reaches a predetermined point and to force the staple contained therein into a book placed beneath, substantially as and for the purpose shown.

402,985. VALVE FOR ENGINES. HENRY C. SERGEANT, New York, N. Y., assignor to the Ingersoll-Sergeant Rock Drill Company, same place. Filed Aug. 10, 1888. Serial No. 282,418. (No model.)

Claim.—1. In a reciprocating engine, means for opening and closing the supply-ports thereof, comprising a pair of valve-actuating pistons driven by the motive fluid independent of the movement of the main piston, substantially as described.

2. In a reciprocating engine, the combination, with the main supply-ports and cylinder, of two valves arranged to move in alternation and to control the necessary supply ports and passages to produce said alternating motion independent of the movement of the main piston, substantially as described.

3. In a reciprocating engine, valve-operating mechanism therefor, consisting of a pair of reciprocating pistons, one of which is connected to and moves the main valve of the engine, the other operating a similar valve controlling the movements of the valve-controlling pistons independent of the movement of the main piston, substantially as described.

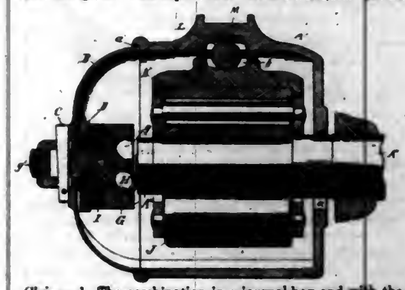
4. In a reciprocating engine, the combination, with the main supply-valve thereof, of a steam or air actuated piston for reciprocating the same, a second similar valve, and ports and passages in the steam-chest for imparting alternating reciprocating movement to the valve-controlling pistons independently of the movement of the main piston, substantially as described.

5. A reciprocating engine having a steam or air actuated piston arranged to open and close the main supply and exhaust ports independently of the movement of the main piston, an auxiliary piston and valve-controlling ports and passages for actuating the main-valve piston, and a contractible passage or passages for regulating the speed of the main-valve piston, substantially as described.

6. In a reciprocating engine, the combination of pistons M N, main valve *m*, attached to piston M, and an auxiliary valve attached to piston N, main supply-ports, and an auxiliary set of ports controlled by the piston N, valve-passages leading from said ports to actuate the piston M, and passages leading from the main ports to give motion to the piston, substantially as described.

7. In a reciprocating engine, the combination of pistons M N, main valve *m*, attached to piston M, and an auxiliary valve attached to piston N, main supply-ports, and an auxiliary set of ports controlled by the piston N, valve-passages leading from said ports to actuate the piston M, passages leading from the main ports to give motion to the piston N, and a contractible exhaust-passage, Q, substantially as described.

8. The valve-actuating pistons M N, in combination with the steam-chest J, having oppositely-located cylinders to receive the pistons, and an enlarged central portion to permit the free passage of steam or air to the ports, substantially as described.



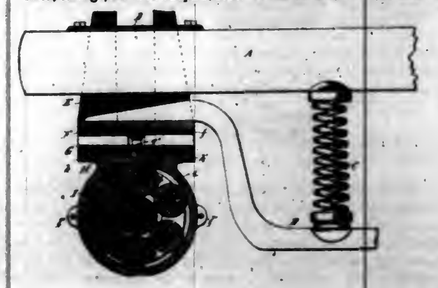
402,986. ELECTRIC SYSTEM OF COMMUNICATION. FREDERICK B. SHAFER, New York, N. Y. Filed Jan. 10, 1889. Serial No. 296,022. (No model.)

Claim.—1. A system of electrical communication comprising the combination of an electrical call or notifying instrument having the contact-points of its brake-wheel specifically adapted for denoting the call, and a second instrument of like character, but having contact-points of its brake-wheel producing distinguishably-different signals for the message and geared with a variably-setting motor to produce one or more signals at a setting, both of said instruments being in electrical connection with a register or bell or other receiving-instrument in the station, substantially as described.

2. A system of electrical communication comprising the combination of an electrical call or notifying instrument having the contact-points of its brake-wheel specifically adapted for denoting the call, a second instrument of like character, but having contact-points of its brake-wheel producing distinguishably-different signals for the message and geared with a variably-setting motor to produce one or more signals at a setting, and a third instrument of like character, but having a brake-wheel for communicating signals or characters which are distinguishable from those of both the first and second instruments, all of said instruments being in electrical connection with a register or bell in the station, substantially as described.

402,987. ANTI-FRICTION JOURNAL-BOX. WILLIAM S. SHARPNECK, Chicago, Ill. Filed Sept. 3, 1888. Serial No. 284,471. (No model.)

Claim.—1. The combination, in a journal-box and with the shell A thereof, of the bar D, cap B, and key C, substantially as described.



2. The combination, in a journal-box and with the shell thereof, of an axle working therein and a bearing-block, and a spring for holding said block against the end of the axle, substantially as described.

3. The combination, in a journal-box and with the shell thereof, of an axle working therein, a holder, as the cross-bar D, and a bearing-block constructed to move endwise therein under the pressure of the axle, substantially as described.

4. The combination, in a journal-box and with the shell thereof, of an axle working therein, a cross-bar, D, attached to the shell, a movable bearing-block, and a cushion, as the spring I, between said cross-bar and bearing-block, substantially as described.

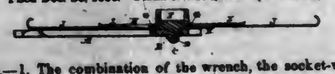
5. The combination, in a journal-box and with the shell thereof, of an axle working therein, a system of anti-friction rollers supporting a roller, as L, and a removable hardened plate to receive the wear of said roller, substantially as described.

402,988. ANTI-FRICTION JOURNAL-BOX. WILLIAM S. SHARPNECK, Chicago, Ill. Filed Sept. 3, 1888. Serial No. 284,472. (No model.)

Claim.—1. The combination, with a timber, A, of a car-truck, an equalizing-bar, B, a spring, C, between the two, and the journal-box thereof, of a reversed pedestal, E, supported by the journal and receiving the timber A and the equalizing-bar B, substantially as described.

2. The combination, with the timber A of a car-truck, an equalizing-bar, B, a spring, C, between the two, and the journal-box thereof, of a reversed pedestal, E, supported by the journal and receiving the timber A and the equalizing-bar B, and a saddle, D, embracing said timber and forming a guide for said pedestal, substantially as described.

3. The combination, with a timber of a car-truck, and the journal-box thereof, and a saddle fastened to the timber, of a yoke receiving the saddle, and supported on a roller resting on said journal-box, and constructed to allow the timber to rise and fall therein under the pressure of the car, substantially as described.

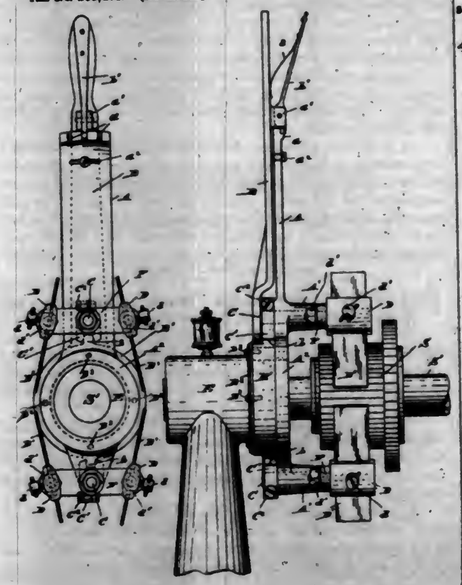


4. The combination, with a journal-box having a recessed support, as the bracket H, having an upwardly-projecting rib, of a roller resting in said support, and having a groove receiving said rib, and supporting a pedestal having a downwardly-projecting rib fitting into the groove in said roller, substantially as described.

5. The combination, with the shell I, of the spider M, the bearing-block secured in the hub *m'* thereof, the cap P, and a fastening device, as the wedge Q, substantially as described.

6. The combination, with the saddle I and spider M, having a threaded aperture in its center, of the bearing-block N, having a threaded and slotted shank, a cap, P, and the wedge Q, substantially as described.

7. The combination, in a journal-box and with the axle and shell thereof, of a bearing-block having a wearing-block set therein and provided with a groove partly formed in said wearing-block and a ball running in said groove, substantially as described.

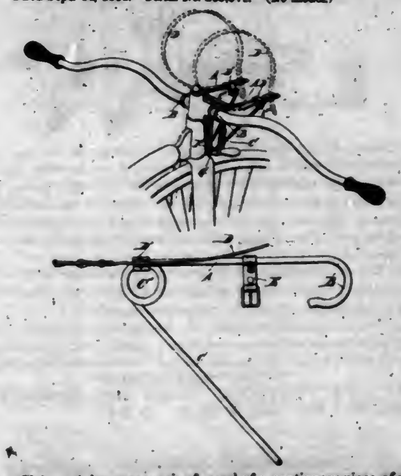


402,989. WHEEL-WRENCH. OLIVER SHEPHERD and JOHN F. HOLMES, Ballston, N. Y.; said Shepherd assignor to Wm. S. Story, same place. Filed Dec. 20, 1888. Serial No. 294,232. (No model.)

Claim.—1. The combination of the wrench, the socket-wrench attached thereto, the plate, and hooked rods attached to the plate for fastening the parts to the spokes of the wheel, substantially as shown.

2. The combination of the socket-wrench, the wrench A, secured thereto, the plate H, loosely attached to the socket-wrench, the springs connected to opposite sides of the plate, and the hooked rods attached to the springs, substantially as described.

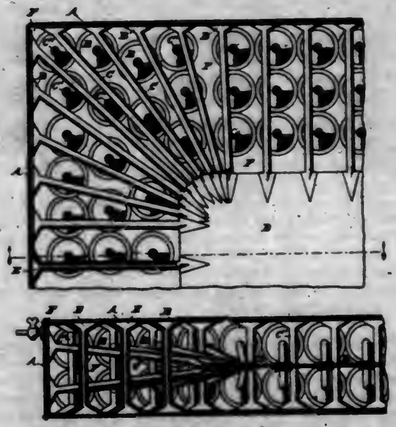
402,990. COMMUTATOR-BRUSH CONTROLLER FOR ELECTRIC MOTORS. WILLIAM L. SILVEY, Lima, Ohio. Filed Aug. 22, 1888. Serial No. 283,478. (No model.)



Claim.—1. In a commutator-brush controller for electric motors, the combination of the ring B', teeth *b b*, lever B, latch *b'*, notched lever *a*, and spindles c^3 c^3, operated by the teeth attached to the ring B', as set forth.

2. The combination, in a commutator-brush controller for electric motors, of the split brushes D' D' D' D', bars F F, rods *c c*, and split clamps *c' c'*, attached to the spindles, whereby the position of the brushes is changed, as set forth.

3. The combination, in a commutator-brush controller for electric motors, of the main ring a^3, mounted on hub or journal-bearing E, ring B' and ring *a'* attached thereto, lever B, for operating holders D D D D, and insulating-bars F' F', spindles *c c*, split clamps *c' c'*, and teeth *b b*, attached to ring B', for operating the brushes D' D' D' D', as set forth.

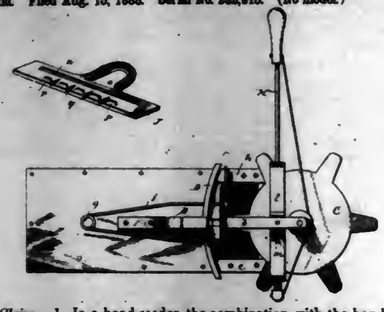


4. In a commutator-brush controller for electric motors, the combination, with the ring *a*, of projecting stems *a' a'*, diametrically opposite each other, rotative spindles *c c*, and clamps *c' c'*, adjustably secured to said spindles by set-screws c^3, as set forth.

402,991. LUGGAGE-CARRIER. CLARENCE H. SMITH, Detroit, Mich. Filed Sept. 14, 1888. Serial No. 285,371. (No model.)

Claim.—A luggage-carrier formed of a continuous piece of metal bent so as to form the bracket-arms C, horizontal arms A, and hooks B, and in connection therewith straps for securing the bundle in place upon the carrier, and a strap adapted to engage the brake so as to secure the carrier firmly upon the bicycle, substantially as described.

402,992. WATER-PROOF AIR-MATTRESS. BENJAMIN F. SHAVELY, Harrisburg, Pa. Filed Aug. 26, 1888. Serial No. 283,731. (No model.)



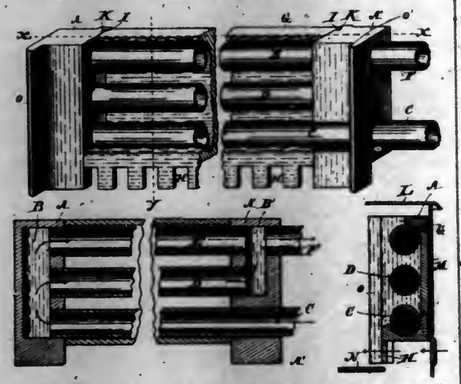
Claim.—1. The water-proof air-mattress having its inner walls provided with water-proof air-tight chambered disks B, to which the interior tubular stays, C, are secured, substantially as specified.

2. A water-proof air-mattress, consisting of the main wall A, the

water-proof air-tight disks B, secured to the inside thereof, the center piece, D, and the tubular stays, substantially as specified.

3. A rubber-coated air-mattress composed of the main wall or casing, the rubber water-proof air-tight disks secured to the inner surface thereof, the center attachment-piece, the radial stays extending from the disks of the sides and ends to said attachment-piece, and the vertical stays connecting the disks of the top and bottom walls, substantially as specified.

402,993. BROADCAST SEEDER. FRANKLIN P. SPANGLER, Goshen, Ind. Filed Aug. 15, 1888. Serial No. 282,813. (No model.)

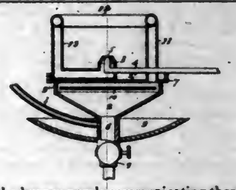


Claim.—1. In a hand-seeder, the combination, with the box having transverse feed-slot and the guides secured to the under side of said box, of the adjustable throat-plate working in said guides, the wire attached to said throat-plate, and the transverse bar connecting the arms of said wire and provided with a right-angled portion engaging the side of one of said guides, substantially as and for the purpose specified.

2. The combination, with the box having transverse feed-slot, of the front throat-plate beneath said slot and formed with a transverse ridge, *n*, substantially as and for the purpose specified.

3. The combination, with the box having feed-slot, of the front throat-plate formed with transverse ridge *n*, ridges *p*, and corrugations *q* between said ridges, substantially as and for the purpose specified.

402,994. WATER-BACK. JAMES H. SPENCE, Milwaukee, Wis. Filed Nov. 7, 1888. Serial No. 290,195. (No model.)



Claim.—1. A water-back constructed and adapted to be inserted horizontally in the fire-box of a stove or range, consisting of two cast-iron end pieces—one at each end—each end piece having one or more water-chambers, in combination with a wrought-iron pipe or pipes connecting said end pieces, each connecting-pipe leading into a chamber of an end piece, and an induction and an eduction water-pipe, substantially as described.

2. A water-back consisting of cast-iron head-pieces A and A', provided with chambers B and B', and a rear wall, G, in combination with a wrought-iron induction-pipe, C, wrought-iron intermediate pipes, D and E, and an eduction-pipe, F, substantially as described.

3. In a water-back, cast-iron heads A and A' and connecting wrought-iron pipes, in combination with a cast-iron wall, G, provided with draft-apertures H H, substantially as described.

402,995. WATER-GAS BURNER. WILBUR F. STEELE, Steele, Dak. Filed Apr. 8, 1889. Serial No. 306,401. (No model.)

Claim.—1. In a water-gas burner, the combination, with a vaporizing-chamber and a burner-nozzle communicating therewith, of a supply-pipe projecting into and extending upwardly within said burner-nozzle and leaving a contracted space beneath the same, a valved blow-off pipe connected to said vaporizing-chamber, and a suitably-secured cup or receiver arranged beneath said burner, substantially as and for the purpose described.

2. In a water-gas burner, the combination, with a vaporizing-chamber and a superheating-chamber arranged above the same and communicating therewith, of a burner-nozzle arranged below said superheating-chamber and above said vaporizing-chamber, a supply-pipe connecting said superheating-chamber and burner-nozzle, and another supply-pipe communicating with said burner-nozzle, substantially as and for the purpose described.

3. In a water-gas burner, the combination, with a vaporizing-chamber and a superheating-chamber arranged above the same and communicating therewith, of a burner-nozzle arranged below said superheating-chamber and above said vaporizing-chamber, a supply-pipe connecting said superheating-chamber and burner-nozzle, and another supply-pipe projecting into the side of and extending upwardly within said burner-nozzle and leaving a contracted space between the same, substantially as and for the purpose described.

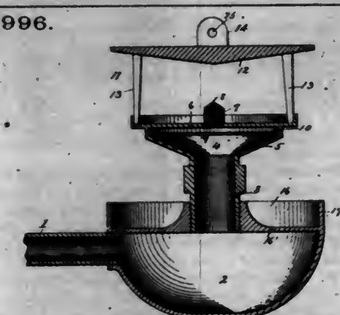
4. In a water-gas burner, the combination, with a vaporizing-chamber, of a loosely-mounted annular plate or disk arranged close beneath the top of said chamber, substantially as and for the purpose described.

5. In a water-gas burner, the combination, with a vaporizing-chamber and a superheating-chamber arranged above the same and communicating therewith, of a loosely-mounted annular plate or disk arranged close beneath the top of said vaporizing-chamber, substantially as and for the purpose described.

6. In a water-gas burner, the combination, with a vaporizing-chamber and a superheating-chamber arranged above the same and communicating therewith, of a burner-nozzle arranged below said superheating-chamber and above said vaporizing-chamber, a loosely-mounted annular plate or disk arranged close beneath the top of said vaporizing-chamber, a supply-pipe connecting the latter and said burner-nozzle, and another supply-pipe communicating with said nozzle, substantially as and for the purpose described.

7. In a water-gas burner, the combination, with the water-vaporizing chamber 2, the water-supply pipe 1, communicating therewith, and the superheating-chamber 12, arranged above said water-vaporizing chamber, of the upright pipe 11, which connects said chamber, the burner-nozzle 3, arranged intermediate of said chambers, the downwardly and inwardly extending steam-pipe 13 14, connecting said superheating-chamber and burner-nozzle, and the oil-pipe 4, projecting into and extending upwardly within said burner-nozzle and leaving a contracted space between the same, substantially as and for the purpose described.

8. In a water-gas burner, the combination, with the water-vaporizing chamber 2, the feed-pipe 6, having the valved blow-off pipe 8, the water-supply pipe 1, and the cup or receiver 9, of the superheating-chamber 12, the upright pipe 11, the downwardly and inwardly extending steam-pipe 13, the burner-nozzle 3, and the oil-pipe 4, having the exit-opening 5, and forming a contracted space between itself and said burner-nozzle, substantially as and for the purpose described.



402,996. VAPOR-BURNER. WILBUR F. STEELE, Steele, Dak. Filed Apr. 8, 1889. Serial No. 306,402. (No model.)

Claim.—1. In a vapor-burner, the combination, with a vaporizing-chamber, of a retarding and deflecting disk located therein, and a superheating-chamber formed between and by said disk and the top of said vaporizing-chamber, substantially as and for the purpose described.

2. In a vapor-burner, the combination, with a vaporizing-chamber provided with a top or cover having a burner-nipple, of a retarding and deflecting disk located within said chamber and at a short distance below said top or cover, substantially as and for the purpose described.

3. In a vapor-burner, the combination, with the vaporizing-chamber 4, provided with the top or cover 6, having the burner-nipple 7, of the retarding and deflecting disk 9, arranged just beneath said top or cover and forming therewith the superheating-chamber 10, and

402,996.

the deflector-plate 12, for deflecting the heat down upon said superheating-chamber, substantially as and for the purpose described.

4. In a vapor-burner, the combination of the receiving-chamber 2, the feed-pipe 3, the vaporizing-chamber 4, the retarding and deflecting disk 9, located therein, and the burner-nipple 7, substantially as and for the purpose described.

5. In a vapor-burner, the combination of the supply-pipe 1, the receiving-chamber 2, having a concaved bottom, the feed-pipe 3, the vaporizing-chamber 4, the disk 9, the burner-nipple 7, and the deflector-plate 12, substantially as and for the purpose described.

6. In a vapor-burner, the combination, with the receiving-chamber 2, the feed-pipe 3, and the vaporizing-chamber 4, having an outwardly-flaring wall or bottom, 5, a flat top, 6, and a central burner-nipple, 7, and the retarding and deflecting disk 9, substantially as and for the purpose described.

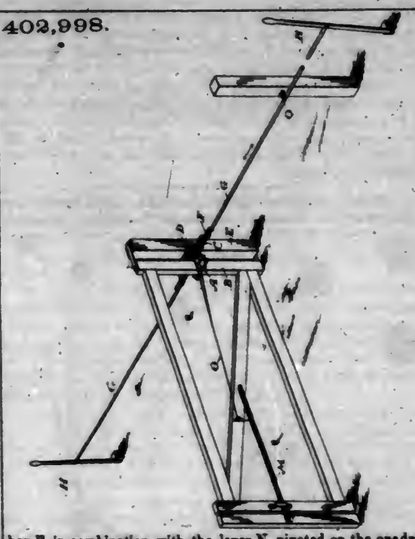
7. In a vapor-burner, the combination of the receiving-chamber 2, the oil-cup 16, the feed-pipe 3, the vaporizing-chamber 4, the retarding and deflecting disk 9 located therein, the burner-nipple 7, and the deflector-plate 12, substantially as and for the purpose described.

8. In a vapor-burner, the combination, with the vaporizing-chamber 4, the retarding and deflecting disk 9 located therein, and the burner-nipple 7 in the top of said chamber, of the deflector 11, consisting of the annular plate 12 and the legs 13, substantially as described.

9. In a vapor-burner, the combination of the receiving-chamber 2, having a concaved bottom, the supply-pipe 1, fitted in the side of said chamber, the feed-pipe 3, the oil-cup 16, the vaporizing-chamber 4, having an outwardly-flaring wall or bottom, 5, a flat top, 6, and a central burner-nipple, 7, the retarding and deflecting disk 9, and the deflector 11, substantially as described.

10. In a vapor-burner, the combination of the receiving-chamber 2, having a concaved bottom, the supply-pipe 1, fitted in the side of said chamber, the feed-pipe 3, the oil-cup 16, the vaporizing-chamber 4, having an outwardly-flaring wall or bottom, 5, a flat top, 6, and a central burner-nipple, 7, the retarding and deflecting disk 9, and the deflector 11, consisting of the plate 12, having the shape of an inverted cone, and the legs 13, substantially as described.

402,997. CASE FOR CARRYING PHONOGRAMS AND GRAPHOGRAMS, &c. ROSWELL H. ST. JOHN, Cleveland, Ohio. Filed Dec. 26, 1888. Serial No. 294,655. (Model.)



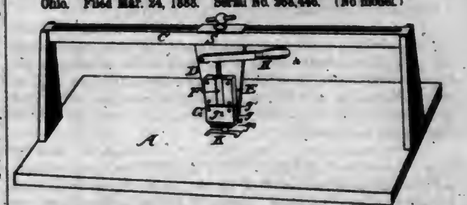
Claim.—1. A new article of manufacture for carrying phonograms and like articles, consisting of a circumferentially-ribbed tube and a cap fitting closely upon each end of the tube and provided with an inwardly-extending conically-tapered portion, forming supports for the ends of a phonogram or like article, whereby said article is adapted to slide up over said conical portions and to be held out of contact with the sides of the tube and against longitudinal movement, substantially as set forth.

2. A new article of manufacture, consisting of a tube having caps at its ends provided with inwardly-projecting conical portions and elastic packing about the base of said conical portions to protect the article conveyed against injury by endwise movement, substantially as set forth.

402,998. MECHANISM FOR OPENING GATES. JOHN H. STONE, Woodbridge, Ontario, Canada. Filed Feb. 13, 1889. Serial No. 299,764. (No model.)

Claim.—1. A rod, G, fixed to or forming part of the bar F, adjustably connected to the rack C, and a pin, K, projecting from the

402,998.



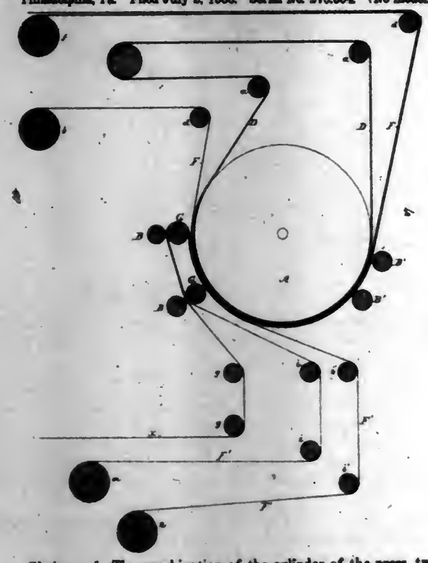
bar F, in combination with the lever N, pivoted on the quadrant A, and connected to the latch M by the cord or chain O, substantially as and for the purpose specified.

2. A rod, G, fixed to or forming part of the bar F, and a pin, L, projecting from the bar F, in combination with the lever P, pivoted on the quadrant A, and connected to the latch M by the cord or chain O, substantially as and for the purpose specified.

3. A rod, G, fixed to or forming part of the bar F, and pins K and L, projecting from the bar F, in combination with levers N and P, pivoted on the quadrant A, and connected to the latch M by the cord or chain O, substantially as and for the purpose specified.

402,999. STAMPING-PRESS. HENRY R. STRAHAHAN, Cleveland, Ohio. Filed Mar. 24, 1888. Serial No. 268,446. (No model.)

Claim.—1. In combination with the hanger D, the ways E, attached thereto, the stem F, sliding in said ways, the spring J and lever H, for moving said stem in reverse directions, and the holder G, attached to said stem, and a movable foot-plate, K, and its retracting-spring, this plate and spring also being attached to said hanger and arranged for co-operating with the type carried by said holder, substantially as set forth.

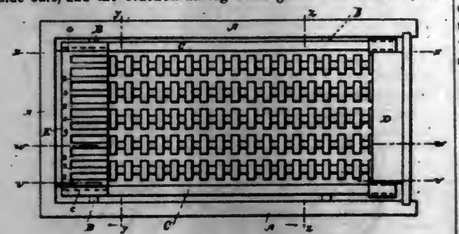


2. In combination with the hanger D, the foot-plate K, having a stem, *k*, the block I, attached to back of said hanger, and the retracting-spring *l*, constructed and operating substantially as specified.

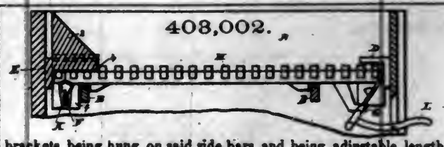
403,000. GEARING FOR ROAD-ENGINES. JOHN W. STRINGER, Marion, Ohio. Filed Jan. 19, 1889. Serial No. 296,848. (No model.)

Claim.—The combination, with the shaft A, the wheel C, having the wrist-pin *c*, the bearings B B', the latter having the depending portion B^3, and the shaft F', standing outward from said depending portion at a proper point, of the gear-wheels D D', the former of which is rigid on the shaft A, while the latter can either turn loosely thereon or be fixed by the set-screw *e*, the gear-wheel E, fixed on the shaft F' and meshing with the wheel D, the gear-wheel E', turning loosely on the shaft F' and meshing with the wheel D', and the bolt d^3, to connect the gear-wheels E E' and cause them to turn in unison, substantially as specified.

408,001. CALICO-PRINTING MACHINE. JAMES SUTHERLAND, Philadelphia, Pa. Filed July 2, 1888. Serial No. 278,834. (No model.)



Claim.—1. The combination of the cylinder of the press, two sets of impression-rolls on opposite sides of the latter, and bearing-rolls interposed between one set of impression-rolls and the cylinder, whereby the sheet to be printed can, after passing between said set of impression-rolls and the bearing-rolls, be reversed and carried around the cylinder to receive the impression from the other rolls, all substantially as specified.



2. The combination of the cylinder, the blanket, the backing-sheet F, two sets of impression-rolls on opposite sides of the cylinder, and bearing-rolls interposed between one set of impression-rolls and the cylinder, and serving as a means of reversing the direction of movement of the fabric to be printed, so as to direct it around the cylinder to the other set of rolls with its printed face in contact with the backing-sheet, all substantially as specified.

3. The combination of the cylinder, the blanket, the two sets of impression-rolls B B' on opposite sides of the cylinder, the bearing-rolls interposed between the cylinder and the rolls B, a backing-sheet, F, passing around the cylinder outside of the blanket, and a second backing-sheet, F', passing between the rolls B and G, and then down between the latter rolls and the cylinder, all substantially as specified.

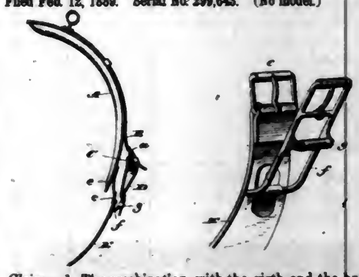
408,002. GRATE. HIRAM P. TALLMADGE, Boston, Mass. Filed May 8, 1888. Serial No. 273,234. (No model.)

Claim.—1. The combination, with the grate-bars, of the rock-bars connected therewith so as to impart a reciprocating motion thereto, the side bars, and the brackets having bearings for said rock-bars, said

brackets being hung on said side bars and being adjustable lengthwise thereof, substantially as described.

2. The combination, with the movable grate-bars, the side bars, and the mechanism for supporting and operating said grate-bars, of the header extending entirely across said grate from side to side and having an inclined face, and composed of solid triangular webs alternating with ribs, as specified, with open spaces between said webs and ribs, substantially as and for the purpose set forth.

3. The combination, with the grate-bars and means for supporting and operating the same, of the header approximately triangular in cross-section, composed of alternate webs and ribs with intermediate air-spaces and having on its under side flanges forming guides for said grate-bars, substantially as described.



4. The combination, with the side bars, the bearing-bar supported thereby, and the series of movable grate-bars, of the tilting supports, one for each grate-bar, said supports having curved upper edges upon which the grate-bars loosely rest, and notches on their under sides for engagement with said bearing-bar, so that adjacent grate-bars are free to reciprocate in opposite directions, substantially as described.

5. The combination, with the side bars, bearing-bar, and movable grate-bars, of the tilting supports having curved upper edges provided with grooves in which the grate-bars rest, and notches on their under sides for engaging and rocking on the edge of said bearing-bar, substantially as described.

408,003. DEVICE FOR TRIMMING AND FILING FINGER-NAILS. COMMODORE P. TEMER, Hillsborough, Ohio. Filed Feb. 8, 1889. Serial No. 299,188. (No model.)

Claim.—A device for cleaning, trimming, filing, and scraping finger-nails, having a point at its outer end, the turned-up sides sharpened at both their ends, and a roughened surface in between the sides, substantially as shown and described.

408,004. HARNESS-GIRTH. WILLIAM S. TRAVER, Owego, N. Y. Filed Feb. 12, 1889. Serial No. 299,643. (No model.)

Claim.—1. The combination, with the girth and the buckle c, attached to one end thereof, of the long-heel buckle *f*, having its lower end bent inward and pivotally attached to said girth below the point of attachment of the buckle c and extended to the outer end of said buckle, substantially as shown and described.

2. The combination, with the girth and the buckle c, attached to one end thereof, of the long-heel buckle *f*, having its lower end bent inwardly and pivotally attached to said girth below the point of attachment of the buckle c and extending to the outer end of the said buckle, and provided between its tongue and the lower end with a cross-bar and roller-guard, substantially as shown and described.

408,005. PROCESS OF ELECTRIC SOLDERING, BRAZING, AND WELDING. ELIHU THOMSON, Lynn, assignor to the Thomson Electric Welding Company, Boston, Mass. Filed Aug. 22, 1887. Serial No. 247,509. (No model.)

Claim.—1. The herein-described method of electric welding, brazing, or soldering, consisting in passing through one or both of the parts or pieces to be operated upon a heavy electric current in the general direction of the line or plane of the joint and of a volume sufficient to bring the piece or pieces to the requisite temperature.

408,005.

2. The herein-described improvement in electric welding and brazing, which consists in making either or both of the parts or pieces to be joined a portion of a continuous electric circuit formed through each, or either independently of the other, and carrying a heavy electric current of a volume sufficient, as described, to effect the desired welding or brazing operation.

3. The herein-described process of forming longitudinal seams or joints in or between elongated metal pieces, consisting in passing a heavy electric current through the piece or pieces longitudinally and of a volume sufficient to heat the same to the desired welding or brazing temperature, as and for the purpose described.

4. The herein-described improvement in affixing light metal pieces to a heavier or base piece, consisting in passing an electric current through the latter of a volume sufficient to heat the same to the requisite welding, soldering, or brazing temperature.

5. The herein-described improvement in forming elongated longitudinal seams or joints, which consists in heating portions of the material in successive lengths by the agency of an electric current passing longitudinally and producing the seam or joint of each section while such section is included in the electric circuit, as and for the purpose described.

6. The herein-described improvement in electric welding, brazing, forging, or soldering, which consists in surrounding the parts acted upon by the electric current with a supporting and heat-retaining jacket or envelope, as and for the purpose described.

7. The combination, with the clamps or connectors, of the intermediate bed-plate, arranged as described, to support the body through which the heating electric current passes, as and for the purpose described.

408,006. METHOD OF ELECTRIC WELDING AND BRAZING. ELIHU THOMSON, Lynn, Mass. Original application filed Feb. 21, 1887, Serial No. 228,277. Divided and this application filed Oct. 19, 1888. Serial No. 288,504. (No model.)

Claim.—1. The herein-described method of forming a welded or brazed joint, consisting in passing an electric current through the material from one side to the other of the joint and then applying lateral pressure directly to the material at the part where the joint or weld is to be formed.

2. The herein-described process of forming a butt-welded joint, consisting in forming or providing the metal with an enlargement at the point of abutment, passing a heating electric current through the material, and then applying lateral pressure to the material directly at the joint, as and for the purpose described.

3. The herein-described improved method of forming an elongated metal joint, consisting in passing a heating electric current across the joint and applying transverse or lateral pressure to successive portions of the object directly at the joint and for the purpose described.

4. The herein-described process of electric welding, consisting in passing an electric current of large heating effect across the joint and then compressing or compacting the joint by pressure applied laterally in a direction transverse to the general line or plane, including the joint and the pieces or portions of object adjacent to the joint.

408,007. ATTACHMENT FOR MINING-MACHINES. HIRAM B. TROUT, Terre Haute, Ind. Filed Dec. 28, 1888. Serial No. 294,856. (No model.)

Claim.—1. In a mining-machine, the combination of a rotary cutter-bar shaft, a sleeve embracing the same and provided with a mortise extending through the same tangentially to the shaft and open on its inner side, a cutter having a cutting-head extending from the sleeve, and a shank located in said mortise and bearing against the cutter-bar shaft, and means for clamping the sleeve to the shaft and the cutter-shank tightly against the shaft, substantially as described.

2. In a mining-machine, the combination of a rotary cutter-bar shaft, a sleeve embracing the shaft provided with an enlarged portion, through which a bore or mortise extends, a cutter consisting of a single piece of steel having its cutting-head enlarged and sharpened, and a straight shank tightly clamped in said mortise, and a set-screw extending through the sleeve and engaging the shaft diametrically opposite the mortise, substantially as described.

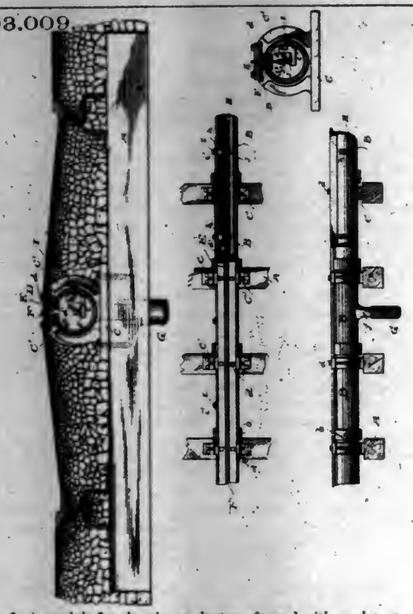
3. In a mining-machine, the combination of a cutter-bar shaft, a sleeve embracing the same and provided with an enlarged portion having a mortise extending therethrough and opening into the bore of the sleeve, said shaft having a flattened portion beneath said opening, a cutter consisting of a single piece of steel having a shank extending through the mortise and resting in said flattened portion of the shaft, and a screw extending through the sleeve and entering a recess in the shaft to clamp the parts together, as set forth.

408,008. AXLE-LUBRICATOR. WILLIAM E. TURNER and JAMES F. HUDSON, Benkelman, Nebr. Filed Apr. 16, 1888. Renewed Mar. 18, 1889. Serial No. 303,530. (No model.)

Claim.—The combination of the skein having an oil-well, C, formed in its top, the well being provided with an opening through its top and a filling-opening at its inner end, with the roller which is journaled in the well and which projects through the opening in its top, so as to bear positively against the inner side of the thimble, and thus caused to revolve when the wheel turns, substantially as shown and described.

408,009. SLOTTED CONDUIT FOR ELECTRIC CONDUCTORS. CHARLES J. VAN DEPOELE, Chicago, Ill. Filed June 6, 1888. Serial No. 276,259. (No model.)

Claim.—1. A conduit for electric conductors, formed of continuously-united tubes or troughs of imperishable insulating material, as earthenware, terra-cotta, or other similar substance, rigid supports encircling the body of the conduit, and a soft or flexible packing between the conduit and its supports, substantially as described.

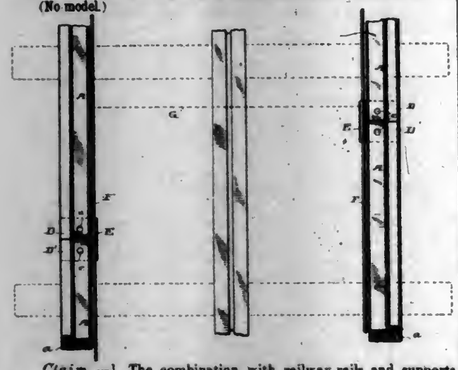


2. The combination of a conduit for containing electric conductors, formed of continuously-united tubes or troughs of earthenware, terra-cotta, or other similar substance, rigid supports encircling the body of the conduit, soft or flexible packing between the conduit and its supports, and surface-pieces or capping-plates resting upon said supports, substantially as described.

3. A conduit for electric conductors, comprising joined sections of solid vitrified pipe, forming a tube or trough within which the conductors are suitably supported, rigid supports encircling the body of the conduit, and soft or flexible packing between the conduit and its supports, and surface-pieces or capping-plates resting wholly upon said supports, substantially as described.

4. A conduit for electric conductors, comprising a tube or trough of fragile material, supports secured to the side walls of the tube or trough and separated therefrom by a layer of elastic insulating material, and one or more electric conductors carried upon the supports within the conduit, substantially as described.

5. A conduit for electric conductors, comprising a tubular body formed of slotted sections united by slotted joints and an elastic composition closing said joints, supports therefor encircling the body of the conduit, and surface-pieces or capping-plates resting upon the said supports and extending downwardly into the slot in the body of the conduit, substantially as described.

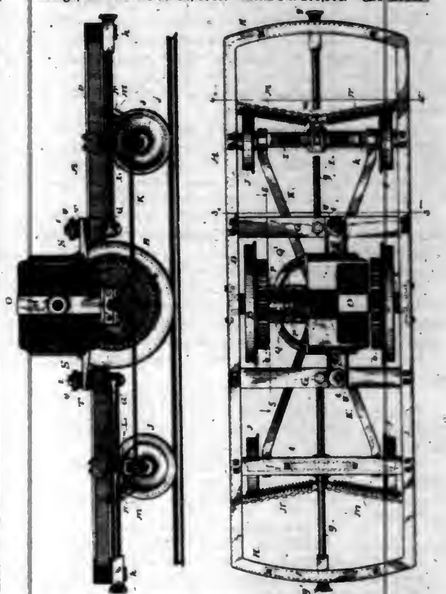


408,009.

6. A conduit for electric conductors, formed with a slot at or near the surface of the roadway, a conductor or conductors suitably supported within the conduit, a rope or cable normally resting in the slot and closing the same, and a traveling contact extending into the conduit and establishing a traveling connection with the conductor or conductors and having a supporting-surface for raising and lowering the slot-closing cable in front and rear of the contact devices, substantially as described.

7. The combination of a conduit having a continuous slot at or near the surface of the roadway, a rope or cable normally resting in and closing said slot, and a concave conductor suitably supported within the conduit, the conductor being located vertically below the slot, substantially as described.

408,010. ELECTRIC CONNECTION FOR RAILWAY-RAILS. CHAS. J. VAN DEPOELE, Chicago, Ill. Filed June 21, 1888. Serial No. 277,772. (No model.)



Claim.—1. The combination, with railway-rails and supports therefor below the surface of the roadway, of means for electrically connecting said rails, comprising plates of zinc or its electrical equivalent arranged under and in electrical connection with said rails, and conductors continuously connecting the plates in contact with the rails, substantially as described.

2. The combination, with railway-rails and supports therefor below the surface of the roadway, of metallic connections for continuously uniting said rails, comprising a plate of zinc or its electrical equivalent arranged under and in electrical connection with each rail, and conductors continuously connecting the plates in contact with the rails, substantially as described.

3. The combination, with railway-rails and supports therefor below the surface of the roadway, of metallic connections for continuously uniting said rails, comprising a plate of zinc or its electrical equivalent arranged under and in electrical connection with each rail, and conductors continuously connecting the plates in contact with the rails, and additional conductors extending between the conductors connecting the separate sets of rails, substantially as described.

408,011. ELECTRIC LOCOMOTIVE. CHARLES J. VAN DEPOELE, Chicago, Ill. Filed Feb. 12, 1889. Serial No. 299,591. (No model.)

Claim.—1. An electric locomotive comprising a platform or vehicle, a single pair of driving-wheels centrally located thereunder, and an electric motor, the armature-shaft of which is mechanically connected with the said driving-wheels by suitable gearing, and which is supported upon the axle thereof in positive relation thereto, substantially as described.

2. An electric locomotive comprising a platform or vehicle, a pair of centrally-located driving-wheels, an electric motor supported in a normally-vertical position upon the axle of said driving-wheels, and positive mechanical connections between the armature-shaft of the motor and the axle of the driving-wheels, substantially as described.

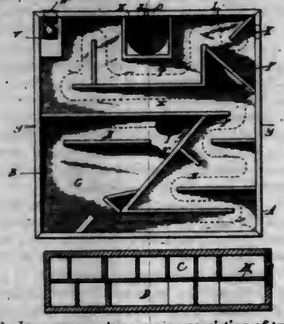
3. An electric locomotive comprising a car or platform, a single pair of centrally-located driving-wheels, the motor located above the driving-wheels, an elongated box or bearing upon the driving-axle, and supports extending between the said box and the frame of the motor, substantially as described.

4. An electric locomotive comprising a car or platform, a single pair of centrally-located driving-wheels, spring-bearings between the platform and the extremities of the driving-axle, a motor supported upon the axle of the driving-wheels, and spring-connections between the frame of the motor and the platform of the car, substantially as described.

5. An electric locomotive comprising a car or platform and a centrally-located pair of driving-wheels, a pair of auxiliary supporting-wheels under the front and rear portions thereof, and pivotal connections between the auxiliary supporting-wheels and the axis of the driving-wheels, whereby free lateral movement is permitted to the ends of the platform, substantially as described.

6. In an electric locomotive, the combination of the car or platform A, centrally-located driving-wheels, metallic frames K, connected to the axles thereof and pivotally attached at the center of the vehicle, auxiliary supporting-wheels secured to the extremities of the frame K, and upwardly-acting springs carried by the axles of the auxiliary wheels between the axles of the auxiliary wheels and the ends of the platform, substantially as described.

7. The combination of a platform, A, centrally-located driving-wheels, supporting-wheels J J, pivoted connecting-frames K, and the lateral springs M, substantially as described.



8. The combination of the platform A, the central driving-wheels, the auxiliary supporting-wheels J J, and pivoted connecting-frames K K, and the lateral springs M, and guard-chains N, substantially as described.

9. The combination of the platform A, centrally-located driving-wheels B B, supporting-wheels J J, rotatably mounted upon axles *j j*, and frames K, rigidly secured to said axles and pivotally connected at the central point of the platform A, substantially as described.

10. The combination of the platform of a car and centrally-located driving-wheels thereunder, supporting-wheels sustaining the end portions thereof and pivotally connected to the center of said platform and attached to axles *j*, tracks located above the auxiliary supporting-wheels and devices extending upward from the axles thereof and resting against said tracks, and laterally-acting springs secured to the platform and to the auxiliary wheels, whereby said wheels are normally retained in central positions beneath the platform, substantially as described.

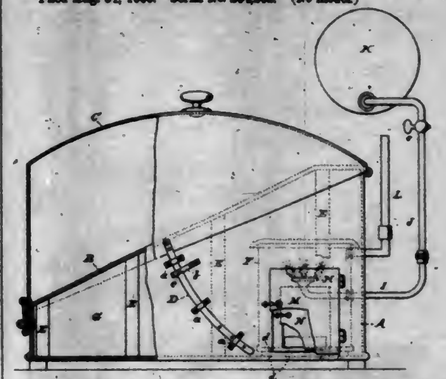
11. The combination of the platform A, having centrally-located driving-wheels, supporting-wheels J J, connecting-arms K, pivotally connected at the center of the platform and rigidly attached to axles *j*, supporting the wheels J, supporting-plates *k'*, located above said axles *j*, and provided with extensions *m*, vertically-acting springs L, mounted upon said plates, and laterally-acting springs M, attached to the extensions *m*, substantially as described.

408,012. GAME. ROBERT M. WASHBURN, Burlington, Iowa. Filed Dec. 31, 1888. Serial No. 295,028. (No model.)

Claim.—1. In a game, a box or case consisting of two compartments each having a labyrinthine channel communicating with the other by an aperture, and each channel beginning at said aperture and terminating at an exit from the box.

2. In a game, an opaque box divided in two compartment having labyrinthine channels dissimilarly arranged and communicating with each other, and each channel provided with an exterior outlet.

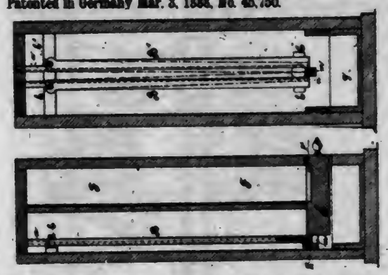
3. In a game, the box or case having the upper and lower compartments each provided with a labyrinthine channel, said channels communicating with each other and one communicating with an inlet-opening in the box or case and the other communicating with an outlet-opening therein, and a ball (one or more) adapted to traverse the said channels, substantially as described.



408,013. SASH-HOLDER. JAMES WEATHERS, Indianapolis, Ind. Filed Feb. 23, 1889. Serial No. 301,470. (No model.)

Claim.—1. The combination of a window frame and sash, a metallic box inserted in the said frame, an adjustable plate secured to the inclined back of this plate, this plate being vertically adjustable and provided with a supporting-lip, and a gravitating roller, substantially as described.

2. The combination of a window-frame, a metallic box inserted in a recess in the same, this box consisting of an inclined back plate, *a*, and sides *a' a'*, a vertically-adjustable plate, *b*, secured to the back plate, *a*, between the sides *a' a'*, and provided at its upper end with a supporting-lip, *c*, a gravitating roller normally resting upon this lip *c*, a window-sash provided with a vertical groove in its edge, a strip inserted in this groove and provided with guiding-pins, and springs for actuating this strip, substantially as described.



408,014. FOOT-STOVE. HAMILTON E. WELSH, Harrisburg, Pa. Filed Aug. 31, 1888. Serial No. 284,262. (No model.)

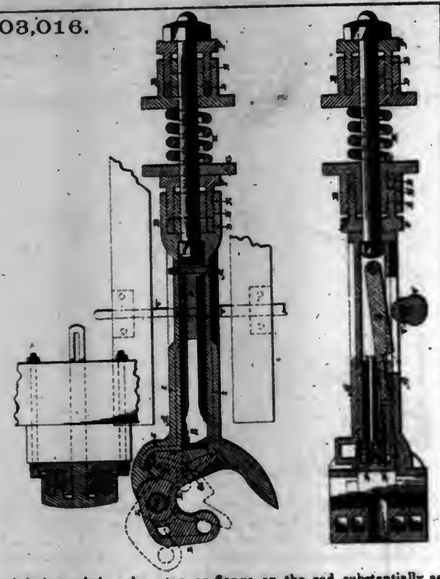
Claim.—1. The foot warmer or stove consisting of the box having the inclined top and a heating agent or machine, and provided with the hinged cover having downwardly-extended curved arms provided with series of apertures, and entering-keepers applied to the sides of the box, said box also having applied thereto latches having engagement with the apertures of said arms, substantially as and for the purpose set forth.

2. The foot warmer or stove consisting of the incline-topped box having a fire-box chamber and a hot-air chamber arranged distantly from the fire-box chamber and beneath the foot-resting portion of the box, and the cover hinged to said box and provided with downwardly-extended curved arms having series of apertures, and entering-keepers applied to the sides of said box, said box also having applied to it latches engaging with the apertures of said arms, substantially as set forth.

408,015. VENDING APPARATUS. BRUNO WIESELMANN, Hamburg, Germany. Filed Feb. 19, 1889. Serial No. 300,436. (No model.) Patented in Germany Mar. 3, 1888, No. 45,750.

Claim.—A locking mechanism for coin-operated apparatus, said locking mechanism consisting of swinging arms, which engage the releasable portion of the apparatus, said arms forming a guide for the coin, which moves the arms to their releasing position, substantially as described.

408,016. CAR-COUPLING. FRANK A. WESTERCOK, Port Jervis, and WINFIELD S. COOK, Middletown, N. Y. Filed Feb. 15, 1889. Serial No. 299,973. (No model.)

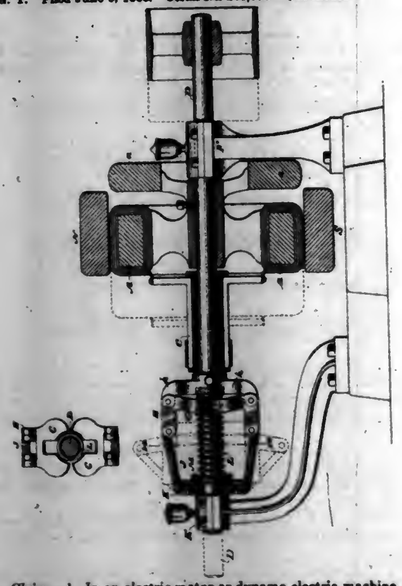


Claim.—1. A draw-head provided with a series of grooves in its thicker portions, so as to enable the head to be annealed, substantially as shown.

2. A coupling-head formed of a series of thin layers which are separated at a suitable distance from each other, substantially as described.

3. The combination of the draw-head with the draw-bolt, two chambers placed upon the draw-bolt, two castings provided with circular tongues or flanges, and the rubber cushions which are placed in the chambers, substantially as described.

4. The combination of the locking-lever, the draw-head in which it is pivoted, the coupling-head provided with a shoulder, T, the endwise-moving operating-rod V, the cam U, the boxes X, in which the



403,016.

rod is journaled, and a stop or flange on the rod, substantially as shown.

5. The combination of the draw-head, provided with a series of horizontal grooves in its front end, with the pivoted coupling-head provided with a series of flanges, P P', on its inner end, substantially as described.

403,017. AUTOMATIC GOVERNOR FOR ELECTRIC MOTORS OR DYNAMO-ELECTRIC MACHINES. SCHUYLER S. WHEELER, New York, N. Y. Filed June 9, 1888. Serial No. 276,650. (No model.)

Claim.—1. In an electric motor or dynamo-electric machine, the combination, with the pole-pieces and the armature which are constructed to have their positions changed with respect to each other, of a dummy-armature or magnetic substitute for the armature, substantially as described.

2. In an electric motor or dynamo-electric machine, the combination, with an armature constructed to be moved out of the field, of a supplementary magnetic core similar to that of the armature and mechanically connected to it, which takes the place of the armature as the latter moves out of the field, whereby the opposition of the armature to displacement is balanced to a greater or less extent and the magnetism of the field is shunted, substantially as described.

3. In an electric motor or dynamo-electric machine, the combination, with an armature constructed to be moved out of the field, of a magnetic plate placed with respect to the field in the position of maximum longitudinal attraction, whereby the opposition of the armature to its movement out of the field is sustained or balanced, substantially as described.

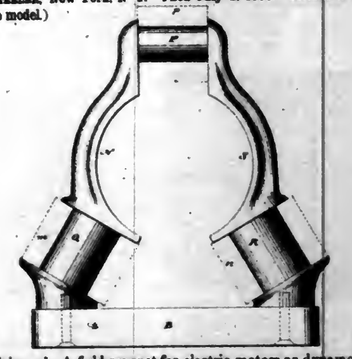
4. In an electric motor or dynamo-electric machine, the combination of a field-magnet and armature which are constructed to have their positions changed with respect to each other, and means whereby the attraction between said field-magnet and armature is magnetically balanced in the direction of movement, substantially as described.

5. In an electric motor or dynamo-electric machine, an armature constructed to move longitudinally into or out of the magnetic field, in combination with means whereby the attraction between the field-magnet and the armature is magnetically balanced in the direction of movement, substantially as described.

6. In an electric motor or dynamo-electric machine, the combination, with the armature, of a dummy-armature or supplementary magnetic core mechanically connected to and rotating with the armature-shaft, substantially as described.

7. In an electric motor or dynamo-electric machine, an armature-core wound or provided with electric conductors, in combination with an unwound magnetic core or dummy-armature, which parts are rigidly connected and rotate together, substantially as described.

8. In an electric motor or dynamo-electric machine, the combination, with the armature, of a dummy-armature or supplementary core and a governor or regulator mechanically connected to said parts, the armature and its dummy being secured to and rotating with the armature-shaft, substantially as described.



9. In an electric motor or dynamo-electric machine, an armature and field-magnet which are constructed to have their positions changed with respect to each other, in combination with a dummy-armature or supplementary core, and a mechanical regulator which effects said change of position, substantially as described.

10. In an electric motor or dynamo-electric machine, an armature constructed to move into or out of the magnetic field, in combination with and mounted upon the same shaft, with a supplementary core or dummy-armature and a centrifugal governor which effects or controls said movement, substantially as described.

11. In an electric motor or dynamo-electric machine, the combination, with the armature, of a supplementary or dummy core of greater magnetic strength or capacity than the armature itself, substantially as described.

12. In an electric motor or dynamo-electric machine, automatic regulating mechanism consisting of an armature constructed to move longitudinally into or out of the magnetic field, in combination with and mechanically connected to a supplementary or dummy core of greater magnetic strength or capacity than the armature itself, whereby said dummy is attracted into and the armature forced out of the magnetic field with an increase of energizing-current, and vice versa, substantially as described.

403,018. FIELD-MAGNET FOR DYNAMOS. SCHUYLER S. WHEELER, New York, N. Y. Filed July 3, 1888. Serial No. 278,914. (No model.)

Claim.—1. A field-magnet for electric motors or dynamos, made in the general form of a triangle, with a core at the vertex capable of being freely wound through the armature-space and cores near the base at the two sides and placed at an angle to each other, so as to be freely wound without interference, substantially as shown and described.

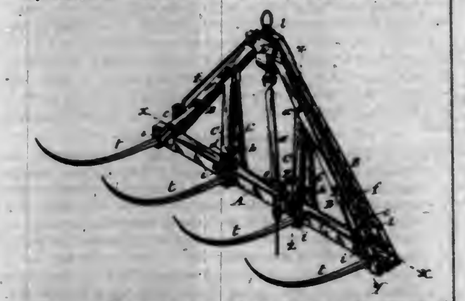
2. A field-magnet for dynamo-electric machines or electric motors made in the general form of the letter A, with a core at the top joining the pole-pieces and forming one magnetic circuit, and a core at each side below, which, with the base or yoke, forms another magnetic circuit, substantially as described.

3. In a field-magnet for a dynamo-electric machine or motor, a core-piece of horseshoe type made of a single piece of magnetic material, with three field-coils, two of which are located near the ends of the core-piece, while the third is located at an intermediate point, the winding of said coils being such that effective field-poles of opposite polarity are created at points between the opposite ends of the intermediate coil and the adjacent ends of the other two coils, substantially as described.

4. In a field-magnet for a dynamo-electric machine or motor, a core of a single piece of magnetic material and three field-coils located, respectively, near the opposite ends and center of said core, the contour or shape of the core being such that a plane passing substantially at a right angle through any one of said coils will intersect the core once and only once, substantially as described.

5. In a field-magnet for a dynamo-electric machine or motor, a core of a single piece of magnetic material of curvilinear or angular shape, and two field-coils, one at or near each end of the core, the angular relation of said coils being such that a plane passing through either of them at substantially a right angle to the core and parallel to the winding of said coil will cut the core once and only once, substantially as described.

6. A dynamo-electric machine having a field-core of a single piece of magnetic material and three or more field-coils, in combination with a magnetic base or support to which the ends of the field-core are secured, substantially as described

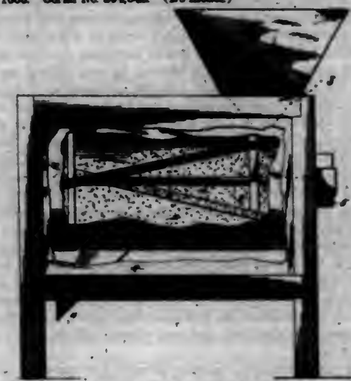


7. In a dynamo-electric machine or motor, a field-core of a single piece of magnetic material, in combination with three or more field-coils and a magnetic base or support, both ends of said field-core being fixed or secured rigidly to said base, the coils being so disposed that they create a consequent field and prevent a magnetic short circuit through the support or base, substantially as described.

8. In a field-magnet for a dynamo-electric machine or motor, a core of a single piece of magnetic material, that portion between the two effective poles of said core constituting a magnetic brace, in combination with a magnetic brace or support, substantially as described.

9. In a field-magnet for a dynamo-electric machine or motor of bipolar form, a core-piece made of a single piece of magnetic material with two or more field-coils, the contour or shape of the core being such that a plane which passes at substantially a right angle through either one of said coils and the core will cut said core once and only once, substantially as described.

10. In a field-magnet for a dynamo-electric machine or motor, a core of a single piece of magnetic material of curvilinear or angular shape, and two field-coils located on said core, the angular relation of said coils being such that any plane passing through either of them at substantially a right angle to the core will cut said core once and only once, substantially as described.

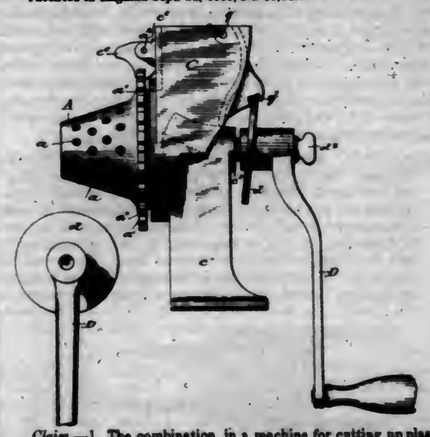


403,019. HORSE HAY-FORK. HARRY WIARD and JAMES L. JUDD, Syracuse, N. Y. Filed Nov. 28, 1888. Serial No. 292,098. (No model.)

Claim.—1. The combination of the head-beam A, the two sets of braces B B, embracing between their lower ends the end portions of said beam and united at their upper ends, the double struts C C, embracing between their lower ends the aforesaid head-beam and having their upper ends inserted between the braces B B of the respective sets, bolts *g g*, passing through the said braces and intervening portions of the struts, blocks *b b*, interposed between the lower portions of the struts, bolts *d d*, passing through the struts and blocks, the straps *i i*, hung on said bolts, and the tines having their heels passing through the straps and through the braces and struts and intervening beam, substantially as described and shown.

2. The combination of the head-beam A, the two sets of braces B B, embracing between their lower ends the end portions of the head-beam and united at their upper ends, the brackets *e e*, mounted on the end portions of the head-beam between the aforesaid braces and fastened to said beam and formed with the sleeve *l*, the bolt *d*, passing through the braces and intervening sleeve *l*, and the bail *f*, hinged to the brackets *e e*, substantially as described and shown.

403,020. GRAIN-SCOURER. HENRY WILHELM, Oneida Mills, assignor of one-half to Benton Smith, near Minerva, Ohio. Filed Dec. 19, 1888. Serial No. 294,042. (No model.)



Claim.—As a new article of manufacture, a beater and scouring-case for grain-scourers, composed of a composition of baked fire-clay and sand, substantially as described.

403,021. PEN. JASPER L. ACKERMAN, Lowell, Ind. Filed Sept. 10, 1888. Serial No. 285,060. (No model.)

Claim.—A pen re-enforced integrally or made thicker centrally for a suitable width at a point inward from the inner end of its slit and thence outward along the meeting edges of said slit for a suitable distance, substantially as and for the purpose specified.

403,022. MACHINE FOR CUTTING MEAT. HERMANN ALBRECHT, Philadelphia, Pa. Filed July 20, 1888. Serial No. 280,508. (No model.) Patented in England Sept. 22, 1888, No. 13,740.

Claim.—1. The combination, in a machine for cutting up plastic or yielding substances, of the following instrumentalities, namely: first, a conical shell having within its larger end spiral cutting-ribs and beyond said ribs perforations through its walls; second, a rotary cutter-head formed as a continuous spiral knife, the cutting-edge of which conforms to the interior of the shell and forms an acute angle with the ribs within said shell, and, third, a hopper at or near the larger end of the shell, substantially as and for the purposes set forth.

2. The combination, in a machine for cutting up plastic or yielding substances, of the following instrumentalities, namely: first, a conical shell having within its larger end spiral cutting-ribs and be-

yond said ribs perforations through its walls; second, a rotary cutter-head formed as a continuous spiral knife, the cutting-edge of which conforms to the interior of the shell and forms an acute angle with the ribs within said shell; third, a hopper at or near the larger end of the shell, and, fourth, a movable feed-plate within said hopper, substantially as and for the purposes set forth.

3. The combination, in a machine for cutting up plastic or yielding substances, of the following instrumentalities, namely: first, a conical shell having within its larger end spiral cutting-ribs and beyond said ribs perforations through its walls; second, a rotary cutter-head formed as a continuous spiral knife, the cutting-edge of which conforms to the interior of the shell and forms an acute angle with the ribs within said shell; third, a journal projecting from the larger end of said cutter-head; fourth, a bearing for said journal beyond the larger end of the conical shell, and, fifth, a hopper at or near the larger end of said shell, substantially as and for the purposes set forth.

4. The combination, in a machine for cutting up plastic or yielding substances, of the following instrumentalities, namely: first, a conical shell having within its larger end spiral cutting-ribs and beyond said ribs perforations through its walls; second, a rotary cutter-head formed as a continuous spiral knife, the cutting-edge of which conforms to the interior of the shell and forms an acute angle with the ribs within said shell; third, a journal projecting from the larger end of said cutter-head; fourth, a bearing for said journal beyond the larger end of the conical shell; fifth, a hopper at or near the larger end of said shell; sixth, a vibratory feed-plate applied to said hopper; seventh, a cam upon the journal of the cutter-head which occasions the vibratory movement of the feed-plate, and, eighth, means for rotating the journal, cutter-head, and cam, substantially as and for the purposes set forth.

5. The combination, in a machine for cutting up plastic or yielding substances, of the following instrumentalities, namely: first, a conical shell having within its larger end spiral cutting-ribs and beyond said ribs perforations through its walls; second, a rotary cutter-head formed as a continuous spiral knife, the cutting-edge of which conforms to the interior of the shell and forms an acute angle with the ribs within said shell, and which is provided with a radial cutting-heel, and, third, a hopper at or near the larger end of the shell, the discharge-opening of which is into said shell across a cutting-edge with which the cutting-heel of the cutter-head co-operates and forms a shears, substantially as and for the purposes set forth.

6. The combination, in a machine for cutting up plastic or yielding substances, of the following instrumentalities, namely: first, a conical shell having within its larger end spiral cutting-ribs and beyond said ribs perforations through its walls; second, a rotary cutter-head formed as a continuous spiral knife, the cutting-edge of which conforms to the interior of the shell and forms an acute angle with the ribs within said shell, and which is provided with a radial cutting-heel; third, a hopper at or near the larger end of the shell, the discharge-opening of which is into said shell across a cutting-edge with which the cutting-heel of the cutter-head co-operates and forms a shears; fourth, a vibratory feed-plate applied to said hopper; fifth, a cam upon the journal of the cutter-head, and suitable means, essentially, for instance, such as set forth, for occasioning the vibratory movement of the feed-plate, and, sixth, means for rotating the cutter-head, substantially as and for the purposes set forth.

408,028. MANUFACTURE OF GLASS BOTTLES, &c. HOWARD M. ASHLEY, Ferrybridge, County of York, England. Original application filed Sept. 26, 1887, Serial No. 250,767. Divided and this application filed Nov. 10, 1888. Serial No. 290,508. (No specimens.) Patented in England Mar. 7, 1887, No. 3,434; in Austria-Hungary Sept. 19, 1887; in Belgium Sept. 23, 1887; in France Sept. 24, 1887; in Canada Jan. 3, 1888, No. 28,396; in Italy Feb. 17, 1888; in Norway Mar. 2, 1888; in Victoria Apr. 18, 1888; in New South Wales Apr. 30, 1888; in Tasmania Apr. 21, 1888; in Spain July 13, 1888, and in Portugal Aug. 3, 1888.

Claim.—1. In the manufacture of hollow glassware, the within-described process of making a hollow parison, which consists of measuring the molten glass and casting a solid parison in inverted position with a head that is finished as to external shape, forming a recess or cavity therein by punching upwardly into the parison while it is inverted, and thus carrying the chilled glass which is cut from within the head into the hotter portion of the mass, for the purposes set forth.

2. In the manufacture of hollow glassware, the within-described process of making a hollow parison, which consists of casting the parison in inverted position, punching upwardly thereinto, and then retracting the punch while simultaneously admitting a gaseous fluid into the cavity to prevent the collapsing of the parison, substantially as hereinbefore specified.

3. In the manufacture of hollow glassware, the within-described process, which consists of casting a parison in inverted position, forming the cavity therein by punching upwardly into the parison while it is inverted, and subsequently expanding the parison by gaseous pressure, substantially as hereinbefore specified.

4. In the manufacture of hollow glassware, the within-described process, which consists of casting a parison in inverted position, forming the cavity therein by punching upwardly into the parison while it is inverted, reverting the parison, and subsequently expanding it by gaseous pressure, substantially as hereinbefore specified.

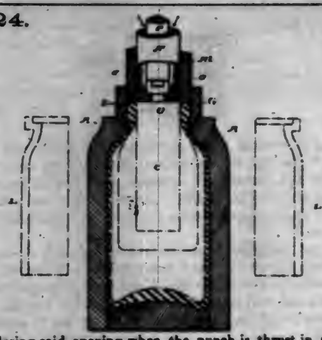
5. In the manufacture of hollow glassware, the within-described process, which consists of casting a parison in inverted position, forming the cavity therein by punching upwardly into the parison while it is inverted, reverting the parison, and subsequently substituting a shaping-mold for the parison-mold and expanding the parison within the shaping-mold by gaseous pressure, substantially as hereinbefore specified.

6. In the manufacture of hollow glassware, the within-described process, which consists of casting a parison in inverted position, forming the cavity therein by punching upwardly into the parison while the latter is inverted, withdrawing the punch from within the parison, and subsequently expanding the parison by introducing a gaseous fluid into the cavity, substantially as hereinbefore specified.

7. In the manufacture of hollow glassware, the within-described process, which consists of casting a parison in inverted position with a head that is finished as to external shape, forming an initial recess or cavity therein by punching upwardly into the parison while it is inverted, then reverting the same and suspending the body portion by the head, and expanding the depending body portion within a shaping-mold by the direct pressure of a gaseous fluid, as air, substantially as hereinbefore specified.

8. In the manufacture of hollow glassware, the within-described process, which consists of casting a parison in inverted position with a head that is finished as to external shape, forming an initial recess or cavity therein while it is inverted, then reverting the parison and suspending the body portion by the head, and expanding the depending body portion by pressure of a gaseous fluid, as air, substantially as hereinbefore specified.

9. The within-described process of manufacturing hollow glassware, which consists of measuring the glass and casting a solid parison in inverted position with a head that is finished as to external shape, including the face of the lip, completing the mouth, and forming an initial recess or cavity in the body portion by punching upwardly into the parison while it is inverted, reverting the parison, and expanding the body portion thereof by pressure of a gaseous fluid, as air, substantially as hereinbefore specified.



10. The within-described process of manufacturing hollow glassware, which consists of measuring the glass and simultaneously casting a solid parison in inverted position with a head that is finished as to external shape, including the face of the lip, completing the mouth, and forming an initial recess or cavity in the body portion by punching upwardly into the parison while it is inverted, immediately retracting the punch, reverting the parison, and suspending it by its head for elongation, regulating its elongation, and slightly chilling its extremity by paddling, and finally confining the depending portion of the parison within a suitable shaping-mold and blowing it by the internal pressure of a suitable gaseous fluid, as air, substantially as hereinbefore specified.

408,024. MACHINERY FOR MAKING GLASS BOTTLES, &c. HOWARD M. ASHLEY, Ferrybridge, County of York, England. Original application filed Sept. 26, 1887, Serial No. 250,767. Divided and this application filed Nov. 10, 1888. Serial No. 290,507. (No model.) Patented in England Mar. 7, 1887, No. 3,434; in Austria-Hungary Sept. 19, 1887; in Belgium Sept. 23, 1887; in France Sept. 24, 1887; in Canada Jan. 3, 1888, No. 28,396; in Italy Feb. 17, 1888; in Norway Mar. 2, 1888; in Victoria Apr. 18, 1888; in New South Wales Apr. 30, 1888; in Tasmania Apr. 21, 1888; in Spain July 13, 1888, and in Portugal Aug. 3, 1888.

Claim.—1. In machinery for making bottles and other like articles of hollow glassware, the combination, with a suitable mold which receives the molten glass, of a hollow punch adapted to be thrust endwise into the glass and immediately withdrawn therefrom to provide the glass with an initial cavity, and having an opening to admit a gaseous fluid, as air, into such cavity while the punch is being retracted, substantially as hereinbefore specified.

2. In machinery for making bottles and other like articles of hollow glassware, the combination, with a suitable mold, of a hollow punch adapted to be thrust endwise into the mold and withdrawn therefrom and having an outlet-opening, and suitable means, as a plug, for closing said opening when the punch is thrust in, substantially as hereinbefore specified.

408,024.

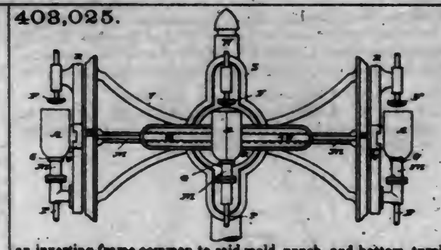
3. In machinery for making bottles and other like articles of hollow glassware, the combination, with a suitable mold, of a hollow punch adapted to be thrust endwise into the mold and withdrawn therefrom and having an outlet-opening in its face, and a plug within said punch fitted to said opening for closing it and having a stem which projects rearwardly through the punch as means for operating both, said plug and punch being connected by a suitable lost-motion device, as a lateral pin and longitudinal slot, substantially as hereinbefore specified.

4. In machinery for making bottles and other like articles of hollow glassware, the combination, substantially as hereinbefore specified, of an invertible mold which receives the molten glass in its inverted position, and a punch at the neck end of the mold adapted to be thrust upward into the inverted mold to provide the molten glass with an initial cavity.

5. In machinery for making bottles and other like articles of hollow glassware, the combination of an invertible mold comprising a body-mold and a distinct head-mold or collar at the neck end of said body-mold, and a punch movable upwardly through said collar into the body-mold, substantially as hereinbefore specified.

6. In machinery for making bottles and other like articles of hollow glassware, the combination of an invertible mold comprising a body-mold and a head-mold or collar at the neck end of said body-mold, a nozzle within said collar, and a punch of substantially the required mouth-diameter, adapted to be thrust upward into the body-mold and withdrawn therefrom, substantially as hereinbefore specified.

7. In machinery for making bottles and other like articles of hollow glassware, the combination of an invertible mold comprising a longitudinally-divided body-mold and a divided head-mold or collar fitted to the neck end of said body-mold, a nozzle within said collar, and a punch fitted to said nozzle and adapted to be thrust upward into the body-mold and withdrawn therefrom, substantially as hereinbefore specified.



8. In machinery for making bottles and other like articles of hollow glassware, the combination, with an invertible mold comprising a longitudinally-divided body-mold and a divided head-mold or collar fitted to the neck end of said body-mold, of a hollow punch adapted to be thrust upward through said collar into said body-mold and having an outlet-opening at its face end, and a conduit supplied with a gaseous fluid, as air, under pressure, in communication with the interior of said punch, substantially as hereinbefore specified.

9. In machinery for making bottles and other like articles of hollow glassware, the combination, with a suitable head-mold or collar for molding the head of the bottle on a cast parison in inverted position, of a nozzle fitted thereto and having at its top in its inverted position an annular surface which shapes the outer face of the lip, substantially as hereinbefore specified.

408,025. MACHINERY FOR MAKING GLASS BOTTLES, &c. HOWARD M. ASHLEY, Ferrybridge, County of York, England. Original application filed Sept. 26, 1887, Serial No. 250,767. Divided and this application filed Nov. 10, 1888. Serial No. 290,508. (No model.) Patented in England Nov. 13, 1886, No. 14,737, and Mar. 7, 1887, No. 3,434; in Austria-Hungary Sept. 19, 1887; in Belgium Sept. 23, 1887; in France Sept. 24, 1887; in Canada Jan. 3, 1888, No. 28,396; in Italy Feb. 17, 1888; in Norway Mar. 2, 1888; in Victoria Apr. 18, 1888; in New South Wales Apr. 30, 1888; in Tasmania Apr. 21, 1888; in Spain July 13, 1888, and in Portugal Aug. 3, 1888.

Claim.—1. In machinery for the manufacture of bottles and other like articles of hollow glassware, the combination of a suitable mold, a suitable punch adapted to be thrust endwise into the neck end of the mold, a movable bottom fitted to the other end of the mold, and

408,025.

an inverting-frame common to said mold, punch, and bottom, turning on a horizontal axis, substantially as hereinbefore specified.

2. In machinery for the manufacture of bottles and other like articles of hollow glassware, the combination, with a suitable mold comprising a longitudinally-divided body-mold, of an inverting-frame provided with lateral ways, and lateral slides working in said ways and carrying the parts of said body-mold, substantially as hereinbefore specified.

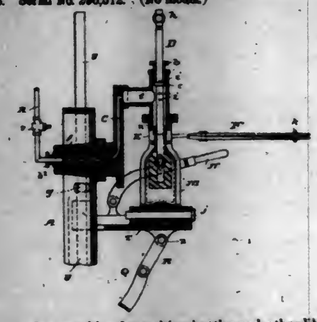
3. In machinery for the manufacture of bottles and other like articles of hollow glassware, the combination, with a suitable mold comprising a suitable body-mold and a divided head-mold or collar fitted to the neck end of said body-mold, of an inverting-frame provided with lateral ways, and lateral slides working in said ways and carrying the parts of said divided collar, substantially as hereinbefore specified.

4. In machinery for the manufacture of bottles and other like articles of hollow glassware, the combination, with a suitable mold and a hollow punch adapted to be thrust endwise into the neck end of the mold and having an outlet-opening in its face, of an inverting-frame common to both turning on a horizontal axis, and a conduit for a gaseous fluid, as air, entering said frame at said axis, and communicating with the interior of said punch, substantially as hereinbefore specified.

5. In machinery for the manufacture of bottles and other like articles of hollow glassware, an inverting-frame provided with a suitable mold, which receives the molten glass in its inverted position and is reverted preparatory to the blowing operation, an open-ended hollow punch at the neck end of the mold, adapted to be thrust upward into the inverted mold to provide the molten glass with an initial cavity and then withdrawn, a movable bottom fitted to the other end of the mold, and a conduit for a gaseous fluid, as air, under pressure, communicating with the interior of said punch, for the purposes set forth.

6. An invertible glass-mold for bottles or the like, comprising a suitable body-mold, a vertically-divided head-mold or collar fitted to the neck end of the said body-mold, a nozzle within said collar, and a suitable bottom at the other end of the body-mold, in combination with a hollow punch adapted to be thrust upward through said nozzle into said body-mold and having an outlet-opening in its face, and a conduit supplied with a gaseous fluid, as air, under pressure, in communication with the interior of said punch, substantially as hereinbefore specified.

7. In combination with a vertical hollow support supplied with a gaseous fluid, as air, under pressure, and a revolving frame mounted thereon and having conduits connecting therewith, a number of invertible bottle-molding machines, each comprising a suitable body-mold, a vertically-divided neck mold or collar, a nozzle within said collar, a suitable bottom, and a hollow punch, the latter being in communication with one of said conduits and adapted to be thrust upward through said nozzle into said body-mold and having an outlet-opening in its face, substantially as hereinbefore specified, whereby machines are adapted to be used in succession, first, for making hollow parisons, and, secondly, for making bottles therefrom in the same molds by a mechanical blowing operation, for the object stated.



408,026. MANUFACTURE OF BOTTLES, &c. HOWARD M. ASHLEY, Ferrybridge, County of York, England. Original application filed Sept. 26, 1887, Serial No. 250,767. Divided and this application filed Nov. 10, 1888. Serial No. 290,511. (No specimens.) Patented in England May 25, 1887, No. 7,560; in Austria-Hungary Sept. 19, 1887; in Belgium Sept. 23, 1887; in France Sept. 24, 1887; in Canada Jan. 3, 1888, No. 28,396; in Italy Feb. 17, 1888; in Norway Mar. 2, 1888; in Victoria Apr. 18, 1888; in New South Wales Apr. 30, 1888; in Tasmania Apr. 21, 1888; in Spain July 13, 1888, and in Portugal Aug. 3, 1888.

Claim.—1. In the manufacture of internally-stoppered bottles, the within-described process of forcing the cool glass stopper into and through the mouth of the finished bottle while the glass of the latter is in the transition state between plastic and elastic.

2. In the manufacture of internally-stoppered bottles, the within-described process of punching the mouth of slightly less diameter

than the stopper and forcing the cool glass stopper into the body of the bottle through the mouth while the glass of the bottle is in the transition state between plastic and elastic, whereby the annular recess for the rubber ring is provided with an overhanging edge, as aforesaid.

408,027. MACHINERY FOR MAKING GLASS BOTTLES, &c. HOWARD M. ASHLEY, Ferrybridge, County of York, England. Filed Nov. 10, 1888. Serial No. 290,512. (No model.)

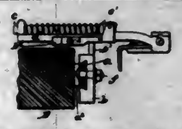
Claim.—1. In a machine for making bottles and other like hollow glassware, the combination, substantially as hereinbefore specified, of a suitable support, an invertible part connected therewith by a horizontal pivot and terminating at one end in a nozzle having an external circumferential groove or the like, a suitably-divided head-mold or collar fitted to said nozzle and having an external circumferential groove or the like at its opposite end, and interchangeable parison and shaping molds fitted internally to the latter at their neck ends, whereby a proper alignment of the parts is insured and the parison-mold is adapted to be held in place and suspended by the attached neck-mold during and after the reversion of the parison.

2. In a machine for making bottles and other like hollow glassware, the combination, with a nozzle and interchangeable parison and shaping-molds, of a diametrically-divided head mold or collar provided with tongs having jaws attached to the respective halves of the collar, substantially as hereinbefore specified.

3. In a machine for making bottles and other like hollow glassware, the combination, with a head-mold or collar, of a diametrically-divided parison-mold fitted at its neck end to embrace said collar and provided with tongs having jaws attached to the respective halves of said mold, substantially as hereinbefore specified.

4. In a machine for making bottles and other like hollow glassware, the combination, with a suitable nozzle, a head-mold or collar, and a parison-mold, of an axial punch sliding through said nozzle and provided with a fixed stop to limit its retraction and an adjustable stop to regulate its insertion into the inverted parison, substantially as hereinbefore specified.

5. In a machine for making bottles and other like hollow glassware, the combination, substantially as hereinbefore specified, of a suitable support, an elevated invertible part connected therewith by a horizontal pivot, a nozzle and a head-mold or collar depending from said part in its reverted position, a divided parison-mold depending from said collar and having laterally-moving parts, and a vertically-moving shaping-mold that is normally beneath the plane of the depending parison-mold.

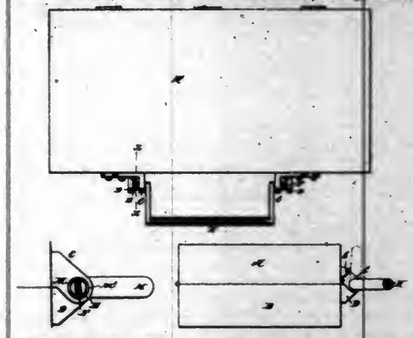


6. In a machine for making bottles and other like hollow glassware, the combination, substantially as hereinbefore specified, of a suitable support, an elevated invertible part connected therewith by a horizontal pivot, a nozzle and a head-mold or collar depending from said part in its reverted position, a divided parison-mold depending from said collar and having laterally-moving parts, a vertically-moving shaping-mold that is normally beneath the plane of the depending parison-mold, and a treadle and suitable mechanical connections for elevating the shaping-mold to inclose the suspended parison.

7. In a machine for making bottles and other like hollow glassware, the combination of a hollow punch, a suitable nozzle through which it works, a hollow T-piece to which said nozzle is attached, suitable hollow connections, a pipe supplied with a gaseous fluid, as air under pressure, and provided with a suitable valve, a hand-lever working said valve, a spring holding said lever normally in an elevated position, and a pair of adjustable stops for regulating the limits of the motion of the lever, substantially as hereinbefore specified.

408,028. LOOM-TEMPLE. JOSEPH BARNES, Fall River, assignor to the Dutcher Temple Company, Hopedale, Mass. Filed June 21, 1888. Serial No. 277,741. (No model.)

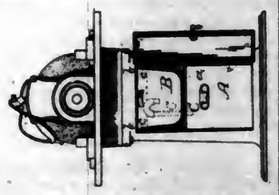
Claim.—1. The combination, with the temple-stand having the series of notches or projections and the holding portion b^2, in which



408,028.

the stand is fitted, of means for clamping the said stand in adjusted position in the said holding portion and a locking device to engage one of the said notches or projections, according to the position of the stand in the holding portion, and prevent the said stand from accidentally slipping forward when the stand is unclamped, substantially as described.

2. The longitudinally-slotted bar dovetailed in cross-section, the horizontally-adjustable slide b, fitted on the said bar, the cross-slide b', dovetailed to slide on the slide b and having a projection, b^3, combined with the temple-stand and with the bolt to hold the cross-slide in the slide b' and the latter in place on the bar B, substantially as described.

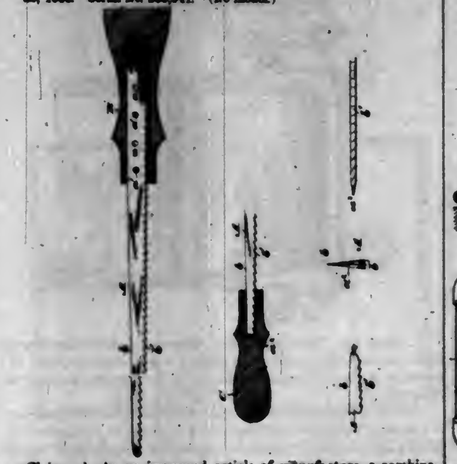


408,029. CATCH FOR BOXES, &c. JOHN A. BARRETT, Brooklyn, N. Y., assignor to the John A. Barrett Company, of Baltimore City, of Maryland. Filed Feb. 8, 1888. Serial No. 263,362. (No model.)

Claim.—1. The combination, with a portable box, bag, or other receptacle formed in two parts adapted to be closed together and having a carrying-handle permanently pivoted to one of said parts, of a locking device composed of a sleeve or collar cut away, as described, and a lug adapted to enter said collar secured, respectively, to the two parts of the receptacle, one of the parts of said locking device being in operative connection with the carrying-handle and so arranged that when the handle is swung into carrying position the lug and collar are locked against separation, substantially as described.

2. The combination, with the sleeve or collar cut away and the lug or pin, either adapted to rotate or turn and secured, respectively, to the two parts of the box or other receptacle requiring to be secured together, of a spring, G, of any suitable form, placed in the path of the rotating element, so as to prevent the same from being turned to unlocking position, as and for the purpose set forth.

408,030. WATER-TANK OF GRINDING-MACHINES. CHARLES A. BAUER, Springfield, Ohio. Filed Jan. 29, 1887. Serial No. 225,836. (No model.)



Claim.—1. The combination, with a grinding-machine, grinding-stone, and means for supplying water thereto, of tank B, into which the impure water from the grinding devices drains, and pipe C, having its upper end bent, as described, so as to drain the water from said tank between the surface and bottom of the water therein, substantially as set forth.

2. The combination, with a grinding-machine, grinding-stone, and means for supplying water thereto, of tank B, into which the impure water from the grinding-stone is drained, pipe C, having its upper end bent, as described, so that its mouth is below the plane of the bore in its bend, so as to drain the water in said tank from below its surface and above its bottom, of a reservoir, A, into which the water from

pipe C drips and from which the water is taken to moisten the grinding-stone, as set forth.

408,031. COMBINATION-TOOL. EUGENE K. BECKWITH, Niantic, assignor of one-half to Franklin B. Wright, Meriden, Conn. Filed Aug. 23, 1888. Serial No. 283,541. (No model.)

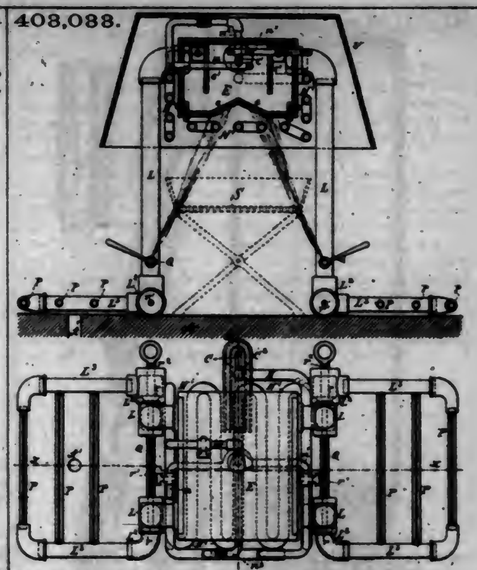
Claim.—1. As an improved article of manufacture, a combination-tool which consists of a blade which is tapered longitudinally, said blade being also tapered in cross-section to provide a thick portion on one edge in which saw-teeth are formed or cut, and opposite thereto a cutting-edge, one end of the blade forming a boring-point, a handle permanently attached to the large end of the blade, and a removable handle having a socket in which the pointed end of the blade can be placed, substantially as shown, whereby the implement can be used either as a compass-saw, boring-tool, drawing-knife, or saw with handle at each end.

2. A key-hole saw-blade having the cutting-edges of the teeth at the point arranged diagonally with relation to the sides of the blade, the angle of the cutting-edges of the teeth decreasing gradually toward the rear end of the blade, where the cutting-edges of the teeth are at right angles with said sides, substantially as described.

3. A key-hole saw-blade having a boring-point at its outer end and the cutting-edges of the teeth arranged at progressively-decreasing angles to the sides of the blade from front to rear, substantially as described.

408,032. PLOW. MARCUS M. BOWERS, Baltimore, Md., assignor to the Roland Plow Works, same place. Filed Dec. 22, 1888. Serial No. 294,955. (No model.)

Claim.—1. A plow-standard setting away from the landside and rising centrally with respect to a cross-section of the share and having a slotted and recessed cap, a foot, A, integral with the standard, said foot having a recessed vertical side, a, provided with a handle-projecting leg, c, and also having a wing side, e, provided with a handle-leg, d.



2. The combination, with the plow-standard A, of the mold D, landside B, and a share, C, provided at its upper landside edge with an upwardly-projecting lug, k, which takes under the mold and between it and the landside, as and for the purpose set forth.

408,033. APPARATUS FOR BURNING PETROLEUM. JOSEPH W. DUDD and GEORGE D. CARROLL, New York, N. Y.; said Dudd assignor to Edward Thistle, West Hoboken, N. J. Filed Nov. 16, 1885. Serial No. 182,690. (No model.)

Claim.—1. The tubular frames L^2 and the slotted or perforated pipes P, passing across from one tubular frame to the other and capable of being partially rotated, in combination with the tubular legs L, generator E, superheating steam pipe and coil, and the pipe for supplying liquid hydrocarbon, substantially as set forth.

2. The tubular legs L, tubular sockets L^2, valve-seats, and valves, in combination with the tubular frames L^2, slotted or perforated tubes

408,033.

P P and Q, generator E, petroleum-supply pipes C, and pipe for supplying superheated steam into such generator, substantially as specified.

3. The generator E, formed as a hollow box with partitions d and a double inclined bottom, c, in combination with the pipes for supplying liquid hydrocarbon and superheated steam into such generator and commingling the same within the generator, pipes for conveying away the inflammable gases, and perforated pipes below the generator, from which the gases issue and are burned beneath the generator and the superheating-pipes, substantially as specified.

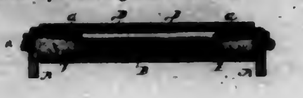
4. The generator E, having within it the partitions d, in combination with the tubular legs L, for supporting the generator, the perforated pipes Q, for the issuing gas that is burned to heat the generator, and the superheating steam-pipes N', passing across below the generator, substantially as specified.

5. The generator E, having a double inclined bottom, in combination with the oil-supply pipes and the pipe for superheated steam, both discharging downwardly, so that the combination of the steam and hydrocarbon vapors is promoted by contact with the heated interior of the generator, substantially as specified.

408,034. GRADING AND DITCHING MACHINE. MORTON G. BUSHELL, Chicago, Ill., assignor to Frederick C. Austin, same place. Filed Jan. 24, 1889. Serial No. 297,448. (No model.)

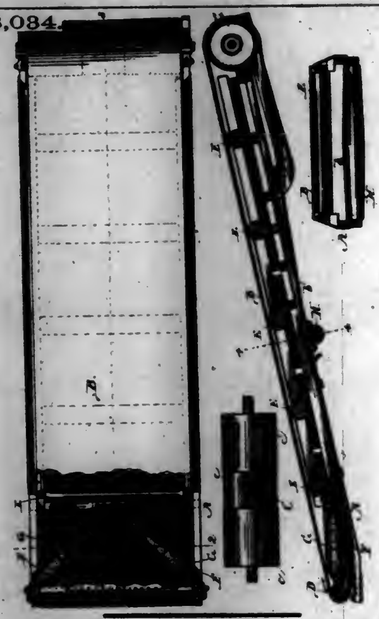
Claim.—1. The combination, substantially as hereinbefore set forth, with the conveyer-belt, of one or more brushes for sweeping off the soil.

2. The combination, substantially as hereinbefore set forth, with the conveyer-belt, of one or more rotary brushes arranged for sweeping the soil from the belt, and means for revolving said brush or brushes simultaneously with the travel of the conveyer-belt.



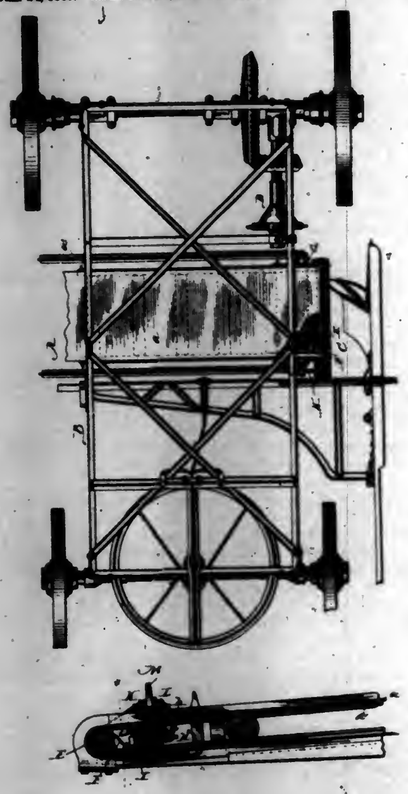
3. The combination, substantially as hereinbefore set forth, with the conveyer-belt, of one or more rotary brushes, F, set obliquely to the direction of travel of the conveyer-belt and arranged between the leaves of the same.

4. The combination, with the conveyer-belt and a rotary brush for sweeping soil therefrom, of a cleaner or wiper for said brush, substantially as and for the purpose set forth.

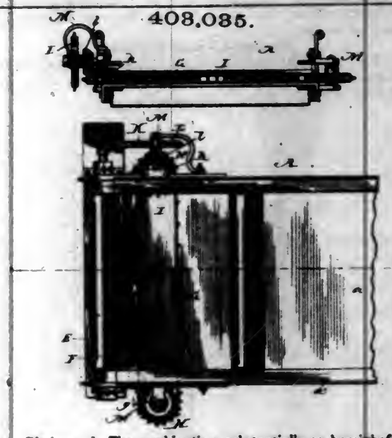


5. The combination, with the conveyer-belt, of a roll supporting the lower leaf of the conveyer-belt and made tapering from its middle toward its ends, substantially as and for the purpose described.

6. The combination, with the conveyer-belt and the roll H, of the driving-roll C, having its end portions of greater diameter than its middle portion, for the purpose described.



7. The combination, with the conveyer-belt and the roll H, of the driving-roll C, having its end portions made of greater diameter than its middle portion by a covering, such as set forth.



408,084.

408,085. GRADING AND DITCHING MACHINE. MORTON G. BUSNELL, Chicago, Ill., assignor to Frederick C. Austin, same place. Filed Jan. 24, 1889. Serial No. 297,447. (No model.)

408,085.

Claim.—1. The combination, substantially as hereinbefore set forth, with the elevator-belt in a grading and ditching machine, of a conveyer to carry off soil that has entered between the leaves of the elevator-belt.

2. The combination, substantially as hereinbefore set forth, with the elevator-belt and a roll about which it passes, of a scraper for removing soil from said roll, and a conveyer for carrying off the soil thus removed by the scraper.

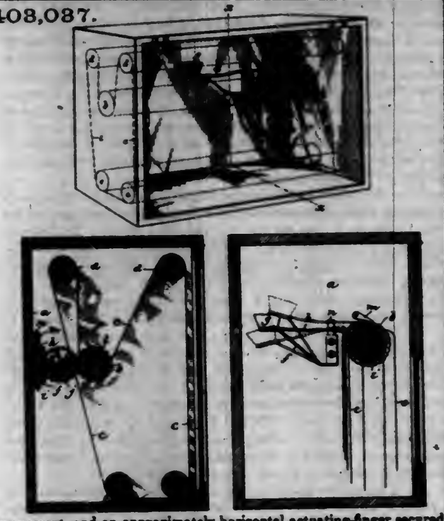
3. The combination, substantially as hereinbefore set forth, with the elevator-belt, of a conveyer, G, consisting of an endless chain or belt provided with conveying teeth or fingers, for the purpose described.

4. The combination, substantially as hereinbefore set forth, with the elevator-belt and roll E, of the conveyer and gearing—such as set forth—for driving said conveyer from said roll.

5. The combination, substantially as hereinbefore set forth, with the elevator-belt and roll E, of the scraper F, conveyer G, and a plate forming in conjunction with the scraper a trough along which the said conveyer travels.

408,086. HOLDBACK FOR VEHICLES. MORRIS E. BURR, Lowville, New York, assignor of two-fifths to Frank C. Bowdish, same place. Filed Jan. 30, 1889. Serial No. 298,072. (No model.)

Claim.—1. In a holdback, the combination, with the plate *a*, chambered, as shown, and formed with the curved hook C, of the spring within the portion *a*, and the tongue pivoted to the walls of the chamber, with its inner end bearing on the spring, and the portions of said tongue upon both sides of its pivot extending in the same general line, substantially as shown and described.



2. The holdback described, consisting of the plate *a*, chambered, as shown, and formed with the curved hook C, forming more than one-half of a circle, with the portion of the base of the hook upon the side nearest the center curved and forming a continuation of the curve of the hook upon the inside, as shown, and the end of the hook terminating in a flat bearing, the spring F, and the tongue pivoted to said plate, with its heel bearing on said spring and its end extending in line with the free end of the hook, and the heel portion extending in line with the outer portion of the tongue, substantially as shown and described.

408,087. ADVERTISING DEVICE. JAMES CASTLE, Toronto, Ontario, Canada. Filed Oct. 10, 1888. Serial No. 287,746. (No model.)

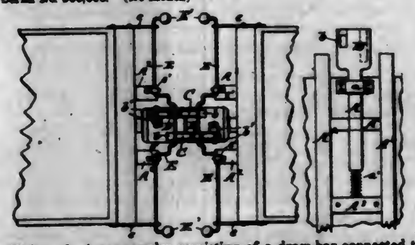
Claim.—1. The combination, with a movable exhibit, of an approximately horizontal spring-bar rigidly secured at one end and having its free vibratory end weighted and connected with and adapted to move the exhibit by a finger secured to the free end of the bar, substantially as described.

2. An inclosing-case, in combination with a movable exhibit in the same, and a spring-bar weighted at one end and rigidly secured in the case at the opposite end to allow the weighted end a vibratory

408,087.

movement, and an approximately horizontal actuating-finger secured to the weighted end of the bar and operating the exhibit, substantially as described.

3. The combination of an inclosing-case, an interior movable exhibit, a spring-bar rigidly secured at one end and having its opposite free vibratory end weighted, an actuating-finger rigidly secured to and moving with the vibratory end of the bar and having its opposite free end adapted to rotate a ratchet-wheel to move the exhibit, and a guide for the finger, substantially as described.

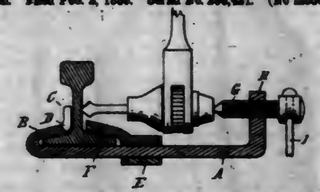


4. In combination, an inclosing-case having a roller therein to actuate a movable exhibit, a ratchet-wheel to rotate the roller, a spring-bar rigidly secured at one end near the wheel and having its vibratory end weighted, a finger secured to the vibratory end and having its free end adapted to engage and rotate the wheel, and a guide to allow the free end of the finger a limited movement and hold it in position to engage the teeth of the wheel, substantially as described.

408,088. SNAP-HOOK. MICHAEL COUDS, Lake, assignor of one-half to Lewis G. Blossom, Chicago, Ill. Filed May 17, 1888. Serial No. 274,129. (No model.)

Claim.—A snap-hook having its shank vertically recessed to receive the base of the latch, and longitudinally recessed to receive a coiled spring, said recess being screw-threaded, a coiled spring therein, seated at one end against a follower screwed into the longitudinal recess and at the other against the base of the latch, the latter being cam-faced, whereby the tension of the spring is increased as the latch closes, substantially as described.

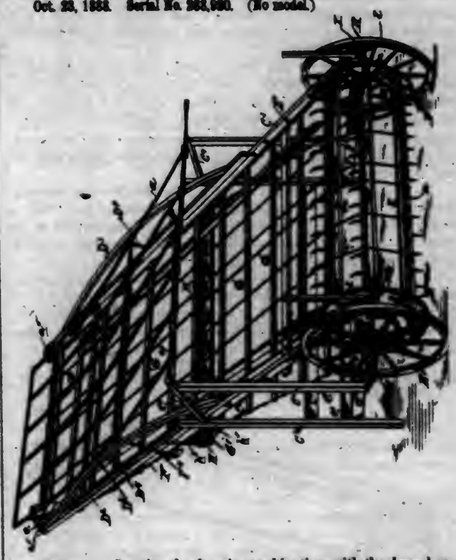
408,089. CAR-COUPLING. ENGELBERT DIETRICH, Cincinnati, Ohio, assignor of one-half to Joseph Fois, same place. Filed Feb. 15, 1888. Serial No. 300,006. (No model.)



Claim.—1. A car-coupler consisting of a draw-bar connected to the bottom end portion of a car, substantially as set forth, and having a slotted opening in the head thereof, in combination with a coupling-jaw pivoted to the top portion of said head and a bent rod passing through a slotted lug on the jaw, said rod having a weighted ball at each end, and suitable mechanism for connecting said rod to the car.

2. In combination with a draw bar and head suitably connected to the car bottom and frame, said head having a slotted opening, *b*, the jaw C, pivoted to the top of said head and having a slotted lug, D, bent rod E, passing through said slotted lug and having the weighted balls E' at each end thereof, bars *c*, and brackets *d*, for securing said rod to the car, substantially as set forth.

3. In a car-coupler, the draw-bar A, having an opening, *b*, therein and connected to the car by means of the bracket *a* and bar A', passing through a slot in said draw-bar, the bar A' being rigidly connected to the side frames, A², and a suitable spring, *a'*, interposed between the rear end of the draw-bar and cross-piece A², in combination with the jaw C, pivotally connected to the draw-head B, and rod E passing through the slotted lug D on the jaw, said rod having the weighted balls E' on each end thereof, and suitable connecting mechanism for securing the rod to the car.



408,040. RAIL-DRILL. JOHN DOYLE and JOHN WILLIAMSON, Ionia, Mich. Filed Feb. 2, 1889. Serial No. 298,621. (No model.)

Claim.—1. In a rail-drill, a rail-clamp consisting of the stationary jaw provided with the laterally-extending shank and with the upwardly-notched lip fitting against the web of the rail, the movable jaw slidingly secured on the lateral shank, and the feed-screw on the end of the shank, the parts being constructed to operate in connection with a ratchet-drill, substantially as described.

2. In a rail-drill, a rail-clamp consisting of the stationary jaw B, provided with the laterally-extending shank A and with the upwardly-extending notched lip C, parallel with and fitting against the web of the rail, the movable jaw E, slidingly embracing the shank A and provided with the tongue F and the feed-screw G, carried in the upturned end of the shank, substantially as described.

408,041. HAY-LOADER. JAMES W. FOOTE, Sterling, Ill. Filed Oct. 23, 1888. Serial No. 288,990. (No model.)

Claim.—1. In a hay-loader, the combination, with the drum having heads provided with circumferential grooves in their outer peripheries, of the drive-wheels, and the forks attached to the frame of the machine on each side in rear of the drum, with the points of the forks one in said groove and the other in close proximity to the inner side of the rim of the drive-wheel, substantially as and for the purpose specified.

2. The combination, with the frame and the endless elevator-belt, of an adjustable roller on the under side of said frame and over which said belt passes, and a shield, H, over the top of said roller, substantially as and for the purpose specified.

403,042. OIL-CAN. CHARLES A. FRAYER, Kutztown, Ill. Filed Aug. 22, 1888. Serial No. 283,490. (No model.)

Claim.—1. In an oil-can or like vessel, an internal flexible pipe valved at its lower end where it touches the bottom, combined with the nozzle and with a pumping mechanism above the nozzle and between it and the discharge-tube, said pumping mechanism being adapted for operation by the hand grasping the can-handle.

2. In the can A, the internal flexible tube, B, having the valve C at its lower end seated in the annulus D and moving on stem *c'*, and provided with spring *c*, and combined with the nozzle G and with the pumping mechanism above it.

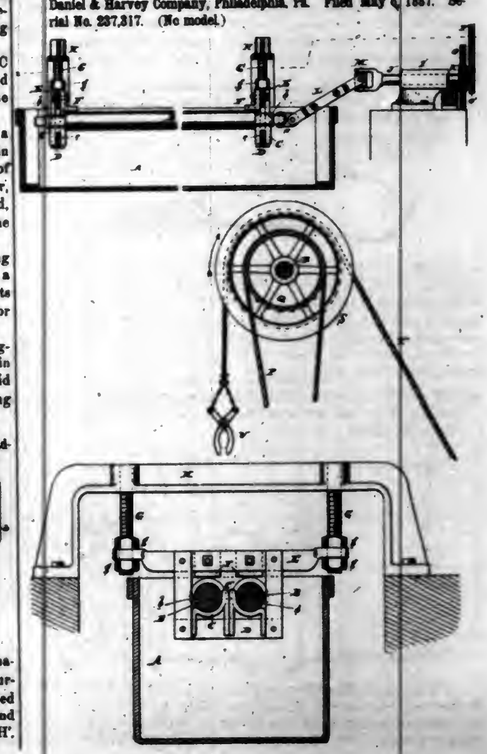
3. In an oil-can or like vessel having above the oil-chamber a tube intermediate between the nozzle and the outlet proper, and in connection therewith the vacuum-producing mechanism, consisting of the plunger I and its rod and the spring L, attached to the plunger, combined with the pipe B, having the spring-closing valve C at its end, and the valves G and N, respectively situated below and above the said mechanism, substantially as described.

4. In an oil-can or similar vessel, the combination of a pumping mechanism exterior to and above the oil-chamber proper, with a flexible pipe connecting with the oil-chamber, spring-valved at its lower end, and a pumping-chamber between the nozzle and outlet or spout, whereby all backflow of the oil is prevented.

5. In an oil-can or like vessel, the internal pipe, B, having spring-valve and annulus D at its lower end, the spring-valves G and N in the portion above the oil-chamber, the pump-chamber F between said valves, the side tube, H, the piston I, actuated as described, the spring L in said chamber, and the outlet O, all substantially as described.

403,043. TEMPORARY BINDER. CHARLES A. GILDERMEYER, Haddonfield, N. J. Filed Feb. 1, 1889. Serial No. 298,335. (No model.)

Claim.—1. A temporary binder having a rigid back, in combination with a plate, E, secured to the edge of the back, a screw, I, journaled at one end, *i*, in said plate, and having its other end, *i'*, shaped to engage with a key, a guide-rod, F, secured to plate E at one end and extending therefrom parallel to screw I, a jaw, H, and a jaw, H', having a threaded perforation, *h*, adapted to fit on and engage with screw I, and a perforation, *h'*, adapted to fit and slide on guide-rod F.

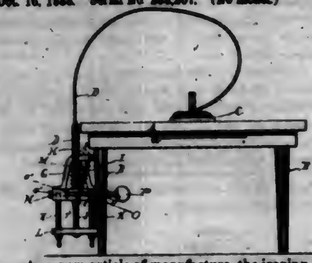


2. A temporary binder having a rigid back, in combination with a plate, E, secured to the edge of the back, a screw, I, journaled at one end, *i*, in said plate, and having its other end, *i'*, shaped to engage with a key, a guide-rod, F, secured to plate E at one end and extending therefrom parallel to screw I, a plate, G, secured on the edges of the back opposite to the plate E to serve as a support for the end of rod F, a jaw, H, and a jaw, H', having a threaded perforation, *h*, adapted to fit on and engage with screw I, and a perforation, *h'*, adapted to fit and slide on guide-rod F.

3. A temporary binder having a rigid back, A, with one or more transverse slots, A', in combination with a plate, E, secured to the edge of the back over the end of a slot, A', a screw, I, journaled at one end, *i*, in said plate, and having its other end, *i'*, shaped to engage with a key, a guide-rod, F, secured to plate E at one end and extending therefrom parallel to screw I, a jaw, H, and a jaw, H', having a threaded perforation, *h*, adapted to fit on and engage with screw I, and a perforation, *h'*, adapted to fit and slide on guide-rod F.

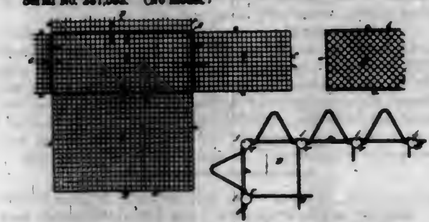
4. A temporary binder having a rigid back, in combination with a wire hinge-rod secured on the edge of the back, a sheet-metal hinge-plate, C, a side cover, D, secured to said hinge-plate, a plate, E, secured to the edge of the back, a screw, I, journaled at one end, *i*, in said plate, and having its other end, *i'*, shaped to engage with a key, a guide-rod, F, secured to plate E at one end and extending therefrom parallel to screw I, a jaw, H, and a jaw, H', having a threaded perforation, *h*, adapted to fit on and engage with screw I, and a perforation, *h'*, adapted to fit and slide on guide-rod F.

5. A temporary binder having a rigid back, in combination with a wire rod secured to the back by being inserted through holes passing through the same and bent to form hinge-rods B B' on each edge of the back, sheet-metal hinge-plates C C, embracing the rods D' D', side covers, D D, secured to said hinge-plates, a plate, E, secured to the edge of the back, a screw, I, journaled at one end, *i*, in said plate, and having its other end, *i'*, shaped to engage with a key, a guide-rod, F, secured to plate E at one end and extending therefrom parallel to screw I, a jaw, H, and a jaw, H', having a threaded perforation, *h*, adapted to fit on and engage with screw I, and a perforation, *h'*, adapted to fit and slide on guide-rod F.



403,044. APPARATUS FOR COATING OR GALVANIZING SHEET METAL. EDMUND A. HARVEY, Wilmington, Del., assignor to the McDaniel & Harvey Company, Philadelphia, Pa. Filed May 6, 1887. Serial No. 237,317. (No model.)

Claim.—1. In combination with a bath for coating sheet metal, rollers suspended in adjustable frames and driven from gears situated outside of the bath by means of connections L, secured to said rollers and to the gear-shafts by universal joints M N, said shafts and rollers being so arranged with respect to their supporting-bearings as to be longitudinally movable therein, so that the roller-frame can be adjusted without altering the length of the connections L.



2. In combination with a bath for coating sheet metal, substantially as shown and described, skimming-rollers B B, situated in the said bath with their axes substantially in the same horizontal plane, a grooved pulley, S, situated above the bath, and gearing connecting said rollers and pulley, whereby they are caused to move with the same peripheral velocity, all substantially as and for the purpose specified.

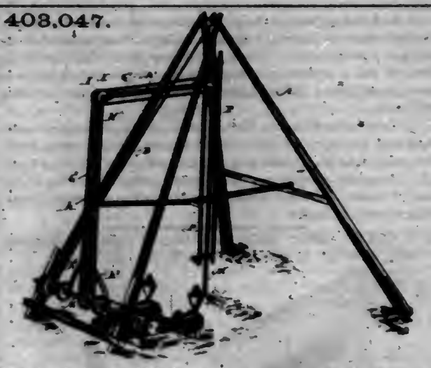
403,045. IRONING DEVICE. CALDWELL HAYES, Ottaloosa, Kans. Filed Oct. 16, 1888. Serial No. 288,207. (No model.)

Claim.—As a new article of manufacture, the ironing device consisting of a bed-plate, N, having terminal hooks O, for attachment, by set-screws P, to the legs of a table, a shaft, F, superposed over the plate N and secured thereto as shown, having terminal bell-cranks H, connected by springs I and hooked-pins J to the yoke L, suspended from plate N, the spring-lever D, pivotally held in the shaft F, having a collar, *d*, a nut, *d'*, and encircled by spring M, the hook *d'*, for attachment to the iron C, and the lever E, that serves to reciprocate the lever D.

403,046. BALE-COVERING. MARK A. HEATH, Providence, R. I., assignor to himself and John S. Lynch, same place. Filed Oct. 8, 1888. Serial No. 287,582. (No model.)

Claim.—1. A bale-covering composed of rectangular pieces of wire-netting which have a selvage-wire at their boundary edges and are connected to each other by means of hooks, which serve to form hinge-joints between the two adjoining rectangular pieces, whereby the same can be folded for transshipment, substantially as described.

2. A bale-covering composed of rectangular pieces of wire-netting having a selvage-wire at their boundary edges, and which are connected to each other by means of hooks which serve to form hinge-joints between the two adjoining rectangular pieces, and provided with a supplementary inner lining, substantially as and for the purpose specified.



3. The improved bale-covering, consisting of a wire-netting composed of wires which are each turned into loops at their intersecting points and are secured by means of rivets having heads which project above the wire fabric, substantially as described.

403,047. WELL-SINKING APPARATUS. JAMES W. HUNT, Paw Paw, assignor to Frederick C. Austin, Chicago, Ill. Filed Mar. 19, 1888. Serial No. 267,791. (No model.)

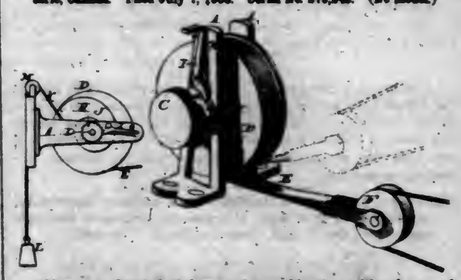
Claim.—1. The combination, substantially as hereinbefore set forth, in a well-sinking apparatus, of a suspended rotary stock for the purpose described, a raising and lowering device by which the rotary stock is suspended, and a flexible power-transmitting device for driving the rotary stock from some suitable source of power, the power-transmitting device being arranged to yield during the descent of the rotary stock and permit it to drop by gravity in a vertical path.

2. The combination, substantially as hereinbefore set forth, in a well-sinking apparatus, of a suspended rotary stock, a raising and

403,047.

lowering device by which the rotary stock is suspended, and a flexible power-transmitting device arranged for driving and permitting the descent by gravity of the rotary stock, and consisting of a jointed swinging pulley-support provided with connected endless belts and pulleys therefor, said jointed support being fulcrumed at its lower end to permit it to swing and yield to allow the rotary stock to descend in a vertical path.

3. In a well-sinking apparatus, the rotary stock provided with a gear, in combination with a vertically-movable head with which the rotary stock is connected by a rotary joint, and a gear carried by said head and engaging the gear upon the rotary stock, substantially as set forth.



4. In a well-sinking apparatus, the combination, with a flexible power-transmitting device, such as set forth, of the rotary stock, having a rotary connection with a suspended and vertically-movable head or bearing, and a gear-connection between the rotary stock and the said flexible power-transmitting device, substantially as described.

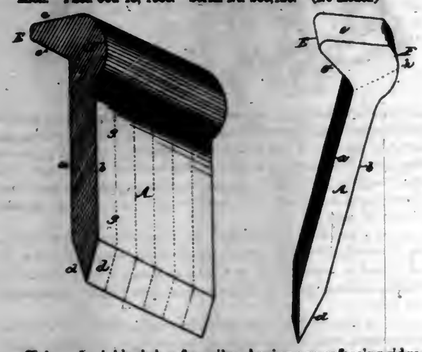
5. In a well-sinking apparatus, the combination, with a head or follower and a gear, E, carried thereby and having its spindle extended to provide a bearing, for the purpose set forth, of the rotary stock and a gear, F, arranged thereon and having a rotary connection with said head or follower, substantially as described.

6. In a well-sinking apparatus, the combination, with the head or follower C, pivotally attached to a vertically-movable slide, of the rotary stock having a rotary connection with said head or follower, substantially as set forth.

7. In a well-sinking apparatus, the combination, with the rotary tube-holding stock swiveled to a suspended head and a raising and lowering device by which the head is suspended, of the jointed support provided with sprockets and belting thereon and having a swivel-joint at a point along its length, for the purpose specified.

403,048. BELT-TIGHTENER. CHARLES W. JONES, London, Ontario, Canada. Filed July 7, 1888. Serial No. 279,249. (No model.)

Claim.—1. In a belt-tightener, the combination, with a drum and a spring, of a flexible band and an unsupported wheel or pulley secured to the free end of the band.



2. In combination with a suitable support, a shaft journaled therein, a drum mounted loosely upon the shaft, but connected therewith by means of a spring, a ratchet-wheel secured to the shaft, a pawl adapted to engage with the ratchet, and a band secured to the drum and provided at its free end with a wheel or pulley.

3. In a belt-tightener, the combination, with a suitable support, of a shaft mounted therein, a drum, a spring, a band secured at one end to the drum and provided at its opposite end with a wheel or pulley to receive the belt to be tightened, and a device for changing the tension of the spring.

4. In a belt-tightener, the combination, with a suitable support, of a shaft mounted therein, a drum, a spring, a band secured to the drum and provided with a wheel or pulley to receive the belt to be tightened, and a tension-equalizing device arranged, substantially as shown, to maintain a uniform tension during the coiling and uncoiling of the spring.

5. The combination of a shaft, a drum, a spring secured at opposite ends to the drum and shaft, a band secured to the drum and provided at its end with a wheel or pulley to receive the belt to be tightened, a device for winding or unwinding the spring to increase or decrease its tension, and a device, substantially such as shown, for maintaining a uniform tension.

408,049. SPIKE-BLANK BAR. JOHN T. JOHNS, Iron Mountain, Mich. Filed Oct. 15, 1888. Serial No. 288,126. (No model.)

Claim.—1. A blank bar for spikes, having a re-enforcing ridge at the back of the portion which forms the lip of the spike when the blank is severed into sections, such ridge extending laterally past a point opposite the point of juncture of the lip with the body of the spike, substantially as described.

2. A spike-blank having a ridge formed on one side at the edge of the blank and a second ridge upon the opposite side and at the same edge of the blank extending laterally past a point opposite the point of juncture of the first ridge with the body of the blank, the first ridge being adapted to form the head upon spikes cut from said blank and the second ridge a swell at the back of said lip extending below the angle formed at the juncture of the lip and the body of the spike, substantially as described.

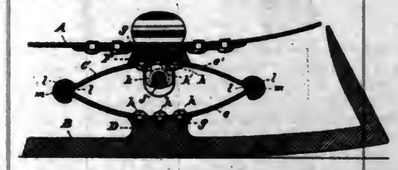
408,050. SADDLE. ARTHUR W. M. KERR, Melbourne, Victoria. Filed Jan. 14, 1889. Serial No. 296,356. (No model.)

Claim.—In a riding-saddle, the herein-described elastic metallic tree, consisting of the rim-piece *a*, having at its forward end the main upright neck-piece *a'*, and a supplemental similarly-shaped upright neck-piece, B, situated in rear of and substantially parallel with said main neck-piece and secured at its lower ends to the rim-piece, substantially as specified.

408,051. DRAFT-EQUALIZER. CHARLES KIRKER, Baltimore, Md., assignor of one-half to Henry W. Ironmonger and Louis C. Gude, same place. Filed Oct. 27, 1888. Serial No. 289,287. (No model.)

Claim.—1. The combination of the base-plate 8, provided with the slanting ribs 9, forming a dovetailed slideway, and further provided with the stud 12, projecting within the said slideway, the draw-bar 10, fitted to slide in the said way and made hollow and provided with a removable end or gate, 13, and further provided with means for attaching a doubletree, and a spring, 11, adapted to fit between the said stud 12 and gate 13, substantially as shown and described.

2. The combination of the draw-bar 10, provided with the hinge-ears 18 at one end and a bolt-hole at the other end, and the link 17, hinged between the said ears and having a bolt-hole to register with the said bolt-hole in the draw-bar, substantially as shown and described.



3. The combination of the base-plate 8, provided with the slideway described, the draw-bar 10, fitted to slide in the said way and having a removable end or gate, 13, the bolt 16 in the draw-bar, the yoke 19, freely pivoted on the said bolt, shoulders 21 on the draw-bar, adapted to engage each arm of the yoke, and chains 20, adapted to connect the ends of the yoke with the wagon-axle 7 near the wheels, substantially as shown and described.

4. The combination of the base-plate 8, provided with the slideway described, and with the stud 12, projecting therein, the hollow draw-bar 10, fitted to said slideway, and the gate 13, pivoted upon the end of the draw-bar to swing across the end of its hollow, substantially as shown and described, whereby a spring may be admitted and held within the draw-bar, as set forth.

5. The combination of the base-plate 8, provided with the slideway and the stud 12, projecting therein, as described, and the draw-bar 10, fitted to be reversed in the said slideway, substantially as shown and described.

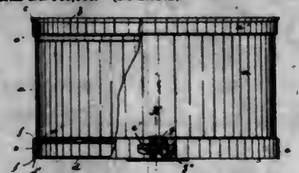
6. The combination of the base-plate 8, provided with the slideway and the stud 12, projecting therein, the draw-bar 10, reversibly fitted to the slideway and provided with a shoulder, 22, adapted to engage the base-plate, and a spring, 11, adapted to fit within the said draw-bar and proportioned to be guarded by the said shoulder against being overstrained, substantially as shown and described.

408,052. SKATE. JOSEPH KIRK, Troy, N. Y. Filed Feb. 15, 1888. Serial No. 299,933. (No model.)

Claim.—1. The skate having its runner provided upon the upper surface with upwardly-extending or elevated concave-faced bearings, and its body provided upon the under side with downwardly-projecting concave-faced bearings, in combination with the elliptic springs arranged in the plane of the runners, and means for fastening the springs in place, substantially as set forth.

2. The skate having its runner provided with elevated concave-faced bearings and its body provided upon the under side with downwardly-extending or pendent concave-faced bearings, in combination with the elliptic springs, and screw fastening said springs upon said bearings, the upper leaves of said springs having their outer ends curved, and embracing corresponding bearings at the ends of the lower leaves, which bearings of the lower leaves receive the connecting-bolts of the leaves of the hinges, substantially as set forth.

408,053. SHUT-OFF FOR HOSE-NOZZLES. WILLIAM T. KIRK, Cambridge, assignor of one-half to Charles E. Berry, Watertown, Mass. Filed Oct. 13, 1888. Serial No. 288,439. (No model.)

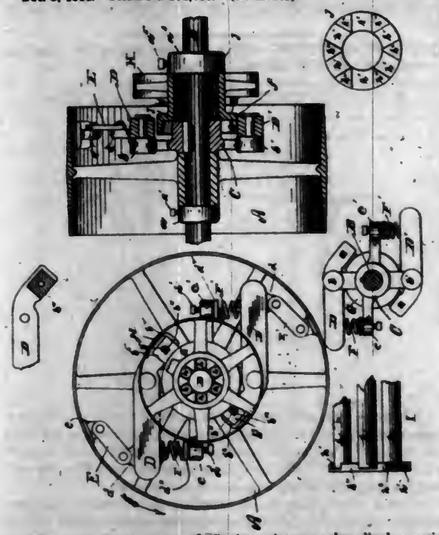


Claim.—1. The chambered plate or disk *b*, externally screw-threaded, and the nozzle *a*, eccentrically secured in said plate or disk, the end of the said nozzle projecting beyond the surface of said plate or disk, combined with the cap *c*, internally screw-threaded to be turned upon the plate or disk and having the hole *c'* of larger diameter than the internal diameter of the end of the nozzle, whereby the water has unimpeded exit, substantially as and for the purposes set forth.

2. The nozzle *a* and the eccentrically-secured chambered plate or disk *b*, externally screw-threaded and having the hole 3, combined with the internally-screw-threaded cap *c*, having the hole 3, substantially as described.

3. The nozzle *a* and the plate or disk *b*, provided with the peripheral groove or passage *d*, having an inclined bottom, combined with the cap *c*, having the pin *e*, entering said passage and bearing upon the inclined bottom thereof, substantially as described.

408,054. BUTTER-CAN. JOHN R. LEVARSEUR, Monticello, Iowa, assignor to Granville W. Simpson, Somerville, Mass. Filed Mar. 27, 1888. Serial No. 305,016. (No model.)



Claim.—The can-body having a permanently-attached cover, *b*, in its upper end and a detachable bottom, *d*, adapted to fit against and around its lower end, combined with a soldered metal binder-strip, *c*, having flap or tongue *c'*, and an angular key secured to said flap and having its lower portion adapted to lie against the under side of the can-bottom, substantially as and for the purpose set forth.

408,055. FRUIT-JAR CLAMP. WILLIAM W. LYMAN, Meriden, Conn. Filed Mar. 30, 1888. Serial No. 305,341. (No model.)

Claim.—A fruit-jar clamp having a yoke and a screw passing through said yoke, the end of the screw being recessed and provided with a plug of elastic material, said plug being partly contained within the body of the screw and partly projected beyond the end of said screw, substantially as and for the purpose described.

408,056. AUTOMATIC FEED-REGULATOR. CHARLES A. MILLER, Urbana, Ohio, assignor of one-half to Sherman Husted, same place. Filed Dec. 5, 1888. Serial No. 292,700. (No model.)

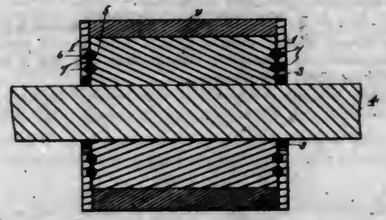
Claim.—1. In an automatic feed-regulator, as described, a main driving-wheel and a feed-wheel, both mounted loosely upon their supporting-shaft, a spider secured rigidly to said shaft between the said driving and feed wheels, and a friction-clutch between said spider and feed-wheel adapted to be released by the propelling force applied to the driving-wheel, substantially as specified.

2. In an automatic feed-regulator, a driving-wheel and a feed-wheel, each mounted loosely on the same supporting-shaft, a friction-wheel connected to said feed-wheel, brake-arms bearing against said friction-wheel, connected to said shaft so as to turn positively therewith, springs to force said arms against said friction-wheel, and connections from said arms to the driving-wheel, whereby the resistance to the driving-shaft operates with the propelling force to overcome the tension of the said springs and release the said friction-wheel, substantially as specified.

3. The combination, with a driving-wheel and a feed-wheel, each mounted loosely on the supporting-shaft, of the spider connected rigidly to said shaft and provided with pivoted brake-levers attached thereto, a friction-wheel connected to said feed-wheel, springs attached to force said levers against said friction-wheel, connecting-links from said levers to the driving-wheel, and means for regulating the tension of said springs, substantially as specified.

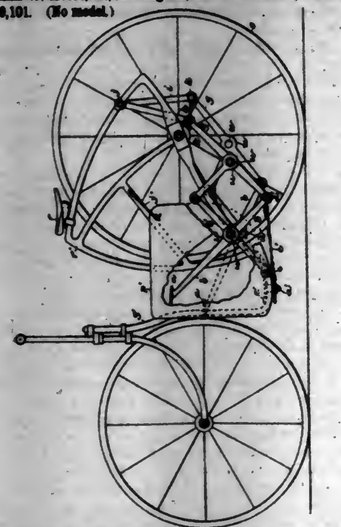
4. In an automatic feed-regulator, a driving-wheel and a feed-wheel mounted on the same supporting-shaft and adapted to turn loosely thereon, said feed-wheel being provided with a roller-bearing, as described, a friction-wheel connected to said feed-wheel, brake-arms engaging with said friction-wheel, springs for operating said brake-arms, connecting-links from said arms to said driving-wheels, and means for connecting said arms to the supporting-shaft, so they shall turn positively therewith, substantially as specified.

5. The combination, with a driving-wheel and a feed-wheel, each mounted loosely on the same supporting-shaft, of a friction-wheel connected to said feed-wheel, a spider connected rigidly to said shaft and provided with brake-levers supported thereon, adjustable brake-blocks in the said brake-levers, springs for operating the said brake-levers against the said friction-wheel, and connecting-links from the said brake-levers to the driving-wheel, substantially as specified.



6. The combination, with a driving-wheel and a feed-wheel mounted loosely on the same supporting-shaft, said feed-wheel being provided with a roller-bearing and a friction-wheel, as described, of a spider having brake-levers with removable brake-blocks adapted to bear against said friction-wheel, springs for operating said brake-levers against said friction-wheel, connecting-links from the said brake-levers to the driving-wheel, and means for adjusting the tension of the said springs, substantially as specified.

408,057. LUBRICATOR FOR LOOSE PULLEYS. WILLIAM P. MILLER, Brooklyn, N. Y., assignor to the William P. Miller Company, same place. Filed Sept. 20, 1888. Serial No. 285,949. (No model.)



Claim.—In a lubricator for loose pulleys, the combination, with a cup for containing the lubricant, having cylindrical sides and a substantially flat bottom integral therewith, and a piston fitted to slide in said cup having a hollow or tubular stem or rod through which the lubricant is forced, of a flat adjustable perforated feed-regulating plate pivotally attached to the piston for regulating the supply of lubricant through the piston and rod to the journal, and a securing device for said plate for securing it in any position into which it may be adjusted, substantially as specified.

408,058. ANTI-FRICTION JOURNAL-BOX. ROBERT W. MOFFETT, Denver, Colo., assignor to the Moffett Journal Box Company, of Colorado. Filed June 20, 1888. Serial No. 278,179. (No model.)

Claim.—In an anti-friction journal, the combination of a series of main rollers each having a circular groove in each of its ends, end plates or rings each having circular grooves on its inner face corresponding to the circular grooves in the ends of the main rollers, means for securing the end plates or rings in proper position, and a plural number of roller-bearings at each end of each main roller lying partly within the main-roller groove and partly within a groove in a head or end, substantially as set forth.

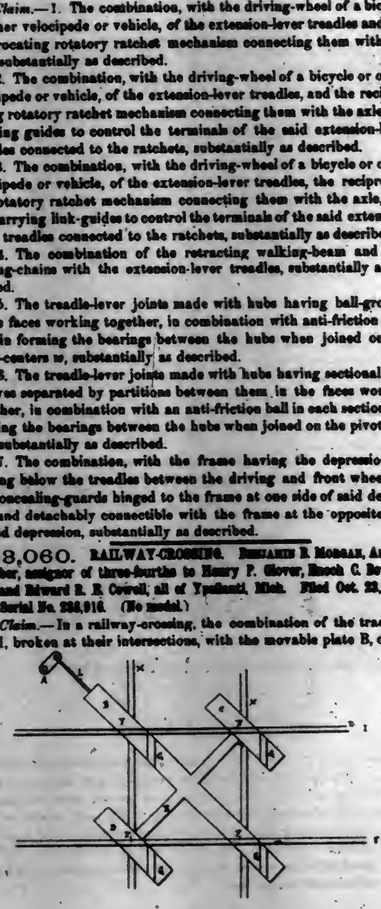
408,059. BICYCLE. THOMAS W. MOORE, Plainfield, N. J., assignor to Thomas W. Moore, Jr., Los Angeles, Cal. Filed Feb. 6, 1888. Serial No. 263,101. (No model.)

Claim.—1. The combination, with the driving-wheel of a bicycle or other velocipede or vehicle, of the extension-lever treadles and the reciprocating rotatory ratchet mechanism connecting them with the axle, substantially as described.

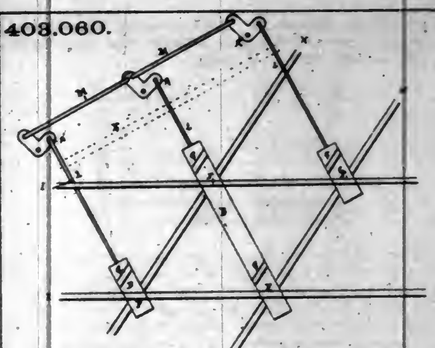
2. The combination, with the driving-wheel of a bicycle or other velocipede or vehicle, of the extension-lever treadles, and the reciprocating rotatory ratchet mechanism connecting them with the axle and carrying guides to control the terminals of the said extension-lever treadles connected to the ratchets, substantially as described.

3. The combination, with the driving-wheel of a bicycle or other velocipede or vehicle, of the extension-lever treadles, the reciprocating rotatory ratchet mechanism connecting them with the axle, and the carrying link-guides to control the terminals of the said extension-lever treadles connected to the ratchets, substantially as described.

4. The combination of the retracting walking-beam and connecting-chains with the extension-lever treadles, substantially as described.



5. The treadle-lever joints made with hubs having ball-grooves in the faces working together, in combination with anti-friction balls therein forming the bearings between the hubs when joined on the pivot-centers *m*, substantially as described.

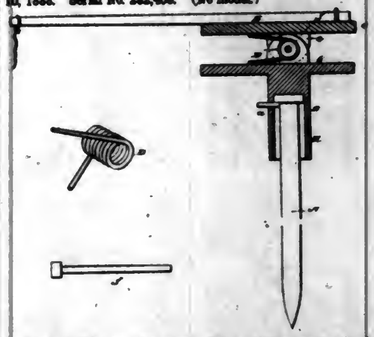


6. The treadle-lever joints made with hubs having sectional ball-grooves separated by partitions between them in the faces working together, in combination with an anti-friction ball in each section and forming the bearings between the hubs when joined on the pivot-centers, substantially as described.

7. The combination, with the frame having the depression extending below the treadles between the driving and front wheels, of the concealing-guards hinged to the frame at one side of said depression and detachably connectible with the frame at the opposite side of said depression, substantially as described.

408,060. RAILWAY-CROSSING. BENJAMIN B. MORGAN, Ann Arbor, assignor of three-fourths to Henry P. Glover, Enoch C. Bowling, and Edward B. B. Covell, all of Ypsilanti, Mich. Filed Oct. 22, 1888. Serial No. 288,916. (No model.)

Claim.—In a railway-crossing, the combination of the tracks H and I, broken at their intersections, with the movable plate B, carrying the four rail-sections F F and G G, and the movable plates C D, each carrying two rail-sections, F G, substantially as shown and described.



408,061. PROCESS OF MAKING IRON PRINTS BY PHOTOGRAPHY. CHARLES B. MCBLAIR and ALEXANDER A. RAFF, Washington, D. C. Filed Dec. 15, 1888. Serial No. 293,697. (No specimens.)

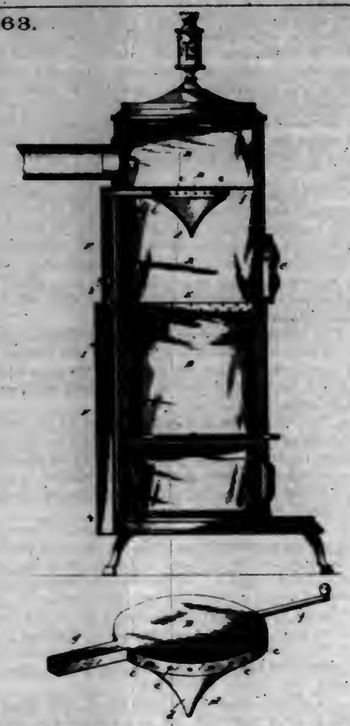
Claim.—1. The method of sensitizing paper for the production of prints and pictures in black lines by a solution of water, sesquichloride of iron, ammonia citrate of iron, nitric acid, tartaric acid, and gelatine, in or about the proportions hereinbefore set forth.

2. The method of sensitizing paper for the production of prints and pictures in permanent black lines directly from a positive by a solution of water, sesquichloride of iron, ammonia citrate of iron, nitric acid, tartaric acid, and gelatine.

3. The process of reproducing drawings, which reproduction will present the same appearance as that of the original, consisting in first sensitizing the paper upon which the reproduction is to be taken, with the following solution: water, sesquichloride of iron, ammonia citrate of iron, nitric acid, tartaric acid, and gelatine, or their chemical equivalents, mixed in substantially the proportions above specified; second, placing the sensitized paper in contact with the original and subjecting both to the action of solar or other strong light; third, developing such reproduction by the use of gallic acid or its equivalent.

408,062. TETHER. WILLIAM J. HERNE, Seneca, S. C. Filed Aug. 10, 1888. Serial No. 282,409. (No model.)

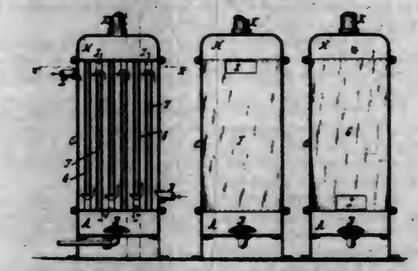
Claim.—1. The combination, with a stake or post, of a hitching-beam, a rotatable cap on the said stake, a hinge connecting the beam with the plate, a spring surrounding the hinge-pintle, so as normally to keep the free end of the hitch-beam elevated, and a cap-plate covering the hinge and spring, substantially as specified.



2. In a cattle-grazer, the combination, with a stake, of a plate adapted to rotate thereon, a plate hinged to this rotatable plate, a spring interposed between the two plates, and a hitch-beam secured to the upper plate, substantially as specified.

408,063. STOVE. CHARLES NEWBURGH, Washington, D. C., assignor to Kate E. Newburgh. Filed Dec. 12, 1888. Serial No. 293,244. (No model.)

Claim.—1. In a stove, the perforated air-heating chamber D, suspended in the combustion-chamber A, its lower or under side forming the imperforated deflector *d*, substantially as and for the purposes specified.



2. In a stove, the combination of the perforated air-heating chamber D, suspended in the combustion-chamber A, its lower or under side forming the imperforated deflector *d*, with the bar *f*, the hollow duct or flue *g*, and the pipe F, substantially as and for the purposes specified.

408,063.

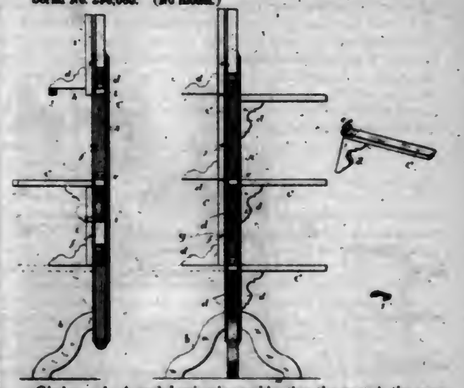
3. In a stove, the combination of the perforated air-heating chamber D, suspended in the combustion-chamber A, its lower or under side forming the imperforated deflector *d*, the bar *f*, the hollow duct or flue *g*, with the air-heating chamber E, located above or upon the upper edge of the fire-pot B, and concentrically therewith, and having the perforations *h*, the hollow duct or flue *i*, and the pipe F, substantially as and for the purposes specified.

408,064. AIR-HEATER. THOMAS HUSSEY, New York, N. Y. Filed Jan. 3, 1889. Serial No. 295,285. (No model.)

Claim.—An air-heater consisting of the air-heating chamber C, having at its base a burner or other source of heat separated from such chamber by a partition, an air-inlet, D, an air-outlet, E, an escape or chimney, K, and a series of vertical hollow partitions arranged in the heating-chamber and providing the alternating air-passages for compelling the air to be heated to traverse a zigzag circuit, said hollow partitions being open at both ends for conducting the products of combustion from the combustion-chamber to the chimney, substantially as described.

408,065. CLARIONET. ROMEO GIBE, Milan, Italy, assignor to Alexander A. Bessi, New York, N. Y. Filed May 17, 1888. Serial No. 274,126. (No model.) Patented in Italy Nov. 10, 1881, XXV, and in Belgium Belgium Nov. 10, 1882, No. 59,583.

408,065.



Claim.—1. In a wind-instrument composed of separate sections, the combination of one section having a two-way groove, *d g*, near its end, with another section having a pin, *h*, near its end adapted to enter the groove *d g* and to contact the closed ends of the groove, whereby the sections may be held extended or contracted in the same alignment, substantially as herein shown and described.

2. In a wind-instrument composed of separate sections, the sleeve *e*, adapted to be carried by one of the sections and having the two-way groove *d g*, combined with the adjoining section, having a pin, *h*, near its end adapted to enter the groove *d g* and to contact the closed ends of the groove, the ends of said groove portions *d g* being aligned, substantially as herein shown and described.

3. In a wind-instrument composed of separate but longitudinally-extensible sections, the key F, carried on one section, in combination with the lever *j*, having rounded outer side carried on another section, the lever *j* being arranged to pass under and operate the key F, substantially as described.

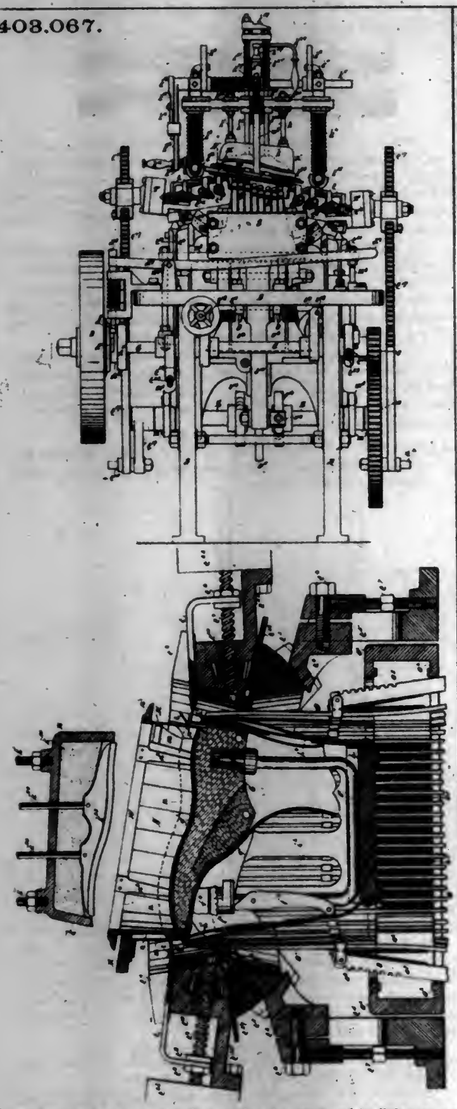
408,066. CLOTHES-HORSE. ELMER A. PARRISH, Baltimore, Md., assignor of one-half to James A. Brooks, same place. Filed Jan. 17, 1889. Serial No. 296,663. (No model.)

Claim.—1. A rack having in combination the post A, the arms C, each having attached a bracket-hook, *d*, the arm and bracket being connected at right angles to each other, and a hinge, *e*, connecting the arm and its hook to the post, as shown and described.

2. A rack having in combination the post A, the arms C, each having attached a bracket-hook, *d*, the arm and bracket being connected at right angles to each other and having an offset, *h*, at the back of the bracket-hook, a hinge, *e*, connecting the arm and hook to the post, and a foot, *i*, attached to the bracket-hook to straddle a turned-up arm next below.

408,067. LASTING-MACHINE. JOHN PATTEN, New York, N. Y. Filed Nov. 27, 1888. Serial No. 292,001. (No model.)

Claim.—1. The combination, with a last, of a rubbing-stretcher, substantially as described, for acting upon the outside of the upper, and lateral pressers, consisting of a plurality of independent fingers which are stationary relatively to the movement of the stretcher, for pressing said stretcher and the upper against the toe and side of the last, substantially as described.



2. The combination, with a last, of a rubbing-stretcher, substantially as described, for acting upon the outside of the upper, lateral pressers, which are stationary relatively to the movement of the stretcher, for pressing said stretcher and the upper into contact, and a shield interposed between said pressers and stretcher, substantially as described.

3. The combination, with a last, of rubbing-stretchers, substantially as described, for acting, respectively, upon the inside and outside of the upper, and lateral pressers for pressing said stretchers and the upper into contact, substantially as described.

4. The combination, with a last, of rubbing-stretchers, substantially as described, for acting, respectively, upon the inside and outside of the upper, lateral pressers for pressing said stretchers and the upper into contact, and a shield interposed between said pressers and the outer stretcher, substantially as described.

5. The combination, with a last, of inner, outer, and intermediate

408,067.

and the upper against the last, and a shield interposed between said fingers and the outer stretcher, substantially as described.

10. The combination, in a lasting-machine, of the last and means for supporting the last, a rubbing-stretcher, substantially as described, for acting upon the outside of the upper, lateral pressers, consisting of a plurality of independent fingers which are stationary relatively to the movement of the stretcher, for pressing said stretcher and the upper against the toe and sides of the last, and side and heel and toe crimpers for folding over the edge of the upper, substantially as described.

11. In a lasting-machine, a rubbing-stretcher consisting of flexible material suspended from a head-plate, with its lower edge hanging free and extending around the toe and along the sides of the last where the upper is to be stretched, substantially as described.

12. In a lasting-machine, an inner rubbing-stretcher consisting of elastic strips *n*, suspended from a head-plate and adapted to be inserted between the last and the portions of the upper which are to be stretched, substantially as described.

13. In a lasting-machine, an inner rubbing-stretcher consisting of elastic strips *n*, suspended from a head-plate and adapted to be inserted between the last and the portions of the upper which are to be stretched, and having the legs n^3, for regulating the extent of such insertion, substantially as described.

14. The combination, in a lasting-machine, of an inner rubbing-stretcher and an outer rubbing-stretcher, arranged one within the other and adapted to extend around the portions of the last where the upper is to be stretched, the inner stretcher being adapted to be inserted between the last and the upper, and the outer stretcher to extend outside the upper, substantially as described.

15. The combination, in a lasting-machine, of inner and outer rubbing-stretchers, arranged one within the other and adapted to receive the upper between them and to extend around the portions of the last where the upper is to be stretched, the inner stretcher being composed of elastic material and the outer stretcher of leather or similar flexible material, and lateral pressers for pressing the stretchers and the upper into contact, substantially as described.

16. The combination, in a lasting-machine, of the inner and outer rubbing-stretchers suspended from head-plates n' m', which overlap one another, substantially as described.

17. In a lasting-machine, the combination, with lateral pressers arranged to press toward the last, of a wedge-shaped head, o^9, for operating the pressers, substantially as described.

18. The combination, in a lasting-machine, of a rubbing-stretcher, lateral pressers, and an expansible shield interposed between said stretcher and pressers, substantially as described.

19. The combination, in a lasting-machine, of rubbing-stretchers, lateral pressers, and an expansible shield interposed between said pressers and the outer stretcher, substantially as described.

20. In a lasting-machine, the combination, with the independently-adjustable supports *o*, of the presser-fingers O, pivoted to said supports, and the springs o^7, for normally retracting said fingers, substantially as described.

21. In a lasting-machine, the combination, with the presser-fingers O, of the independently-adjustable supports *o* for said fingers, and the locking-frame provided with the clamping plates and blocks o^3 o^4 for said supports, substantially as described.

22. In a lasting-machine, the combination, with inner and outer rubbing-stretchers, of means, substantially as described, for moving the outer stretcher in advance of the inner stretcher, substantially as described.

23. In a lasting-machine, the combination, with the inner and outer rubbing-stretchers, one supported upon the other, of means, substantially as described, for imparting a vertical movement to the outer stretcher and through that to the inner stretcher, with lost motion between the two, substantially as described.

24. In a lasting-machine, the combination, with the inner and outer rubbing-stretchers, one supported upon the other, of the standards m^6, cross-heads m^8, and cams m^7, for imparting a vertical movement to the stretchers, substantially as described.

25. In a lasting-machine, the combination, with the inner and outer rubbing-stretchers and means for imparting a vertical movement to them, of the standard m^9 and the catch for engaging with said standard to retain the stretchers in their raised position, substantially as described.

26. In a lasting-machine, the combination, with the last, of the loose removable jack, substantially as described, for supporting the last in the machine, substantially as described.

27. The combination, with the last, the loose removable jack for supporting the last from beneath, and a downhold for the last, of inner and outer rubbing-stretchers for stretching the upper around the last, and lateral pressers for pressing said stretchers and the upper against the last, substantially as described.

28. The combination, with the last and an underneath support for the last, of a downhold for the last, inner and outer rubbing-stretchers for stretching the upper around the last, and lateral pressers for pressing said stretchers and the upper against the last, substantially as described.

rubbing-stretchers arranged to receive the upper and its lining or cap between them, respectively, and lateral pressers for pressing said stretchers and the upper, including its lining or cap, into contact, substantially as described.

6. The combination of a last and a rubbing-stretcher, substantially as described, for acting upon the outside of the upper, with lateral pressers, composed of adjustable fingers which are stationary relatively to the movement of the stretcher, for pressing the stretcher and the upper against the last, substantially as described.

7. The combination, with a last and a rubbing-stretcher, substantially as described, for acting upon the outside of the upper, of lateral pressers composed of adjustable fingers for pressing the stretcher and the upper against the last, and a shield interposed between said fingers and stretcher, substantially as described.

8. The combination, with a last, of rubbing-stretchers, substantially as described, arranged to receive the upper between them, and lateral pressers composed of adjustable fingers for pressing the stretchers and the upper against the last, substantially as described.

9. The combination, with a last, of rubbing-stretchers, substantially as described, arranged to receive the upper between them, lateral pressers composed of adjustable fingers for pressing the stretchers

29. In a lasting-machine, the combination, with the last and means for supporting it from beneath, of a telescopic downhold consisting of two members, one of said members being yielding with respect to the other, substantially as described.

30. In a lasting-machine, the combination, with the last, of a telescopic downhold composed of an inner and an outer member, and means, substantially as described, for moving one member away from the last in advance of the other, substantially as described.

31. In a lasting-machine, the combination, with the rubbing-stretchers having the standard m^9, of the catch k^{27} and the vertically-moving guide-rod k^3, carried by the downhold mechanism, substantially as described.

32. In a lasting-machine, the combination, with the telescopic downhold composed of inner and outer members, each having a vertical movement independent of the other, of means, substantially as described, for depressing said members simultaneously, substantially as described.

33. In a lasting-machine, the combination, with the telescopic downhold composed of inner and outer members, each having a vertical movement independent of the other, of means, substantially as described, for depressing said members simultaneously, and springs for raising said members independently, substantially as described.

34. In a lasting-machine, the combination, with the telescopic downhold composed of outer and inner members and springs for raising said members independently of each other, of the bar k^2, shaft k^3, and cams k^4, for depressing said members simultaneously, substantially as described.

35. In a lasting-machine, the combination, with the telescopic downhold composed of inner and outer members, of springs for raising said members independently of each other and an automatic tripper for releasing said outer member, substantially as described.

36. In a lasting machine, the combination, with the last and an underneath support for the last, of a telescopic downhold for the last, composed of an outer member which conforms approximately to the shape of the insole and bears upon its margin, and an inner member which bears upon the insole inside the outer member, and means for raising the outer member in advance of the inner member, substantially as described.

37. The combination, with means for supporting the last and for stretching the upper around the last, of side-crimpers carried upon oscillating arms s^{10}, and eccentrics s^{14}, for rocking said arms to move the crimpers to and from each other, substantially as described.

38. In a lasting-machine, the combination, with the last and means for stretching the upper around the last, of side-crimpers carried upon oscillating arms s^{10}, and the eccentrics s^{14}, forming the fulcra for said arms, substantially as described.

39. The combination, with the last and means for stretching the upper around the last, of side-crimpers carried upon oscillating arms s^{10}, the eccentrics s^{14}, forming the fulcra for said arms, and the driven eccentrics s^{20}, connected to said fulcra, to impart a rising-and-falling movement to said crimpers, substantially as described.

40. The combination, with the last and means for stretching the upper around the last, of side-crimpers carried upon oscillating arms s^{10}, the eccentrics s^{14}, forming the fulcra for said arms, the driven eccentrics s^{20}, connected to said fulcra, to impart a rising-and-falling movement to the crimpers, and the eccentrics s^{14}, for imparting an oscillating movement to the arms carrying the crimpers, substantially as described.

41. In a lasting-machine, the herein-described side-crimper, consisting of a head, s^5, the loose removable head-blocks s^3, fitting into a chamber in said head, the loose removable blocks s^6, and clamping-screw s^7, for locking said blocks s^3 in any position to which they are adjusted, and the crimping-fingers *s*, having shanks which enter openings in said head-blocks and are adjustable therein, substantially as described.

42. The combination, with the last and means for stretching the upper around the last, of heel and toe crimpers, each composed of a number of radially-arranged independently-moving crimping-fingers, and independent means, substantially as described, for imparting a rising-and-falling movement to said fingers independently of their movement toward and from the last, substantially as described.

43. In a lasting-machine, the combination, with the independently-moving radially-arranged crimping-fingers *t*, of the adjustable spheroidal head-blocks t^6, carrying said fingers and resting in concave bearings, whereby said fingers can be adjusted to different inclinations both vertically and laterally, substantially as described.

44. In a lasting-machine, the combination, with the radially-arranged crimping-fingers *t*, of the threaded rods t^9 t^{12}, connected to said fingers, and the engaging gears t^{10} t^{13}, for imparting simultaneous and independent movement to said fingers, substantially as described.

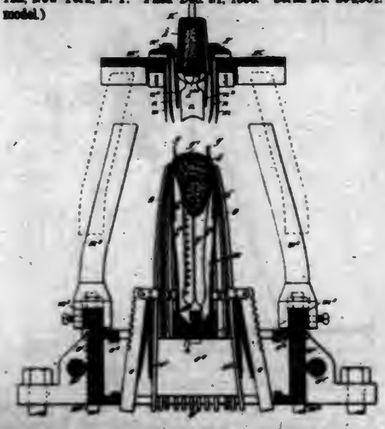
45. In a lasting-machine, the combination, with the radially-arranged crimping-fingers *t*, of the threaded rods t^9 t^{12}, connected to said fingers, the engaging gears t^{10} t^{13}, for imparting simultaneous and independent movement to said fingers, and the rack and pinion for imparting movement to one of said threaded rods, substantially as described.

46. In a lasting-machine, the combination, with the radially-arranged crimping-fingers *t*, of the threaded rods t^9 t^{12}, connected to said fingers, the engaging gears t^{10} t^{13}, for imparting simultaneous and independent movement to said fingers, the rack and pinion for imparting movement to one of said threaded rods, and the universal joint t^{14}, through which said movement is imparted, substantially as described.

47. In a lasting-machine, the combination, with the independently-moving radially-arranged crimping-fingers *t*, of the driven eccentric t^{20} and connections, substantially such as described, for imparting a rising-and-falling movement to said fingers, substantially as described.

48. In a lasting-machine, a heel or toe crimper consisting of a number of independently-moving screw-actuated radially-arranged crimping-fingers, *t*, which converge and overlap as they move toward and diverge as they move away from the last, substantially as described.

49. In a lasting-machine, the combination, with a stretching mechanism for stretching the upper around the last and crimpers for folding over its edge, of a driving-shaft and connections for operating said stretching mechanism and crimpers in proper sequence, a clutch for starting and stopping said shaft, a lever for operating the clutch, an automatic tripping mechanism, substantially as described, for tripping said clutch to stop the shaft after the stretching and after the folding operations, respectively, and an automatic tripping mechanism, substantially as described, for tripping the lever to disconnect it from the clutch after the clutching has been effected, substantially as described.



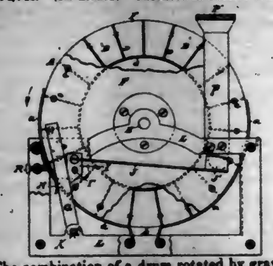
50. The combination, in a lasting-machine, of means for supporting the last, inner and outer rubbing-stretchers and co-operating lateral pressers for stretching the upper around the last, substantially as described, and side and heel and toe crimpers for folding over the edge of the upper, substantially as described.

51. The combination, in a lasting-machine, of an underneath support for the last, a telescopic downhold composed of inner and outer members, each having a vertical movement independent of the other, rubbing-stretchers and co-operating lateral pressers for stretching the upper around the last, substantially as described, and side and heel and toe crimpers, substantially as described.

52. The combination, in a lasting-machine, of the removable jack for supporting the last, the telescopic downhold consisting of two members each having a vertical movement independent of the other, rubbing-stretchers and co-operating lateral pressers for stretching the upper around the last, substantially as described, side-crimpers, and heel and toe crimpers composed of radially-arranged independently-moving crimping-fingers, substantially as described.

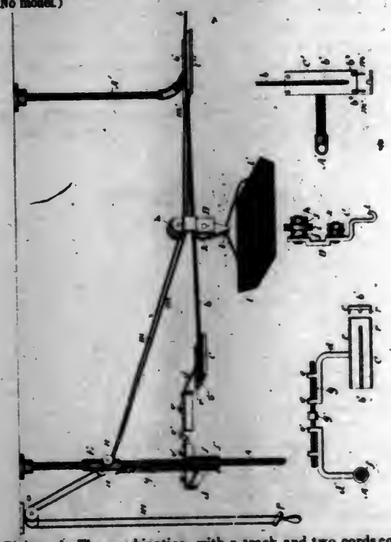
53. In a lasting-machine, the combination, with the last and means for stretching the upper around the last, of lateral pressers, substantially as described, arranged around the toe and along the sides of the last where the upper is to be stretched and adapted to be closed against the last to hold the upper in its stretched condition after the stretching, and mechanism for simultaneously closing said pressers against the last, substantially as described.

408,068. METHOD OF LASTING BOOTS OR SHOES. JOHN PATTEN, New York, N. Y. Filed Dec. 21, 1888. Serial No. 294,301. (No model.)



Claim.—1. The herein-described method of stretching the uppers of boots or shoes in lasting by the rubbing action of a moving flexible surface which is pressed laterally toward the toe and sides of the last and against those parts of the upper intervening between said surface and said parts of the last by a plurality of pressing instrumentalities which are stationary relatively to the movement of such surface, substantially as described.

2. The herein-described method of stretching the uppers of boots or shoes in lasting by the rubbing action of moving flexible surfaces which are pressed against the inner and outer sides of the upper to be stretched by instrumentalities which are stationary relatively to the movement of said surfaces, substantially as described.

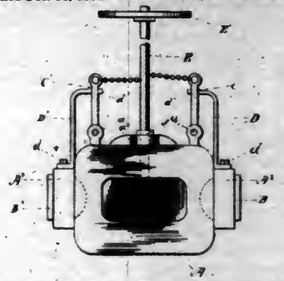


3. That improvement in the art of lasting boots or shoes which consists in stretching the upper over the last between moving flexible surfaces applied inside and outside of the upper, holding the upper in position after such stretching operation, and folding the edge of the upper over upon the insole and securing the same, substantially as described.

403,069. VENDING APPARATUS. STEPHAN FRASCHL, Paris, France, assignor to M. Morris Mihalovitch, Cincinnati, Ohio. Filed Dec. 27, 1888. Serial No. 294,741. (No model.) Patented in France Jan. 27, 1888, No. 186,871.

Claim.—The combination of a drum rotated by gravity and provided with a series of peripheral receptacles for the storage of vendible articles, said drum having at one end an annular series of projections, *c*, a spring-pressed catch-lever, G, having pins *c c'*, to engage said projections, the chute P, the swinging arm J, provided at one end with an eccentric, I, that bears on the catch-lever, and carrying at its other end a pan, J', that is normally supported beneath the chute to receive a coin dropped therein for tripping the catch-lever and permitting the drum to rotate by gravity, and the curb *a*, located beneath the drum and having a central opening for the discharge of articles, substantially as described.

403,070. STORE-SERVICE APPARATUS. GEORGE W. PRICE, Baltimore, Md., assignor to John R. Johnson, Franklin M. Dunn, and John F. Walters, all of same place. Filed Dec. 21, 1888. Serial No. 294,352. (No model.)



Claim.—1. The combination, with a track and two cords constituting a flexible extension, of a carrier provided with a roller having a central track-groove and a groove on each side thereof to receive the cords, the flexible extension being adapted to receive and to start the carrier.

2. The combination, with a track and two cords constituting a flexible extension, of a carrier having two rollers, one of which takes above the track and the other below, and one roller provided with a central groove and a groove on each side thereof to receive the cords, the flexible extension being adapted to receive and to start the carrier.

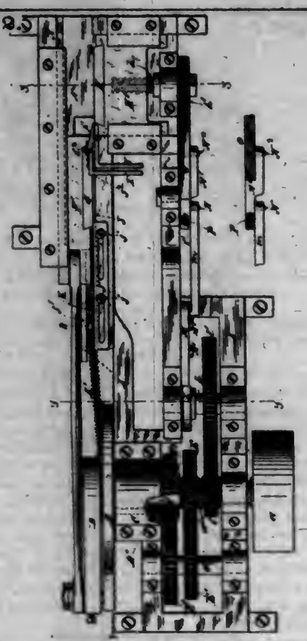
3. The combination, with a track and two cords constituting a flexible extension, of a vertical rod, A, a sleeve movable up and down on the said rod and provided with side rollers, a pulley, *o*, fixed at an elevation above the sleeve, a carrier provided with a roller having a central track-groove and a groove on each side thereof to receive the cords, the said two extension-cords both passing up under the side rollers of the sleeve to the elevated pulley *o* and then down.

4. The combination, with a track and two cords constituting a flexible extension, of an end supporting-plate, C, provided with a central bead or rib and a cord-guard each side thereof, and a carrier provided with a roller having a central track-groove and a groove on each side thereof to receive the cords.

403,071. CAR-COUPLING. WILLIAM W. PUTNAM, Bloomer, assignor of two-thirds to G. W. Spugle and J. H. Raney, both of Auburn, Ark. Filed Dec. 31, 1888. Serial No. 295,099. (No model.)

Claim.—In a car-coupler, the combination, with a draw-bar, A, having the head A' and the recessed lateral extensions A^2, of the clutch-blocks B B', located in the recesses of said extensions, and having curved points *b b* and flaring slots b^2, the levers C C', pivoted to extensions upon the upper surface of the draw-bar, the lower ends of the levers engaging the slots in the clutch-blocks, springs D D', secured at their lower ends to the lateral extensions A^2 and engaging the upper ends of the levers C C' and the vertical operating-shaft E, and the chains connecting the upper ends of the levers with said operating-shaft, substantially as described.

403,072. SCREW-SWAGING MACHINE. EDWARD E. GUILBY, Orange, N. J., assignor to Hayward A. Harvey, same place. Filed Feb. 6, 1889. Serial No. 298,842. (No model.)



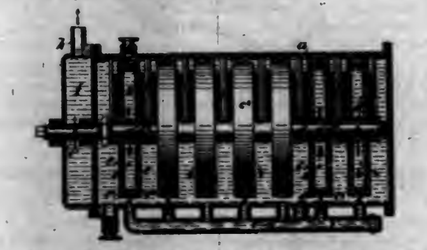
Claim.—1. In a screw-swaging machine of the type in which the thread upon the shank of the blank is formed by the rolling of the blank to and fro between the suitably-ribbed opposing faces of two dies, the combination, as herein set forth, of a supporting-die and an endwise-reciprocating die, and means for imparting to the reciprocating die a prescribed number of relatively short strokes for rolling the blank forward and backward along the face of the supporting-die, and then a longer stroke for effecting the discharge of the finished screw preparatory to the delivery of another blank to the operation of the dies.

2. The combination, as herein set forth, of a supporting-die, an endwise-moving die mounted upon a reciprocating carrier, a movable crank-arm, a pitman connecting said carrier with a crank-pin inserted in said movable crank-arm, and a cam for varying at prescribed intervals the distance of said crank-pin from the axis of the crank-shaft and correspondingly varying the movement of said reciprocating carrier.

3. The combination, as herein set forth, of the supporting-die H, the endwise-moving die G, the reciprocating-die carriage F', the pitman F, the radially-movable crank-pin *d*, the crank-pin cam B, loosely mounted upon the crank-shaft *a'*, and suitable gearing for rotating said cam at a speed varying in prescribed degree from the speed of rotation of said crank-shaft.

4. The combination, as herein set forth, of a supporting-die, an endwise-reciprocating die, means for producing an elongated stroke of said reciprocating die at prescribed intervals and thereby discharging the finished screw, and a deliverer for delivering a blank to the dies during the first portion of the next following return-stroke of said reciprocating die, whereby the blank is fed to the same end of the supporting-die as that from which the finished screw was discharged.

403,072.



5. The combination, as herein set forth, of the slide-bar or deliverer J, with the shouldered arm *f'*, connected to the reciprocating-die carriage F', the pivoted arm K, the spring-tooth *k*, mounted upon the arm K, the tripper k^2, and the spring K', for the purpose of effecting the operation of the deliverer by motion derived from the die-carriage F'.

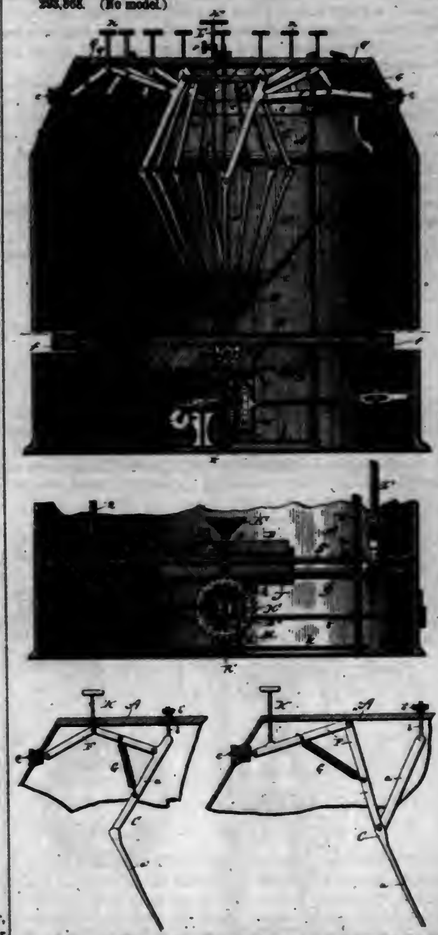
6. The combination, as herein set forth, of the dies G and H, the ways composed of the stationary bar *i* and the hinged bar *i'*, the deliverer J, and means, substantially as described, for imparting prescribed endwise movements to the die G and to the deliverer J, respectively.

7. The combination, as herein set forth, of a reciprocating die and a supporting-die, and appropriately-arranged ways for guiding blanks suspended in said ways, with a magnetic deliverer for delivering blanks successively from said ways to said dies.

8. The combination, as herein set forth, of the laterally-sliding die-carriage H', the feed-screw A, the pinion *h'*, the segmental gear O, the radially-adjustable crank-pin N, the pitman *m*, and slide-bar M, with the cam L and retracting-spring Q.

403,073. FILTERING APPARATUS. CARL W. RAMIN, Hamburg, Germany, assignor to Heinrich Jürgen Ernst Jessen and Johann Julius Adolph Kohlhil, both of same place. Filed Jan. 19, 1888. Serial No. 261,264. (No model.) Patented in Germany Dec. 18, 1884, No. 31,915, Apr. 2, 1886, No. 36,436, and May 14, 1887, No. 41,357; in England Apr. 24, 1886, No. 5,060, and in Belgium June 17, 1887, No. 77,846.

Claim.—The combination, in a filtering apparatus, of a chamber, one or more filtering-drums located therein and covered with felt or cloth and provided with brushes for cleaning the filtering-surface, a mixing-chamber located at one side of the main chamber for containing the filtering fibers and communicating with said main chamber, and an agitator located in said mixing-chamber, substantially as set forth.



403,074. HITCH FOR THE ENDS OF CORD OR ROPE. GEORGE RACE, Norwich, N. Y., assignor of one-half to William Breese, same place. Filed Aug. 22, 1888. Serial No. 283,422. (No model.)

Claim.—1. In a hitch for ropes, &c., the combination, with a hook, of the swinging jaw arranged in contact with the side of the hook and pivoted at its upper edge to the extremity of the same, the jaw being provided at its rear side with a notch, I, and having a lateral stud or projection, L, substantially as specified.

2. In a hitch for ropes, the combination, with a hook, A, having a shoulder, D, at the rear side of its hooked portion, of the swinging notched jaw F, pivoted at its upper edge to the extremity of the hook, the said jaw being provided with a lateral stud or projection, L, and a curved flange or lip, K, which conforms to the outline of the notch and bears against the inner surface of the hooked portion of the hook A, substantially as specified.

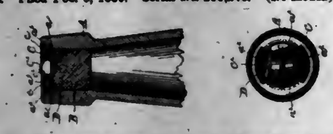
403,075. TYPE-WRITING AND MATRIX-MAKING MACHINE. WILLIAM RENSTROM, Norristown, Pa. Filed Dec. 17, 1888. Serial No. 293,868. (No model.)

Claim.—1. The combination of a frame, a circular series of toggle-levers, operating-keys connected to the toggles, and a circular series of type-bars pivotally connected to the said toggle-levers, as and for the purpose set forth.

2. The combination of a frame, a circular series of jointed type-

bars, means for guiding these type-bars, a series of radial toggle-levers pivotally connected at their inner ends to the said jointed type-bars, operating-keys, and springs for restoring the parts to their normal positions, substantially as described.

3. The combination of a casing, the vertically-adjustable type-bars, the adjustable toggle-levers radially arranged and connected to the said type-bars, and operating-keys connected to the toggle-levers.

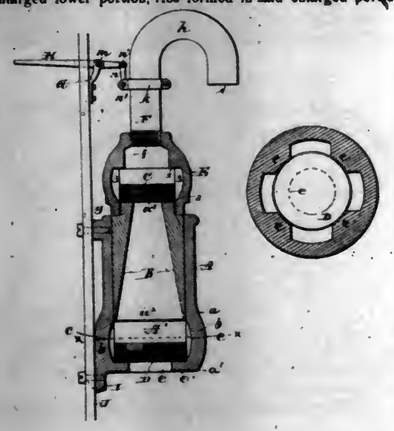


4. The combination of a frame, a pivotally-supported jointed type-bar depending from the said frame, a toggle-lever pivotally connected to this depending type-bar, an operating-key connected to the toggle-lever, and a spring for restoring the parts to their normal position, as and for the purpose set forth.

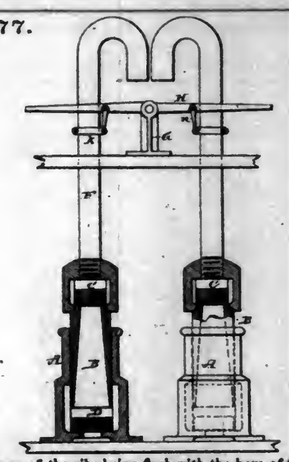
5. The combination of a frame, a depending pivotally-supported type-bar connected to this frame, this type-bar being constructed of two sections pivotally connected together at their adjoining ends, a toggle-lever, F, pivotally connected at its inner end to the joint or knuckle of the said jointed type-bars, an operating-key resting upon the said toggle-lever, and a spring for restoring the parts to their normal position, whereby the type-bar sections themselves form a toggle, as and for the purpose set forth.

6. The combination of a frame, type-bars, toggle-levers for operating the said type-bars, a vertically-guided ring arranged below the said toggle-levers and operated thereby, a depending operating-rod, P, connected to the said ring, a pivoted escapement-lever connected to rod P, a pinion provided with an internally-toothed escapement-wheel, and a spring-actuated carriage provided with a rack-bar upon its under side controlled by said pinion and escapement, as and for the purposes specified.

7. The combination, with a spring-actuated carriage provided with a rack-bar upon its under side, of a shaft journaled below the said carriage, a pinion upon this shaft and engaging the said rack-bar upon the carriage, two or more internally-toothed escapement-wheels connected to the said pinion, these escapement-wheels being provided with a different number of teeth, means for adjusting the said shaft, an escapement-lever constructed to engage the teeth of the said escapement-wheels, and means for operating the said escapement-lever, substantially as described.



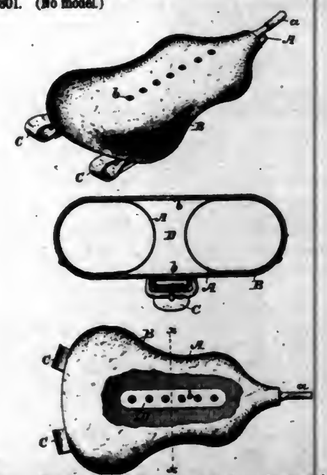
408,076. BOTTLE-STOPPER HOLDER. JOSIAS J. SANDS, Merton, Wis. Filed Feb. 9, 1889. Serial No. 299,576. (No model.)



Claim.—The combination, with a vessel the orifice of which is provided with opposite shoulders a', separated by opposite spaces a^5, and with a stopper in said orifice, of a holding-bar, C, having a central arch or outward bend in which is formed a slot for the admission of a flat instrument by which the holding-bar may be rotated into and out of its place beneath the shoulders a'.

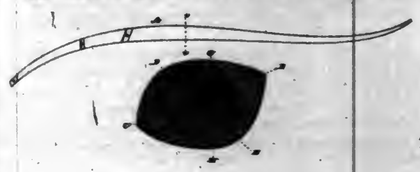
408,077. PUMP. URIAH P. SAWYER, Camilla, Ga., assignor of one-half to Joseph A. Dollar, same place. Filed Nov. 23, 1888. Serial No. 291,617. (No model.)

Claim.—1. The combination, with a cylinder having an internally-enlarged lower portion, ribs formed in said enlarged portion,



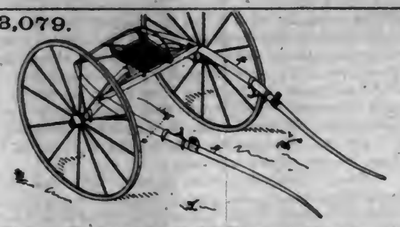
408,077.

the inner faces of the ribs being flush with the bore of the main portion of the cylinder, and a valve, of a hollow plunger and a discharge-pipe attached to the plunger, substantially as set forth.



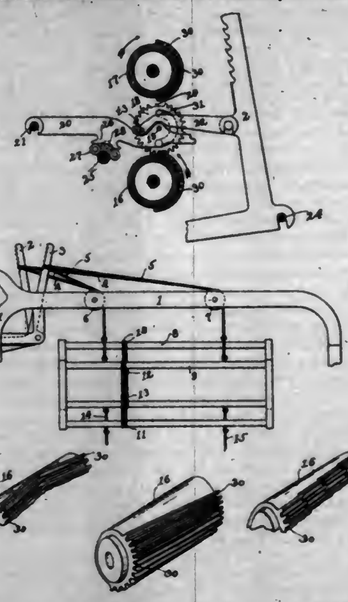
2. In a pump, the combination, with a cylinder enlarged internally near its lower end, ribs formed in this enlarged portion of the cylinder, and a valve covering the inlet-opening, of a plunger having a tapering bore, a cap secured to the upper end of the plunger and provided with internal ribs, a valve located within the cap and resting on the top of the plunger, and a discharge-pipe leading from the cap, substantially as set forth.

408,078. SADDLE FOR VELOCIPEDES. CHARLES F. SWETT, Auburn, Me., assignor of two-thirds to Charles R. Morse and Charles E. Kershaw, Jr., both of same place. Filed Sept. 29, 1888. Serial No. 286,801. (No model.)



Claim.—The herein-described saddle for velocipedes, consisting of a pointed or saddle-shaped inflatable bag, a leather covering for the same, and suspending-straps secured to the said covering, one at the forward or small end of the saddle and two at the rear or broad end, substantially as shown.

408,079. THILL FOR SULKIES. SAMUEL TOOMEY, Canal Dover, Ohio. Filed Mar. 11, 1889. Serial No. 302,841. (No model.)



408,079.

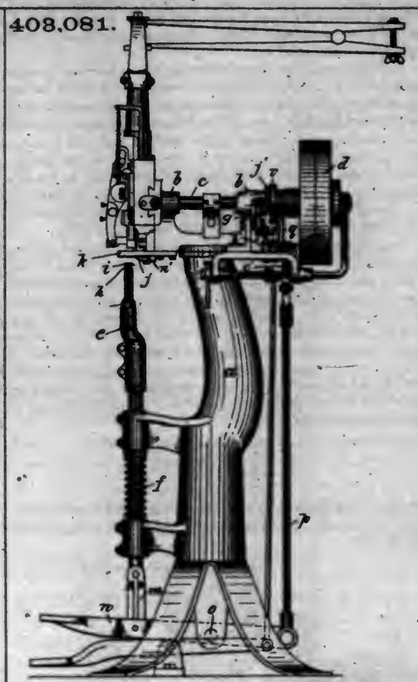
Claim.—The herein-described thill, irregular in cross-section, the diameter of the cross-section being greatest in the oblique direction from B to C, and having bulges on opposite sides, one above and one below the horizontal axis, substantially as set forth.

408,080. SHEDDING MECHANISM FOR LOOMS. WILLIAM WATTIE, Worcester, Mass., assignor to the Knowles Loom Works, same place. Filed Jan. 17, 1889. Serial No. 296,661. (No model.)

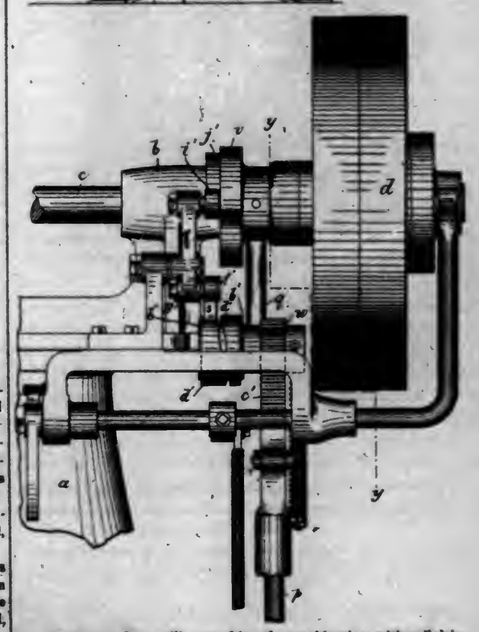
Brief.—By setting the teeth on the cylinder-gears at an angle to the axis of rotation the initial tooth will engage the vibrator-gears successively, thereby raising the harness-frames successively, and by bringing the warp-threads to the central plane at different times cause them to pass each other with less than the customary friction.

Claim.—1. In a loom-harness mechanism, a cylinder-gear provided with teeth arranged at an angle to the axis of rotation of said gear, for the purpose stated, substantially as set forth.

2. In a loom-harness mechanism, the cylinder gear or gears having teeth thereon extending in a line not parallel to the axis of rotation of said gear or gears, for the purpose stated, substantially as shown and described.



3. In a loom-harness mechanism, the cylinder gear or gears having teeth extending in a broken or zigzag line, for the purpose stated, substantially as set forth.



4. In a loom, the pattern-indicators controlling vibrator-levers and the vibrator-levers, vibrator-connectors, and harness-levers, in combination with vibrator-gears and cylinder-gears adapted to engage successively the vibrator-gears in the series, for the purpose stated, substantially as shown and described.

5. In a loom, the combination, with the pattern-indicators, the vibrator-levers, the vibrator-connectors, and harness-levers, of the vibrator-gears and cylinder-gears, the cylinder-gears provided with teeth adapted to engage successively the vibrator-gears, for the purpose stated, substantially as set forth.

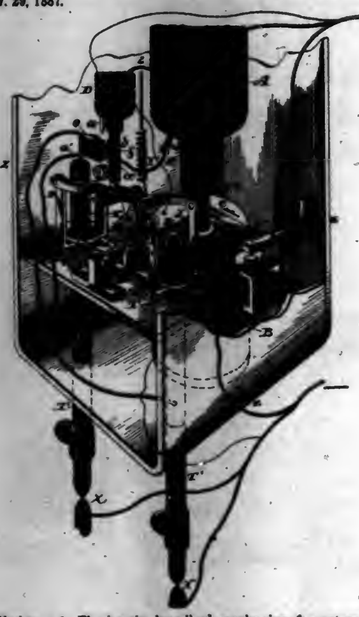
408,081. BOOT OR SHOE NAILING MACHINE. MORRIS WILSE, Quincy, Mass., assignor to the Union Metallic Fastening Company, of New Jersey. Filed Dec. 22, 1888. Serial No. 294,400. (No model.)

408,081.

Claim.—1. In a nailing-machine, the combination, with nail-driving and work-feeding mechanism, of a horn having a heavy supporting-spring, *f*, mechanism whereby the horn is depressed at intervals to release the work from the pressure of said spring, and a foot supported on the horn by a lighter spring, whereby the work is lightly held while relieved of the pressure of the spring *f*, as set forth.

2. In a nailing-machine, a vertically-movable horn provided with a spring-supported foot adapted to rotate in the horn, combined with an edge gage or guide for the work, as set forth.

3. In a nailing-machine, the combination of a horn having a foot,



i, the throat *k*, the movable gage *j* on said throat, and the plate *n'*, engaged with said gage and having a diagonal slot, *p'*, and a fixed guiding-pin, *o'*, as set forth.

4. In a nailing-machine, the combination of the horn and its supporting-spring *f*, the pivoted bell-crank lever having a pinion on one of its arms and a collar or hub, *b'*, affixed to said pinion, the spiral band or brake surrounding said hub and having one end supported by the bell-crank lever, the rod *p*, having a rack meshing with said pinion, a treadle connected with the horn and the rod, a cam on the driving-shaft whereby the bell-crank lever is displaced periodically, and means for compressing the band or brake upon the hub during the displacement of the bell-crank lever, whereby the pinion is locked and the rod *p* is rigidly connected to the bell-crank lever, as set forth.

5. In a nailing-machine, the combination of the horn and its supporting-spring *f*, the pivoted bell-crank lever having a pinion on one of its arms and a collar or hub, *b'*, affixed to said pinion, the spiral band or brake surrounding said hub and having one end supported by the bell-crank lever, the rod *p*, having a rack meshing with said pinion, a treadle connected with the horn and the rod, a cam on the driving-shaft whereby the bell-crank lever is displaced periodically, a cam, *j'*, operated by the driving-shaft, and a lever, *g'*, pivoted to the frame of the machine and having one arm arranged to be moved by the cam *j'* and another arm in contact with a lug on the free end of the band or brake, as set forth.

REISSUES.

11,002. ELECTRIC-ARC LAMP. CLARENCE R. NOBLE, Cleveland, Ohio. Filed Feb. 15, 1889. Serial No. 300,078. Original No. 374,129, dated Nov. 29, 1887.

Claim.—1. The herein-described mechanism for automatically switching the current from one set of carbons to the other, consisting of the magnet D, carrying a coil of fine wire which is located in a shunt around the arc, and also a coil of coarse wire which is adapted to form a part of the main circuit, the core of said magnet being movable, connected with the tilting lever *h*, and carrying contact-piece *b'*, in combination with two pairs of contacts so arranged that when the piece *b'* bridges one pair the main current shunts the magnet D, and when it bridges the other pair the main current passes through the said magnet, as set forth.

2. In an electric lamp in which two sets of carbons are operated successively, the combination, with a tilting lever carrying at each end a clutch for operating to feed each set of carbons, of an arm, K, magnet D and its core, and spring Y', for making operative successively the clutches when they are thrust within its reach by the tilting lever, the motions of the lever being controlled by the partial or entire consumption of a set of carbons, as specified.

3. In an electric lamp, a slotted core for the main and shunt magnets, a slotted block sliding within the slot in the core, a pin passing through the core and a slot in said block, an arm connected with said pin, and a pair of contacts adapted to be brought together by the movement of said arm, the said contacts completing a circuit to cut out the lamp, substantially as described.

4. The combination, in an arc lamp, with the coarse and fine wire magnets for establishing and regulating the length of the arc, of a magnet carrying a coil of coarse and fine wire, the fine wire being in a shunt around the arc and the coarse wire adapted to be thrown in circuit with the second set of carbons, and having a movable core which is attached to one end of a tilting lever, which carries at each end a clutch to feed each set of carbons, and a spring connected to the other end of said lever to counterbalance the pull of the magnet, and an arm extending beneath each clutch to operate successively the clutches when they are lowered upon it by the tilting lever, the motions of the lever being controlled by the partial or entire consumption of a set of carbons, as described.

5. In an electric-arc lamp in which two sets of carbons are burned successively, the combination of arc establishing and regulating magnets, a core movable therein, clutches, an arm actuated by the movable core and extending beneath the clutches, and a device engaging both clutches for holding them, one at a time, out of the way of the arm when the latter moves up to establish the arc.

6. The herein-described mechanism for automatically switching the current from a burned-out set of carbons to an unburned set of carbons, consisting of an independent circuit for each set of carbons, and the arc establishing and regulating mechanism, in combination with a tilting lever carrying at each end a clutch for feeding each set of carbons, a magnet carrying a coil of coarse and fine wire, the fine wire being in a shunt around the arc and the coarse wire adapted to be thrown in circuit with the second set of carbons when the first set has been consumed, the core of said magnet being movable and carrying a contact-piece which plays between two pairs of contacts so arranged that when the said contact-piece bridges one pair the main current passes through the first set of carbons and shunts the said magnet and the second set of carbons, and when the contact-piece bridges the other pair of contacts the main current passes through this magnet and the second set of carbons and shunts the first set of carbons, substantially as set forth.

7. A cut-out for an electric-arc lamp, consisting of the main and shunt arc establishing and regulating magnets, respectively, of a slotted core movable therein, a pin passing through the side thereof, an arm secured to said pin, a slotted block inserted in the slot in the core and hung on said pin, a spring supporting the weight of said core, and a pair of contacts adapted to be brought together to cut out the lamp by the movement of said arm, the movement of said arm being produced when the shunt-magnet increases in strength abnormally, due to the consumption of the carbons in the lamp, substantially as described.

PHOTO LITH NORRIS PETERS WASHINGTON D.C.

DECISIONS

OF THE

COMMISSIONER OF PATENTS

AND OF

UNITED STATES COURTS IN PATENT CASES.

COMMISSIONER'S DECISIONS.

DANIELS *v.* MORGAN.

Decided May 1, 1889.

1. RIGHT OF THE COMMISSIONER OF PATENTS TO REHEAR THE DECISIONS OF HIS PREDECESSOR IN OFFICE—HISTORY AND REVISIONS OF RULE 144 OF THE RULES OF PRACTICE DISCUSSED AND DECISIONS THEREUNDER REVIEWED.

Rule 144 had its origin in an executive order, was transformed into a judicial rule when the Commissioner of Patents was, by act of July 1, 1870, substituted for the Supreme Court of the District of Columbia as the tribunal having final jurisdiction, and at a later date the office of Commissioner was recognized as a continuing one, placed upon the same footing as a court, and given the power of granting new trials.

2. JURISDICTION OF THE COMMISSIONER TO REHEAR.

Rule 144, based upon the procedure in courts of law, does in terms confer, and was intended to confer, upon the Commissioner jurisdiction to rehear the decisions of his predecessor when grounds other than those based on fraud, error in computation, or newly-discovered evidence are alleged and set forth in motions filed for the rehearing of such decisions.

3. DUTIES OF THE COMMISSIONER DEFINED—WHICH ARE SUBJECT TO REVIEW.

The duties of the Commissioner of Patents are in part administrative and in part of a judicial nature. In the discharge of the latter duties he acts as the direct representative and agent of the law, subject to no appeal excepting to the tribunals expressly designated by statute. The rule limiting the right of an administrative officer to review his predecessor's decision to the three cases specified may be applicable to the Commissioner in his capacity as an administrative officer; but it is clear that it is not binding upon the Commissioner in the discharge of his judicial duties.

4. IN DISCHARGE OF OFFICIAL DUTIES, REASONABLE RULES AND REGULATIONS ARE VALID.

Since the Commissioner of Patents in the discharge of his judicial duties in determining the question of priority between interfering parties exercises the function of a court, reasonable rules and regulations, based upon analogies derived from the procedure in courts of law, are valid rules and regulations when prescribed by the competent authority.

5. IN INTERFERENCE PROCEEDINGS A REHEARING OTHERWISE ALLOWABLE SHOULD NOT BE BARRED BECAUSE OF A CHANGE IN COMMISSIONER.

It certainly would be a hardship if in an interference proceeding, when the Commissioner who rendered the decision would on sufficient showing have been swift to afford a rehearing, the defeated applicant should be without remedy because of the succession to office of a new Commissioner, and a rule adapted to prevent such a result certainly commends itself as a part of a system of procedure designed to do justice between parties who are asking the Patent Office to determine which of them is the prior inventor of an invention which can be patented to but one of them.

MOTION to dismiss motion for rehearing.

MECHANISM FOR COILING WIRE RODS.

Application of Fred. H. Daniels filed June 26, 1886, No. 206,323. Application of Charles H. Morgan filed June 24, 1886, No. 206,009.

Mr. Charles H. Burleigh for Daniels,
Mr. Anthony Pollok for Morgan.

MITCHELL, *Commissioner:*

On March 22, 1889, my predecessor, having previously heard the parties to this interference, awarded priority of invention to Morgan. On the 26th day of March a motion for rehearing was filed, and under the Commissioner's direction the motion was assigned for hearing on April 16, 1889. At that time it was fully understood by him that his successor was to take charge of the Office from and after the 1st day of April.

The motion for rehearing, alleging that in the former decision were palpable errors of law and fact, came before me for disposition on the day fixed by the former Commissioner. Thereupon counsel for Morgan presented a motion to dismiss the motion of Daniels for rehearing, stating the ground of said motion as follows:

The ground is that the said motion for rehearing cannot be entertained by the Commissioner, inasmuch as it asks for a reconsideration of a decision of his predecessor upon the same facts and evidence upon which such decision was based, contrary to the rule of the Patent Office and to the rule and practice of all the executive departments of the Government.

In support of this motion it was urged that by the practice of all the executive departments of the Government no officer has the right or the power to re-examine a question finally disposed of by his predecessor, excepting in the cases either of fraud, error in computation, or of the discovery of new evidence, and that Rule 144 of this Office was intended to give no greater power of reconsideration to a new Commissioner than he would have if it contained a limitation to the three cases specified. It was also contended that if the rule gives any greater latitude for reconsideration than the foregoing it is to that extent in contravention of law and should be disregarded.

Two questions therefore arise: *First*, what is the lawful construction of Rule 144? *Second*, if it is intended to confer, and does in terms confer, upon the Commissioner any greater power of reconsideration than that based upon fraud, error in computation, or newly-discovered evidence, is such rule to that extent void?

Rule 144 is as follows:

Cases which have been deliberately decided by one Commissioner will not be reconsidered by his successor, except in accordance with the principles which govern the granting of new trials.

This rule was first enacted in its present form in the year 1879, and was re-enacted in the revision of the Rules of the Patent Office under date of April 13, 1888, by my predecessor, with the approval of the then Secretary of the Interior, pursuant to section 483 of the Revised Statutes, which is as follows:

The Commissioner of Patents, subject to the approval of the Secretary of the Interior, may from time to time establish regulations, not inconsistent with law, for the conduct of proceedings in the Patent Office.

Although the rule in its present form dates from

the year 1879, as already stated, I find that rules regulating the power of a Commissioner to reconsider the action of his predecessor have existed from an early date. As early as 1849 the following was one of the printed rules:

> A decision deliberately made and affirmed by one Commissioner cannot be disturbed by his successor. Some years since the evils arising from such revisions became so apparent and embarrassing that a positive rule to that effect was adopted. It was submitted to and approved by the President of the United States. This Office cannot, therefore, except under extraordinary circumstances, disturb decisions so reaffirmed, but must refer all who consider themselves aggrieved to their remedy by appeal. For instructions with regard to which or withdrawal see sec. VI, par. 3 & 4. For instructions relative to interfering applications, sec. VI, par. 5.

The sections referred to provide a remedy by appeal to the Chief Justice of the District Court of the District of Columbia.

In the printed edition of August 1, 1871, the rule is as follows:

> Cases which have been deliberately decided by one Commissioner will not be reconsidered by his successor upon the same state of facts. They may, however, be reopened in accordance with the general principles which govern the granting of new trials.

It will thus be seen that power was given to one Commissioner to reconsider the decisions of his predecessor under certain limitations prescribed by the rule. One reason for conferring the power of reconsideration, doubtless, was the abolishment by the act of July 1, 1870, of the remedy by appeal to the Supreme Court of the District. It is noticeable that when the right of appeal was done away with the right to a new trial was recognized; but it is noticeable also that the rule seems to be hostile to a reconsideration "upon the same state of facts." In the edition of December 1, 1879, however, the rule was put into the form which now appears in Rule 144, in which occurs the significant omission of the words "the same state of facts." It will thus be seen that the rule under consideration, having its origin in an executive order, was transformed into a judicial rule when the Commissioner of Patents was, by the act of July 1, 1870, substituted for the Supreme Court of the District of Columbia as the tribunal having final jurisdiction, and that at a later date the office of Commissioner was recognized as a continuing one, placed upon the same footing as a court, and given the power of granting new trials, with no proviso forbidding reconsideration upon the same state of facts.

It will be remembered that the words "the same state of facts" were first omitted from the rule in the edition of December 1, 1879. But in *Huttner et al.* v. *Knox et al.*, decided March 6, 1879, (C. D., 1879, 231,) Commissioner Paine seems to have understood the second clause of the rule then existing as warranting the opening of a case for a rehearing in accordance with the general principles which govern the granting of new trials, even when there was no new evidence presented. This was shortly before he caused the rule to be redrafted into its present form. Again, in the case of *Packard* v. *Sandford*, (C. D., 1879, 315,) decided December 12, 1879, the same Commissioner says:

> It is also true that upon a motion for a rehearing or for a new trial the findings of fact will not be disturbed unless wholly unsupported by or manifestly against the facts.—

thus showing that in his opinion rehearings and new trials were to be regarded as interchangeable terms under the rule, and that the rule would not stand in the way of the correction of manifest errors in the former decision. I find, too, that it has been customary for my predecessors to construe the rule so as to include other grounds for reconsideration than fraud, newly-discovered evidence, and miscalculation. Thus in the case of *Stevens* v. *Putnam*, (C. D., 1880, 164,) Commissioner Marble says:

> My predecessor, on April 15, 1880, issued an order allowing the present motion on behalf of Putnam for a rehearing of this interference to be made. The grounds upon which this motion is based are alleged errors of law and fact in the findings of my predecessor in that portion of his decision rendered April 10, 1880, wherein priority of invention as to the first issue of the interference was awarded in favor of Stevens.

After discussing the alleged errors of fact and the law involved, the Commissioner adds:

> I must therefore hold that the first ground in the motion for rehearing is well taken, and that there was an error in the finding that Stevens was the first to conceive the invention at issue. I have reached this conclusion realizing fully the fact that to warrant the grant of a motion of this character the error must appear to have been such a one as would entitle the defeated party to a new trial in the courts, and I should feel great hesitation in disturbing the judgment of my predecessor were I not satisfied from the proofs that substantial justice requires me so to do.

In the case of *Atha* v. *Wheeler* (MS. Dec., Vol. 34, 188) this rule (then Rule 139) was interpreted by my predecessor as follows:

> Rules 137 and 139 seem to control this motion. The latter provides that "cases which have been deliberately decided by one Commissioner will not be reconsidered by his successor except in accordance with the principles which govern the granting of new trials."
>
> Some attempt was made in the argument to take the case out of this rule by claiming that the decision had not been "deliberately" made by the preceding Commissioner, because of the doubt or uncertainty expressed by him as to where the priority belonged, and because of the expression in his decision "without going into the evidence in detail," &c. But the fact that the case is close and the mind, after examination of the evidence, not wholly satisfied, does not suggest the idea of non-deliberation, but rather the contrary; and as to the expression "without going into the evidence," &c., it is clear, and simply means without analyzing or attempting to set out the evidence in detail in his opinion, and cannot justify the inference attempted to be drawn that he had not gone into or examined the evidence fully or deliberately.
>
> I see no justification for taking this motion out of the rule. Indeed, but for this rule it is doubtful if there could be any rehearing in any case under any circumstances. Such appeals and decisions are effectual by operation of the statute.
>
> What then are the principles of new trials?
>
> *First.* The former decision has the force and effect of a verdict of a jury or a finding of a court.
>
> *Second.* A new trial will not be granted except where the verdict is unsupported by evidence or is manifestly the result of prejudice, bias, or passion, or where, the facts being conceded, there has been a clear error or mistake in the application of the rules of law to them.

Whatever view may be taken as to the correctness of this interpretation of the rule, it is certainly clear that it was regarded by Commissioner Hall as conferring jurisdiction to reconsider other cases than those based upon fraud, miscalculation, or newly-discovered evidence, and it is equally clear that it must have been intended, when it was re-enacted by the same Commissioner (with the approval of the Secretary of the Interior) who had thus interpreted it, to confer at least as comprehensive a power of revision as had been by him ascribed to the same rule before its enactment.

In view of this history of the development of the rule and of the expositions of it by former Commissioners and of its re-enactment after such expositions had been given to it, and in view also of its manifest meaning upon its face, I have no doubt that the power of reconsideration conferred by it is not limited to cases of fraud, miscalculation, and newly-discovered evidence—that is to say, is not limited so as to be merely declaratory of the rule which is claimed to be applicable to purely administrative officers.

The remaining question is whether, so expounded, the rule is contrary to law, to the extent to which it

aims to confer jurisdiction in motions for reconsideration upon other grounds than the three grounds specified. If I had any serious doubt upon this question I should proceed with great caution. It would certainly require a strong case to justify me in declaring that a rule deliberately enacted by competent authority is either wholly or in part invalid. Especially is this true in view of the concession made at the hearing that if I have no jurisdiction then Morgan would be entitled in any event to compel me, by mandamus, to issue a patent, under the decision of my predecessor, without reference to my own opinion, because in that case my action would be wholly void, and I therefore think that it would be my duty in any other case than a very clear one indeed to uphold the rule as established and leave any aggrieved party to the clear remedy pointed out. In this instance, however, it seems to me very clear that Rule 144 is the result of a lawful exercise of the authority reposed in the Commissioner of Patents and the Secretary of the Interior to establish rules and regulations.

The duties of the Commissioner of Patents are in part administrative and in part of a judicial nature. In the discharge of the latter duties he acts as the direct representative and agent of the law, subject to no appeal excepting to the tribunals expressly designated by statute. (*Butterworth* v. *Hoe*, 112 U. S., 50.) This distinction between the judicial and administrative duties devolving upon the Commissioner is clearly drawn in the decision of the Secretary of the Interior in the matter of *Sargent*, (12 O. G., 475,) where the following language occurs:

> In the discharge of your judicial duties you hear and determine the rights of parties within the statute governed by the same rules as a court. In the discharge of your administrative duties, whether of a ministerial or directory character, the law must be executed according to its letter and intent.

While it may be admitted that the rule limiting the right of an administrative officer to review his predecessor's decision to the three cases specified may be applicable to the Commissioner in his capacity as an administrative officer, it is, I think, equally clear that it is not binding upon the Commissioner in the discharge of his judicial duties in determining questions *inter partes*, in such sense that the power of the Commissioner to establish rules and regulations, with the approval of the Secretary, is subordinate thereto.

Since the Commissioner in the discharge of his judicial duties in determining the question of priority between interfering parties exercises the function of a court, I cannot doubt that reasonable rules and regulations, based upon analogies derived from the procedure in courts of law, are valid rules and regulations when prescribed by the competent authority.

That this rule (144) is based upon the procedure in courts of law appears from the decision in *Insurance Company* v. *Wilson*, (8 Peters, 291, 303,) where the Supreme Court says:

> In this case the district judge seems to think that as the judgment was not rendered by him he has no power to grant a new trial, as he is not acquainted with the facts and circumstances which should influence his discretion in making such an order. * * But the district judge is mistaken in supposing that no one but the judge who renders the judgment can grant a new trial He, as the successor of his predecessor, can exercise the same powers, and has a right to act on every case that remains undecided upon the docket as fully as his predecessor could have done. The court remains the same, and the change of the incumbents cannot and ought not, in any respect, to injure the rights of litigant parties.

It is impossible for me to doubt that it was competent for the Commissioner of Patents, with the approval of the Secretary of the Interior, to make the practice in this Office in causes to be adjudicated between parties conform to the practice in the courts as thus recognized.

The argument from inconvenience adds but little to the weight of the argument derived from the fact that in determining interference cases the procedure of this Office is essentially like the procedure of a court, and yet it is worthy of consideration. In the pending case the decision of my predecessor was rendered on the 22d day of March, 1889. That the defeated party was entitled to a rehearing upon a proper showing no one would question, if that rehearing could have been had by the same Commissioner who heard the case originally; but it was practically impossible for my predecessor to accord such rehearing, the time being too limited. Hence the action of the Commissioner in causing a day to be fixed for bringing up the motion before me. It certainly would be a hardship if, in a case of such a nature that the Commissioner who rendered the decision would have been swift to afford a remedy, had opportunity been presented—and such cases might arise—the applicant should be without remedy because of the succession to office of a new Commissioner; and a rule adapted to prevent such a result certainly commends itself as a part of a system of procedure designed to do justice between parties who are asking the Patent Office to determine which of them is the prior inventor of an improvement that can be patented to but one of them.

I hold, therefore, that Rule 144 is not inconsistent with the law, within the meaning of section 483 of the Revised Statutes, but is a reasonable rule in aid of a procedure essentially judicial, and therefore the motion to dismiss the motion for a rehearing for want of jurisdiction is overruled.

It is not intended by this opinion to foreshadow to any extent the action of the Commissioner upon the motion for rehearing or to indicate any definite construction of Rule 144, but simply to hold that he is not without jurisdiction to grant a rehearing in a proper case, and that proper cases are not limited to the rule applicable to strictly administrative offices.

GREEN *v.* HALL *v.* SIEMENS *v.* FIELD.

Decided March 29, 1889.

1. PRACTICE IN THE PATENT OFFICE—MOTIONS FOR REHEARINGS.

   The practice of splitting up cases and allowing separate parties to file separate motions and present them at different times condemned. In interference proceedings motions for rehearings presented by the parties thereto ought to be heard at the same time, in order that the entire case may be disposed of at once.

2. MOTION FOR REHEARING OVERRULED—SIEMENS.

   Siemens's motion for rehearing overruled, and *Held*, *first*, that while the law does not require that a caveat shall give a complete and accurate description of the construction and details of an invention, the caveat filed by Field is a full and complete disclosure of the subject-matter in controversy. *Second*, that knowledge of foreign invention, although of an earlier date than an original invention in this country, is not necessarily a bar to a domestic patent.

3. SAME—GREEN.

   Green's motion for rehearing overruled because (*first*) it involves a question of merits which is *res adjudicata* by reason of the previous decision of the Commissioner and also that of his predecessor, and (*second*) because it shows no error in the former decision which Green seeks to have set aside

MOTION for rehearing.

ELECTRIC RAILWAYS.

Application of George F. Green filed May 15, 1886, No. 202,287. Application of Thomas Hall filed July 22, 1885, No. 172,325. Application of Ernst W. Siemens filed October 25, 1884, No. 146,473. Application of Stephen D. Field filed March 10, 1880, No. 4,752.

Mr. R. D. O. Smith and *Mr. G. W. Dyer* for Green.

Mr. E. N. Dickerson and *Messrs. Foster & Freeman* for Hall.

Mr. C. S. Whitman for Siemens.

Mr. F. L. Pope, *Mr. F. W. Whitridge*, and *Messrs. Marble & Mason* for Field.

HALL, *Commissioner:*

Since the Commissioner's decision of March 6, 1889, Green, Hall, and Siemens have respectively filed motions for a rehearing in this case. On the day of the hearing a motion was made by the counsel for Hall to postpone such hearing on account of the absence of counsel owing to professional engagements in other parts of the country. This motion not being sustained, Hall at once withdrew his motion for a rehearing, and took no part in the proceedings. Whether this was done with a view of renewing the motion at some future period it is impossible to determine; but I think it is proper to suggest the unadvisability of splitting up cases and allowing separate parties to file separate motions and present them at different times. Although there are four applicants in this controversy, there is but one case to which they are all parties, and motions for rehearing ought to be presented and heard at the same time, in order that the entire case may be disposed of at once.

It is the practice in many courts that when a motion for a new trial has been filed and a party subsequently sees proper to dismiss or withdraw it, such action precludes his right thereafter to file a similar motion, except when new matter has been subsequently discovered.

SIEMENS' MOTION.

Siemens presents no new points so far as I have been able to observe, and has simply reargued the merits of the case as they were originally presented. He insists—

First. That the caveat filed by Field on the 21st of May, 1879, did not disclose the invention, because it did not contain a specific description of the circuit-controller or manner in which it should be incorporated into the combination, but only suggested a circuit-controller. I am not able to accept this view of the meaning and construction of the caveat. The law does not require that a caveat shall give a complete and accurate description of the construction and details of the invention; and I may further say, however, that, in my opinion, this caveat is a full and complete disclosure of the invention. Every one of the elements embraced and described or spoken of was well known to those learned in the art, and with the description contained in this caveat all that was left to be done so far as the construction of the invention was concerned was for the mechanic.

Second. Siemens presents a legal proposition which is founded upon the allegation that Field did not believe himself to be the first inventor, because at the time he filed his application he had seen in a publication a description of Siemens's railway and knew that Siemens, although a foreign inventor, had made the invention at an earlier date than he (Field) had. He relies upon section 4923 of the Revised Statutes, and insists that an American applicant who is a true inventor, but who, before he files his application, becomes aware of the fact that an inventor in a foreign country has made the invention at an earlier date, is barred of his right to prosecute his application and obtain a patent. Siemens cites in support of the proposition *Forbush* v. *Cook*, (2 Fish., 668.) The quotation made by counsel is an imperfect one and does not fairly express the meaning of Curtis, judge. It should have been quoted as follows:

> The act of Congress of July 4, 1836, section 15, has provided that when it shall satisfactorily appear that the patentee, at the time of his making his application for a patent, believed himself to be the first inventor or discoverer of the thing patented, the same shall not be held to be void on account of the invention or discovery, or any part thereof, having been before known or used in any foreign country, it not appearing that the same, or any substantial part thereof, had before been patented or described in any printed publication. If you find that when Crompton made application for the patent, he believed himself to be the first inventor of the thing patented therein, his patent is not invalidated by the prior existence of the Witch loom in England. But in considering whether he did believe himself to be the original inventor of what was patented to him, it is material to determine whether he was, in fact, the original inventor thereof. If he was, there is an end to all inquiry on this subject. If he was not, still he may have believed himself to be so.

Many other cases might also have been cited, stating the same proposition, viz: that the evidence of an earlier invention or an earlier knowledge and use in a foreign country, which has been brought home to the knowledge of the American inventor, is competent and proper, and may be considered by the jury for the purpose of establishing the fact that the American inventor was not a true inventor, but borrowed the ideas or obtained the invention from such knowledge. But neither of these authorities intimates that foreign invention, although of an earlier date than an original invention in this country, bars the inventor here from his right to a patent. Indeed, the statute itself is express that such foreign invention shall not have this effect. *Roemer* v. *Simon* (95 U. S., 214) is to the same effect where it is said:

> Antecedent patents here or elsewhere are not set up in the answer; and it is clear that proof of prior use in a foreign country will not supersede a patent granted here, unless the alleged invention was patented in some foreign country. Proof of such foreign manufacture and use, if known to the applicant for a patent, may be evidence tending to show that he is not the inventor of the alleged new improvement; but it is not sufficient to supersede the patent if he did not borrow his supposed invention from that source, unless the foreign inventor obtained a patent for his improvement, or the same was described in some printed publication.

GREEN'S MOTION.

The entire argument in behalf of Green proceeds upon the proposition that the combination involved in the issue, with a galvanic battery as the generating source of power, is the equivalent of the same combination with a dynamo as the source of electric power. This question is *res adjudicata* in this case, and the motion which asks me to set aside my own decision upon the merits will also require me to set aside the decision of Commissioner Montgomery when the question was presented to him as to whether Green's original application of 1879 could be admitted into this interference.

The history of the case is as follows: Green's original application had been filed and he made a motion before the Office to be admitted into the interference, when a question arose as to whether his application showed the invention involved in the issue. The matter was referred to a committee, who reported to the Commissioner and advised him that the application did not show the invention. The Commissioner so held and overruled the motion of Green to be admitted into the interference. Thereupon, on May 15, 1886, Green filed the present application, by which he was admitted and introduced into the interference. It will thus be seen that Green has not taken any steps to relieve himself from the decision of Commissioner Montgomery, by mandamus or otherwise to compel the Commissioner to act, but has acquiesced in that ruling, filed a new application, come into the interference, and the case has been tried and heard upon that construction. I do not now feel myself justified in reversing that decision or reorganizing the case upon a different construction. Not only this, but I am satisfied that they are not equivalents. There is no question at all but that both of the elements—the galvanic battery and the dynamo-generator—supply electricity; but they supply it under different conditions and in a manner which requires different construction and arrangement for its utility.

There are many authorities holding that the question whether the introduction of one element is an invention over another may be satisfactorily determined by reference to the results. In this case the combination involved with a galvanic battery for the source of electric energy has never been introduced or made commercially valuable; but as soon as the dynamo was employed the invention at once assumed a status among the valuable and practical inventions of the world and was immediately recognized as such, and there is no limit to the results which may be obtained by its use. I might further add that the supply of electricity through the instrumentality of such a generator is such as to require different means of control and management in its practical application, and I am not prepared to believe that in a proper sense the use of such a generator is the equivalent of the galvanic battery.

The question of equivalency being settled, I do not see that any other question of importance has been urged against the correctness of the decision sought to be set aside. Green has shown that he experimented from 1874 to 1880 with models and devices involving all of the elements except the dynamo, for which he substituted the galvanic battery, and that during these experiments and while conversing with other parties he repeatedly suggested that he intended to employ a dynamo. Some ten or eleven witnesses have been introduced, who establish this fact with a great degree of certainty. Some of them testify that he represented he was going to purchase a dynamo as soon as he could, and expected to see what the results would be from the introduction of a dynamo instead of a galvanic battery. All this testimony can only have the effect, giving it its greatest force, of establishing a conception. It is not pretended that Green ever reduced the invention thus organized to practice; but, on the contrary, in 1878, when he constructed a railway with the combination involved, he still employed the galvanic battery. Giving to him, therefore, the full benefit of all he claims, he had made a conception of the invention at the early dates mentioned from 1874 to 1880, but had not reduced it to practice nor had he filed an application for the invention until 1886. There is no reason shown why Green should postpone filing his application, which is regarded by the Office as constructive reduction to practice, for so long a period. There is no pretense that he was not able to have furnished the necessary means to prosecute an application, and his omission to do so under the circumstances must be regarded as negligence. In other words, he is in the situation of one who has not prosecuted his conception with the necessary diligence to give him priority over another person who has conceived the invention and diligently prosecuted it by caveat and application, in accordance with the statute.

I see nothing to change the conclusions reached by me in the decision of March 6, 1889, and therefore I am forced to overrule both the motions.

DECISIONS OF THE U. S. COURTS.

U. S. Circuit Court—District of Massachusetts.

MCMURRAY *et al. v.* EMERSON.

Decided November 21, 1888.

INFRINGEMENT—ESTIMATING DAMAGES.

The basis for estimating damages for infringement should be the amount of profit or savings made by the use of the infringing device over what could have been made by the use of devices free and open to the public.

STATEMENT OF THE CASE.

This was an action for infringement of Reissue Patent No. 8,781, dated July 1, 1879, for an invention of Abel Barker, and Reissue Patent No. 10,672, dated December 15, 1885, for an invention of Jabez A. Bostwick, each invention being for an improvement in tools for soldering the caps or covers on tin cans, and both patents being owned by the plaintiffs as as ignees.

Mr. Benjamin Price and *Mr. Causten Browne* for the complainants.

Mr. A. H. Briggs for the defendant.

The court instructed the jury as follows:

NELSON, *J.:*

In this suit the plaintiff seeks to recover damages for the infringement of two patents of which he is the owner, the Barker patent and the Bostwick patent. These patents relate to improvements in tools for soldering tin cans. There does not seem to be any dispute between the parties as to the ownership of the patents nor as to their validity. The defendant concedes that the plaintiff owns them and that they are valid, and also that he has infringed them by the use of a tool in his tin canning establishment, and that tool has been produced and exhibited to the jury. The defendant also concedes, and the plaintiff accepts the concession as true, that the tool embodying the improvements has been used by the defendant in soldering fifty thousand tin cans.

In regard to the rule of law applicable generally to the case as to the construction which the jury are to give to the patents, it is not necessary for the court to make any extensive or elaborate explanation, be-

cause they will not be troubled with the consideration of any question as to their validity or as to the defendant's infringement; and it is only necessary for the court to read to the jury two prayers which the plaintiff has requested the court to give upon this branch of the case, and to say that the court adopts these prayers as containing a correct exposition of the law. The defendant concedes, also, that these prayers state the rule of law correctly.

In regard to the Barker patent, the plaintiff requests the court to give, and the court does give, this instruction: That the fifth claim of the Barker reissue patent is for a soldering apparatus consisting of a disk to melt and spread the solder, which disk is formed with a recess in its under side, to give room for the convex lid of the can and confine the soldering process to the outer edge of the lid, this disk being in combination with and mounted upon a rod movable independently of the disk, which rod holds the can-cap in place while the disk is moved down to the solder, and back and forth upon the solder, to melt and spread it evenly around the edge of the can-cap. And if the jury find that the defendant's soldering apparatus contains substantially such a disk mounted upon substantially such a rod, the disk and rod operating substantially in the same manner as described in plaintiff's patent and producing substantially the same results, the verdict must be for the plaintiff.

The second prayer is in regard to the Bostwick patent, and the plaintiff requests the court to give, and the court does give, this instruction: That the claim in the Bostwick patent is for a hollow soldering-iron having a handle and having its lower rim beveled, in combination with a rod located centrally within the hollow soldering-iron, to guide the soldering-iron properly to the cap to be soldered, and to hold the cap firmly till secured by the solder. And if the jury find that the defendant has used substantially such a soldering-iron and rod, combined and operated substantially as described in the Bostwick patent and producing substantially the same result, their verdict must be for the plaintiff. So upon the question of the validity of the patent, and also to the question of infringement, the jury will find a verdict for the plaintiff.

The more important question is the question of damages. It has been stated by the counsel that this is one of a number of cases, and that it is to be treated as a test case for the purpose of obtaining a judicial determination by a jury of a fair measure of damages for the infringement of the patents, in order that the verdict of the jury and the judgment of the court in this case may be used in obtaining settlements with other infringers and for ending other legal proceedings. Therefore it is necessary for the jury to consider very carefully what the damages are in this case, remembering that the public generally have some interest in the decision of the jury.

The jury will notice that the only evidence in the case upon the subject of damages is proof of what saving results in that part of the process of manufacturing canned goods which consists in fastening the cover by solder from the use of these ingenious inventions over the old process of using a soldering-iron. The plaintiff has produced evidence from persons familiar with the business and skilled in this manufacture, from which it appears that by the new process there is a saving of labor; that where by the old process a skilled workman could solder only 1,500 cans a day, under the new process a laborer less skilled can solder 4,000 cans a day, so that the actual saving resulting from diminished labor by the use of the new process over the old amounts, according to the plaintiff's computation, to $1.20 per 1,000 cans. There is also evidence that by the patented operation there is a saving of solder and less waste, and that where under the old process a pound of solder would be sufficient to seal or fasten only 80 cans, by the new process the same amount of solder will seal or fasten 150 or 160 cans. The plaintiff figures out, on this evidence, a saving of 75 cents per 1,000 cans in the quantity of solder used. Both together amount to $1.95 per 1,000 cans. The only evidence in the case is that which I have called your attention to, and that is all the evidence before you from which you can compute the damages to which the plaintiff is entitled for the infringement. It is frequently the case that a license-fee is established by the owner of a patent for the use of his invention, and that is ordinarily the basis upon which a jury estimates its verdict; but there is no evidence in this case of a license-fee ever having been established by the plaintiff for these patents or fixed by a court, and therefore the jury have no such evidence of that character to guide them. The jury have simply the saving which results from the use of the patented devices over the old process. Upon this evidence the jury are justified, if they see fit, in finding a verdict of $1.95 per 1,000 or $1.75 per 1,000, which was the amount suggested by the counsel for the plaintiff. There is no claim here that this amount should exceed $1.95 per 1,000 cans, and the jury therefore will be justified in finding that sum or any other less sum which they think would be a fair compensation to the plaintiff for the infringement of his rights as the owner of the patents. I will read to you the prayer which the plaintiff has asked the court to give. I am requested to instruct you that the jury are to award the plaintiff a sum equal to the actual damage caused by the infringement, and in forming their estimate of damages they are to consider as evidence of such damages the amount of profits or savings made by the defendant by the use of the infringing device over what the defendant could have made by the use of tools free and open to the public use; and I instruct you that in accordance with that prayer you are to award the plaintiff an amount equal to his damage, and you are to consider as evidence the gains or savings made by the defendant by the use of the patented device.

You are also to find the amount of the plaintiff's damages per 1,000 cans. The verdict which the clerk will hand to you will contain a memorandum of the number of cans on which the device has been used by the defendant—50,000—and you are to fill the blank with the amount which you find the damage to be per 1,000 cans.

The Official Gazette.

THE OFFICIAL GAZETTE is published every Tuesday, simultaneously with the weekly issue of patents. From January 1, 1872, (the commencement of its publication,) to June 30, 1883, it was published and bound in semi-annual volumes; since July 1, 1883, in quarterly volumes. All subscriptions must commence with the beginning of a volume; none taken for less than three months. Terms: To all subscribers within the United States and Canada, $5 per annum; to foreign subscribers, $7; single copies, 10 cents; bound semi-annual volumes, (prior to June 30, 1883,) full sheep, $4 per volume; bound quarterly volumes, (subsequent to July 1, 1883,) full sheep, $2.75 per volume. No club rates. *Payment in advance.* All orders should be addressed to "The Commissioner of Patents, Washington, D. C."

Indexes to Patents on Electricity.

Indexes to patents relating to electricity, covering the period of time from July 1, 1882, to June 30, 1887, have been issued, and are for sale. These indexes, arranged alphabetically, numerically, and by classes, comprise the following volumes, the prices of which are given below:

Vol. 1. Index to patents relating to electricity granted by the United States prior to June 30, 1881, with an appendix, July 1, 1881, to June 30, 1882. One volume, 250 pages. In paper covers, $3; bound, $5.

Vol. 2. Appendix No. 2, July 1, 1882, to June 30, 1883. One volume, 50 pages. In paper covers, $1.50.

Vol. 3. Appendix No. 3, July 1, 1883, to June 30, 1884. One volume, 60 pages. In paper covers, $1.50.

Vol. 4. Appendix No. 4, July 1, 1884, to June 30, 1885. One volume, 60 pages. In paper covers, $1.50.

Vol. 5. Appendix No. 5, July 1, 1885, to June 30, 1886. One volume, 54 pages. In paper covers, $1.50.

Vol. 6. Appendix No. 6, July 1, 1886, to June 30, 1887. One volume, 52 pages. In paper covers, $1.50.

Notice.

UNITED STATES PATENT OFFICE,
Washington, D. C., April 13, 1889.

To expedite the distribution of the mail in this Office, and to insure the prompt and certain delivery of communications to the divisions and officials having charge of the matters to which they relate, attorneys and correspondents are respectfully requested to enter upon the upper left-hand corner of amendments and other communications, if known to them, the number of the room and the name of the examiner or designation of the division to which the communication should be sent.

BENTON J. HALL,
Commissioner of Patents.

DESIGNS.

19,088.—BOTTLE-CASE.—*William Bettmann*, New York, N. Y., assignor to *Restorff & Bettmann*, same place. Application filed October 18, 1888. Serial No. 288,470. Term of patent 14 years.

19,089.—CARPET.—*Louis Clémencet*, West Hoboken, N. J., assignor to *The Bigelow Carpet Company*, Clinton, Mass. Application filed April 15, 1889. Serial No. 307,354. Term of patent 3½ years.

19,090.—ORNAMENTATION OF PISTOL-HANDLES.—*Gilbert H. Harrington* and *William A. Richardson*, Worcester, Mass. Application filed August 8, 1888. Serial No. 282,253. Term of patent 14 years.

19,091 to 19,094, inclusive.—FABRIC FOR CLOAKS, &c.—*Frank T. House*, Port Chester, N. Y., assignor to *The Hawthorne Woolen Mills*, Glenville, Conn. Applications filed April 10, 1889. Serial Nos. 306,717 to 306,720, inclusive. Term of patents 3½ years.

19,095 to 19,097, inclusive.—KNITTED FABRIC.—*George D. Kinsey*, Brooklyn, N. Y., assignor to *The Australian Knitting Company*, Paterson, N. J. Applications filed April 12, 1889. Serial Nos. 307,031 to 307,033, inclusive. Term of patents 7 years.

19,098.—KNITTED FABRIC.—*Peter S. Kinsey*, Newark, assignor to *The Australian Knitting Company*, Paterson, N. J. Application filed April 12, 1889. Serial No. 307,034. Term of patent 7 years.

19,099.—ORGAN-CASE.—*Louis H. Marston*, Chicago, Ill. Application filed March 1, 1889. Serial No. 301,707. Term of patent 3½ years.

19,100.—OPERA-GLASS RECEPTACLE.—*Joseph E. Neiswanger*, Chicago, Ill., assignor to *William J. Jefferson*, same place. Application filed March 11, 1889. Serial No. 302,903. Term of patent 7 years.

19,101.—BROOM-HOLDER.—*John St. John*, Bridgeport, Conn., assignor to *The Smith & Egge Manufacturing Company*, same place. Application filed February 6, 1889. Serial No. 298,904. Term of patent 7 years.

19,102.—WATCH CHARM OR PENDANT.—*Theodore B. Stayner*, Providence, R. I. Application filed April 12, 1889. Serial No. 307,035. Term of patent 3½ years.

19,103.—SMOKER'S SET.—*William S. Whiting*, Waterbury, Conn., assignor to *Charles F. Trott*, same place. Application filed January 28, 1889. Serial No. 297,832. Term of patent 7 years.

TRADE-MARKS.

[Certificates of registration of Trade-Marks numbered 8,191 and upward are registered under the act of March 3, 1881.]

16,561.—SMALL CARDS, BANNERS, PANELS, HANGERS, FANS, CALENDARS, AND THE LIKE.—*Cosack & Co.*, Buffalo, N. Y. Application filed February 21, 1889. Used since January 1, 1887.
"The letter 'B' inclosed in a diamond-shaped figure."

16,562.—SEWING-MACHINES AND THEIR PARTS AND ATTACHMENTS. *Demorest Fashion and Sewing Machine Company*, New York, N. Y. Application filed January 23, 1889. Used since December 1, 1888.
"The word 'COLUMBIA.'"

16,563.—SMOKING-TOBACCO.—*Fishburne Bros.*, Roanoke, Va. Application filed January 11, 1889. Used since 1879.
"The words 'GOLD LEAF,' in combination with an outspread leaf of the tobacco-plant, the said phrase 'GOLD LEAF' being invariably set horizontally above the said pictorial representation of an outspread leaf of the tobacco-plant, and the said pictorial representation being invariably set horizontally below said phrase."

16,564.—BITTERS.—*The Hochstadter Company*, New York, N. Y. Application filed February 18, 1889. Used since January 8, 1889.
"The figure of a woman in a sitting posture, having in her left hand a wine-glass and her right arm resting on a bottle bearing an outline of the label used."

16,565.—SOCKS AND STOCKINGS.—*August Kitz*, New York, N. Y. Application filed March 27, 1889. Used since December, 1888.
"The representation of an arrow."

16,566.—BLACK SOCKS AND STOCKINGS.—*August Kitz*, New York, N. Y. Application filed March 27, 1889. Used since December, 1888.
"The words 'MIDNIGHT DYE,' inclosed in a crescent and the words 'GUARANTEED ABSOLUTELY FAST & STAINLESS.'"

16,567.—SOCKS AND STOCKINGS.—*August Kitz*, New York, N. Y. Application filed March 27, 1889. Used since December, 1888.
"The representation of a star with letter 'D' inside the same, and beneath said star the words 'MIDNIGHT DYE.'"

16,568.—EXTRACTS AND ESSENCES OF MEATS.—*John Lawson Johnston*, London, England. Application filed February 26, 1889. Used since November 2, 1886.
"The word 'BOVRIL.'"

16,569.—PERFUMERY.—*Ladd & Coffin*, New York, N. Y. Application filed March 16, 1889. Used since 1849.
"The word 'LUNDBORG.'"

16,570.—TOBACCO OF ALL KINDS, INCLUDING CIGARETTES.—*Joseph Meyer*, London, England. Application filed February 25, 1887. Used since 1870.
"The representation of two pyramids and a sphinx."

16,571.—REMEDIES FOR CHICKEN DISEASES.—*William F. Muchmore*, Morristown, N. J. Application filed March 22, 1889. Used since August 1, 1888.
"The word 'CHICKDUCKATURK.'"

16,572.—SOAP-POWDER.—*Rutherford & Barnes*, Brooklyn, N. Y. Application filed March 14, 1889. Used since March 1, 1889.
"The representation of a shield having a globe produced thereon, a crown surmounting the shield, and branches at each side of the shield."

16,573.—LOZENGES.—*A. Slauson & Co.*, New York, N. Y. Application filed March 9, 1889. Used since August 25, 1886.
"The word 'MEDALLION.'"

16,574.—LIQUID FOR HEALING BURNS AND FLESH WOUNDS.—*Henry Carl von der Lühe*, Brooklyn, N. Y. Application filed March 19, 1889. Used since January 1, 1888.
"The representation of a salamander in the central field of two concentric broad bands inclosing an annular or segmental space."

16,575.—[Withdrawn.]

16,576.—COMPLEXION-POWDER.—*Bettie L. Binford*, Topeka, Kans. Application filed January 24, 1889. Used since July, 1887.
"The words 'LA MARGUERITE.'"

16,577.—MEDICAL COMPOUND FOR ALL NERVOUS AND INFLAMMATORY DISEASES.—*Joseph Winslow Bird*, Millville, Ind. Application filed January 3, 1889. Used since August, 1887.
"The words 'DR. BOOTH'S.'"

16,578.—ALKALOIDS MADE FROM THE CALABAR-BEAN.—*C. F. Boehringer & Soehne*, Waldhof, near Mannheim, Germany. Application filed March 16, 1889. Used since April, 1888.
"The word 'ESERIDINE.'"

16,579.—FLOUR.—*Bourne, Graham & Fell*, London, England, and New York, N. Y. Application filed March 23, 1889. Used since March 20, 1889.
"The words 'LA FAMA.'"

16,580.—SHEET-METAL ROOFING.—*Caldwell & Peterson Manufacturing Company*, Wheeling, W. Va. Application filed March 23, 1889. Used since January 1, 1889.
"The words 'PEEPING ROOFERS.'"

16,581.—CACHOUX.—*Thomas Jackson*, Manchester, county of Lancaster, England. Application filed March 21, 1889. Used since 1849.
"The initials and words 'H. R. H. PRINCE ALBERT'S.'"

16,582.—CIGARS, CIGARETTES, AND CHEROOTS.—*L. Kahner & Co.*, New York, N. Y. Application filed March 5, 1889. Used since January 1, 1886.
"The words 'THE OLD OAKEN BUCKET.'"

16,583.—BRANDY.—*Edward Kane & Son*, Brooklyn, N. Y. Application filed December 13, 1888. Used since January 1, 1885.
"The representation of a series of three French coins arranged to touch circumferentially and to form a triangular figure upon a gold ground."

16,584.—RHEUMATIC REMEDIES.—*John Lloyd*, Wyoming, Pa. Application filed April 13, 1889. Used since February 20, 1889.
"The word 'RELAXOR.'"

16,585.—CONDENSED PUDDINGS.—*S. Elwood May*, Nyack, N. Y. Application filed February 8, 1889. Used since October 23, 1888.
"The three letters 'U F P.'"

16,586.—STONEWARE LAUNDRY TUBS AND SINKS.—*Henry McShane & Co.*, Brooklyn, N. Y. Application filed March 21, 1889. Used since October 11, 1886.
"The word 'CROWN' or the representation of a crown."

16,587.—COUGH-MEDICINE.—*The Piperine Medicine Co.*, Racine, Wis. Application filed March 23, 1889. Used since February, 1887.
"The word 'PIPERINE.'"

16,588.—REMEDIES FOR RHEUMATISM.—*Rumalto Manufacturing Co.*, Cleveland, Ohio. Application filed April 12, 1889. Used since April 4, 1889.
"The word 'RUMALTO.'"

16,589.—MEDICAL COMPOUND FOR THE CURE OF SNAKE-BITES.—*Howell Marshall Strange*, Beaver Valley, Ala. Application filed March 27, 1889. Used since January, 1887.
"The words 'SIC SEMPER SERPENTIBUS' associated with a representation of the Goddess of Liberty."

16,590.—RHEUMATIC REMEDIES.—*Dr. J. G. Wannamaker Manufacturing Company*, Orangeburg, S. C. Application filed March 16, 1889. Used since February 1, 1889.
"The word 'COHOSHINE.'"

LABELS.

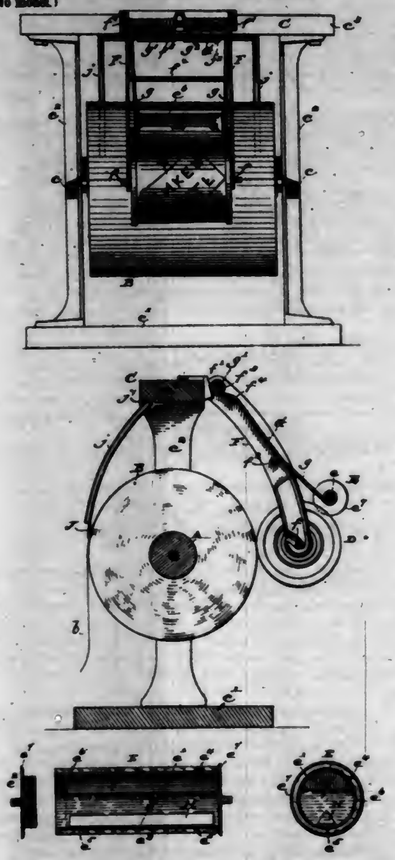
5,905.—Title: "IRWIN'S POKE ROOT POWDERS."—*Barnett & Jones*, Atlantic, Iowa. Application filed April 22, 1889.

5,906.—Title: "HUNGARIAN OINTMENT."—*Charles A. Kish*, Chester, Pa. Application filed April 22, 1889.

5,907.—Title: "LIGHT WEIGHT STEEL FRAME PIANO."—*Albert Riley*, New York, N. Y. Application filed April 10, 1889.

DISCLAIMER.

248,930.—*Charles F. Henis*, Philadelphia, Pa. Patent dated November 1, 1881. IMPROVEMENT IN DISINTEGRATOR AND STRAINER. Disclaimer filed May 9, 1889, by *Thomas D. Mowlds*, executor of said *Henis*, deceased.



Enters his disclaimer to claim 2 of said patent, which is in the following words:

"2. In a disintegrator and strainer, the combination of a perforated cup or receptacle, a handle fixed thereto, and a handle pivoted to the receptacle and carrying a pressing-plate adapted to be vibrated therein or entirely withdrawn therefrom, substantially as set forth."

PATENTS

GRANTED MAY 14, 1889.

403,082. PRINTING DEVICE. STEPHEN G. ADAMS and CHARLES L. LEONARD, St. Louis, Mo. Filed May 7, 1888. Serial No. 273,040. (No model.)

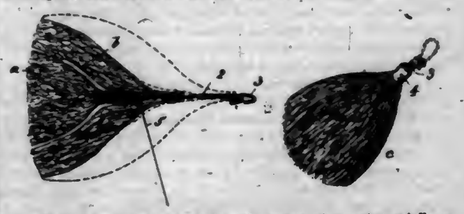
Claim.—1. In a printing device, the hollow inking-roller E, having the circumferential outstanding flanges e^2 at its ends, closed at one end by the screw plug or stopper e^3, provided with a single longitudinal line of perforations, e^4, surrounded by the cloth e^5, which does not stand out quite as far as the flanges from the surface of the roller, and the interior loose bar, H, having a cross-section in the shape of an equilateral triangle, substantially as specified.

2. The herein-described printing device, composed of the frame C, having the base c', uprights c^2, and top plate or bar, c^3, the paper-roller A, journaled in bearings in the uprights c^2, the arm F, hinged to one side of the top plate and having the cross-bars f^3 and f^4, the coiled spring G, having the arms g, the inking-roller E, journaled in eyes in the ends of said arms, and the form-bearing roller D, journaled in the ends of the arm F, substantially as specified.

403,083. DRILL-CHUCK. MOSES L. ANDREW, Delhi, Ohio. Filed Feb. 14, 1889. Serial No. 299,853. (No model.)

Claim.—1. In a drill-chuck, the combination of the bit-holding head, the set-pin fitted to slide in said head, a screw-cap fitted over said head and pin, and a flaring ring within said cap to force the pin inward and clamp the bit-shank, substantially as set forth.

2. The combination, substantially as specified, of head A^2, having screw-threaded part a^3, inclined part a, and reduced end a', the said part a being perforated, as shown, the pin C, fitted to slide in said perforation, the ring E, fitted upon part a' and having its end flaring counter to part a of the head, and the screw-cap B, fitting over the reduced part a' and screw-threaded interiorly to engage the thread upon the head A^2, for the purpose set forth.

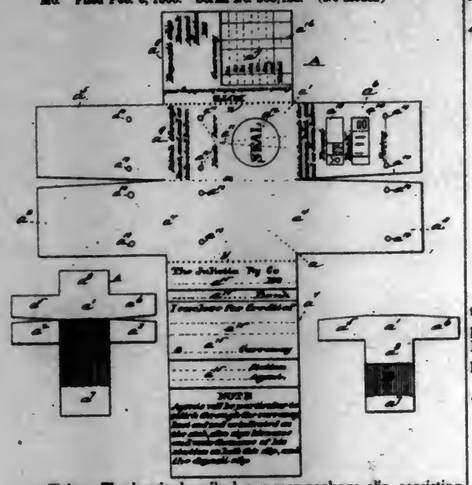


3. The combination, substantially as specified, of the chuck-head screw-threaded exteriorly and inclined at a, the pin c, fitted to slide through said inclined part, a spring having one end secured to the head and the opposite end secured to said pin, a flaring ring counter to the inclined part of the head, and a screw-cap to force said ring upon the pin for the purpose of securing the bit in the chuck.

4. In a lathe-chuck, substantially as described, the combination of the bushing F, adapted to fit the bore of said chuck and slotted upon one side, the latch F, fitted to play in said slot and hinged to the bushing, and a set-pin to force the latch inward, for the purpose set forth.

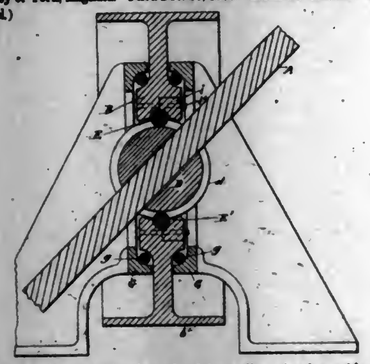
5. The combination of a chuck-head and a set-pin fitted to slide through said head, and means, such as shown, to force the pin inward and release the same, with a bushing having a hinged spring-latch, and a bit-shank having a flattened and inclined side upon which the latch presses and locks the bit against withdrawal when the set-pin is forced in, substantially as hereinbefore set forth.

6. The herein-described bushing for drill-chucks, consisting of the cylindrical shell F, having the outwardly-projecting flange f and slotted upon one side, the latch F, having the lug f', the pin f^2, passing through the flange f, and lug f', hinging the latch to the shell, substantially as specified.



403,084. PLUME. WILLIAM P. BARNES, Florence, Mass. Filed Aug. 13, 1888. Serial No. 282,634. (No model.)

Claim.—1. A plume consisting of a center piece, substantially as described, having several successive tufts of wool, one above the other, secured thereto by a winding-wire, the outer one of said tufts enveloping the inner ones, but all having the same terminal length, substantially as set forth.

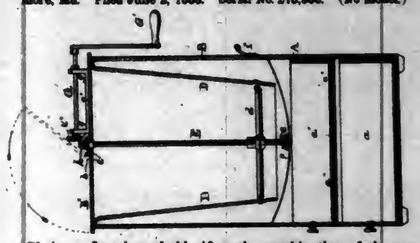


2. A plume consisting of a center of twisted wires, one of which wires has a hook formed on one end thereof, and several successive tufts of wool, one above the other, secured thereto by a winding-wire, substantially as set forth.

403,085. CURRENCY-PACKAGE. ENRIQUE S. BARRERAS, Kirkwood, assignor to the Buxton & Skinner Stationery Company, St. Louis, Mo. Filed Feb. 6, 1888. Serial No. 263,122. (No model.)

Claim.—The herein-described currency-package clip, consisting of the top and bottom parts adapted to be folded, and provided, respectively, with the laps and with the coupons, substantially as set forth.

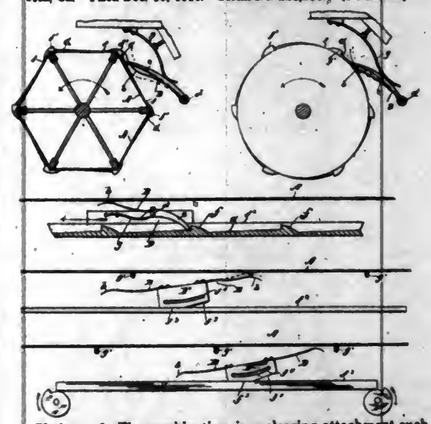
403,086. DRIVE-PULLEY. WILLIAM H. BLENKLEY, Harrogate, County of York, England. Filed Dec. 20, 1888. Serial No. 294,213. (No model.)



Claim.—1. The combination of a drive-pulley, circular guides or bearings encircling and supporting the outside of the pulley-hub, an axle provided with a spherical boss inside said pulley-hub, and permitting the plane of rotation of the pulley and the axis of rotation of the axle to be varied with reference to each other, and one or more balls interposed between the said boss and hub and engaging with both in the direction of rotation, thereby causing the said pulley and axle to revolve simultaneously.

2. The combination, with a drive-pulley having a spherical cavity in its hub, of an axle provided with a spherical boss fitting within said cavity, one of the said elements being provided with one or more curved lateral grooves, and the other element being provided with one or more square flat-bottomed receptacles, and a ball fitting into each receptacle and engaging with one of the said grooves, thereby causing the simultaneous revolution of the axle and pulley and permitting the plane of rotation of the pulley and the axis of rotation of the axle to be varied with reference to each other.

3. The combination, with a drive-pulley having a spherical cavity, and one or more curved lateral grooves in its hub, of an axle provided with a spherical boss having one or more square flat-bottomed receptacles in it, and a ball fitting into each receptacle and engaging with the corresponding groove in the hub, substantially as and for the purpose set forth.



4. The combination, with a drive-pulley having a spherical cavity in its hub, and an axle provided with a spherical boss fitting within the said cavity, of one or more balls interposed between said boss and hub and engaging with both in the direction of rotation, thereby causing the axle and pulley to revolve together, and a ball-bearing for the said pulley to revolve in, substantially as and for the purpose set forth.

403,087. HOUSEHOLD SIFTER. HENRY S. BREWINGTON, Baltimore, Md. Filed June 2, 1888. Serial No. 275,886. (No model.)

Claim.—In a household sifter, the combination of the case A, the drawers *a a'*, the revolving case B, the open bottom pot, D, the perforated revolving plate *d*, shaft E, and operative gearing, the lid B', having the knob *b'*, and standards C, substantially as and for the purpose described.

403,088. BOLTING-CLOTH CLEANER. GEORGE S. BURNAP, Marietta, Ga. Filed Dec. 10, 1886. Serial No. 221,216. (No model.)

Claim.—1. The combination, in a cleaning attachment such as described and with the bolting material, a tilting traveling carriage provided with two sets of flexible rods or whippers and reversed bearings, ways co-operating with said bearings to maintain the whippers in position and guide the carriage, and devices, substantially such as described, acting upon the carriage to reciprocate and tilt the latter to bring each set of whippers into operative position alternately, substantially as described.

2. In combination with a flat bolting-surface, a reciprocating carriage supported upon ways and provided with one or more flexible rods or whippers held removed from the bolting-surface, ribs or projections engaging said rod or rods as they are reciprocated to set the latter in vibration, and cams acting upon the ways to elevate the carriage, substantially as described.

3. In combination with a horizontal bolting-surface, a reciprocating carriage supporting two sets of flexible whippers, guiding-plates having reversed inclines or bearings resting upon ways, and an endless belt at each end of the carriage, provided with a crank carrying a pin for engaging and tilting the carriage at the opposite ends of the bolt to alternately bring the whippers into operative position, substantially as described.

4. In combination with the traveling carriage, its two sets of whippers and the reversed bearings, the ways, the lifting-cams, the two endless belts, the arms on said belts, and the links connecting said arms to the carriage, substantially as described.

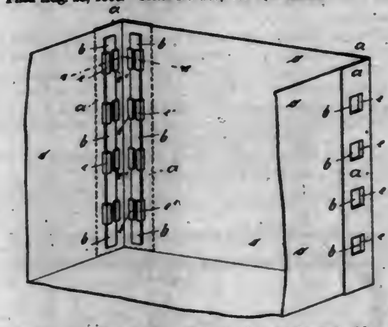
5. In combination with a horizontal bolting-surface, a reciprocating carriage provided with a flexible rod or whipper whose free end is held in proximity to the bolting-surface, ways upon which said carriage is guided, and ribs or projections engaging said flexible rod to set the latter in vibration and cause it while vibrating to impinge against the bolting material, substantially as described.

6. In combination with a horizontally-disposed bolting-surface, a reciprocating carriage supported upon ways, a flexible rod or whipper mounted upon the carriage, ribs or projections engaging said rod to set the latter in vibration, and inclines or cams operating upon the carriage to gradually advance the latter toward the bolting-surface while the rod is vibrating, substantially as described.

7. The combination, with a bolting-surface, of a reciprocating carriage or support, a flexible whipper mounted thereon, its freely-vibrating portion normally supported in proximity to but removed from the bolting-surface, and devices, substantially as indicated, connected to the support on which the whippers are carried for advancing the latter toward the bolting-surface while vibrating, substantially as described.

8. The combination, with a bolting-surface and an endless belt or chain supported upon pulleys, of a reciprocating cleaning attachment attached to the said belt or chain on the inner side thereof at a distance substantially equal to the radius of the pulleys, substantially as and for the purpose set forth.

9. In combination with a bolting-surface, an endless belt surrounding supports located at the ends of the bolting-section, and a cleaning attachment mounted to reciprocate beneath the bolting-surface, said attachment being pivotally connected to the traveling belt at a point below the upper line of bolting, substantially as described, whereby the cleaning attachment will be caused to traverse back and forth and in substantially the same plane beneath the bolting-surface, as set forth.



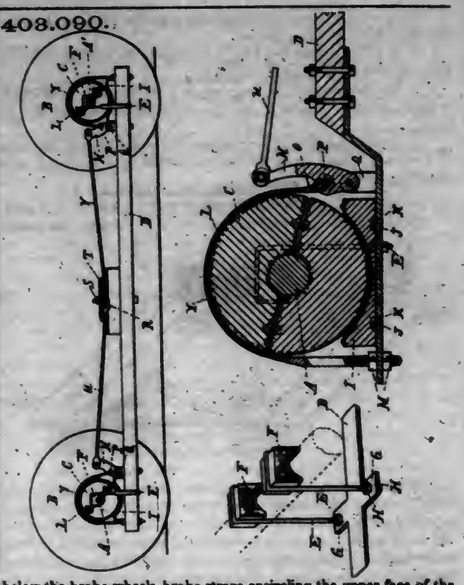
10. In combination, with a bolting-surface and a flexible vibrating rod held in proximity thereto, a reciprocating support upon which said rod is mounted for advancing the latter toward the bolting material as the vibrations of the rod diminish in length, substantially as described.

11. In combination with a bolting-surface and a vibrating flexible rod or whipper, a laterally-movable support for said whipper, and devices, such as described, engaging the whipper to set it in vibration, substantially as described.

12. In combination with a bolting-surface, a carriage reciprocating in a plane substantially parallel with said bolting-surface, and vibrating whippers mounted upon said reciprocating carriage in proximity to the bolting-surface.

13. In combination with a bolting-surface, a carriage reciprocating in a plane substantially parallel with the bolting-surface, and two series of vibrating whippers mounted upon said reciprocating carriage, one series operating alternately with the other as the carriage is reciprocated, substantially as described.

408,089. COLLAPSIBLE BOX. LEOPOLD CASPER, Berlin, Germany. Filed Aug. 25, 1888. Serial No. 283,779. (No model.)



Claim.—A collapsible card-box having perforated side walls, *c*, and provided with edge-joinings *a*, having separated hooks *c c'*, arranged parallel and opposite to each other, passing through the perforations and secured by the metal strips *b*, which close the openings of the side walls, for the purpose as described.

408,090. CAR-BRAKE. GEORGE COLLIN, Detroit, Mich. Filed Oct. 29, 1888. Serial No. 289,379. (No model.)

Claim.—1. The combination, with a pair of brake-wheels secured upon the front and rear axles, respectively, of a brake-beam risingly and fallingly supported below such brake-wheels, brake-shoes supported upon the ends of the brake-beams below the brake-wheels, brake-straps encircling the upper face of each brake-wheel and having one end secured to the end of the brake-beams, and levers controlled by the brake mechanism pivotally secured near the ends of the brake-beams and having the free ends of the brake-strap secured thereto, substantially as described.

2. The combination, in a car-brake, of the brake-wheels secured to the front and rear axles, respectively, a brake-beam risingly and fallingly supported by means of hangers from the axles of the car, brake-shoes slidingly supported upon the ends of the brake-beams

408,090.

below the brake-wheels, brake-straps encircling the upper face of the brake-wheels and having one end secured to the ends of the brake-beams, and levers N, operated by the brake mechanism, pivotally secured near the ends of the brake-beams and having the other end of the brake-strap secured thereto, substantially as described.

3. In a car-brake, the combination, with the front and rear axles having brake-wheels secured thereon, of a brake-beam risingly and fallingly supported below such brake-wheels and carrying brake-shoes slidingly secured thereon, and the brake mechanism for vertically operating such brake-beam, substantially as described.

4. The combination, with the front and rear axles of a car having brake-wheels secured thereon, of a brake-beam loosely supported from the axles below the brake-wheels and provided with brake-shoes on the under side of the brake-wheels, a brake-strap encircling the upper face of the brake-wheels, and secured at one end to the outer end of the brake-beam and its other end to the power-lever, pivotally secured to the brake-beam and actuated by the brake mechanism, substantially as described.

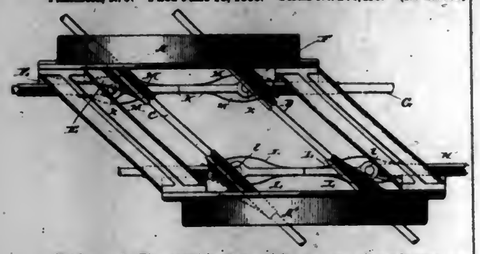
5. In a car-brake, the combination of the brake-beam with the hangers E loosely supporting such brake-beam from the axles, the brake-shoes I, slidingly supported upon the ends of the brake-beam, and the levers N, pivotally secured to the ends of the brake-beam and operated by the braking mechanism to the straps L, encircling the upper face of the brake-wheels and adjustably secured to the outer ends of the brake-beam, and provided at the inner ends with eyes pivotally secured to the levers N, substantially as described.

6. In a car-brake, the combination, with the front and rear axles having the brake-wheels C secured thereon, the brake-beam D, extending below the brake-wheels and constructed in two parts, with the central part above the plane of the outer ends, the brake-shoe I, slidingly supported upon the outer ends of the brake-beams by means of pins J and slots K, the hangers E, loosely supporting the brake-beam from the axles, the bearings F, upon which said hangers engage, the levers N, pivotally secured near the ends of the brake-beams, the straps L, secured at one end to the outer ends of the brake-beams and pivotally connected at their inner ends to the levers N, the brake-lever R, pivotally secured to the brake-beam, and the brake-rods U and V, connecting the brake-levers with the levers N, substantially as described.

408,091. CARRIAGE-BOW. JAMES C. COSS, Cleveland, Ohio. Filed Mar. 5, 1888. Serial No. 301,536. (No model.)

Claim.—1. The within-described bow-socket, consisting of the tube A, the tube B fitted therein, and the slat-iron C, substantially as shown.

2. The within-described bow-socket, consisting of two tubes, one tube being fitted within the other, and the slat-iron, substantially as shown.

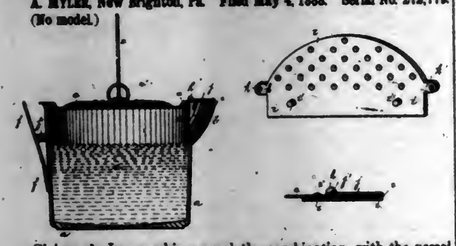


3. In a bow-socket, the double tube, one tube being fitted within the other, substantially as shown.

4. In a bow-socket, the tube B, having the slit *b*, in combination with the tube A, substantially as shown.

5. The combination, in a carriage-bow, of the tube A, the tube B, fitted within the tube A, and the short bow D, substantially as shown.

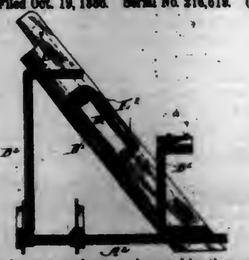
6. The combination, in a carriage-bow, of the tube A, the tube B, fitted within the tube A, the slat-iron C, and the short bow D, substantially as shown.



408,092. CONNECTOR FOR ELECTRIC RAILWAYS. LEO DAFT, Plainfield, N. J. Filed June 18, 1888. Serial No. 277,433. (No model.)

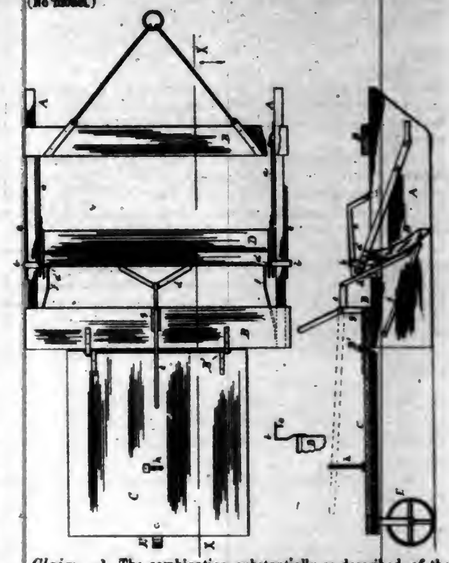
Claim.—1. The combination, with two sets of conductors arranged to cross each other at an angle, of a connector consisting, essentially, of a frame, supporting-arms connected to the frame for one set of conductors, and jaws connected to the frame for another set of conductors, and hinged arms connected to the jaws permitting the passage of the collector, substantially as described.

2. In a cross-connector for electric circuits, the combination, with the jaws connected to the terminals of the circuit, of hinged arms connected to the jaws, and springs arranged to maintain the arms in alignment with the jaws, substantially as described.



408,093. COOKING-VESSEL. EDWARD I. DAWES and WILLIAM A. MYLER, New Brighton, Pa. Filed May 4, 1888. Serial No. 272,779. (No model.)

Claim.—1. In a cooking-vessel, the combination, with the vessel having a pouring lip or spout, of the circular sheet-metal cover and the malleable-iron strainer extending over said pouring-spout, said strainer being secured to said sheet-metal cover, substantially as and for the purposes set forth.

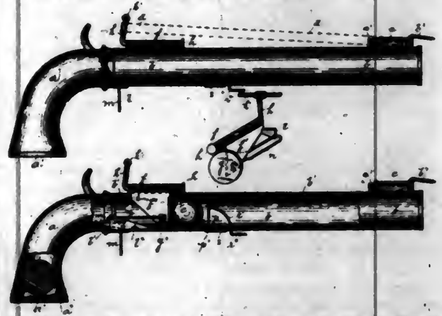


2. In a cooking-vessel, the combination, with the vessel, of a circular sheet-metal cover, a malleable-iron strainer secured thereto and having perforated wings cast thereon, and the flap journaled within said wings, the wings being turned up over pins or bearings on the flap, substantially as and for the purposes set forth.

408,094. HARVESTER ELEVATOR-FRAME. JAMES R. DEERING, Evanston, Ill. Filed Oct. 19, 1886. Serial No. 216,619. (No model.)

Claim.—In a harvester-elevator, in combination with the elevator-frame and the canvas-slides, a metallic sheet-lining located interiorly to the frame and exteriorly to the canvas-slides and secured by bolts passing through the supporting-posts of the frame and through the canvas-slides, substantially as set forth.

408,095. EARTH-LEVELING SCRAPER. DENNIS M. [illegible] and HIRAM W. CHILDS, Acampo, Cal. Filed June 8, 1888. Serial No. 276,541. (No model.)



Claim.—1. The combination, substantially as described, of the sled-frame with a suitable draft attachment, the scraper D, the iron straps *a*, with bifurcated perforated upper ends, the Γ-shaped straps *b*, the detachable pins *a'*, the adjustable yokes *c*, the platform C, hinged to the rear of the rear bar B and provided with the supporting-wheel E, and a suitable lever for raising and lowering the blade D.

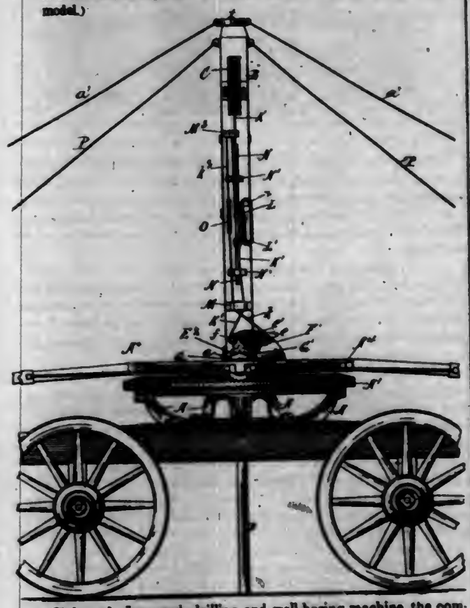
2. The combination, substantially as described, of a sled and frame, a scraper-blade suitably attached transversely of such frame between the sled-runners, a platform hinged to the rear of the sled-frame and supported at its rear by a pivot-wheel, a lever suitably attached to the scraper-blade and having its fulcrum at the rear of the sled-frame.

3. The combination, substantially as described, of the platform C and the hook-shaped post *h*, attached to the platform C, the sled and frame A B B, hinged to the platform C, and the scraper-blade D, suitably attached between the sled-runners A and provided with the controlling-lever mechanism, composed of the forked iron rod *d*, the lever *e*, and the fulcrum-post *g*.

408,096. SPRING-GUN. JACOB D. EGLER, Pittsburg, Pa. Filed Oct. 19, 1888. Serial No. 288,534. (No model.)

Claim.—1. In a marble-gun, the combination of a barrel having a slot extending along the top thereof and a buffer or elastic cushion at the forward end of the barrel, and an ejector fitting within the barrel and slot and having a bumper above the barrel adapted to strike against said buffer, substantially as and for the purposes set forth.

2. In a marble-gun, the combination of a barrel having a slot extending along the top thereof and a buffer having an elastic cushion on its face, an ejector fitting within the barrel and having a bumper or shoulder above the barrel adapted to strike against the cushion of said buffer, and an elastic-band connection between said ejector and the forward end of the barrel, substantially as and for the purposes set forth.



3. In a marble-gun, the combination, with the barrel having a slot extending along the top thereof, of the skeleton ejector *f*, fitting in said barrel and slot and provided with the longitudinally-extending body *f'*, having the circular disk *g*, forming an ejecting-face at the forward end, the shoulder *i* at the rear end, and the arm *k* above the barrel, and the elastic band connecting the arm *k* with the forward end of the barrel, substantially as and for the purposes set forth.

4. In a marble-gun, the combination, with the barrel having the slot extending along the top thereof and having a trigger, of the ejector fitting in said barrel and slot and provided with the body *f'*, having the ejecting-face *g* at the forward end thereof, the spring-loop *n*, engaging with said trigger and the arm *k* above the barrel, and the elastic band connecting said arm with the forward end of the barrel, substantially as and for the purposes set forth.

5. In marble-guns, the barrel *b*, having the ball-retainer *p*, hinged at its rear end to the base of the barrel and extending up into the same in the course of the ejector and provided with means for holding it in such position, but so as to be forced down when the ball is discharged, substantially as and for the purposes set forth.

6. In marble-guns, the combination, with the barrel, of the trigger formed of the triangular piece *l*, bent up so as to form parallel faces or guideways and having the inclined edges l^3 and shoulder l^4, the elbow-piece *m*, fitting between the parallel faces of said piece *l*, and the ejector mechanism within the barrel, substantially as and for the purposes set forth.

408,097. MACHINE FOR WELL-BORING AND DRILLING. CHAS. S. GARDNER, Chicago, Ill. Filed Apr. 12, 1888. Serial No. 270,477. (No model.)

Claim.—1. In a rock-drilling and well-boring machine, the combination of a vertical pivot-casting with a central vertical aperture, a horizontal circular cogged trackway, a hub-casting, with two spokes to revolve about said pivot, a frame bolted to the ends of said spokes, beams secured upon said hub by hinges and fastened together at their other ends by a cap-piece with a central aperture, a pulley secured near the end of one of said beams farthest from the hub, a shaft for drill or auger, a cord secured to said shaft and passing over said pulley, a windlass secured in said frame and furnished with lugs at right angles to its inner end, on which fingers may be fixed, an eccentric furnished with a lug at right angles to said lugs and fingers, and connected with the drill-shaft by cords passing over said pulley, an eccentric-wheel within said eccentric, and levers for the application of power, all secured upon the trucks of a wagon, for the purposes stated.

2. In a rock-drilling and well-boring machine, substantially as described, the combination of the hollow pivot A^9, the ring A^5 encircling it, the circular trackway A', the hub A^2, provided with two spokes, the frame A^4, bolted to the ends of said spokes, the horizontal shafts E and H, journaled in said frame and hub, the beveled pinions E^2 and H', secured on shaft so as to revolve in said trackway, the beams B, hinged upon said hub and held together at their ends by a cap-piece, and provided with the guides I' on their inner faces, the guy-ropes P and *a'*, secured to said cap-piece, the drill and auger shaft D, the weight I, provided with flanges to move in said guides, the cross-head J, the screw-threaded rods *i*, secured in said weight and in said cross-head, and levers for the application of power secured in the frame A^4, all secured upon the trucks of a wagon, as and for the purposes stated.

3. In a well-boring and rock-drilling machine, substantially as described, the combination of the eccentric-wheel F, keyed on the shaft E, against the inner end of the windlass E', the eccentric F', grooved on its outer edge and having at its upper corner the lug *f*, extending at right angles to its outer face, the windlass E', provided with the lugs *e*, extending from its inner end at right angles to its length, the finger-pieces *e'*, fitting on said lugs, the spring O, the rod N, moving in guides secured to the beam B, and furnished with the hooks L and L', the cord *k*, secured to the lower corner of said eccentric and passing about it and under said pulley and secured to the lower end of said spring, the pulleys M, M', and M^4, pivoted on said beam, the cord K', secured to the upper corner of said eccentric, passing about the pulley M and secured to the hook L', the cord *k*, secured to the upper end of said spring and passing over the pulley M^3 and secured to the hook L, and the cord K, secured to the cross-head J, passing over the pulley C, and secured to the hook L, as and for the purposes stated.

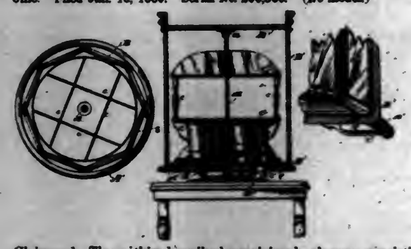
4. In a rock-drilling and well-boring machine, substantially as described, the combination of the anti-friction rollers a^6, the ring A^5, having said rollers pivoted to it at its periphery, the pivot-casting A^9, furnishing a trackway for said rollers, and the hub-casting A^2, resting on said rollers, substantially as stated.

5. In a rock-drilling and well-boring machine, substantially as described, the weight I, furnished with flanges to move in guides I' on the inner sides of the beams B, having an opening for the passage of the drill and auger shaft D, fitted with the rods *i*, rigidly secured to its upper part, in combination with the cross-head J above the head of said shaft, as and for the purpose stated.

6. In a well-boring and rock-drilling machine, substantially as described, the combination of the pinion H', rigidly secured on the shaft H, the gear-wheel H^2, secured to the pinion H', the gear-wheel A, keyed on the shaft A', and having a diameter equal to an aliquot part of the diameter of wheel H^2, the gear-wheel H^3, keyed on said shaft and being of equal diameter with wheel H^2, the gear-wheel A^3, pivoted on the shaft H and having a diameter equal to that of wheel A, the balance-wheel H^4, rigid with the wheel A^3 and pivoted on the shaft H, and having its hub pierced with a hole for a set-screw, as and for the purposes specified.

7. In a well-boring and rock-drilling machine, substantially as described, the combination of the shaft E, the worm G, the worm-wheel G', the eccentric-wheel F, the grooved eccentric F', having at its outer edge the lug *f*, the windlass E', having on the periphery of its inner end the lugs *e*, and the finger-pieces *e'*, made to fit upon said lugs, as and for the purpose specified.

408,098. FRICTION-CLUTCH. GEORGE L. GERHARD, Reading, Pa. Filed Nov. 10, 1888. Serial No. 290,490. (No model.)

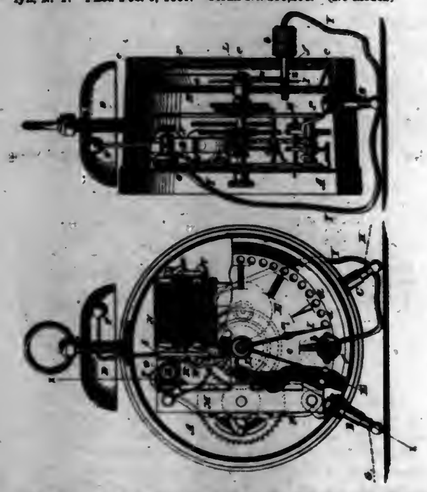


Claim.—1. In a clutch of the class described, the combination, with independent shafts 1 and 2, of the pulley 5, having the hub 6, fixed to the shaft 1 and formed with the flange 8, the clutch-pulley 9, mounted upon the shaft 2, and having the flanges 11 and 14, perforated, as at 12 and 13, and having the segments 15, provided with pins passing through the openings 12, and with perforated lugs 23, and of the sliding sleeve 19, mounted upon the gib 18 of the shaft 2, and the bearing-lugs 21, and toggle-links 22, connecting the lugs 21 and 23, substantially as specified.

2. The shaft 1, having the pulley 5, formed with the hub 6, and set-nut 7, and the peripheral flange 8, in combination with the shaft 2, having the gib 18, and the fixed clutch-pulley 9, having the flanges 11 and 14, perforated, as at 12 and 13, the segments 15, having pins 16, passing through openings 12, and having lugs 23, passing through openings 13, and provided with one member of a toggle-link, 22, and

the sliding collar 19, having the annular groove 20, mounted on the shaft 2, and having opposite lugs, 21, and provided with the opposite member of the toggle-link, each of said members having oppositely-disposed screw-threads, and an oppositely-threaded adjusting-sleeve for connecting said members, substantially as and for the purpose specified.

403,099. REVOLVING BOOK-CASE. CURTIS GODDARD, Alliance, Ohio. Filed Jan. 16, 1889. Serial No. 296,508. (No model.)

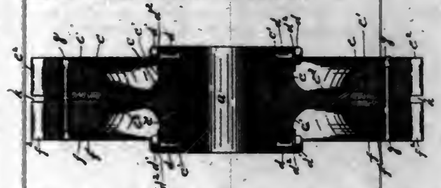


Claim.—1. The within-described revolving book-case, consisting of the central standard, A, secured to the base A', provided with the rail *a'*, the stationary case B', provided with a solid top cover, B, secured to the top of the standard A, and the door *b*, the bottom of the case having an opening adapted to receive and fit the lower revolving shelf, the inclosed revolving shelves C, with supports *c*, the casters E, attached to the lower revolving shelf, and the circular hand-rail C', secured to the lower shelf, C, by means of the arms *c'*, so placed as to extend said hand-rail beyond the outer edges of the exterior case, B, substantially as shown.

2. In a revolving book-case, the combination of the central standard, A, the stationary case B', having the solid cover B secured to the standard A, and the door *b*, the bottom of the case having an opening adapted to fit the lower shelf, the inclosed revolving shelves C, and means for revolving the shelves, consisting of the hand-rail C', secured thereto by the arms *c'*, substantially as shown.

3. The combination, in a revolving book-case, of the base A', supporting the central standard, A, the stationary case B', having the solid cover B secured to the standard A, and an opening in its bottom adapted to fit the lower revolving shelf, the inclosed revolving shelves, and the hand-rail C', secured to the lower shelf by the arms *c'*, substantially as shown.

403,100. ELECTRIC ALARM-CLOCK. THOMAS H. GRADY, Brooklyn, N. Y. Filed Feb. 9, 1889. Serial No. 299,291. (No model.)



Claim.—1. In an electric alarm-clock, the dial of non-conducting material provided with the line of apertures, and the revoluble transparent face provided with an aperture in position to be brought over any one of the apertures in the dial, combined with the movable plug connected with the conductor from the electro-magnets and adapted to be inserted through said apertures, the vibrating armature connected with the bell-hammer and arranged between the electro-magnets and the back contact, the latter being in connection with one wire of the battery, and a hand upon the clock forming a conductor through the clock mechanism to the other wire of the battery and adapted during its travel to come into contact with the plug in said apertures, substantially as set forth.

2. In an electric alarm-clock, the dial of non-conducting material provided with the line of apertures, and the transparent revoluble face provided with an aperture in position to be brought over any one of the apertures in the dial, combined with a movable plug adapted to be inserted through said apertures in the desired position, and a hand traversing the dial and of a length to be arrested by contact with said plug, the hand and plug forming the terminals of the electric circuit in which the alarm-hammer is connected with the vibrating armature, substantially as set forth.

3. In an electric alarm-clock, the hammer and bell, the dial having the series of apertures, and the transparent face having an aperture in line with the apertures in the dial, combined with the movable plug adapted for insertion into said apertures, the hand traversing said dial and of a length to be arrested by said plug, and an electric circuit of which said hand and plug are the terminals, and in which the armature is connected with the said hammer, substantially as set forth.

4. An alarm-clock having its bell-hammer connected with the armature in an electric circuit, and a dial having a series of apertures, combined with a hand traversing the dial and extending to said apertures, and a removable plug adapted to be inserted into said apertures and to arrest said hand, the hand and plug forming the terminals of the circuit, substantially as set forth.

403,101. GEAR-WHEEL. MARTIN T. GRAF, Buffalo, N. Y. Filed Aug. 13, 1888. Serial No. 282,527. (No model.)

Claim.—1. A gear-wheel having two annular series of teeth of corresponding size and shape around its periphery and having a circumferential space between the two sets of teeth, formed by offsets upon the ring and main portion, the teeth of one series exactly registering with the open spaces between the teeth of the other series, as set forth.

2. A gear-wheel comprising a central sleeve, a hub, an outwardly-extending web, two annular series of teeth of corresponding size and shape, the teeth of one series registering with the spaces between the teeth of the other series, and a circumferential chamber interposed between the teeth and the hub and having a non-sonorous filling, substantially as set forth.

3. A gear-wheel comprising a hub, an outwardly-extending web having an annular recessed enlargement, said annular recessed portion constituting a portion of the rim of the wheel and having a circumferential series of teeth, and an annular recessed ring constituting the remaining portion of the rim and having a circumferential series of teeth, said rim or ring fitting within the recessed side of the web and being secured in position, as described.

4. A gear-wheel having two annular series of teeth upon separable parts, each part having an annular recess, one part formed integrally with a web extending from the hub and the other part separately therefrom and removably attached thereto.

5. A gear-wheel having two annular series of teeth upon separable parts of the rim of the wheel, each part having an annular recess, one part formed integrally with the hub and the other part separately therefrom and removably attached thereto, the respective parts forming a seed-chamber between them, and the two series of teeth having a circumferential division-space, as set forth.

6. A gear-wheel comprising the sleeve, rim, and hub described, keys *d*, and securing-bolts connecting said sleeve and hub together, and a non-sonorous material interposed between the adjacent contact-surface of the sleeve, hub, and keys, substantially as described.

403,102. FASTENER FOR THE MEETING-RAILS OF SASHES. GEORGE M. GRISWOLD, New Haven, Conn. Filed Feb. 16, 1889. Serial No. 300,147. (No model.)

Claim.—1. In a lock for the meeting-rails of sashes, the combination, with a vertically-projecting post fast upon one sash, of a housing upon the rail of the other sash, said housing having an opening therein in line with said post, and a roll arranged within said housing and adapted to engage the post, substantially as set forth.

2. In a lock for the meeting-rails of sashes, the combination, with the stationary and vertically-projecting post arranged upon the rear rail, of a housing mounted upon the outer rail, a vertical opening in

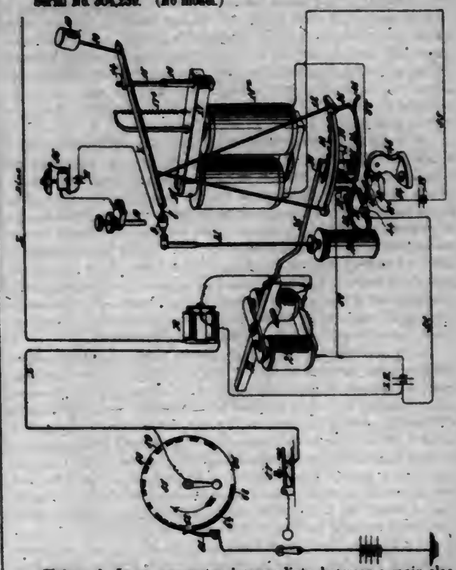
403,102.

said housing in the same plane with and adapted to admit the post, a rolling wedging element mounted within said housing and having a movement therein at an angle to the line of entrance of the post, and an operating-lever or the like engaging said wedging element and accessible from without the housing, whereby the wedging element may be raised upward and backward out of its engagement with the post, substantially as specified.

3. The combination, with the vertically-disposed post, of the recessed housing, into and out of which said post is adapted to slide, a roll mounted within said housing and adapted when in its normal position to engage the post upon one side and the wall of the housing upon the other side, a spring whereby said roll is impelled downward into engagement with said post, and means, as a knob or lever, arranged without the housing, whereby the roll may be lifted upward and backward out of engagement with the post, substantially as specified.

4. In a lock for the meeting-rails of sashes, the combination, with the post secured to the rear rail and projecting upward vertically therefrom, of the housing mounted upon the outer rail and having a recess for the accommodation of the post, said recess increasing in cross-section from bottom to top, a wedge-roll arranged within said recess and lying against the inside wall thereof, and a spring-actuated frame arranged about the roll, and whereby the latter may be raised and lowered in the recess, substantially as specified.

403,103. HAY-ELEVATOR. JOHN L. HARRISON, Mason City, Iowa. Filed Feb. 13, 1889. Serial No. 299,807. (No model.)



Claim.—1. A carrier for hay-elevators, comprising the frame having two pulleys arranged one above the other at its upper end links pivoted near the middle and the lower end, a supporting-hook pivoted at the lower end to the side opposite to the links, a keeper for retaining the free end of the said hook, and a pulley arranged above the said keeper, and the trip-cord attached to the keeper and passing over said pulley, substantially as set forth.

2. A carrier for hay-elevators, comprising the side pieces or cheeks, A A, the pulleys C D, journaled between the latter, the shank K, links J P, supporting-hook N, pivoted keeper S, pulley H, and trip-cord E', all combined and operating substantially as set forth.

3. In a hay-carrier, the combination of the herein-described car having pulleys C D, links J P, trip-hook N, keeper S, and pulley H, with the rope V, pulleys W X Z, loose pulley B', having hook C', and the sling D', all arranged and operating substantially as and for the purpose set forth.

403,104. ELECTRICAL SIGNALING APPARATUS. ADIN A. HATCH, Kansas City, Mo., assignor to Benjamin F. Jones, Edward L. Martin, and Alfred W. Jones, all of same place. Filed Mar. 22, 1888. Serial No. 304,230. (No model.)

Claim.—1. In an apparatus intermediate between a main electrical conductor and a separate signaling or other instrument, the combination, with a plate or support having single and manifold keys, representing, respectively, one electric pulsation or a series of such pulsations, with intervals between the single and manifold keys, of an armatured escapement-lever vibrated by said pulsations and provided with a finger adapted to engage said key-bars and work out the combination represented, said plate having normally a progressive movement proportioned to the character of said pulsations, and said escapement-lever having a vibrating finger by which the movements produced by the long pulsations are spaced or equalized, substantially as described.

2. In an apparatus of the type set forth, the combination, with a plate or support having normally a progressive movement, of an armatured escapement-lever having a rigid finger and carrying a vibrating escapement-finger, each having alternate engagement with a series of key-bars on said plate arranged to represent a predetermined combination of long and short pulsations transmitted over a main line upon which a series of apparatus of the type specified is arranged, a restoring-magnet acting upon a lever by which the key-supporting plate is restored to normal position, a short circuit for the magnet operating the escapement-lever, and means for closing said circuit and the circuit of the restoring-magnet automatically, substantially as described.

3. In an apparatus of the type specified, the combination, with a mechanically-rotated rock-shaft, of a plate or support suspended therefrom and provided with a series of key-bars representing electrical pulsations of different length, with open intervals between, an armatured escapement-lever having a rigid finger resting upon and a vibrating escapement-finger lying below said key-bars, a restoring-magnet attracting a lever which is linked to a toggle-arm on the rock-shaft, a circuit for said magnet automatically closed by the failure of the lever-fingers to engage the key-bars, and means for retarding the rotary motion of the mechanically-revolved rock-shaft, substantially as described.

4. In an apparatus of the type specified, the combination, with a continuous electrical conductor, of an apparatus comprising a plate or support carrying a series of key-bars formed and arranged to repre-

sent a predetermined combination of electrical pulsations of different length, means for imparting to said plate a constant progressive movement, an escapement-lever operated by a magnet lying in a local circuit, said lever provided with a rigid finger descending on said keys and a vibrating escapement-finger engaging the latter when the rigid finger is raised, a lever-link connected to the parts supporting said plate, a magnet attracting said lever, an independent local circuit for said magnet, a short circuit for the escapement-magnet, means for automatically making and breaking said circuits, and a separate signaling or other circuit closed by the complete working out of the combination of pulsations, substantially as described.

5. In an apparatus of the type specified, the combination, with a plate or support having a series of keys mounted thereon, each single key consisting of a key-bar bent to the form of a staple inclosing a definite space and each double key inclosing two or more of such spaces, of an escapement-lever having a finger the end of which engages said keys successively or drops through open intervals between the same, a magnet energized by said pulsations to vibrate the escapement-lever, a restoring-lever, a magnet operating the latter, and a circuit therefor closed by the drop of said lever caused by the finger passing between the keys, substantially as described.

6. In an apparatus of the type specified, the combination, with a weight-impelled rock-shaft supporting a plate upon which are mounted a series of single and double keys, with suitable open intervals between, of an escapement-lever, a magnet vibrating the same, a rigid finger and a vibrating escapement-finger, both carried by said escapement-lever and alternately engaging the keys, a short circuit for the escapement-magnet closed by a contact carried by the escapement-lever, a restoring-magnet attracting a lever linked to an arm on the rock-shaft, and a spring-lifted circuit-closing arm arranged beneath the vibrating end of the escapement-lever to close the circuit of the restoring-magnet upon the fall of the lever by the passage of its fingers between the keys on the plate, substantially as described.

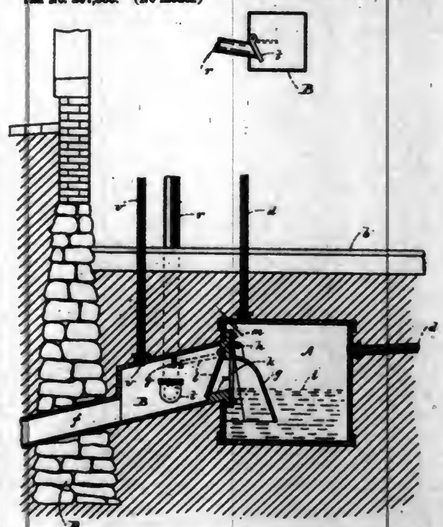
7. In an apparatus of the type specified, the combination, with a swinging plate carrying a series of single and double keys with open intervals between, of an escapement-lever having a rigid detent-finger and a vibrating spacing or escapement finger, each engaging the keys alternately, a contact, also carried by said lever, adapted to engage a bracket on the plate as the escapement-lever drops by the passage of its rigid finger through one of the intervals between the keys, a short circuit for a magnet operating the escapement-lever closed by such drop, a restoring-magnet operating a lever retracting the swinging plate, a circuit for said magnet, a circuit-closing arm normally raised by a spring to break the circuit of the restoring-magnet and depressed by the fall of the escapement-lever to close the said circuit, and a continuous electrical conductor connected with a relay opening and closing the circuit of the escapement-magnet, substantially as described.

8. In an apparatus of the type specified, the combination, with a swinging plate carried by a weight-impelled rock-shaft and having a series of keys separated by open intervals, of an escapement-lever, a magnet connected with the continuous electrical conductor to operate said lever, a restoring-circuit including a magnet acting upon a lever producing retrograde motion of the rock-shaft, a circuit-closer operated by the fall of the escapement-lever and establishing the restoring-circuit, a retarding-magnet lying in a circuit made by the rise of the restoring-lever and broken by its fall, and a pivoted retarding-lever linked at one end to an arm of the rock-shaft and having an armature which is drawn over the core of the retarding-magnet by the rotation of the rock-shaft, substantially as described.

9. In an apparatus of the type specified, the combination, with a continuous electrical conductor, of a series of local circuits opened and closed by relays in the main line, a series of escapement-magnets lying in the local circuits, escapement-levers operated by said magnets and having rigid and vibrating or escapement fingers, a series of vibrating or swinging plates carrying keys of the form described, arranged with open intervals to present a series of different combinations of long and short electric pulsations, means for vibrating said plates in one direction, a series of restoring-magnets actuating levers which vibrate said plates in the opposite direction, a series of short circuits for the escapement-magnets, a series of independent circuits for the restoring-magnets, means for simultaneously closing said circuits, and a series of separate circuits closed by the complete vibration of said plates, substantially as described.

10. In an apparatus of the type specified, the combination, with a continuous electric circuit, of an escapement-magnet lying in a local circuit, a relay, a vibrating plate having keys formed like single and double staples with open intervals between and arranged to represent a predetermined combination of long and short pulsations, a lever vibrated by the escapement-magnet and having a rigid finger engaging and resting upon said keys, said lever carrying a chair having a forked stop-plate in which is pivoted a spring-actuated escapement-finger limited in its vibrations by the forks of the stop-plate, said finger being arranged under the keys, a weight giving progressive movement to the plate between the rise and fall of the escapement-lever, a restoring-magnet attracting a lever producing motion in the opposite direction, a short circuit for the escapement-magnet, an independent circuit for the restoring-magnet, a contact carried by the chair on the lever and making engagement with a bracket-piece carried by the vibrating plate to close the short circuit, and a circuit-closing arm pivoted beneath the escapement-lever and raised by a spring to break the circuit of the restoring-magnet and thrown down to close said circuit by the descent or fall of the chair and lever, substantially as described.

408,105. VETERINARY INCISOR-CUTTER. REINHARD HAHNMANN, Chicago, Ill. Filed Dec. 12, 1887. Serial No. 257,567. (No model.)



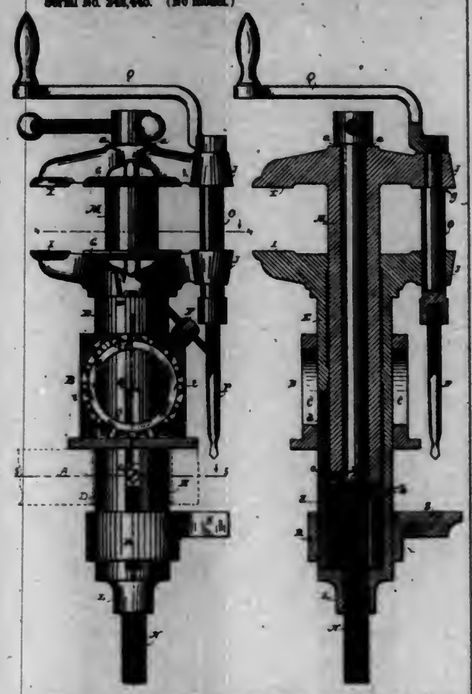
Claim.—1. In a veterinary dental incisor-cutter, the cutting-jaw having a straight cutting-edge, and the sustaining-jaw pivoted together, in combination with a supplemental jaw supported by and movable on the sustaining-jaw, the edge of the cutting-jaw extending at a right angle to the length of the supplemental jaw, substantially as described.

2. In a veterinary dental incisor-cutter, the cutting-jaw having a straight cutting-edge, and the sustaining-jaw pivoted together, in combination with a supplemental jaw pivoted to the sustaining-jaw, the edge of the cutting-jaw extending at a right angle to the length of the supplemental jaw, substantially as described.

3. In a veterinary dental incisor-cutter, the cutting-jaw, and the sustaining-jaw pivoted together, in combination with a supplemental jaw supported by and movable on the sustaining-jaw, and provided at its inner end with a flange or shoulder, substantially as described.

4. In a veterinary dental incisor-cutter, the combination of a cutting-jaw, a sustaining-jaw, and a supplemental jaw pivoted to the sustaining-jaw, the bearing of said supplemental jaw being in a line coincident with that traversed by the cutting-edge of the cutting-jaw, substantially as described.

408,106. SEWER-TRAP. DANIEL HIGGINS, Boston, Mass., assignor to himself and James J. Costello, same place. Filed Jan. 25, 1889. Serial No. 297,555. (No model.)



Claim.—1. In a sewer-trap, the combination of a receiving-box disposed within the building, an inclined trap connecting said box with the sewer, waste-pipes opening into said box, a waste-pipe opening into said trap and provided with a hinged valve, a ventilating-pipe for said trap, a hinged valve closing the mouth of the trap within its body and adapted to be opened by the water from said box, and a hinged hood closing the mouth of said trap within said body, all being arranged to operate substantially as described.

2. In a sewer-trap, the combination of the receiving-box A, the waste-pipes *d*, opening therein, the inclined trap B, connecting said box and the sewer, the waste-pipe *r*, opening into said trap and provided with the valve *t*, the hinged valve *l*, for automatically closing the mouth of said trap, and the hood *g*, hinged to said trap within said body, substantially as and for the purpose set forth.

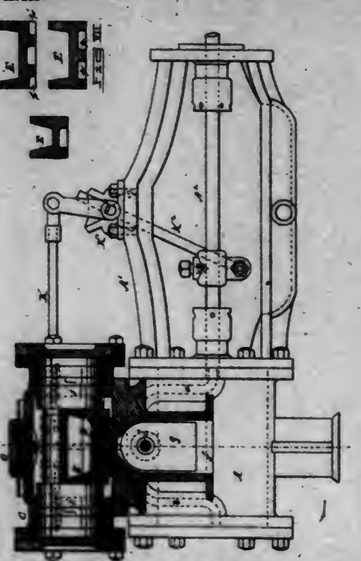
3. In a sewer-trap, the receiving-box A and waste-pipes *d*, opening therein, in combination with the inclined trap B, opening into said box, the hinged valve *l*, for automatically closing the mouth of said trap, the hook *q*, for holding said valve open, the hood *g*, hinged to the trap within said box, the waste-pipe *r*, opening into said trap and provided with the valve *t*, and the ventilating-pipe *v*, all being arranged substantially as described.

4. In a sewer-trap, a receiving-box into which the waste-water pipes of the building empty, in combination with an inclined trap connecting said box with the sewer, a closet waste-pipe opening into said trap, and a hinged valve in said trap adapted to be opened by the water from said box, whereby the waste from said closet-pipe may be carried from the trap, substantially as described.

408,107. VISE. RUSSELL HOLLY, Lockport, N. Y., assignor of one-fourth to Thomas S. Bellah, Wilmington, Del. Filed June 25, 1887. Serial No. 242,445. (No model.)

Claim.—1. The fixed holder formed, as described, to hold the fixed portion of a vise in either a horizontal or a vertical position, in combination with the fixed portion of the vise and the sliding portion carried by said fixed portion, substantially as set forth.

2. The fixed three-way holder provided with holding-apertures on its six sides, in combination with a vise constructed, as described, so that it may be held in any opposite pair of said apertures, substantially as set forth.



3. The fixed three-way holder provided with holding-apertures on its six sides and a vise which may be inserted in any opposite pair of said apertures, in combination with a set-screw carried by said holder and bearing against said vise, the axis of said screw being substantially in line with the center of the holder, substantially as set forth.

4. A vise having four fixed jaws extending radially at right angles to each other, in combination with four movable jaws extending radially at right angles to each other and adapted to the fixed jaws each to each, substantially as set forth.

5. The fixed hollow mandrel having a series of four jaws extending radially at right angles to each other, in combination with a sliding mandrel fitting and sliding within said fixed mandrel, said sliding mandrel having a series of four similar radially extending jaws adapted to the jaws of the fixed mandrel each to each, substantially as set forth.

6. The fixed and sliding mandrels and two jaws, one of each mandrel formed with oppositely-arranged bores or apertures, and a drill having a bearing in the apertured jaw of the sliding mandrel, whereby it may be advanced by movement of said mandrel, and the shank of said drill extending through the aperture in the jaw of the fixed mandrel, in combination with a removable and adjustable drill-plate supported by the fixed mandrel, substantially as set forth.

408,108. DOUBLE-CYLINDER DIRECT-ACTING ENGINE. WILLIAM D. HOOKER, St. Louis, Mo. Filed July 6, 1888. Serial No. 279,173. (No model.)

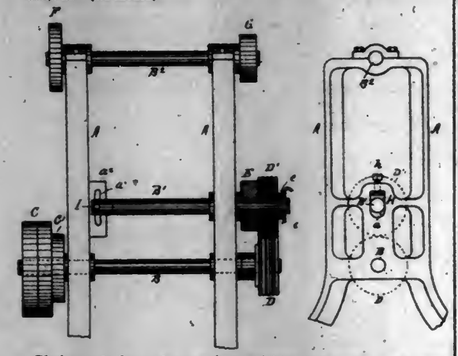
Claim.—1. The combination of a main direct-acting supplemental-valved engine, as A, with a secondary engine, as B, said secondary engine having no independent supplemental valve or valve-moving device, and a main valve to supply and exhaust the steam simultaneously to and from both engine-cylinders, so that the main engine shall control the steam admitted and exhausted to drive the main pistons in their cylinders by the use of the one main valve only, said main pistons being separate and having no mechanical connection with each other, so that one can run in advance of the other, as set forth.

2. A supplemental-valved engine-cylinder, combined with its secondary engine-cylinder having but one main valve to supply and exhaust the steam to and from both engine-cylinders, and a regulating-valve in the main exhaust, so that the main supplemental-valved engine shall impart the motion to and the regulating-valve control the motion of both main pistons in their engine-cylinders, as set forth.

3. The combination, in a double-cylinder direct-acting engine, of a regulating-valve in the main exhaust to close the opening of the exhaust of the secondary engine, whereby said secondary engine is stopped and the main engine permitted to run alone and independently of the secondary engine, as set forth.

4. In a double-cylinder steam-engine, a regulating device in the exhaust-passage common to both engines, consisting of an adjustable plate to control the motion of either engine, as set forth.

5. In a double-cylinder steam-engine, a regulating device in the exhaust-passage common to both engines, consisting of a plate having an elongated end to separate the exhaust of the two engines, as set forth.

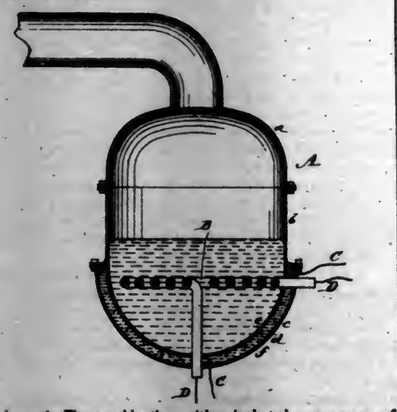


6. In a double-cylinder steam-engine, the combination, with the separate exhaust-ports and main exhaust-passage, of a screw-rod operated from the outside, and a regulating device placed in the main exhaust between the mouths of the separate exhaust-ports, said device consisting of a plate having a threaded opening and being suspended upon the threaded portion of the rod, as set forth.

7. In a double-cylinder direct-acting steam-engine employing but one main valve for both engines, and one engine having no independent valve-moving device, the combination, with said cylinders and main valve, of the supplemental ports and the main ports, said main valve controlling all of the ports, steam being supplied through both the main and supplemental ports to both ends of both main steam-

cylinders and released through the main ports only, to arrest and cushion both main pistons at the termination of their strokes, as set forth.

8. In a double-cylinder direct-acting steam-engine, the combination, with a main valve having a B exhaust-cavity at one end and a D exhaust-cavity at the other, and transverse narrow cavities between them, and side cuts, of the main steam-ports *a* and *b*, having the exhaust-port *c* between them, the main steam-ports *a'* and *b'*, having the exhaust-port *c'* between them, and the secondary steam-ports *c e*, *d e'*, opening into the main-valve seat longitudinally between the end sets of ports, as set forth.

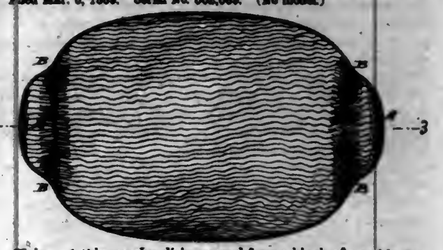


408,109. FEED DEVICE FOR WIRE-WEAVING MACHINES. ORELLO R. HUNT, Minneapolis, Minn. Filed Mar. 5, 1889. Serial No. 301,946. (No model.)

Claim.—1. In a wire-weaving machine, a rotating and a non-rotating shaft, the latter being supported by an adjustable pivot and having a spring tension in the direction of the former shaft, and feed-rolls, one of which is rotated by the former shaft and the other by a pulley on the latter shaft, substantially as set forth.

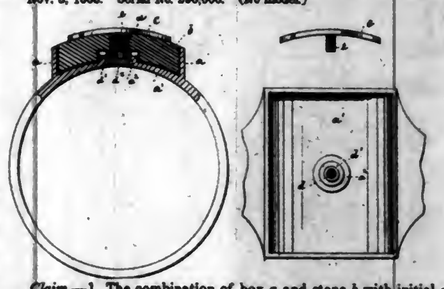
2. In a wire-weaving machine, a frame, a driving-shaft and pulleys, a driven shaft and pulleys, a non-rotating shaft sliding in a slot in said frame, an adjustable pivotal support therefor, and an adjustable spring whose tension thereon is in the direction of the driving-shaft, a feed-roll and pulley thereon rotated by belting from the driven shaft, and a roll rotated by the driving-shaft, substantially as set forth.

408,110. ELECTRICALLY-HEATED VACUUM-PAN. GAIL B. JOHNSON and MILBANK JOHNSON, Elgin, Ill. Filed June 1, 1888. Serial No. 275,729. (No model.)



Claim.—1. The combination, with a jacketed vacuum-pan, of electric resistance-wires within the liquid-containing part of the pan and also around the lower part of the same, substantially as set forth.

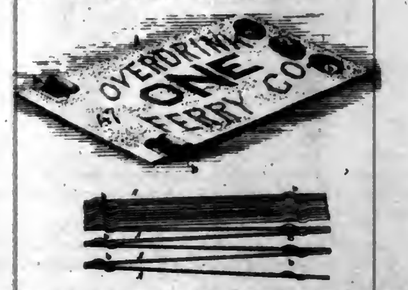
2. The combination, with the vacuum-pan A, having its rounding bottom provided with a jacket, of an insulating heat-conducting material within the jacket, an electric resistance-wire passing spirally around the jacketed space and inclosed in said material, a horizontal coil of pipe within the liquid-containing part of the pan and having its ends extending through the pan, and an electric resistance-coil within said pipe and insulated therefrom, substantially as set forth.



3. The combination, with the heating-coil B and the wire D, arranged within the said coil, of the spiders A, adapted to support the wire in a central position in the coil, substantially as specified.

408,111. WOODEN DISH. WILLIAM D. JOHNSON, Seymour, Ind. Filed Mar. 6, 1889. Serial No. 302,069. (No model.)

Claim.—A thin wooden dish scooped from a block of wood in concavo-convex form, with end extensions or ears formed by the outward curve, B, and upward curve, C, for bracing the fibers and preventing warping and chipping, substantially as and for the purpose described.

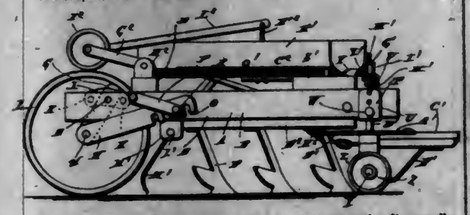


408,112. RING. FREDERICK KAFFEMAN, New York, N. Y. Filed Nov. 5, 1888. Serial No. 290,000. (No model.)

Claim.—1. The combination of box *a* and stone *b* with initial *c*, having downwardly-projecting screw *e*, and with the screw *d*, projecting upwardly into box *a*, and provided with a collar, *d'*, within the box, one of the screws *c d* being hollow for the reception of the other screw, substantially as specified.

2. The combination of box *a*, having base-plate *a'* and shoulder a^2, with the screw *d*, having collar *d'* and head d^3 on opposite sides of said shoulder, and with perforated stone *b* and initial *c*, having screw *e*, one of the screws *c d* being hollow and internally threaded for the reception of the other screw, substantially as specified.

408,113. TICKET. JOHN KELLER, New York, N. Y. Filed Oct. 1, 1887. Serial No. 251,162. (No model.)

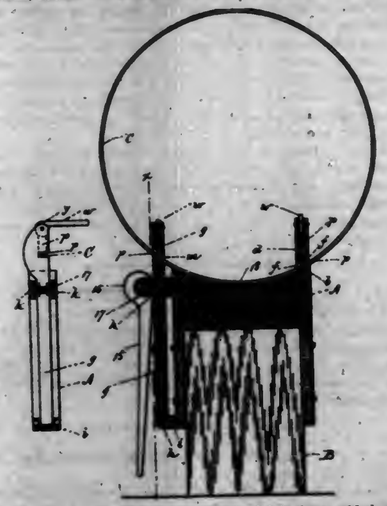


Claim.—1. A ticket adapted for single-trip use on ferries or railways, permanently provided with a prominence or projection adapted to support the body of the ticket upon a plane surface with its edges elevated at a distance above said surface, substantially as and for the purpose described.

2. A series of tickets adapted for single-trip use upon ferries or railways, said tickets being situated in contact with each other and being provided with prominences and depressions, the projecting portion of one ticket corresponding with and resting in the depression of the next.

3. A ticket-strip in width equal to one dimension of the ticket, with transverse lines of perforations at the points of separation between the tickets, and provided with points of prominence on one side and corresponding depressions on the other, whereby the prominences of one ticket enter the depressions of the one next above or below it when they are packed together.

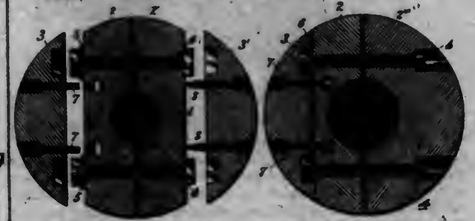
4. A ticket-trip consisting of a series of tickets adapted for single-trip use on ferries or railways, each ticket being embossed with a prominence or projection adapted to support the body of the ticket, when detached upon a plane surface, with its edges elevated at a distance above said surface, substantially as and for the purpose described.



408,114. COMBINED PLOW, CULTIVATOR, AND SEEDER. HENRY M. KINGSBURY, Middletown, Cal. Filed Sept. 18, 1888. Serial No. 285,723. (No model.)

Claim.—1. The combination of the frame having the diagonally-arranged beams with plows, the truck having the upwardly-extending king-bolt pivoted to the front end of the frame, the adjusting-lever H', fulcrumed on the upper end of the king-bolt and connected to the frame, the pivoted arm G at the rear end of the frame, the supporting-roller L, journaled in said arms, the brace-arms N, pivoted to arms G, and having the adjusting-notches O engaging studs R projecting from the frame, the diagonally-arranged hopper supported on the frame, the rock-shaft thereon having the stirring-arms and the arm F^2, the arms G^2, pivoted on the frame, the roller P^2, journaled in said arms bearing on the roller L and having the crank, and the pitman connecting the crank to the arm F^2, substantially as described.

2. The frame having the supporting-truck at the front end, the roller L at its rear end, and the diagonally-arranged beam with plows, the hopper diagonally on the frame and having the rock-shaft with stirring-arms and arm F^2, the pivoted arms G^2, with roller P^2, journaled therein, bearing on the roller L and having the crank, the pitman connecting the latter to the arm F^2, the scatter-box arranged under the hopper, and the shaft L', arranged transversely in the frame in rear of the hopper, and having the stirring-plows N' and the lever O' secured to the said shaft to adjust the stirring-plows, substantially as described.

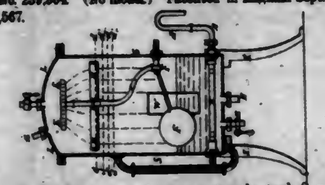


408,115. TIRE-SHRINKER. ROSS B. LANCILL, River John, Nova Scotia, Canada. Filed Jan. 26, 1889. Serial No. 297,542. (No model.)

Claim.—1. The combination of a solid body provided with a curved upper face adapted to serve as an anvil, standards secured at one end of said body and provided with a curved slot, a vertical bar pivoted at the opposite end of said body, and also provided with a curved slot, clamping-plates projecting into said slots, cam-levers for forcing said plates into engagement with the tire, and a cam-lever pivoted to said body for forcing the pivoted bar toward said standard, substantially as described.

2. In a tire-shrinker, the combination of the body A, provided with the curved shoe *b*, the standard *d*, secured thereto and having the slot *f*, the bars *g*, pivoted to said body and provided with the slot *m*, the cam-lever 15, for actuating said bar, the clamping-plates *p* in said bar and standard, the springs *t* and rods *r*, for elevating said plates, and the cam-levers *w*, for depressing said plates, all being arranged to operate substantially as described.

408,116. PULLEY. P. V. LAWSON and WALLACE L. FIELD, Menasha, Wis. Filed Oct. 20, 1888. Serial No. 288,113. (No model.)

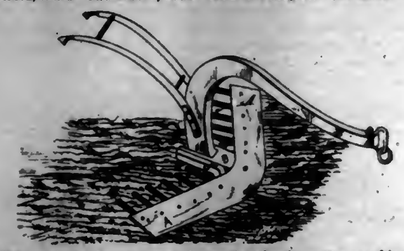


Claim.—1. As an improved article of manufacture, a separable pulley divided into two equal parts upon a plane longitudinally with its bore, each of said parts being divided upon a parallel plane into two segments, and having clamp-bolts, as 4 4, whereby the inner segments thereof may be connected together and clamped upon a shaft, and means, as described, for securing the outer circular segments to the aforesaid inner ones, substantially as described.

2. As an improved article of manufacture, a separable pulley consisting of sections divided upon planes parallel with its bore, the sections containing said bore being provided with bolts for their connection together and for being clamped upon a shaft, and means, as described, for securing the outer circular segment of a section to said section, substantially as described.

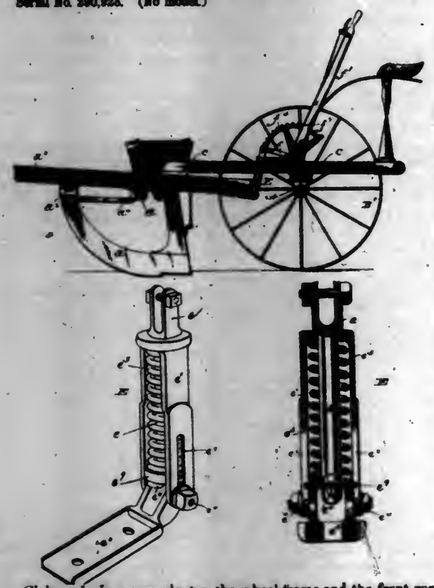
3. In a separable pulley divided into two equal sections upon a plane longitudinally of its bore, one of said sections being divided upon a parallel plane into two segments, the combination of the iron plate 6, arranged upon the outer surface of the inner one of said segments, and clamp-bolts, as 4 4, for clamping said plate, inner segment, and the undivided section together and upon a shaft, and means, as described, for securing the outer circular segment to the inner one, substantially as set forth.

408,117. APPARATUS FOR MANUFACTURING AERATED WATER. JOHN T. LIGHTON, Edinburgh, Scotland. Filed May 25, 1887. Serial No. 239,304. (No model.) Patented in England Sept. 20, 1886, No. 11,567.



Claim.—1. In a water-aerating apparatus, the tank S, water-supply pipe C, rose-pipe E, tray D, float-valve F, and strainers *d* and *d'*, in combination with the perforated gas-pipe B, the pipe A, connected therewith, the gas-outlet pipe G, located at the top of the said tank S, the water-outlet pipe H, located at the bottom of said tank, the air-outlet pipe or tap J, located on top of the aforesaid tank S, and the outlet-pipe K, connected with the bottom of the said tank S, substantially as shown and described.

2. In a water-aerating apparatus, the tank S, containing the water-supply pipe C, connected with the float-valve F, the rose-pipe arranged on the end of said pipe C, the tray D, suspended within the said tank S, the strainer *d*, placed within said tray D, the strainer *d'*, located beneath the said tray D, the perforated gas-pipe B, connected with the pipe A, the sight-hole, the gas-outlet pipe G, connected with the top of the tank S, the water-outlet pipe H, connected with the bottom of said tank, the air-outlet pipe J or tap, connected with the top of said tank S, and the outlet-pipe K, connected with the bottom thereof, in combination with the cooler Y, substantially as shown and described.



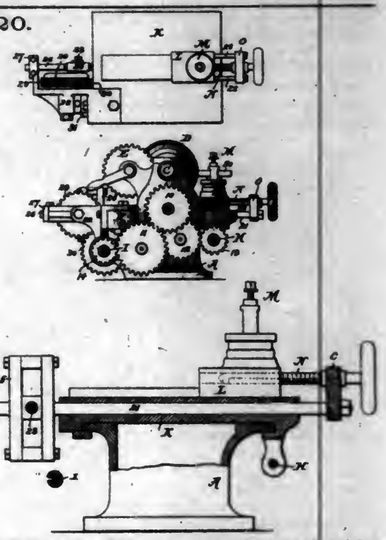
3. The combination substantially as shown and described, consisting of the tank S, containing the water-supply pipe C, terminating at its top end with the rose-pipe E, the float-valve connected with said pipe C, the tray D, containing the strainer *d*, the strainer *d'*, located beneath said tray D, the perforated gas-pipe B, pipe A, sight-hole W, the gas and air outlet pipes G and J, located on top of the tank S, and the water-outlet pipes H K, connected with the bottom thereof, the whole forming a complete apparatus.

408,118. STIRRER AND PULVERIZER. IRVIN C. LIGHTY, Warnerton, Kans. Filed Dec. 1, 1888. Serial No. 292,387. (No model.)

Claim.—As an improvement in earth-pulverizers, the combination of the share, the rearwardly-projecting fingers secured to the under side of the share, the shank secured to the under side of the share projecting rearwardly therefrom and having a longitudinal slot in its rear end, the standard having its end secured in said longitudinal slot, and the braces lying alongside the shank and secured thereto, and having their front ends bent outward and secured to the under side of the share, as specified.

408,119. CORN-PLANTER. AUGUST LINDGREN, Moline, Ill., assignor to the Moline Plow Company, of Illinois. Filed Nov. 15, 1888. Serial No. 290,923. (No model.)

Claim.—1. In a corn-planter, the wheel-frame and the front runner-frame hinged thereto, in combination with an intermediate extensible and compressible spring-coupling, substantially as described, whereby the runner-frame is permitted to yield in opposite directions from its normal position.



2. In a corn-planter, the combination of the wheel-frame, the front runner-frame hinged thereto, the hand-lever and its locking device, and the spring-coupling consisting of the parts movable longitudinally in relation to each other and the intermediate spring resisting the movement of said parts in each direction.

3. In a corn-planter, the wheel-frame and the runner-frame jointed to its front, in combination with an intermediate spring-coupling which resists the descent of the rear end of the runner-frame.

4. The coupling consisting of the rod, the spring and loose washer thereon, and the outside member seated on the spring and arranged to slide on the rod.

408,120. LATHE FOR TURNING NON-CIRCULAR FORMS. JAS. W. MALOY, Marietta, Ga. Filed July 7, 1888. Serial No. 279,255. (No model.)

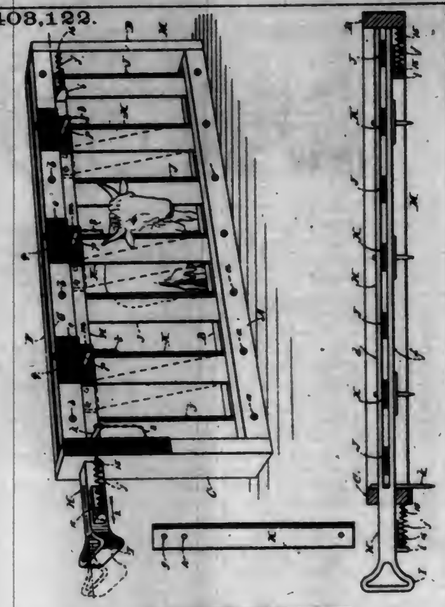
Claim.—1. The combination, with a slide-rest and a tool-post mounted thereon, of a driven crank-disk carrying an adjustable stud, and a rod mounted to reciprocate in fixed bearings having connections with said tool-post and having a yoke embracing said stud for reciprocating said tool-post, substantially as described.

2. The combination, with a slide-rest, means for moving it longitudinally, and a tool-post mounted adjustably thereon, of a crank-disk carrying an adjustable stud, a rod mounted to reciprocate in fixed bearings having connections with said tool-post at one end and at the other provided with a yoke embracing said stud for reciprocating said tool-post, a driven shaft, and a gear mounted to turn therewith and slide longitudinally thereon for driving the crank-disk, substantially as described.

3. The combination, with a slide-rest, a tool-post mounted thereon, a head, and an adjusting screw-rod for varying the position of the tool-post on the slide-rest, of a driven crank-disk carrying a stud, a connecting-rod mounted to reciprocate in fixed bearings, one end provided with a yoke embracing said stud and the other rigidly secured to said head to reciprocate the tool-post, substantially as described.

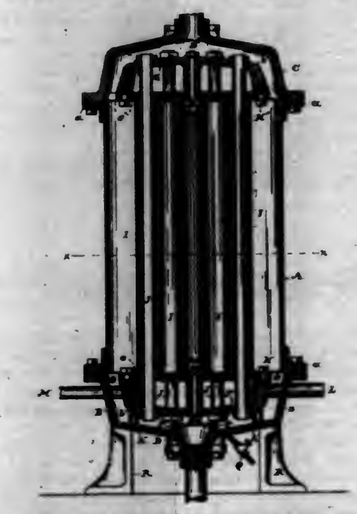
4. The combination, with a slide-rest, a tool-post mounted thereon, a head and an adjusting screw-rod for varying the position of the tool-post on the slide-rest, and a lead-screw shaft for moving the slide-rest and tool-post longitudinally, of a toothed crank-disk carrying a stud, a connecting-rod, one end provided with a yoke embracing said stud and the other rigidly secured to said head to reciprocate the tool-post, a driven lead-shaft, and a gear mounted to rotate therewith and slide longitudinally thereon for driving the said crank-disk, substantially as described.

5. The combination, with a slide-rest and a tool-post mounted thereon, of a driven crank-disk carrying a stud, a rod mounted to reciprocate in said slide-rest and provided with a yoke at one end embracing said stud and at the other end secured to a head, O, and an adjusting screw-rod between said head and the tool-post, substantially as described.



408,121. LINIMENT. MORGAN P. MARTIN, Brunswick, Ga. Filed Mar. 29, 1888. Serial No. 268,869. (No specimens.)

Claim.—The herein-described composition of matter to be used for the purpose and in the manner as specified, said composition consisting of the following ingredients: turpentine, kerosene, camphor-gum, oil of sassafras, oil of peppermint, oil of pennyroyal, chloroform, in the proportions specified.

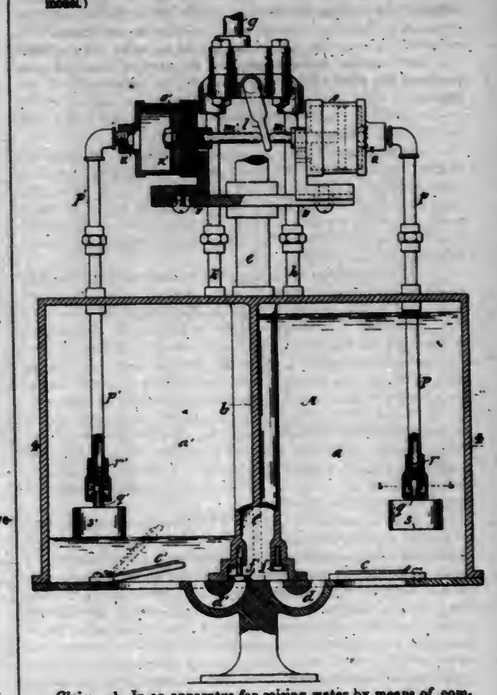


408,122. STANCHION. ALBERT P. MEARS, Wakefield, Mass. Filed Oct. 9, 1888. Serial No. 287,642. (No model.)

Claim.—The combination of a frame, a series of vertical fixed stanchions, a series of pivoted stanchions alternating with the fixed stanchions and provided with pin-holes near their upper ends, a horizontally-movable bar sliding in said frame, and provided with a laterally-projecting lug near one end and with pin-holes at intervals opposite the pivoted stanchions, pins for connecting said pivoted stanchions with the sliding bar, a spring interposed between the post of the frame and said lug for automatically sliding said bar to open the stanchions, and a key for holding said bar in normally-closed position.

408,122.

408,123. STEAM WATER-HEATER. WILLIAM MEARS, Cleveland, Ohio. Filed June 23, 1888. Serial No. 278,444. (No model.)



Claim.—1. In combination, the outer jacket, a series of water-pipes within the same, the hollow heads F G at each end of said pipes, the said heads being held within the jacket and away from the walls thereof, inlet and outlet pipes for the water, a series of steam-pipes extending through the water-pipes and hollow heads, and inlet and outlet pipes for the steam, whereby the steam may circulate through and around the water-pipes and also through and around the hollow heads, substantially as described.

2. In combination, the vertical jacket, the vertical water-pipes within the same, the hollow heads at each end of said pipes, the steam-pipes, inlet and outlet pipes for the steam and water, and the supporting-posts K for the hollow head F, whereby all the water and steam pipes and the heads F and G are held within the jacket to permit the steam to circulate freely.

3. In combination, the outer jacket, the series of water-pipes, the hollow heads F G, with inlet and outlet pipes for the water, the steam-pipes and the inlet and outlet pipes for the steam, and the partition in the hollow head F, whereby the water is caused to flow through the pipes, substantially as described.

408,124. APPARATUS FOR RAISING WATER. ABEL B. MERRILL, Bound Brook, N. J., assignor to the Hartford Compressed Air Pump Company, of New Jersey. Filed Jan. 12, 1888. Serial No. 260,518. (No model.)

Claim.—1. In an apparatus for raising water by means of compressed air or gas, the combination, with two compartments adapted to contain water and each provided with an exit-passage for the water, of a valve controlling the direction of the air or gas into one compartment or the other, and an exit-passage for the compressed air or gas from each compartment, each of said exit-passages being closed by a valve connected with a float, and one of said floats being arranged to operate its valve for a higher level of water than the other, substantially as described.

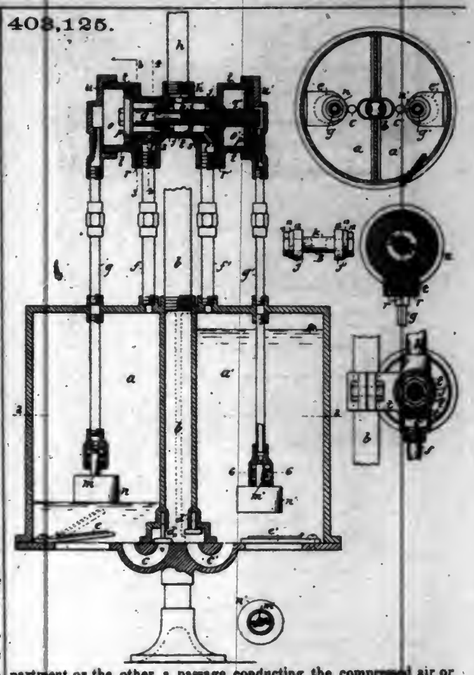
2. In an apparatus for raising water by means of compressed air or gas, the combination, with two compartments adapted to contain water and each provided with an exit-passage for the water, of a valve controlling the direction of the air or gas into one compartment or the other, the ports connecting the valve-chamber with the passages to the respective compartments being arranged so that when the valve is centered each port will be slightly open, whereby the water will be forced out of both the compartments, substantially as described.

3. In an apparatus for raising water by means of compressed air or gas, the combination, with two compartments adapted to contain water and each provided with an exit-passage for the water, of a valve controlling the direction of the air or gas into one compartment or the other, return-passages whereby the air is returned from said compartments to operate said valve, a valve controlling each of said return-passages, a float located in each compartment, connecting mechanism between each float and one of said last-mentioned valves, whereby, when the compartment within which the float is located is free from water, the said float will be suspended from said valve and hold the same open by its weight, said floats being each adapted to be raised by the buoyancy of the water to permit its valve to close, substantially as described.

4. In an apparatus for raising water by means of compressed air or gas, the combination, with two compartments adapted to contain water and each provided with an exit-passage for the water, of a valve controlling the direction of the air or gas into one compartment or the other, and return-passages whereby the compressed air or gas is returned from each compartment to operate the valve, said return-passages connecting with their respective compartments below the level of the water therein, whereby the water within the compart-

ments acts as a packing to assist in preventing the escape of the air into the return-passage until the level of the water within the compartment has fallen, substantially as described.

5. In an apparatus for raising water by means of compressed air or gas, the combination, with two compartments adapted to contain water and each provided with an exit-passage for the water, of a slide-valve controlling the direction of the air or gas into one compartment or the other, return-passages whereby the compressed air is returned from each compartment to operate the valve, and a cylinder and piston actuated by the compressed air returned from each compartment, the pistons being connected with the exhaust side of said slide-valve, substantially as described, whereby the connections for moving the slide-valve from the returned compressed air do not enter the pressure-chamber of the slide-valve.



6. In an apparatus for raising water by means of compressed air or gas, the combination, with two compartments adapted to contain water and each provided with an exit-passage for the water, of a valve controlling the direction of the air or gas into one compartment or the other, and the pipes *p* and *p'*, extending down toward the bottom of the respective compartments and each provided with a valve, substantially as described.

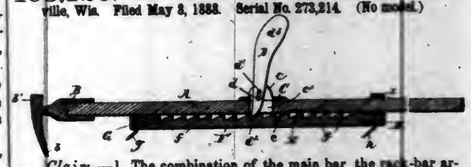
7. In an apparatus for raising water by means of compressed air or gas, the combination, with two compartments adapted to contain water and each provided with an exit-passage for the water, of a valve controlling the direction of the air or gas into one compartment or the other, and the pipes *p* and *p'*, each provided with a valve having its seat located within the pipe at a distance back from the end thereof, whereby the air entrapped in the end of the pipe will prevent the entrance of same into the valve-seat, substantially as described.

8. In combination, the passage *g*, whereby the air is conducted to the valve, the reciprocating slide-valve, the passages *h* and *h'*, into which the air is alternately directed by the valve, the cylinders *o* and *o'* and their respective pistons, and the lever *l*, whereby the power of the compressed air or gas is applied to the movement of the slide-valve, substantially as described.

9. In an apparatus for raising water by means of compressed air or gas, the combination, with two compartments adapted to contain water and each provided with an exit-passage for the water, of a valve controlling the direction of the air or gas into one compartment or the other, return-passages whereby the compressed air is returned from each compartment to operate the valve, and a cylinder and piston operated by the compressed air returned from each compartment, the said pistons being connected with the valve to move the same, and the said cylinders being each provided with an exhaust-passage, *u*, of relatively small area to the area of the return-passage, substantially as described.

403,125. APPARATUS FOR RAISING WATER. FRANK H. MERRILL, Bound Brook, N. J., assignor, by mesne assignments, to the Hartford Compressed Air Pump Company, of New Jersey. Filed Jan. 31, 1888. Serial No. 262,541. (No model.)

Claim.—1. The casting *t*, containing at either end the cylinders *o* and *o'*, connected by a cylinder, *i*, of lesser diameter, in combination with a sliding valve within the cylinder *i* and the pistons *p p'* within the cylinders *o* and *o'*, substantially as described.

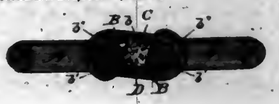


2. In combination, the valve-chamber *i*, the cylinders *o* and *o'*, the valve B, the compressed-air passage *h*, leading to the valve-chamber between the flanges of the valve, the pistons *p* and *p'*, each having its piston-rod supported in the end of the valve, and the compressed-air passages *g* and *g'*, leading, respectively, into the cylinders *o* and *o'* on the outsides of the pistons, the said valve being spool-shaped, whereby the flanges thereof exclude the pressure of the compressed air from the inner sides of the pistons, substantially as described.

3. In an apparatus for raising water by means of compressed air or gas, the combination, with two compartments adapted to contain water and each provided with an exit-passage for the water, of a valve controlling the direction of the air or gas into one compartment or the other, and return-passages from the respective compartments for the air or gas, whereby the compressed air or gas, after forcing the water, is brought to bear upon mechanism whereby the valve is moved, the said valve being constructed spool-shaped, substantially as described, whereby the pressure of the air upon it is balanced, substantially as described.

4. A valve for controlling the flow of compressed air, consisting of a body, *k*, provided with end flanges, 3 4, and said flanges being perforated and grooved, substantially as described, whereby the pressure of the compressed air in the valve-chamber is brought to bear upon the packing, as set forth.

5. In an apparatus for raising water by means of compressed air or gas, the combination, with two compartments adapted to contain water and each provided with an exit-passage for the water, of a slide-valve controlling the direction of the air or gas into one compartment or the other, a passage conducting the compressed air or gas into the valve-chamber between the flanges of the valve, passages leading thence to the respective compartments, and passages leading from the respective compartments back to mechanism for moving the valve, the said valve being spool-shaped, and the last-named passages leading from below the high-water level in the respective compartments and being respectively controlled by float-operated valves, substantially as described.

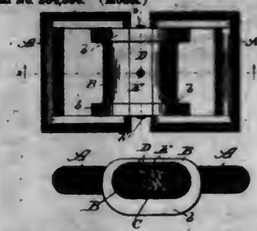


403,126. CARPET-STRETCHER. AUGUST W. MÜHLHAUSER, Platteville, Wis. Filed May 8, 1888. Serial No. 273,214. (No model.)

Claim.—1. The combination of the main bar, the rack-bar arranged below the same and having the rack-teeth on its upper side, the lever fulcrumed on the main bar and having its lower end passing therethrough and engaging the rack-bar, the cross-bars secured to the ends of the rack-bar, the bracket I, secured to the rear cross-bar and passing over the main bar, and the spring, having one end secured to the under side of the main bar and its other end projecting downward therefrom, and having a transverse arm engaging the rack-bar and projecting laterally beyond the same, substantially as specified.

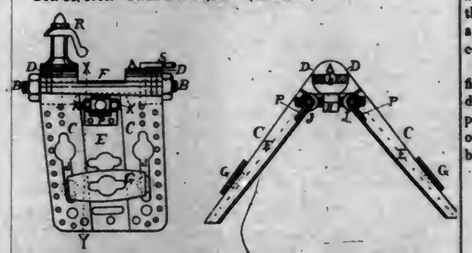
2. The herein-described carpet-stretcher, comprising the main bar A, the pin *b* on the bracket B, secured to the outer end of the said bar, the slotted bracket C, secured to the main bar with its slot registering with the slot therein and provided with the bearing-ears *e*, the pivoted actuating-lever D, having the slot *d*, the pivotal pin *d'*, passing through said slot, the rack-bar F, having the teeth *f*, the cross-bars G H, the teeth *g h*, secured to said bars, respectively, the spring-detent E, having the transverse detent-arm *e* on its free end, and the bearing-bracket I, secured to the cross-bar H and straddling the main bar, substantially as specified.

403,127. DRIVE-CHAIN. THOMAS H. MCCRAY, Chicago, Ill., assignor of one-half to Alexander H. Gunn, same place. Filed Sept. 3, 1888. Serial No. 284,396. (Model.)



Claim.—1. A coupler for drive-chains, composed of duplicate C-shaped pieces, substantially the width of the sprocket-openings of the links, each of said pieces having a hook at one end thereof and a larger hook at the other end thereof, in combination with and adapted to engage the links of a chain by drawing the larger of said hooks over the smaller thereof, in substantially the manner and for the purposes described.

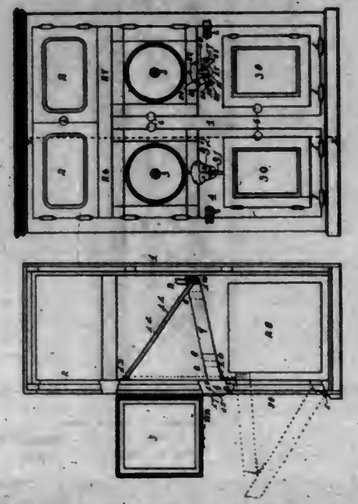
2. In a drive-chain link, the combination of a metal half-link formed of a piece of metal having a hook at one end thereof and a larger hook at the other end thereof, with a like half-link having like hooks thereon, the larger of said hooks being adapted to fit over the smaller thereof, and forming a link adapted to receive the end bars of adjacent rectangular links, and the lock-guard adapted to slide in place in the link formed by said half-links and between the end bars of said rectangular links, all substantially as described.



403,128. DRIVE-CHAIN. THOMAS H. MCCRAY, Chicago, Ill., assignor of one-half to Alexander H. Gunn, same place. Filed Sept. 3, 1888. Serial No. 284,396. (Model.)

Claim.—1. In a drive-chain, the combination of a link having a hook at each end thereof, a lock having ears or projections at the ends thereof, rectangular links having end bars fitting into said hooked link, the said lock fitting into said hooked link and holding said rectangular links in position by the ears or projections thereon, the body of said lock forming the top, the ears thereon the ends, the end bars of said rectangular links the sides, and the portion of said hooked link between said end bars the bottom of a closed chamber suitable for the placing therein of lubricating material, substantially as described.

2. In a drive-chain, the combination of a link having a hook at each end thereof, a rectangular link having end bars fitting into said hooked link, a lock having ears thereon adapted to form a lock holding said rectangular links in place, and a receptacle in said hooked link and between the end bars of said rectangular link, and porous material, as oakum, placed in said receptacle and adapted to have placed thereon lubricating material, all substantially as described.



403,129. SADDLE-TREE. ANDREW MCKAY, Philadelphia, Pa. Filed Dec. 31, 1888. Serial No. 295,060. (No model.)

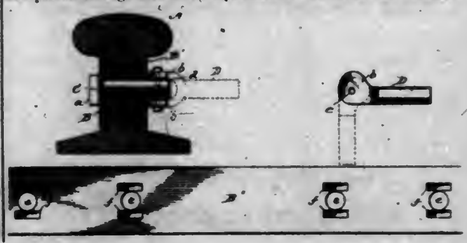
Claim.—1. A saddle-tree consisting of the block A, cut away centrally at the top and bottom and provided at each end with the vertical triangular holes and a longitudinal bore, the check-hook and crupper-loop having the triangular posts adapted to fit in the triangular openings in the block, the sides C C, provided with bearings D D, and rod B, having a nut at each end and adapted to hold the several parts together, substantially as set forth.

2. A saddle-tree consisting of the block A, check-hook R, crupper-loop S, and sides C C, secured together substantially as set forth, said sides having the slots *d d*, in which the button-heads of the cross-bars G are fitted, said cross-bars and the right and left adjusting-screw fitted in pivoted nut-bearings in the sides C C, said bearings secured in the sides by the caps P, substantially as set forth.

403,130. BEER CHEST OR REFRIGERATOR. OTTO NEUMAN, Denver, Colo. Filed Jan. 21, 1889. Serial No. 296,969. (No model.)

Claim.—1. The combination, with the frame of a beer chest or refrigerator, of a door pivoted or hinged thereto and a keg-supporting rack pivoted or hinged to such door and swinging outwardly therewith, substantially as set forth.

2. The combination, with the frame of a beer chest or refrigerator, of a door hinged thereto to swing downwardly and outwardly, a keg-rack pivoted or hinged at its front end thereto, and supports for the rear end of the rack pivoted thereto and to the body or frame of the chest, substantially as set forth.



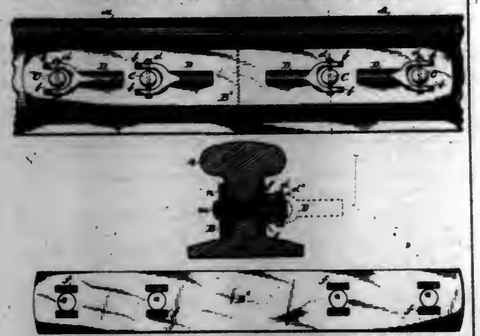
3. The combination, with the frame of a chest or case, 1, of a door, 4, a keg-rack pivoted thereto at 10, and rods or straps 11, pivoted at their upper ends to the frame and at their lower ends to the rear end of the rack, substantially as set forth.

4. The combination, with the door of a beer chest or refrigerator, of a base-plate to be secured thereto, wings or guard-plates pivoted to the base-plates and swinging either to or from each other, and a top plate holding the wing or guard plates to the surface of the door, substantially as set forth.

403,131. BOLT-LOCKING DEVICE. CHARLES I. PENROSE, Chatham, N. Y. Filed Jan. 19, 1889. Serial No. 296,841. (No model.)

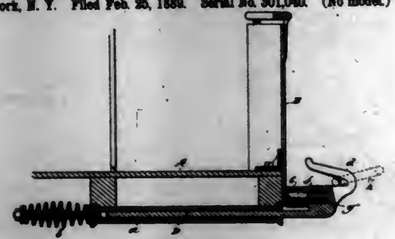
Claim.—1. The combination, with the adjacent ends of two connecting railway-rails and the fish-plates upon either side thereof, of the bolts passed through said plates and rails, the bifurcated lever adapted to embrace the outer end of the bolt, and the pin or bolt connecting said lever and bolt, substantially as described.

2. The combination, with the two adjacent railway-rails and the fish-plates B and B', the plate B' being provided with recesses *f*, as described, of the bifurcated lever D, the free ends of the bifurcated portions of which are cam-shaped and adapted to embrace the end of the bolt and engage the recesses *f* in the fish-plate B', and a pin or bolt passed through said cam-shaped ends of the lever and through



408,131.

the opening in the end of the bolt, substantially as and for the purpose described.



408,132. BOLT-LOCKING DEVICE. CHARLES I. PENROSE, Chatham, N. Y. Filed Feb. 16, 1889. Serial No. 300,096. (No model.)

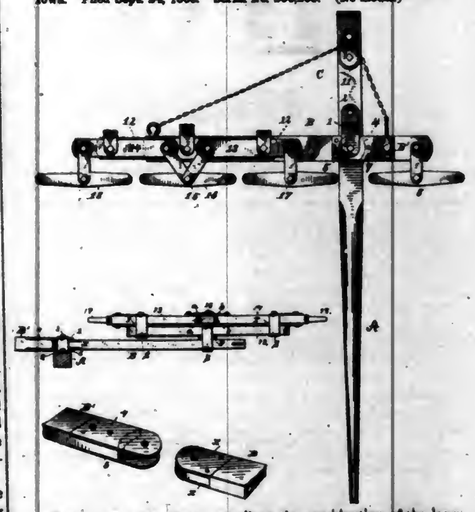
Claim.—1. The combination, with the adjacent ends of two connecting railway-rails and the fish-plates upon either side thereof, of a bolt passed through said plates and rails, a bifurcated lever adapted to embrace the outer end of the bolt, a pin connecting the lever and bolt, and a nut adapted to engage the screw-threaded inner end of the bolt and to bear against the flanged base portion of the rail, substantially as and for the purpose specified.

2. The combination, with the two adjacent railway-rails and the fish-plates, of a bolt passed through said rails and plates, a nut engaging the screw-threaded inner end of the bolt, a bifurcated locking-lever the arms of which are cam-shaped and adapted to embrace the end of the bolt, and a pin or bolt passed through said cam-shaped ends of the lever and through a transverse opening through the end of the bolt, substantially as and for the purpose specified.

408,133. DRAW-BAR AND HOOK. BRADLEY N. PHELPS, New York, N. Y. Filed Feb. 25, 1889. Serial No. 301,040. (No model.)

Claim.—1. The combination, with the draw-bar D, movable in the guide-casing *a*, of the spring *b*, located upon the inner end of the bar and arranged to receive the draft exerted upon the bar, and the elastic buffer *c*, located between a shoulder, *f*, formed upon the outer end of the bar and the dash, substantially as described.

2. The combination, with the draw-bar D, removable in the guide-casing *a*, of the spring *b*, located at the inner end of the bar and arranged to receive the draft put upon the bar, and the elastic buffer *c*, seated in a recess formed within a shoulder upon the outer end of the bar and acting against the dash, substantially as described.

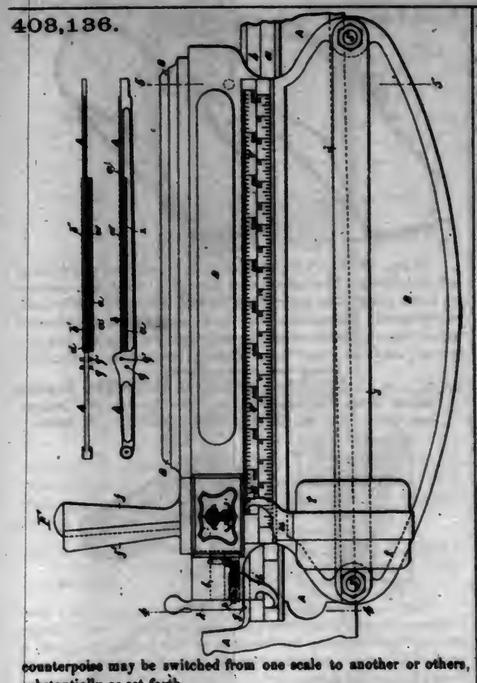


3. The herein-described hook of a draw-bar, having the side projections, 3, for preventing the link from being drawn off the hook by lateral draft, substantially as described.

408,134. HYDROCARBON-BURNER. AMBROSE A. PHILLIPS, Toledo, Ohio. Filed Oct. 31, 1887. Serial No. 253,325. (No model.)

Claim.—A hydrocarbon-burner consisting of a block of refractory material provided interiorly with a central chamber extending through the base of the block, lateral channels extending through the side walls of said block, said channels located one above the other, an oil-pipe located in the upper and a steam-pipe in the lower channel, and an ejector-nozzle placed in said chamber and forming the communication between the oil-supply and the chamber, and lugs formed upon the base of the block serving to elevate the latter for the escape of the flame, substantially as described.

408,135. DRAFT-EQUALIZER. WILLIAM R. PLUMER, Sioux City, Iowa. Filed Sept. 24, 1888. Serial No. 286,295. (No model.)



Claim.—In a four-horse equalizer, the combination of the long and short levers B B', having their inner ends placed one within the other, the lever B being secured to the tongue by the pivot-bolt and the short lever B' being secured to said bolt by the elongated plates, said levers being connected by a chain, C, the doubletree 12, pivotally mounted on washers at its center to the lever B at a point near its free end inside of the chain C, and the levers 13 and 14, mounted on washers at the ends of said doubletree, their long arms being pivotally connected to each other and to the singletree 16 by the straps *a b*.

408,136. STEELYARD FOR WEIGHING-MACHINES. HENRY POOLEY, Liverpool, County of Lancaster, England. Filed June 4, 1886. Serial No. 204,107. (No model.) Patented in England Nov. 10, 1885, No. 13,642; in France May 8, 1886, No. 176,006; in Belgium May 10, 1886, No. 73,051; in Norway May 26, 1886, No. 74; in Sweden May 26, 1886, No. 744; in Germany June 5, 1886, No. 38,447; in Canada June 14, 1886, No. 24,232, and in Spain Sept. 1, 1886, No. 9,845.

Claim.—1. The combination, with a steelyard, of a counterpoise, two or more engaging notched bars thereon, and a device upon the counterpoise having two or more projections alternately engaging with the notches on one or the other of said bars, whereby the sliding

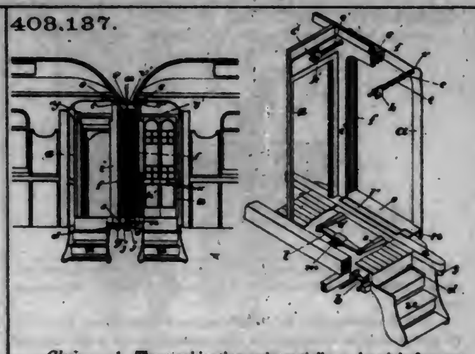
408,136.

counterpoise may be switched from one scale to another or others, substantially as set forth.

2. The combination, with a steelyard, of a counterpoise, two or more notched bars thereon, a device upon the counterpoise having two or more shifting projections for engaging with the notches on one or the other of said bars, two or more corresponding scale-plates attached to said steelyard, and two or more pointing-fingers rigidly attached together, substantially as described.

3. The combination, with a steelyard, of a counterpoise, two or more notched bars, an engaging device with two or more shifting projections for engaging with the notches on one or other of said bars, and two or more corresponding scale-plates for the major units of weights, and two or more scale-plates and a sliding pointer for the minor units of weights, substantially as described.

4. The combination, with the steelyard A, of the scale-plates *a b*, arranged with an upward inclination, the counterpoise B, the engaging device K, engaging-notches *a' b'*, pointer *i*, scale-plates *v*, pointer *u*, weight *t*, and its guide-bar *s*, substantially as set forth with reference to the drawings.



5. The combination, with a steelyard and a counterpoise-weight, of a plurality of scale-plates bearing scale-divisions of different lengths, a plurality of notched bars, and a device having a plurality of projections alternately engaging with the notches on one or the other of said bars, substantially as described.

6. The combination, with a steelyard and a counterpoise-weight, of a plurality of scale-plates, a plurality of notched bars, a device having a plurality of projections alternately engaging with the notches on one or the other of said bars, and a sliding pointer having a plurality of pointing-fingers arranged one ahead of the other, substantially as described.

7. The combination of a steelyard and counterpoise-weight, a plurality of notched bars, a device having a plurality of projections alternately engaging with the notches on one or the other of said bars, a plurality of scale-plates bearing divisions corresponding to those on said notched bars, and a sliding pointer having fingers rigidly attached to each other and one set ahead of the other, substantially as described.

8. The combination of a steelyard and counterpoise-weight, scale-plates bearing scale-divisions of different lengths, a sliding pointer attached to said counterpoise having fingers set one ahead of the other and being rigidly attached to each other, scale-plates on said counterpoise bearing scale-divisions of different lengths, and a sliding pointer moving on said counterpoise having fingers set one ahead of the other and being rigidly attached to each other, substantially as described.

408,137. VESTIBULE-CONNECTION FOR RAILWAY-CARS. GEO. M. PULLMAN, Chicago, Ill. Filed May 13, 1887. Serial No. 238,134. (No model.)

Claim.—1. The combination, substantially as hereinbefore set forth, of a face-plate forming the open end of a vestibule-extension to a railway-car when not coupled with another car in a train, and a buffer-plate which is pivotally connected with a spring-extended buffer-rod and arranged, as described, to be capable of oscillating on a fixed center, but restrained by guide-rods, as described, to compel its center of oscillation to move only in a line passing longitudinally and horizontally through the center of the car, the said buffer-plate and the face-plate of the vestibule connected therewith being free to move angularly with such fixed longitudinal line of their movement.

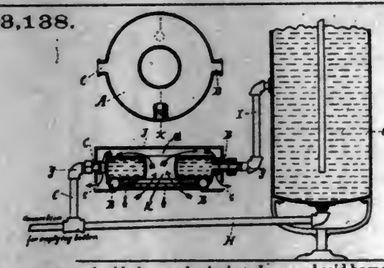
2. The combination, substantially as hereinbefore set forth, of a face-plate forming, when railway-cars are not coupled, the open end of a vestibule-extension of a car, a buffer-plate pivotally connected with a spring-extended buffer-rod, and a threshold-plate, the said buffer-plate and threshold-plate being arranged, as described, to be capable of oscillating on a fixed center, but restrained as to other movements to one in a line passing longitudinally and horizontally through the center of the car.

3. The combination of a face-plate, forming, when railway-cars are not coupled, the open end of a vestibule-extension to a car, a buffer-plate pivotally connected with a spring-extended buffer-rod, and the said face-plate connected at its upper end with spring-extended guide-rods, substantially as described, and its foot to the buffer-plate, whereby the said face-plate is made capable both at its top and at its bottom to oscillate on a vertical central line, but is restrained as to other movements to one in a line passing longitudinally and horizontally through the center of the car, substantially as hereinbefore described.

4. The combination of a face-plate forming, when railway-cars are not coupled, the open end of a vestibule-extension to a car and arranged, as hereinbefore described, to be capable of oscillating on a vertical central line, but restrained as to other movements to one in a line passing longitudinally and horizontally through the center of the car, and a flexible bellows or equivalent extensible connection uniting the face-plate with the car-body structure, substantially as described.

5. A vestibule-extension to a car-body, which is made up of the following components: first, an extension of the car-body, so as to practically inclose the entrance-platform and provided with doors at the sides; second, an extensible section of flexible material uniting the said extension of the car-body with a face-plate, which forms, when railway-cars are not coupled, the open end of the vestibule; third, the said face-plate, combined with the car structure and arranged, as described, to oscillate on a central vertical line, but restrained as to other movements to one in a line passing longitudinally and horizontally through the center of the car, and, fourth, a threshold-plate having the same movements and restraints as the said face-plate, substantially as described.

408,138. WATER-HEATER. PHILIP H. REED, Chicago, Ill., assignor to the Chicago Gas Stove Company, same place. Filed Apr. 3, 1888. Serial No. 269,453. (No model.)

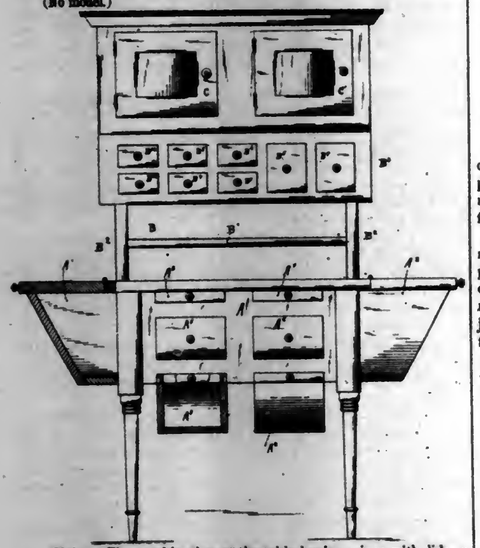


Claim.—1. The combination, in a water-heater or water-front, of a water compartment or boiler provided integrally with a gas compartment or burner, substantially as described.

2. The combination, in a water-heater or water-front, of the annular water-ring and the annular gas ring or burner cast integrally with it on the under side thereof, substantially as described.

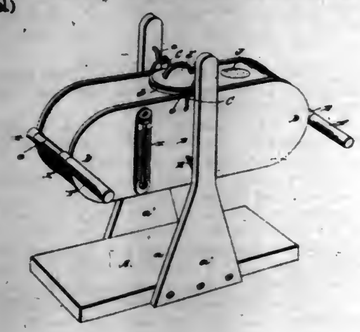
3. The combination, in a water-heater or water-front, of the annular water-ring A, substantially rectangular in cross-section, and the annular gas ring or burner B, cast integral with the water-ring around the outer, upper, or lower edges thereof, substantially as described.

4. The combination, with the water-ring and the gas-ring formed integral therewith, near the lower outer edge thereof, of an open-



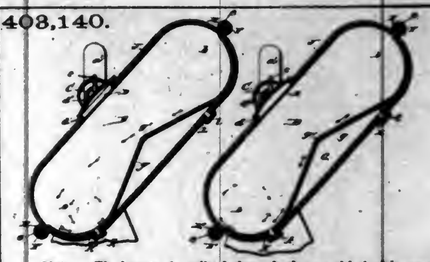
408,138.

ing in the center of said ring, and a jacket, J, around said burner and water-ring, substantially as shown and described, and for the purpose specified.



5. The combination, in a water-heater or water-front, of a vertical series of single water-heaters, each consisting of a water-ring and a gas ring or burner integrally formed therewith and of intermediate connections between said water-rings alternately upon opposite sides, substantially as described.

408,139. KITCHEN TABLE AND DRESSER. CHARLES W. E. RIPLEY, Washington, D. C. Filed Jan. 26, 1889. Serial No. 297,675. (No model.)

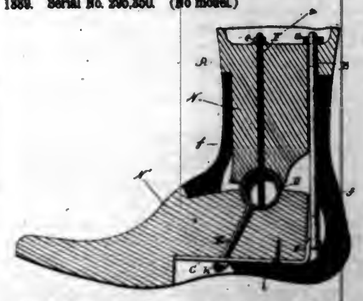


Claim.—The combination of the table having wings with lids, a drawer-frame having its drawers arranged substantially as described, and a shelf-frame upon said table between the wings and supporting the drawer-frame, and having a shelf interposed between the top of the table and the bottom of the drawer-frame, substantially as described.

408,140. CHURN. GEORGE F. ROBERTSON and WILLIAM D. GANNON, Morristown, Tenn. Filed Mar. 5, 1888. Serial No. 266,188. (No model.)

408,140.

Claim.—The herein-described churn-body, provided with rounded ends and having a false bottom with upwardly-curved ends conforming to the shape of the end walls of the said churn-body, and a raised central portion intermediate the curved ends, forming a transverse apex, whereby a compartment is constituted between the false bottom and the lower wall of the churn-body, substantially as described.

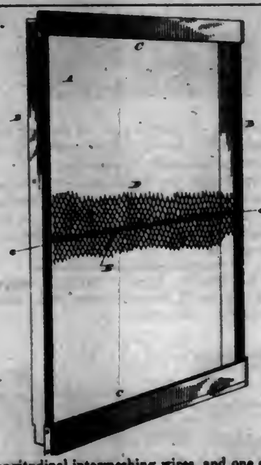


408,141. METAL PACKING FOR CAR-AXLE BOXES. HAMILTON ROGERS, Toledo, Ohio, assignor to the Rogers Car Axle Box Company, same place. Filed Mar. 16, 1888. Serial No. 267,430. (No model.)

Claim.—1. In combination with a car-axle box provided with an oil-receptacle and axle-journal revolving within the box, a flexible packing for conducting the lubricant to the journal, composed of metal wire having a covering of waste or analogous material, as and for the purpose set forth.

2. In a combination with a car-axle box and axle-journal, an oil-receptacle beneath the journal provided with a supplemental channel-plate packed with a flexible oil-conducting medium, consisting of a central core of resilient metal and an outer covering of textile material in contact with the journal, the packing being held beneath the journal by means of the channel-plate, as and for the purpose set forth.

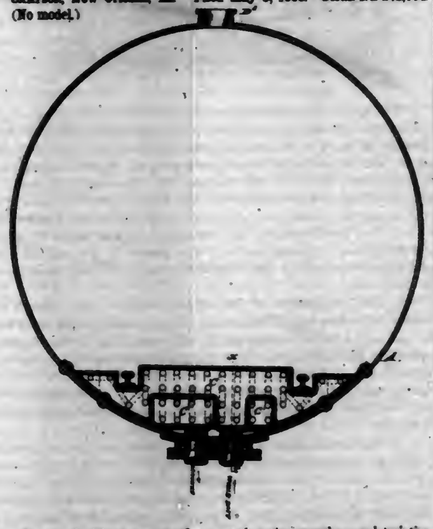
408,142. ARTIFICIAL LEG. BENJAMIN F. ROUNDS, Kansas City, Mo., assignor of one-half to James P. Bird, same place. Filed Jan. 3, 1889. Serial No. 295,350. (No model.)



Claim.—The artificial leg consisting of the articulated leg and foot sections, the metallic plate having an upwardly-projecting hook at its outer end, said plate being disposed in a longitudinal recess in the under side of the foot-section, the oblique rod loosely connected at its upper end to the leg-section and passed through said foot-section in an inclined direction and secured to said hooked plate, and made adjustable, and the cord secured at its upper end to the leg-section and passed down in a substantially straight line and looped upon the hook of said metallic plate, substantially as set forth.

408,143. WOVEN-WIRE BED-BOTTOM. JAMES B. RYAN, New York, N. Y. Filed May 23, 1888. Serial No. 274,877. (No model.)

Claim.—1. In a bed-bottom composed of a frame and a woven-wire fabric, the combination, with such fabric, of stiffening rods or strips passed transversely through its meshes and having their ends connected to the side edges of the fabric, substantially as described.



2. In a bed-bottom, the combination of a rectangular frame, a woven-wire bottom disconnected at the sides from the frame, and

408,143.

composed of longitudinal intermeshing wires, and one or more transverse strips secured to the edges of the woven-wire bottom and extending through the coils formed by the intermeshing wires, substantially as and for the purpose set forth.

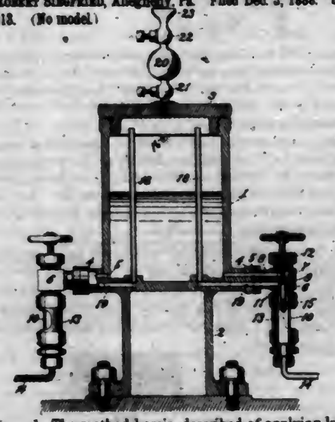
408,144. PROCESS OF PRESERVING LUMBER. THOMAS H. SAMPSON, New Orleans, La. Filed May 5, 1888. Serial No. 272,991. (No model.)

Claim.—1. The process of preventing the warping and twisting of lumber, which consists in first removing the sap, then dissolving the imperfectly-formed cellular tissue by an alkaline solution and extracting it by a vacuum, and finally precipitating the remaining matters in the wood in an insoluble state by a basic metallic salt and drying, substantially as described.

2. The process of preventing the warping and twisting of lumber, which consists in first removing the sap by heating the wood to a temperature below the coagulating point of the sap and extracting the same by a vacuum, then dissolving the imperfectly-formed cellular tissue by an alkaline solution and extracting it by a vacuum, then precipitating the remaining matters in the wood in an insoluble state by a basic metallic salt and drying, substantially as described.

3. The process of preventing the warping and twisting of lumber, which consists in first removing the sap by heating the wood to a temperature below the coagulating point of the sap and extracting the latter by a vacuum, then dissolving the imperfectly-formed cellular tissue by an alkaline solution and extracting it by a vacuum, then precipitating the remaining matters in the wood in an insoluble state by a basic metallic salt, and finally drying the wood first in a vacuum and then under pressure, substantially as and for the purpose described.

408,145. VETERINARY FILE-HOLDER. DAVID M. SCHEFFER, New Castle, Ind., assignor to Haussmann, McComb & Dunn, Chicago, Ill. Filed July 26, 1888. Serial No. 281,130. (No model.)



Claim.—1. The combination, with a file, of a holder provided with a socket for the reception of said file, and a spring clamping device for locking the file in position, whereby friction alone operates to hold the file, substantially as described.

2. The combination, with a file, of a holder provided with a socket for the reception and of substantially the depth of said file, a spring-arm on said holder, and a screw working through said arm and engaging the body of said holder, substantially as described.

3. The jointed holder composed of sections having a hinge-connection therebetween, in combination with files mounted in each of said sections, substantially as described.

4. The jointed holder composed of sections hinged together, each of which has a file-socket therein, and tongue-shields at the reverse sides of said sockets, in combination with files fitting into each of said sockets and spring clamping devices for locking said files in position, substantially as described.

408,146. METHOD OF FEEDING LUBRICANTS. ALBERT SOBBIE and ROBERT SIEGFRIED, Allegheny, Pa. Filed Dec. 3, 1888. Serial No. 292,513. (No model.)

Claim.—1. The method herein described of applying lubricants, which consists in feeding the lubricant in regulated quantities to fluid under pressure, and then delivering such lubricant to the place or places of desired application by such fluid-pressure, substantially as set forth.

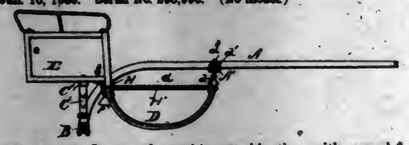
2. The method herein described of applying lubricants, which

consists in feeding the lubricant by gravity to fluid under pressure and then delivering such lubricant to the place or places of desired application by such fluid-pressure, substantially as set forth.

408,147. CAR-COUPLING LINK. JACOB SCHNEBELLER, Pittsburg, Pa., and JOHN T. JONES, Iron Mountain, Mich. Filed Nov. 21, 1888. Serial No. 291,626. (No model.)

Claim.—1. A car-coupling link formed of a continuous band of metal wrapped in several layers or strands, and having the ends of the band united to the body of the link, some of the layers or strands being curved or sprung at or near the center of the link to impart elasticity thereto, substantially as and for the purposes set forth.

2. A car-coupling link formed of a continuous band of metal wrapped in several layers or strands, and having the ends of the band united to the body of the link, some of the layers or strands being curved or sprung at or near the center of the link to impart elasticity thereto, and one or more of the layers or strands being straight between the bent ends of the link, substantially as and for the purposes set forth.



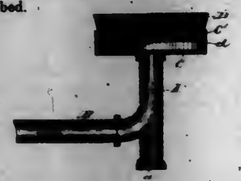
3. A car-coupling link formed of a continuous band of metal, said band being wrapped in several layers or strands, the one upon the other, and having the ends of the band united to the body of the link, substantially as and for the purposes set forth.

4. A car-coupling link formed of a continuous band of metal, said band being wrapped in several layers or strands, the one upon the other, and having some of the layers curved or bent at or near the center of the link to impart elasticity thereto, substantially as and for the purposes set forth.

5. A car-coupling link formed of a continuous band of metal wrapped in several layers or strands, and having the several strands united at one or both ends, said strands being unconnected in the central portions thereof, substantially as and for the purposes set forth.

6. A car-coupling link formed of a continuous band of metal wrapped in several layers or strands, and having said strands united together at one end and unconnected at the other end and in the central portions thereof, substantially as and for the purposes set forth.

408,148. ROAD-CART. ROBERT D. SCOTT, Pontiac, Mich. Filed Jan. 10, 1889. Serial No. 295,906. (No model.)



Claim.—1. In a road-cart, the combination, with curved foot-board sills extending from the front backward and up to the seat, of a close body beneath the seat, the forward upright edges of the said body framed to the upright rear portions of the said curved foot-bar sills, substantially as described.

2. In a road-cart, the combination of curved foot-board sills D, extending from the front backward and up to the seat, a box beneath the seat having its forward upright edges framed to the upright portions of said sills, adapted to sustain the box, and rods G, passing through the bracket and joining the upright portions of the foot-board sills, substantially as described.

408,149. FORGE-TUYERE. WILLIAM H. SHANK, Huntington, Ind. Filed Mar. 18, 1889. Serial No. 303,732. (No model.)

Claim.—1. In a forge-tuyere, the combination, with the tuyere-pipe and the blast-pipe leading into the same, of the flanged disk on the tuyere-pipe and a grate for dividing the blast on said disk, substantially as described.

408,149.

2. The grate, as D, consisting of the inclined outer portion, the ring F, and deflector G, having inclined walls and united with each other by supports, substantially as described.

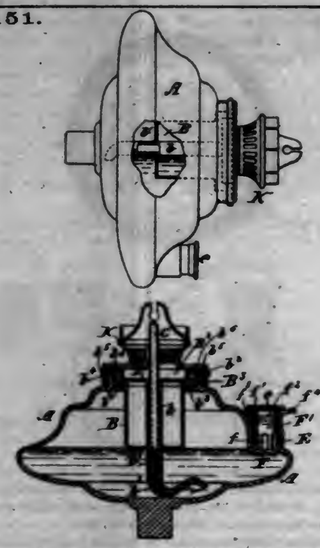
3. In a forge-tuyere, the combination of the tuyere-pipe A, having the slide *a* in its bottom, the blast-pipe B, leading into the pipe A, the disk on the pipe A, and the grate, as D, on the disk having a series of inclined divisional rings or bars for deflecting the blast, substantially as described.

408,150. ENGINE. JABEZ F. SHAWHAN, Dayton, Ohio, assignor of one-half to James W. Carpenter, same place. Filed Mar. 23, 1888. Serial No. 268,266. (No model.)

Claim.—1. The combination of a series of reciprocating engines connected with each other and revolving around one axis, a revolving head at an angle to the said axis and connected with the piston-rods of the said engines, a governor and a governor-shaft arranged parallel with the axis of the said engines and connected with one of the said revolving parts to control the flow of motor-fluid to the engines, and a case which surrounds all of said parts, substantially as set forth.

2. The combination of the revolving engines, barrel E, inclined revolving head 7, connected with the pistons of the engines, and a governor connected by a flexible shaft with said head, substantially as described.

3. The combination of the series of reciprocating engines connected to revolve around a common axis, a revolving head at an angle to the said axis and connected to the piston-rods of the engines, a revolving block connected with one of the said revolving parts to be driven thereby, the L-shaped levers carried by said block, a reciprocating rod against which said levers bear, and a valve connected with said rod controlling the steam-passage to the engines, substantially as described.



4. The combination of the series of reciprocating engines connected to revolve around a common axis, a revolving head at an angle to the said axis and connected to the piston-rods of the engines, a revolving block, 16, mounted adjacent to the said head and connected thereto by a flexible shaft, a reciprocating rod mounted parallel with the axis around which the engines revolve, connected to move the governing-valve, and the levers carried by the said block connected to reciprocate the said rod as the speed of the engines varies, substantially as described.

5. The combination, with the series of engines connected to revolve around a common axis, of a frame having a chamber, *x*, a ring provided with inlet and outlet ports mounted in the said chamber and having the shoulder or offset *v*, whereby the ring is held against the heads of the revolving engines by the steam-pressure, and the steam and exhaust passages in the frame, substantially as described.

6. The combination of the series of revolving engines, the inclined head 7, provided with a shaft, B, the piston-rods connecting the engines with the said head, the case inclosing the said parts, and a removable cap having an inclined bracket wherein is mounted the shaft of the said head, substantially as described.

408,151. HYDROCARBON-LAMP. STEFAN SIERHAKL, Vienna, Austria-Hungary, assignor of one-half to Adalmar Breden, same place. Filed Jan. 12, 1888. Serial No. 260,574. (No model.) Patented in France Jan. 16, 1886, No. 173,576; in Belgium Jan. 16, 1886, No. 71,660; in Germany May 14, 1887, No. 42,494, and in England June 1, 1887, No. 7,956.

408,151.

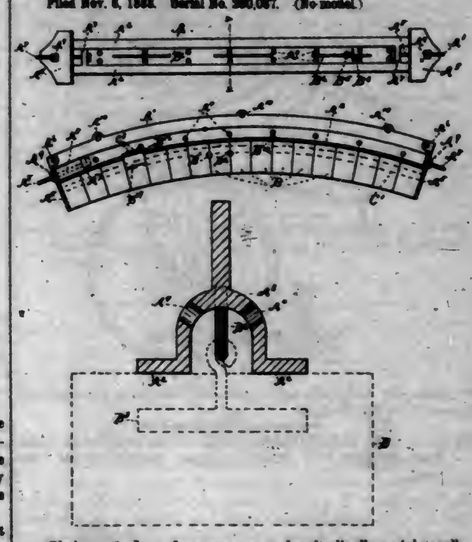
Claim.—1. In a hydrocarbon-lamp, the combination, with the oil-fount and a wick-tube projecting axially into the fount and terminating in close proximity to the bottom thereof, of a filling-aperture located in a plane dividing the fount horizontally, so that the capacity of the portion below said plane will not exceed the capacity above the same, substantially as and for the purpose specified.

2. In a hydrocarbon-lamp, the combination, with the oil-fount and a wick-tube projecting axially into the fount and terminating in close proximity to the bottom thereof, and having its lower end curved laterally, as shown, of a filling-aperture located in a plane dividing the fount horizontally, so that the capacity of the portion below said plane will not exceed the capacity above the same, substantially as and for the purpose specified.

3. In a hydrocarbon-lamp, the combination, with the oil-fount, a wick-tube, and a wick-tube sheath extending close to the bottom of the fount, said sheath being formed of two tubes so arranged as to form a hiatus between them, of a filling-aperture located in a plane dividing the fount horizontally, so that the capacity of the portion below said plane will not exceed the capacity of the portion above the same, substantially as and for the purpose specified.

4. In a hydrocarbon-lamp, the combination, with the oil-fount, a wick-tube, and a wick-tube sheath extending close to the bottom of the fount, said sheath being formed of two tubes and a closed chamber with which both tubes communicate, of a filling-aperture located in a plane dividing the fount horizontally, so that the capacity of the portion below said plane will not exceed the capacity of the portion above the same, substantially as and for the purpose specified.

5. In a hydrocarbon-lamp, the combination, with the oil-fount, of the casing B, the open-ended tubes *b* and *b'*, connected therewith, as described, and the wick-tube C, fitted loosely in said tubes *b* and *b'*, of a filling-aperture located in a plane dividing the fount horizontally, so that the capacity of the portion below said plane will not exceed the capacity of the portion above the same, substantially as and for the purpose specified.



6. In a hydrocarbon-lamp, the combination, with the oil-fount, of the casing B, having a recess formed in its top or cover, the open-ended tubes *b* and *b'*, connected therewith, as described, and the wick-tube C, fitted loosely in said tubes *b* and *b'*, of a filling-aperture located in a plane dividing the fount horizontally, so that the capacity of the portion below said plane will not exceed the capacity of the portion above the same, substantially as and for the purpose specified.

7. In a hydrocarbon-lamp, the combination, with the oil-fount and the wick-tube, of a wick-tube sheath comprising two open-ended tubes and a closed chamber with which said tubes communicate, said chamber having a recessed or cupped top or roof surrounding the wick-tube, substantially as and for the purpose specified.

8. In a hydrocarbon-lamp, the combination, with the oil-fount and the wick-tube, of a wick-tube sheath comprising a casing whose top plate is recessed or cupped, a tube extending axially into said casing to near the bottom thereof, and a tube projecting from the bottom of said casing, substantially as and for the purpose specified.

9. In a hydrocarbon-lamp, the combination, with the oil-fount and the wick-tube, of a wick-tube sheath comprising a casing whose top plate is recessed or cupped, a tube extending axially into said casing to near the bottom thereof, and a tube projecting from the bottom of the casing and terminating near the bottom of the fount, said tube having its lower end bent laterally, substantially as and for the purpose specified.

408,152. FURNACE-COVER. WILLIAM SLEICHER, Jr., Troy, N. Y. Filed Nov. 6, 1888. Serial No. 290,067. (No model.)

Claim.—1. In a furnace-cover, a longitudinally and laterally arched brick-supporting beam made of a single bar of ir6n, substantially as described.

2. In a furnace-cover, the combination, with a brick-supporting beam, of end clamps pivoted upon the beam, one at each end, a row of fire-bricks inclosed between the clamps, and adjustable connections for securing the oscillatory ends of the clamps upon the ends of the beam, as screw-bolts A^5 and cross-bars A^7, substantially as described.

3. In a furnace-cover, the combination, with a brick-supporting beam having end clamp, of a row of clamp-inclosed bricks and a brick-supporting link connecting an individual brick in the row with the beam, substantially as described.

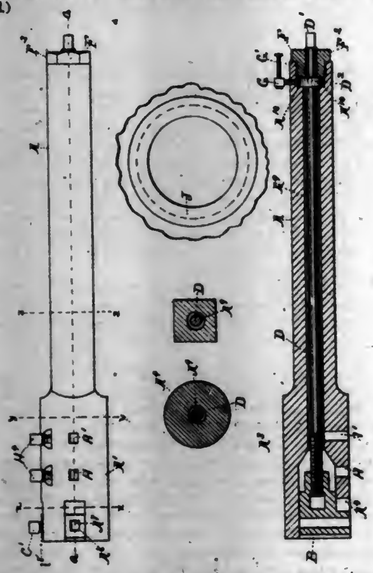
4. In a furnace-cover, the combination, with a brick-supporting beam having an end clamp, of a row of clamp-inclosed bricks having link-channels between contiguous bricks, and supporting-links adapted to fit such channels secured to the iron beam, substantially as described.

5. In a furnace-cover, the combination, with a brick-supporting beam, of a row of bricks having key-channels, a brick-supporting link connecting a brick central of the row with the beam, and brick-supporting keys, substantially as described.

408,153. BICYCLE. WILLIAM E. SMITH, Washington, D. C., assignor, by mesne assignments, to Philip T. Dodge, trustee, same place. Original application filed Feb. 16, 1888, Serial No. 264,187. Divided and this application filed Oct. 15, 1888. Serial No. 288,127. (No model.)

Claim.—1. In a bicycle, the combination of two ground-wheels arranged one directly in advance of the other, the connecting-frame provided with a seat and depressed between the wheels and forward of the seat to about the level of the rider's feet, and an elevated brace spanning the depressed portion of the frame and connected thereto in front and rear, said brace movably connected to the frame, substantially as described, whereby the frame may be stiffened for the use of male riders or adjusted to admit the skirts of female riders at will.

2. In a bicycle having a front steering and a rear driving wheel, and the main frame depressed between the wheels, as described, a brace to span the depressed portion and connect the two ends of the frame, hinged at one end to said frame and detachably connected thereto at the opposite end, whereby said brace may be disconnected at one end and turned out of its operative position without removal from the frame.



3. In combination with the frame depressed between the wheels and provided with a seat-standard, J, and the ears *k* and k^2, the brace hinged to the seat-standard, detachably connected to the front end of the machine and adapted to swing downward to the ear k^2, whereby

408,153.

the brace may be thrown out of action and fastened in place without removal from the machine.

408,154. ADJUSTABLE MULTIPLE-CUTTER BORING-BAR. JAMES STONE, Waterford, N. Y. Filed Aug. 4, 1888. Serial No. 281,924. (No model.)

Claim.—1. In a multiple-cutter boring-bar, a stationary fixed bar provided with a tool-socket, in combination with a tool-carriage for carrying a separate tool, movably supported by such fixed bar and adjustable longitudinally thereon, for the purpose of simultaneously cutting two interior faces, substantially as described.

2. The combination, in a multiple-cutter boring-bar, of a shank, A, head A', provided with tool-sockets H, tool-carriage B, movably mounted upon the head, carriage-adjusting stem D, and means for locking the adjusting-stem, as binding-screw G, substantially as described, and for the purpose of simultaneously working two cutting-tools upon the opposite faces of a straight-way valve.

408,155. RIBBON-HOLDER. CHESTER R. SULLY, Spencer, Iowa. Filed Sept. 1, 1888. Serial No. 284,941. (No model.)

Claim.—1. A ribbon-holder formed of a single piece of wire, comprising a transverse middle part having opposite longitudinally-extending arms B B', formed by bending the wire twice upon itself,

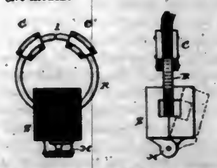
408,155.

straight parts C C', extending at right angles to said arms, the sides D D', springs formed on the sides, and the trunnions projecting inwardly from the springs, substantially as set forth.

2. A ribbon-holder comprising a middle part, side arms, D D', terminating at their lower ends in the curved springs E E', formed at their ends with the bent parts F F', respectively, each provided at its end with the inwardly-projecting trunnions G G', said trunnions being held from outward movement by the side arms, substantially as set forth.

3. A ribbon-holder formed of a single piece of wire, comprising a middle transverse part having longitudinal arms with their ends bent downward, straight sides extending at right angles to the transverse middle part, springs formed at the ends of the said sides and passing in the front and rear of the said sides, projecting ends formed on the said springs, and trunnions formed on the said ends, substantially as shown and described.

408,156. COVER FOR FRUIT-BASKETS. FREDERICK A. THOMAS, Chicago, Ill. Filed Mar. 25, 1889. Serial No. 304,663. (No model.)

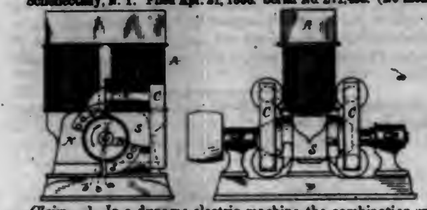


Claim.—1. The cover for fruit-packages, provided with a lower row of slats to keep the fruit in place, and an upper row of slats to take the weight in piling, substantially as set forth.

2. The combination, with a fruit-package, of an upper and a lower row of slats covering the package, and end pieces to which the slats are secured, substantially as set forth.

3. The combination of end pieces having ledges *d*, with upper slats, E, and lower slats, D, secured to said end pieces, substantially as set forth.

408,157. METHOD OF ELECTRIC WELDING AND SHAPING OF METALS. ELIHU THOMSON, Lynn, Mass. Filed Oct. 15, 1888. Serial No. 288,163. (No model.)



Claim.—1. The herein-described improvement in electric metal-working, consisting in setting up or establishing a counter electro-motive force or tendency in those parts of the work which form a shunt to the part to be heated, for the purpose of confining or localizing the heating-current at the part to be operated upon.

2. The herein-described improvement in electrical ring-welding,

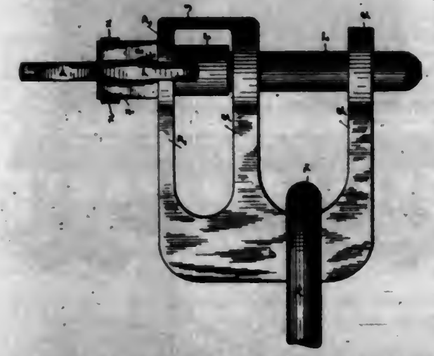
&c., consisting in establishing in the continuous portion of the blank a counter electro-motive force or tendency opposing the flow of current therethrough from one to the other of the clamps by which the heating-current is supplied.

3. The herein-described improvement in electric metal-working by alternating currents, which consists in establishing in the part of the work forming a shunt to the portion to be heated a series of alternating currents derived from the same source as the main heating-currents, and tending to oppose the main heating-current in the shunt, while at the same time assisting such main currents in heating the work.

408,158. DYNAMO-ELECTRIC MACHINE. HENRY R. WALTER, Schenectady, N. Y. Filed Apr. 21, 1888. Serial No. 271,498. (No model.)

Claim.—1. In a dynamo-electric machine, the combination, with the armature and main field-magnet, of an extra magnet having coils in series with the armature and acting on the armature-coils outside of the main field of force, substantially as set forth.

2. In a dynamo-electric machine, the combination, with the armature and main field-magnet, of two extra magnets, each having coils in series with the armature and acting upon the armature-coils at opposite ends of the armature and outside of the main field of force, substantially as set forth.



3. In a dynamo-electric machine, the combination, with the armature and main field-magnet, of an extra magnet having coils in series with the armature whose poles are situated so as to act upon the armature-coils outside of the main field of force and so as to assist the parts of the main magnet-poles which are weakened by the armature magnetism, substantially as set forth.

4. In a dynamo-electric machine, the combination, with the armature and main field-magnet, of the extra magnet having coils in series with the armature and acting upon the armature-coils outside of the main field of force, the effective poles of the main magnet and extra magnet being situated so as to act upon the armature at an angle with each other, substantially as set forth.

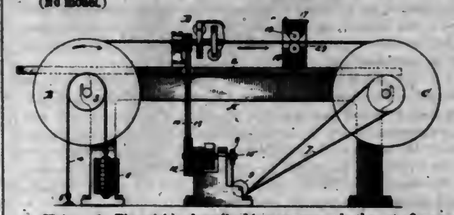
5. In a dynamo-electric machine, the combination of the armature, the field-magnet, and the extra magnet acting on the armature-coils outside the main field of force and wound partly in series and partly in shunt with the armature, substantially as set forth.

6. In a dynamo-electric machine, the combination of the armature, the field-magnet, an extra magnet having coils in series with the armature and situated so as to prevent self-induction in the armature-coils, and an extra coil on the field-magnet in series with the armature, substantially as set forth.

408,159. COUPLER FOR MINING-CARS. WILLIAM WALTER, Greensburg, Pa., assignor of one-fourth to Samuel A. Clements, same place. Filed Feb. 3, 1888. Renewed Mar. 19, 1889. Serial No. 303,944. (No model.)

Claim.—1. In a flexible or loose coupler, the clevis *o*, provided with an extra bar, *p*, the coupling-pin *r*, having secured in suitable bearings two levers, *v*, each provided with a hook, *w*, adapted to engage with the under surface of the top bar, *p*, of the clevis.

2. In a flexible or loose coupling such as described, the clevis *o*, provided with an extra bar, *p*, as and for the purpose described.



3. In a coupling such as described, the clevis *o*, provided with an extra bar, *p*, and connecting-bar *s*, substantially as described.

4. A coupling-pin consisting of the pin *r*, having secured in suitable bearings at the top two levers, *v*, each provided with a hook, *w*, capable of moving toward or away from the body of the pin.

5. A coupling-pin for the purpose set forth, consisting of the pin *r*, having secured in suitable bearings at the top of the same two levers, *v*, each provided with a hook, *w*, capable of moving toward or away from the body of the pin *r*, and a spring, *x*, connecting the two levers *v* together, as and for the purpose set forth.

6. In a loose coupling such as described, the combination consisting of the clevis *o*, provided with an extra bar, *p*, and connecting-bar *s*, the pin *r*, having two parallel flanges, *l*, formed on the top of the same, the levers *v*, each provided at their lower extremities with hooks *w*, the spring *x*, connecting the two levers *v* together, and the small bar *y*, arranged between the same, substantially as set forth and described.

408,160. MANUFACTURE OF DRESS-STIFFENERS. IRA DE VER WARNER, Bridgeport, Conn. Filed Sept. 20, 1888. Serial No. 286,759. (No model.)

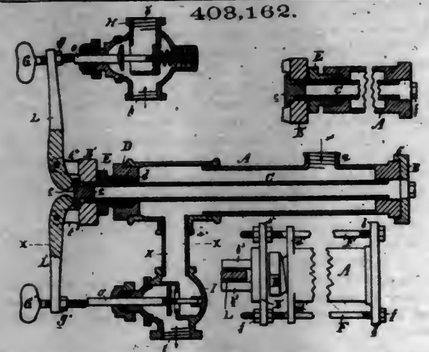
Claim.—1. The within-described improvement in the art of manufacturing stiffening-blades, the same consisting in arranging fibers longitudinally in bundles and then bringing two or more of said bundles parallel side by side and binding them together under tension, whereby the fibers of said bundles are brought into substantially parallel straight lines and held in this condition, substantially as set forth.

2. The within-described process of forming stiffening-blades, consisting in arranging fibers longitudinally in bundles and arranging two or more of said bundles parallel side by side, binding them together under tension, and subjecting the composed bundle to heat and pressure, substantially as set forth.

3. In the manufacture of stiffening-blades, arranging fibers longitudinally in bundles, bringing two or more of said bundles together parallel side by side, binding them together under tension, coating the same with cement, and flattening under heat and pressure, substantially as set forth.

408,161. CORSET-STIFFENER. IRA DE VER WARNER, Bridgeport, Conn. Filed Sept. 29, 1888. Serial No. 286,760. (No model.)

Claim.—1. A flat stiffening-blade consisting of bundles of fibers arranged side by side, with a surrounding binding material confining the fibers of the said bundles in straight lines parallel with each other and with the edges of the blades, substantially as set forth.

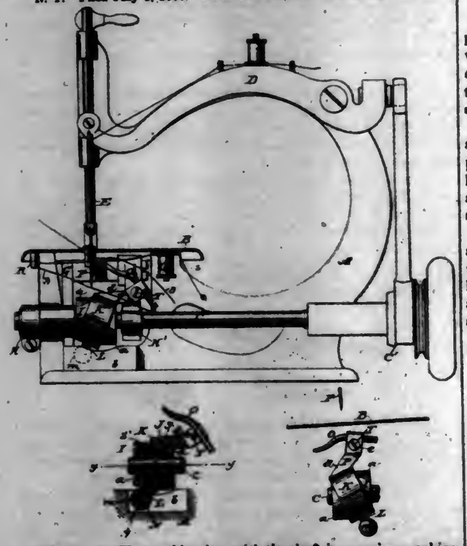


2. A flat stiffening-blade consisting of bundles of fibers arranged side by side, with a surrounding binding material confining the fibers of the said bundles in straight lines parallel with each other and with the edges of the blade and cemented to the inclosed fibers, substantially as set forth.

408,162. STEAM TRAP AND REGULATOR. ADOLPH WEBER, Detroit, Mich., assignor of one-half to William L'H. Mahon, same place. Filed Jan. 11, 1889. Serial No. 296,112. (No model.)

Claim.—1. The combination of the iron cylinder A, provided with the inlet and outlet pipes and the wings *b* and *d'*, the gland E, the cap B', having wings b^3 and provided with the studs b^3 b^3 and b^4 b^4, the rods F F, with the nuts *f f*, for connecting the cap B' with the cylinder and for regulating the extent of the action of the thermostatic tube C, the thermostatic tube C, the lever L, operated by the thermostatic tube, the means for controlling the extent of the opening of the valve H, and the valve H, substantially as and for the purpose described.

2. The combination of the iron cylinder A, provided with inlet and outlet passages and wings *b d'*, the gland E, the cap B', having

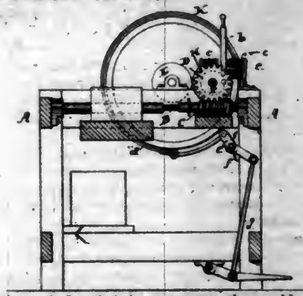


408,162.

wings b^3 and provided with the studs b^3 b^3 and b^4 b^4, the rods F F, and nuts for connecting the cap B' with the cylinder A and for regulating the extent of the action of the thermostatic tube C, the thermostatic tube C, the lever L', the means for regulating the extent of the opening of the valve I, the valve I, and the pipe K, substantially as and for the purpose described.

3. The combination of the iron cylinder A, provided with the inlet and outlet pipes and the wings b c, the gland E, the cap B', having wings b^3 b^4 and provided with the studs b^3 b^4, the rods and nuts for connecting the cap B' with the cylinder and for regulating the extent of the action of the thermostatic tube C, the thermostatic tube C, the levers L L', the means for regulating the extent of the opening of the valves H and I, the valves H and I, and the tube K, substantially as and for the purpose set forth.

408,163. SEWING-MACHINE. CHARLES W. WEBB, Brooklyn, N. Y. Filed July 5, 1888. Serial No. 279,044. (No model.)



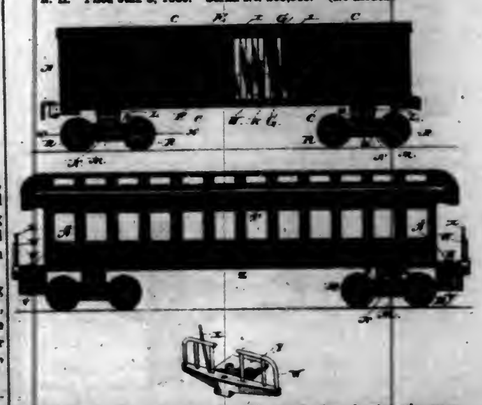
Claim.—1. The combination, with the shaft in a sewing-machine, of a cylindrical block fixed upon said shaft and having a peripheral groove formed thereon in a plane inclined to its axis, an oscillating non-revoluble band encircling said groove loosely, and a looper carried by said band, substantially in the manner and for the purpose herein set forth.

2. The combination, substantially as described, of the rotating cylindrical block I, having an inclined peripheral groove, the band K, encircling said groove loosely, the looper O, carried by said band, the guide-arm L, projecting from said band and terminating in a ball or spherical end, m, and the lateral parallel guide-walls b b, between which said plates are fitted to move freely.

3. The combination, in the stitch-forming mechanism of a sewing-machine, of the rotating shaft C, the reciprocating needle F, the means, substantially as described, whereby the needle is actuated by the rotation of the shaft, the looper O, traversing the path of the needle, the cylindrical block I, secured upon the shaft C and having an inclined groove encircling its periphery, and the oscillating non-revoluble band encircling said groove and to which the looper is secured, substantially in the manner and for the purpose herein set forth.

4. The combination, in the stitch-forming mechanism of a sewing-machine, of the bed-plate B, the reciprocating needle F the longitudinally-perforated looper O, traversing the path of the needle under the bed-plate, the rotating shaft C, the cylindrical block I, secured upon the shaft immediately under the needle and having a groove encircling its periphery at an inclination to the axis of the shaft, an oscillating non-revoluble band, K, encircling said groove and by which the looper is carried, means, substantially as described, for actuating the needle by the rotation of the shaft, an eye, R, upon the under side of the bed-plate at a point in front of the looper, and a tension device, Q, fixed under the bed-plate at a point in the rear of the looper, all substantially in the manner and for the purpose herein set forth.

408,164. HOIST. JOHN WIEST, York, Pa. Filed Sept. 19, 1887. Serial No. 250,097. (No model.)



Claim.—1. In a hoisting apparatus, the combination, with the power-shaft having a worm-gearing, of the counter-shaft provided with a worm-wheel and having a universal bearing at one end and carrying a friction-pulley at the other end, the slotted journal-box, the lever connected thereto, and the windlass having a friction-pulley, substantially as set forth.

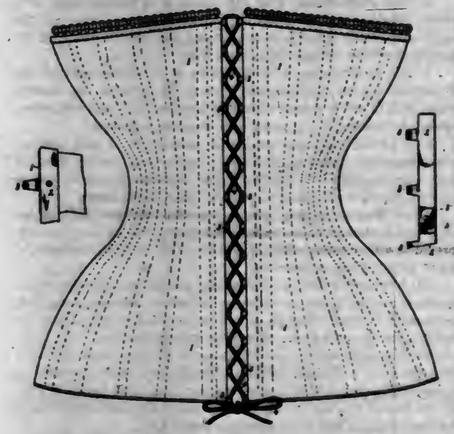
2. The combination of the shaft E, having one end provided with a universal bearing, a windlass-shaft and windlass, a hollow friction-pulley and its smaller pulley located on said windlass-shaft, a pulley located on the shaft E, and electro-magnets for moving said shaft E against the interior of said hollow pulley or its smaller pulley, substantially as and for the purpose set forth.

3. The combination of the power-shaft B and counter-shaft E, and worm-gearing between the same, a universal bearing and a transversely-movable bearing for said shaft E, pulley on the latter, a windlass-shaft having hollow friction-pulley and smaller friction-pulley, and a lever for moving said transversely-movable bearing, substantially as and for the purpose set forth.

408,165. TOY RAILROAD-CAR. JAMES S. WILKINS, Jr., Keene, N. H. Filed Jan. 5, 1889. Serial No. 295,515. (No model.)

Claim.—1. In a toy car, the sides or castings having the openings or doorways B, the studs C, projecting from their outer sides, the bottom D, projecting from their inner sides, the wires or rods stretched on the studs and having their ends passed through openings in the sides of the car and clinched, and the sliding doors guided between said wires or rods and the sides of the cars, said doors having the studs bearing on the wires, substantially as described.

2. In a toy car, the sides or castings having the openings or doorways B, and the studs C, projecting from their outer sides, the wires or rods G, stretched between the studs across the upper and lower sides of the doorways, and having their ends passed through openings in the sides of the car and clinched, and the sliding doors made of cast metal and guided between said wires or rods and the sides of the car, said doors having the outwardly-projecting studs I K, cast with them at their upper and lower sides and bearing on the upper and lower sides of the upper and lower wires, respectively, substantially as described.



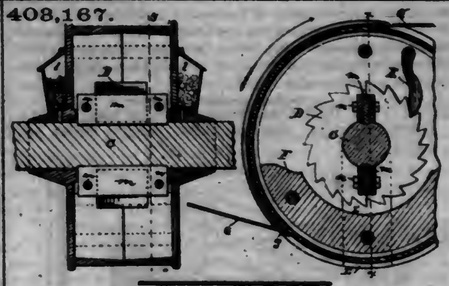
3. In a toy car, the combination, with the box or body having the depending standards L, of the castings M, centrally pivoted to said standards, and the car-axles having their ends journaled in recesses on the inner sides of the castings at the ends thereof, substantially as described.

4. In a truck for toy cars, the castings M, representing the side springs, bars, and axle-boxes of a car-truck, and the axles having their ends journaled in recesses on the inner sides of the castings M, at the ends thereof, substantially as described.

5. The combination, in a toy car, of the body having the platforms at its ends, and the hand-rails having the plates Y secured under the car-platforms, substantially as described.

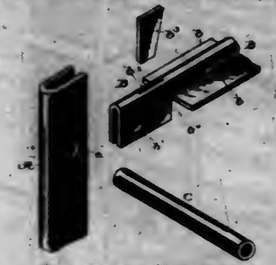
6. In a toy car, the body formed of longitudinal separable sections or castings having the end platforms, in combination with the hand-rails having the plates Y under said platform, said plates being riveted or secured to the platforms and thereby securing the ends of the car-sections together, substantially as described.

408,166. CORSET-FASTENING. NATHANIEL B. WILLIAMS, Bridgeport, Conn. Filed Jan. 3, 1888. Serial No. 260,751. (No model.)



Claim.—1. The combination, with a corset-lacing stay provided with projecting eyes extending beyond its edge and open in the direction of the length of the stay, of strips of thickening material placed at each side of the stay and between the latter and the corset fabric, to thicken the back edge of the corset, so that crossed lacing-cords will not project outside of the outer face of the corset, substantially as set forth.

2. The combination, with a corset-lacing stay provided with projecting metallic eyes extending beyond its edge and open in the direction of the length of the stay, said eyes being flattened in the plane of the stay to form elliptical openings through which the lacing-cord can freely pass, of strips of thickening material placed at the sides of the stay to thicken the back edge of the corset, so that the crossed lacing-cords will not project outside of the outer surface of the corset.



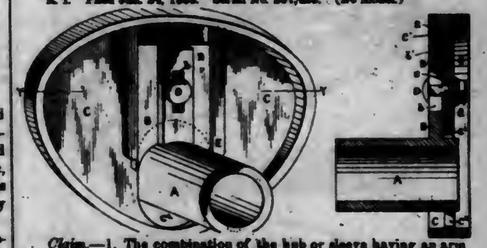
408,167. CAR-STARTER. BARTHOLOMEW WHITAR and MILES PRETTE, Wellington, Ontario, Canada. Filed Mar. 11, 1889. Serial No. 302,733. (No model.)

Claim.—In a car-starter, the combination of the weighted loose drum B, provided with movable section L and pawl E, ratchet-wheel D, provided with keys n n, and chain G-G' with car-axle C, all constructed and arranged as and for the purpose shown and described.

408,167.

408,168. FILE CASE OR CABINET. WILLIAM T. WOOD, Washington, D. C. Filed Dec. 14, 1888. Serial No. 293,547. (No model.)

Claim.—1. The knockdown cabinet for file-boxes, consisting of standards A A', the independent flanged bars B, and cross-bars C, passing through and uniting the standards and bars B, substantially as shown.



2. In a case for file-boxes, the channeled standards, the bars B, fitted at their ends therein, the transverse rods uniting the standards and bars, and the keys, applied substantially as shown.

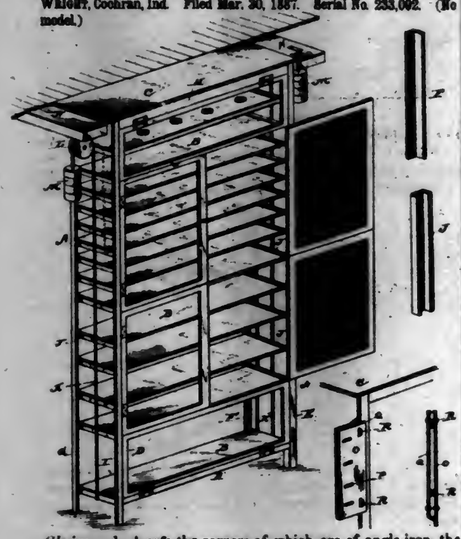
3. A file-case having a front suspension-rod, C, and box-sustaining bars with side flanges separated from the rod by an opening, b^4, in combination with a file-box having suspending plates or hooks adapted to pass through the openings and underride the bars, whereby the box is guided within the case and automatically arrested and suspended when withdrawn in position to be disconnected.

4. A case for file-boxes, having the front standards, the rear standards of greater width, and the intermediate flanged rails, whereby the boxes are sustained.

5. In a file case or cabinet, the combination of the standards A', the cross-rods C, and the plates c', inserted between the rods and standards, substantially as described and shown.

408,169. ADJUSTABLE CAM. ALVIN D. WOODWARDS, Bristol, R. I. Filed Jan. 24, 1888. Serial No. 297,450. (No model.)

Claim.—1. The combination of the hub or sleeve having an arm or plate, B, projecting therefrom, and a cam, C, the said arm and cam being provided with teeth and adapted to engage each other, whereby the throw of the cam may be varied and the cam be held in a fixed position on said arm when adjusted, substantially as set forth.

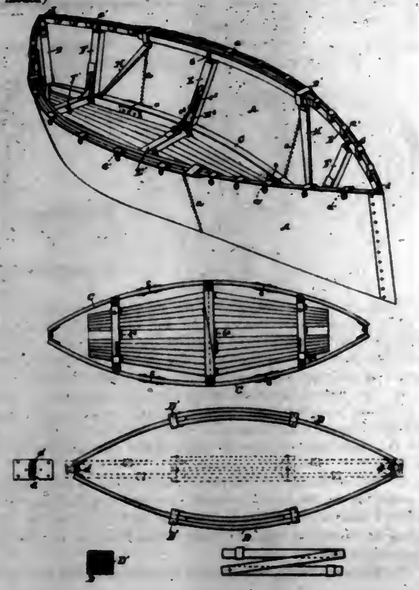


2. The combination of the hub or sleeve having an arm or plate, B, projecting therefrom, and a cam, C, the said arm and cam being provided with teeth and adapted to engage each other, and a rib or ribs, E, located upon the cam for engaging the arm, substantially as set forth.

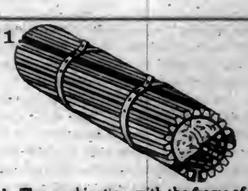
3. The combination of the hub or sleeve having an arm or plate, B, projecting therefrom, and a cam, C, the said arm and cam being provided with teeth and adapted to engage each other, and the cam having an opening or hole, c^2, therein, substantially as and for the purposes specified.

4. The combination, with the hub or sleeve A, having an arm or

plate, B, which is perforated, of the cam C, perforated and having a rib or ribs, E, the said cam and arm being provided with teeth and adapted to engage each other, and a fastening passing through the perforations in the arm and cam and adjustably securing the parts to each other, substantially as set forth.



408,170. VERTICALLY-MOVABLE KITCHEN-SAFE. JOHAN C. WRIGHT, Cochran, Ind. Filed Mar. 30, 1887. Serial No. 233,092. (No model.)



Claim.—1. A safe the corners of which are of angle-iron, the rear posts being so placed that the sides of the iron will register with the back and ends of the safe, while the front posts are so placed that only one side of each post will register with the ends of the safe and the other side will project from the safe, in combination with guides within which the sides of the front posts are placed.

2. A safe the sides of which are provided with flanges, in combination with guides provided with slots and having a channel or groove upon the inner edge of each and anti-friction rollers journaled along said channel.

408,171. FOLDING BOAT. DAVID H. ALLEN and WILLIAM H. GAMBLE, Miamisburg, Ohio. Filed Sept. 17, 1888. Serial No. 285,615. (No model.)

Claim.—1. The combination, with the frame of a folding boat, of a separable and expansible gunwale made in three sections and composed of overlapping strips hinged together and provided with sleeves or ferrules adapted to slip over the pivotal joint thereof, substantially as described.

2. In a folding boat, the combination, with the ribs and gunwale thereof, of the interposed screw yokes or forks located on the upper ends of said ribs for adjusting the height of the gunwale, substantially as described.

3. In a folding boat, the combination, with the gunwale and bottom frames, of the cross-brace E', the ribs E, hinged thereto, the adjustable brace e^3, and means, substantially as described, for fastening said brace.

4. The combination, with the gunwale and bottom frame of a folding boat, of the cross-brace E' and the ribs E, united by a knee pivoted at the junction of said cross-brace and ribs and provided with a foot or downward extension and lip, e^5, on said extension for engaging said bottom frame, and an adjustable brace, e^3, attached to said knee, and means for fastening the same, substantially as described.

5. In a folding boat, and in combination with the gunwale and bottom frame, the ribs F, provided with the socketed knees F^3, and a jointed expanding cross-bar, F', engaging said socketed knees and having its ends notched or shouldered for engaging said bottom frame, for the purpose and substantially as described.

6. The combination, with the frame of a folding boat, of a jointed cross bar or brace made in two overlapping pieces pivoted together and at its opposite ends engaging the bottom frame for expanding the same, substantially as set forth.

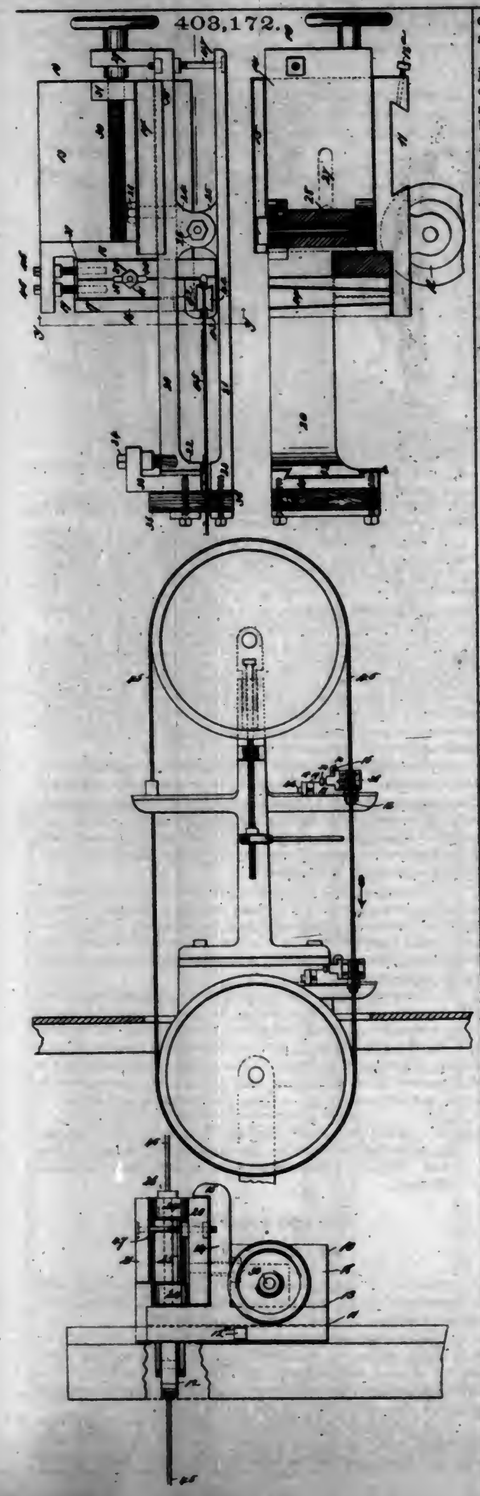
7. The combination, with the frame of a folding boat, of the pivoted brace-arms H, interposed between the gunwale and bottom frame, both of which extend the entire length of the boat, and retaining-feet *h*, substantially as and for the purpose described.

8. A folding and expansible frame provided at its ends with tubular hinge-pins, in combination with a canvas sack having blocks B at its ends, provided with hinge-pins and recesses adapted to receive the ends of said folding and expansible frame, as set forth.

9. A folding and expansible frame provided with the tubular hinge-pin, in combination with a canvas sack having blocks B at its ends, provided with screw-threaded pins b^2 and nuts b^3 thereon, substantially as and for the purpose described.

10. A separable covering for folding and sectional boats, consisting of a canvas sack made in one piece, folded and seamed as described, and secured to blocks B at its ends, and provided with hooks *a'*, for engaging the gunwale-frame, all substantially as specified.

11. The combination, with the frame of a folding boat, provided with pins i^2, of a flooring made in two sections, each composed of tapering slats united by a flexible strip or sheet, and hooks or eyes secured to said flooring for suspending it from the cross-braces E' and F', substantially as and for the purpose described.



12. The combination, with the frame of a folding boat, of a flooring composed of slats united by a flexible strip or sheet, and hooks and pins secured to said flooring and to the cross-braces E' and F', of the frame for supporting said flooring, substantially as specified.

13. The combination, with the frame of a folding boat, of a separable and expansible bottom frame composed of a number of strips or pieces, C, of wood or suitable material, an equal number on either side of the frame, said strips or pieces being pivotally united by means of parallel side straps, *c*, adapting the frame as a whole to be folded one section upon another, and the end pieces provided with hinges at either end of the frame, whereby said bottom frame may be expanded or folded compactly, as shown and described.

14. A covering for folding boats, made of a single piece of canvas folded and seamed, as described, and provided with hooks secured thereto, in combination with a folding and expansible frame having an adjustable gunwale and screw-yokes, substantially as described, for adjusting the height of said gunwale, for the purpose specified.

408,172. GUIDE FOR BAND-SAWS. CHARLES R. BACKUS, Evansville, Ind. Filed May 4, 1888. Serial No. 272,817. (No model.)

Claim.—1. The combination, with a ribbed guide-bed and spaced pivoted jaws adapted to slide upon said bed, having secured to their outer ends adjustable clamping-blocks, of parallel angular guide-blocks having the contiguous faces of their vertical members recessed to re-

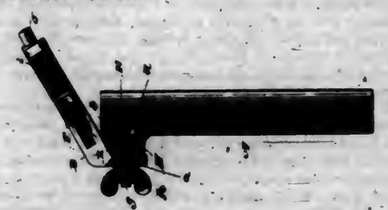
ceive a soft-metal block, and means for adjusting the jaws laterally and endwise, substantially as shown and described.

2. The combination, with a ribbed guide-bed and pivoted spaced jaws sliding upon said bed, one jaw being provided with an adjustable clamping-block upon its outer end and the opposite jaw upon the same end with an opposing fixed clamping-block, of angular guide-blocks adjustable upon the guide-bed, the vertical members of which guide-blocks project upward between the opposing jaws, having grooved contiguous faces and metal blocks secured in said grooves, and means, substantially as shown and described, for adjusting the jaws endwise and laterally and means for adjusting the guide-blocks, as and for the purpose specified.

3. The combination, with a ribbed guide-bed and pivoted spaced jaws sliding upon said bed, one jaw being provided with an adjustable clamping-block at its forward end and the other jaw with an opposing fixed clamping-block, angular guide-blocks sliding upon said guide-bed the vertical members of which project upward between the inner faces of the jaws, having grooves in their contiguous sides, and soft-metal blocks inserted in said grooves, of a screw secured to one jaw and passing through a nut upon the guide-bed, a screw uniting the rear ends of the jaws, and adjusting-screws passing through the said guide-bed into the said guide-blocks, all combined to operate substantially as and for the purposes specified.

408,173. LATCH. JUDSON A. BALDWIN, Winooski, Vt. Filed Oct. 27, 1888. Serial No. 289,804. (No model.)

Claim.—The combination of the keeper, the locking-lever, the pivotal bolt, the plate provided with an opening, and the spring having a turned-out end and made to project through the opening and to catch in a recess in the inner side of the lever, substantially as shown.



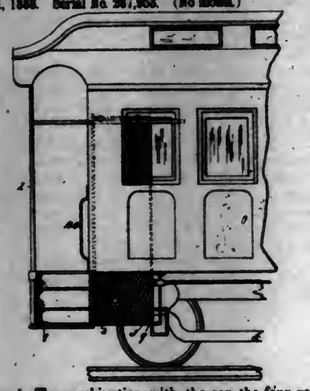
408,174. LAMP-BLACK MACHINE. ERASTUS R. BLOOD and SWAN P. WENSTRAN, Ludlow, Pa., assignors to Martha P. Blood, same place. Filed Oct. 29, 1888. Serial No. 289,465. (No model.)

Claim.—1. In a lamp-black machine, the combination, with a condensing-plate having a vent or slot through it directly over the center of the flame for the escape of non-condensed products of combustion, of a secondary plate supported above said vent.

2. In a lamp-black machine, the combination, with a condensing-plate having through it a vent for the escape of the non-condensed products of combustion, of a clearer for keeping the said vent open.

408,175. GAGE FOR GRINDING TWIST OR FLAT DRILLS. ADOLPH F. BREWER, San Francisco, Cal. Filed Aug. 15, 1888. Serial No. 282,830. (No model.)

Claim.—1. The combination, with the box-square and gage-rule, of a guide-box formed thereon and provided with a bevel, as described, and adapted to serve in sustaining the gage-rule, substantially as specified.



2. The combination, with a box-square provided with a guide-box beveled as described, of a slide arranged in said guide-box, a gage-rule connected with said slide, and a set-screw for adjusting the slide and rule, substantially as specified.

3. The combination, with a box-square, of a gage-rule connected therewith, and a screw for laterally adjusting the rule with relation to the square, substantially as specified.

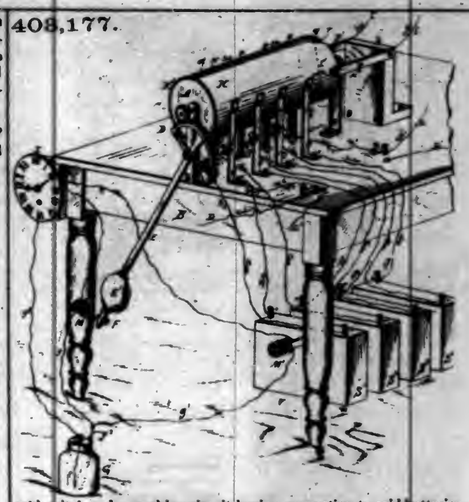
4. The combination, with the gage-square provided with the guide-box beveled as described, of the slide arranged in said box and hav-

ing an internally-threaded aperture, a reduced rectangular portion and a reduced threaded portion, a set-screw journaled in the guide-box and engaging the threads in the slide, the gage-rule having an aperture to receive the reduced rectangular portion of the slide, and a wing-nut to receive the reduced threaded portion of said slide, substantially as specified.

403,176. APPARATUS FOR OPERATING SAFETY-GATES OF RAILWAY-CARS. William M. Brown, Jr., Sacramento, Cal. Filed Mar. 21, 1888. Serial No. 267,953. (No model.)

Claim.—1. The combination, with the car, the four gates at the steps thereof, of the horizontal lever 18, pivoted between its ends to the under side of the car, oppositely-projecting rods 16, pivotally connected at their inner ends with the ends of said lever, two transverse levers, 11 11, pivoted at each end of the car, with their inner ends, 14, overlapped and slotted, a pin or bolt extending through said slots into the outer ends of the two rods 16, a rod connecting the end of each lever 11 with a gate, and means for operating the lever 18 to throw and retract the rods 16, substantially as set forth.

2. In an apparatus for opening and closing the safety-gates of a passenger-car, the combination, with the cylinder 24, connected by means of main supply-pipes 28 and 30 with pipes 29 31, and having the piston-head 27 with piston-rod 26, and sliding block 21, mounted on frame 22, of the double-ended lever 18, mounted in brackets 19, connected at one end by means of pivoted rod 20 with sliding block 21, actuating-rod 16, connected at one end with the double-ended lever 18, mounted in brackets 17, and having a pin, 15, levers 11, pivoted in brackets 12, having slotted ends 14, engaging pin 15, and the bars or rods 10, connecting levers 11 with gates 1, all located and arranged beneath a car, substantially as described.



3. In an apparatus for opening and closing the safety-gates of a railway passenger-car, the combination, with sliding gates 1, having grooved rollers 3, mounted on tracks 4 5, the tracks 5, having projections 8 and 9 9, located at the forward and rear ends thereof, the pockets or recesses 6, to receive the gates, pivoted rods 10, connected with said gates and with pivoted levers 11, and actuating-rods 16, having a pin, 15, at one end, engaging the slotted ends 14 of levers 11, and pivoted at their other ends to a double-ended lever, 18, in combination with rod 20, pivoted to one end of double lever 18 and at its other end to block 21, sliding in frame 22, piston 27, connected with block 21 cylinder 24, branch pipes 28 and 30, and main supply-pipes 29 and 31, leading to the locomotive, substantially as shown and described.

4. An apparatus for operating the safety-gates of railway passenger-cars, consisting of sliding gates 1, having rollers 3, mounted on tracks 4 5, the latter having stops 8 9 9, levers 11, pivoted rods 10, connecting with gates 1, double-ended lever 18, with actuating-rods 16, having a sliding connection with the slotted ends of levers 11, cylinder 24, with piston 27, connecting with double lever 18, main steam-supply pipes 29 31, connecting with the ends of cylinder 24 by branch pipes 28 and 30, and couplings connecting the sections of pipes 29 and 31, consisting of sections 32 clamped thereto, and having automatically-closing hooks 33, lugs 35, guide projections 37, and lugs 38, automatically-closing valves 40, and projecting arms 43, holding valves 40 open, all constructed and arranged substantially as shown and described.

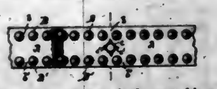
403,177. TIME-SWITCH FOR SECONDARY BATTERIES. Charles R. Bull, New Haven, Conn. Filed Nov. 15, 1881. Serial No. 45,422. (No model.)

Claim.—1. The combination, with a charging-circuit of secondary batteries and a switch for connecting said circuit to said secondary batteries, of a branch of said charging-circuit leading around

403,177.

said switch and a working-circuit having connection to said batteries through independent switch mechanism.

2. The combination, with a charging-circuit and a secondary battery, of a switch for alternately connecting said circuit to and disconnecting it from said battery, a branch circuit comprising a resistance through which the charging-circuit is connected when said battery is disconnected therefrom, and a working-circuit having connection to said battery through independent switch mechanism.



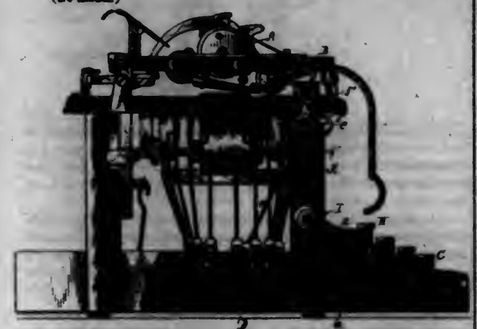
3. The combination of a charging-circuit, a series of stations, each provided with a secondary battery, and a switch for alternately connecting said battery to and disconnecting it from said circuit, a branch circuit through which the charging-circuit is connected when said battery is disconnected therefrom, and a working-circuit at each station, having connection to said battery through independent switch mechanism.

4. The combination, with a charging-circuit, a working-circuit, and a secondary battery or batteries, of an automatic switch and time-indicating devices adapted to connect said battery or batteries at predetermined intervals with the charging-circuit to be charged and the working-circuit to be discharged, and to indicate time, with independent switch devices for opening and closing the working-circuit at will, substantially as described.

5. The combination of a charging-circuit charged by a suitable electrical generator with one or more secondary batteries, a switch, and an electro-magnet for controlling it for connecting or disconnecting the said secondary battery to or from the charging-circuit, and a working-circuit having connection to said battery through independent switch mechanism.

6. The combination of a charging-circuit charged from a suitable generator, secondary or storage batteries located at intervals along said charging-circuit, and devices for introducing the batteries into the charging-circuit at the several stations, a branch at each through which the charging-circuit is connected when the battery is disconnected therefrom, whereby the batteries may be charged in series, and independent circuits from the batteries at each station.

403,178. BOX-STRAP. Spencer C. Cary, Baldwin, N. Y., assignor, by mesne assignments, to the Cary Manufacturing Company, of New York. Filed Mar. 5, 1888. Renewed Oct. 13, 1888. Serial No. 288,048. (No model.)

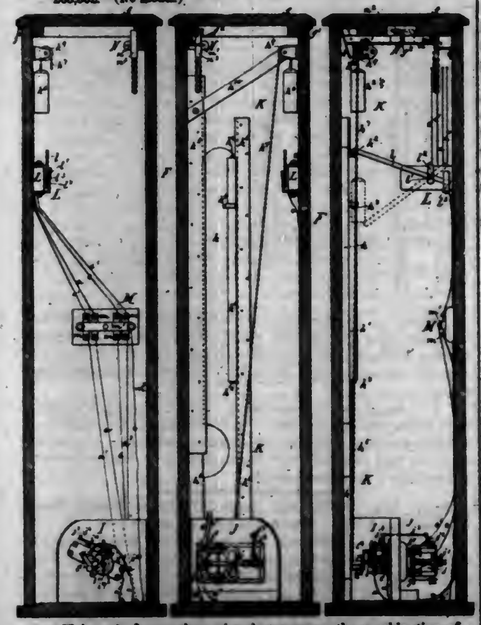


Claim.—1. A box-strap composed of a metal band having a series of successive bosses at each side edge and extending longitudinally thereof, substantially as and for the purpose set forth.

2. A box-strap composed of a metal band having bosses of uniform shape and size and equidistant from each other in series along the side edges of the band, each individual boss in the series at one edge being respectively opposite to an individual boss in the series at the other edge, substantially as and for the purpose set forth.

3. A box-strap of indefinite length composed of metal bands having similar bosses successively in series throughout their length, with their ends overlapped flatwise, with the said similar bosses fitted to

each other in the respective bands and provided at or near their said lapped ends with corresponding transverse apertures, with the rims thereof clamped together, substantially as and for the purpose set forth.



403,179. FRACTION-KEY FOR TYPE-WRITING MACHINES. Asa Davis and James H. W. Marriott, Baltimore, Md.; said Davis assignor to Warren H. Sadler, same place. Filed May 6, 1886. Serial No. 201,294. (No model.)

Claim.—1. A fraction-key for type-writing machines, which consists of a lever or key pivoted to a suitable part of the machine and arranged to bear upon the upper-case lever, in combination with the roller-frame of the machine and the upper-case lever connected thereto, whereby the roller-frame may be shifted with a positive motion backward to any desired position between the upper and lower case positions, substantially as described.

2. A fraction-key for type-writing machines, which consists of a lever or key pivoted to a suitable part of the machine and arranged to bear upon the upper-case lever, in combination with the roller-frame of the machine, the upper-case lever connected thereto, and an adjustable stop or set-screw co-operating with the fraction-key, whereby the throw of said key and consequent motion of the roller-frame may be determined, substantially as described.

403,180. ELECTRICAL FLOAT-SIGNALING APPARATUS. John R. De Mier, Las Cruces, N. Mex. Filed Aug. 21, 1883. Serial No. 283,302. (No model.)

Claim.—1. In an alarm-signal apparatus, the combination of a flag mechanism, K, comprising a flag-staff, chain, pulley, weight, flag-furling rod, flag-detent, and a flag-staff detent, an electric signaling mechanism, I, comprising a main driving-wheel, notched crank-handle pinion-wheels, signal-disk i^9, escape-wheel i^8, escape-lever i^{10}, check and contact plate i^{12}, insulated contact-plates i^{13} i^{14} i^{15}, and insulating-blocks i^{16} i^{17} i^{18}, clock-starting mechanism J, comprising electric magnet j, armature j', lever j^2, check-rod j^3, having insulated head j^4, battery E, float d^3, electric switch d, and connecting-wires a a', c c', and telegraph-line wire, substantially as and for the purpose described.

2. The combination, with the flag-staff k and float d^3, of the clock-work I, having escape-lever i^{10}, and magnet j, having a starting-rod, j^3, and a battery, E, and a float-switch, d, substantially as and for the purpose set forth.

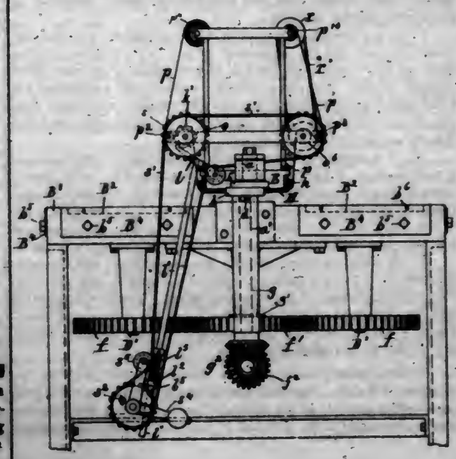
3. The combination of the clock-work I, having crank-lever i^{11}, with notch i^{19}, and flag-staff k, having detent k^2, chain k^3, pulley k^9, and weight k^4, substantially as and for the purpose set forth.

4. In the described flag mechanism K, the combination of the chain k^3, pulley k^9, weight k^4, flag-staff k, guides k^5, cross-bar k^{10}, flag k', unfurling-rod k^7, and flag-detent k^2, substantially as and for the purpose set forth.

5. In the described flag mechanism K, the combination of the flag-staff k, the locking-hook n^4, sliding rod n, inclined plate n^2, and swinging top f, having locking-pin f^3, substantially as and for the purpose described.

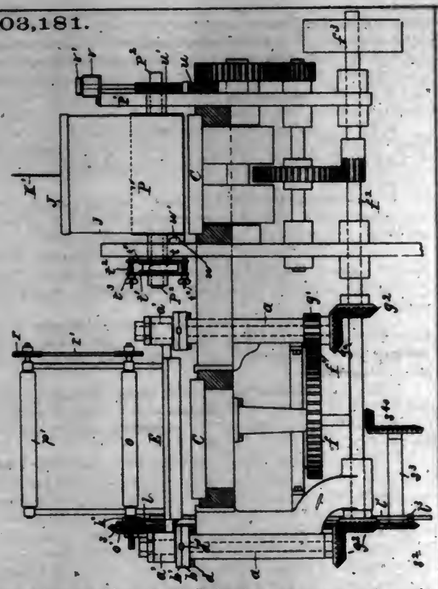
6. The combination of the switch L, battery E, magnet j, flag-staff k, detent k^2, notch-lever i^{11} of clock-work I, chain k^3, pulley k^9, and flag-staff-operating weight k^4, substantially as and for the purpose set forth.

7. The combination of the flag mechanism K, comprising a flag-staff, chain, pulley, weight, flag-furling rod, flag-detent, flag-staff detent, electric signaling apparatus I, comprising main driving-wheel, notched crank-handle, pinion-wheels, signal-disk i^9, escape-wheel i^8, escape-lever i^{10}, check and contact plate i^{12}, insulated contact-plates i^{13} i^{14} i^{15} and insulating-blocks i^{16} i^{17} i^{18}, clock-starting mechanism J, comprising electric magnet j, armature j', lever j^2, check-rod j^3, having insulated head j^4, battery E, float d^3, electrical switch d, thermostat G, telegraph-line wire A, and connecting-wires a a' c c' c^3 c^4, substantially as described.



8. The within-described signaling apparatus, comprising float, thermostat, switches thereof, starting mechanism J, battery and circuit-wires thereof, signaling mechanism I, and flag mechanism K, whereby signals at stations and at a bridge can be given both by action of high water and fire, substantially as and for the purpose described.

403,181. PLATE-PRINTING MACHINE. Ulrich Eberhardt and Henry E. Eberhardt, Newark, N. J. Filed May 3, 1888. Serial No. 273,631. (No model.)



Claim.—1. In a plate-printing press, the combination, with the horizontal driving-shaft f^2 and the sprocket-wheel shafts D', of the spur-wheels f, the spur-wheel f', intermediate to the same, and the pinion g', driven by the bevel-wheels g^2, substantially as herein set forth.

2. In a plate-printing press, the combination, with the horizontal driving-shaft f^2 and the sprocket-wheel shafts D', of the shafts a, for driving the crank-pins a', the bevel-wheels connecting such shafts with the main shaft f^2, the spur-wheels f upon the sprocket-wheel shafts, the spur-wheel f', intermediate to the same, and the pinion g', applied to one of the shafts a to drive the intermediate wheel, as and for the purpose set forth.

3. In a plate-printing machine, the combination, with the pad-frame E, provided internally with the grooves e, of the T-shaped

403,181.

presser-bars provided with rib E', fitted to such grooves and movable vertically within the pad-frame, as and for the purpose set forth.

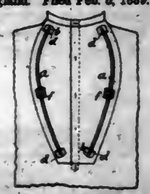
4. In plate-printing machine, the combination, with the pad-frame E and the pad H, of clamps *h*, secured to the opposite edges of the pad, and the hanger-bolts *h'* and nuts fitted upon the pad-frame to tighten the pad, substantially as set forth.

5. In a plate-printing machine, the combination, with the eccentric-shafts *a* and the disks *b*, fixed thereon, of the disks *b'*, provided with the crank-pins *a'*, the key *d'*, for guiding one disk upon the other, and the bolts *d*, for clamping the disks when adjusted, as and for the purpose set forth.

6. In a plate-printing machine, the combination, with the pad-frame, the pad, and the wiper rag or cloth, of two feed-rollers for the wiping-cloth, provided each with a continuously-rotating friction-wheel, and a ratchet with latch for intermittently releasing one of such rollers, as and for the purpose set forth.

7. In a plate-printing machine, the combination, with the pad-frame, the pad, and the wiper-cloth, of a feed-roller rotated intermittently to feed the cloth beneath the pad, a feed-roller rotated continuously upon the cloth at the opposite side of the pad, and a winding roller for winding up the cloth, as and for the purpose set forth.

8. In a plate-printing machine, the combination, with the pad-frame, the pad, and the wiper-cloth, of two feed-rollers provided each with a continuously-rotating friction-wheel, a ratchet-wheel fixed removably upon one of the rollers, and a latch held normally in the teeth of such ratchet-wheel and intermittently drawn therefrom, as and for the purpose set forth.

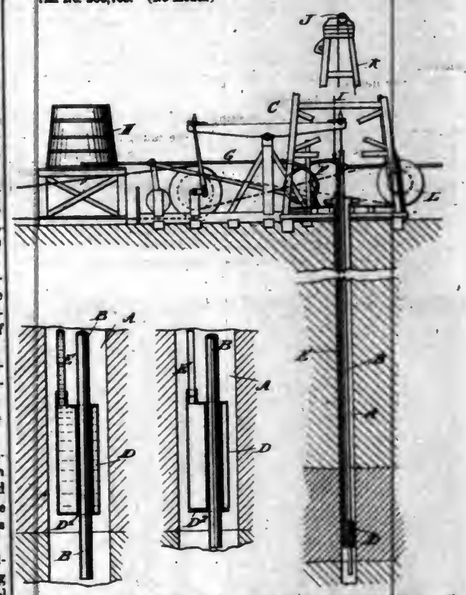


9. In a plate-printing machine, the combination, with the pad-frame, the pad, and the wiper-cloth, of two feed-rollers for winding cloth, provided each with friction clamping-disks, a sprocket-wheel clamped between said disks, a chain provided with a tightener and rotating such sprocket-wheels continuously, a ratchet-wheel fixed upon one of such rollers, and a latch operating to intermittently release the ratchet, as and for the purpose set forth.

10. In a plate-printing machine, the combination, with the frame A and the ways B, formed parallel with the four sides of the frame, of the planks C, propelled in such ways as set forth, the spring-plates affixed to the frame at the forward ends of the ways, the notches cut in the frame, and the wooden blocks secured to the spring-plates and operating as a buffer for the planks C, substantially as herein set forth.

11. In a plate-printing machine, the combination, with the compression-roll P and a blanket, J, operated normally to reverse the roll after each impression, of the segmental brake *t*, formed with tapering ends and attached to the roll-shaft P², and the stationary friction-clamps *t'*, adapted to admit the brake and to grasp the same elastically, as and for the purpose set forth.

12. In a plate-printing machine, the combination, with the impression-roll P and a blanket, J, operating normally to reverse the roll after each impression, of the segmental brake *t*, formed with tapering ends and attached to the roll-shaft P², and the stationary clamp-plates *t'*, with leather facing *t*² and adjustable toward one another by the bolts provided with nuts *t*³, as and for the purpose set forth.

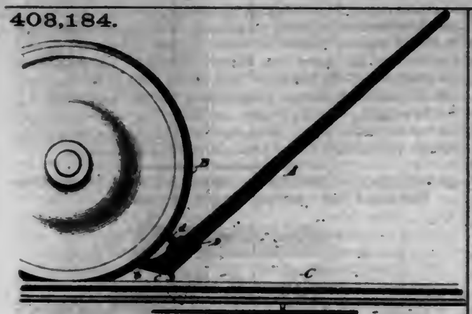


403,182. SHIRT AND SHIRT-BOSOM SUPPORTER. PHILIP E. EVANS, London, England. Filed Feb. 6, 1889. Serial No. 298,857. (No model.)

Claim.—1. In combination with a shirt provided at the back of its bosom with the upper and lower button-holed tabs *d d* at each side of said back, the pair of separate independent flexible retainers *a*, each provided at each of its ends with a stud to engage with such tabs, all as set forth.

2. In combination with a shirt provided at the back of its bosom with the loops *f*, and also with the tabs *d*, provided with button-holes, the retainers *a*, as described, having studs at each of their ends and adapted to be applied to the bosom and to be held to place by the loops and tabs, as set forth.

403,183. APPARATUS FOR REMOVING GUMMY MATTER FROM OIL-WELLS. JOHN F. FIETH, Titusville, Pa. Filed Oct. 22, 1888. Serial No. 288,763. (No model.)

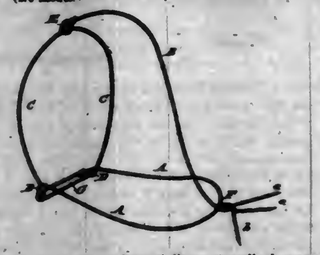


Claim.—1. An apparatus for removing gummy matter from oil-wells, comprising a receptacle to enter the bore of the well and having a lateral discharge, and a vertically-movable pipe on the lower end of which said receptacle is suspended in the well, substantially as set forth.

2. In an oil-well, the combination, with the tubing, of a receptacle having openings and held to slide vertically on the said tubing, a supply-pipe supporting the said receptacle, and a tank or boiler for supplying said receptacle with steam, benzine, or other substances, substantially as shown and described.

403,184. PINCH-BAR. PETER C. FORRESTER, Wilkeson, Wash. Filed Mar. 8, 1889. Serial No. 302,451. (No model.)

Claim.—The combination, with the pinch-bar proper, A, of the slotted and slidable fulcrum piece or attachment D, in block form, adapted to freely receive the bar A through it, and provided with a sharp tooth, *c*, on its under side pointed with or formed of steel, and means, substantially as specified, operating from the exterior of the bar to clamp or hold the fulcrum piece or attachment to its place of adjustment upon the bar, essentially as and for the purposes herein set forth.

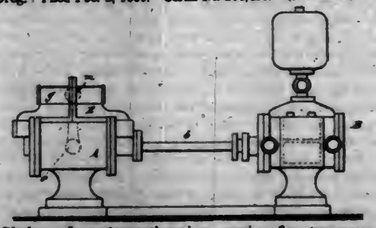


408,184.

408,185. ALTERATIVE TONIC. THEODORE C. FULLER, Pawtucket, R. I. Filed Jan. 21, 1889. Serial No. 297,044. (No specimens.)

Claim.—The herein-described composition of matter to be used for stomach difficulties and illness of like nature, consisting of prince's pine, (*Chimaphila*,) buckthorn-berries, checkerberry (*Gaultheria*) leaves, yellow-dock root, burdock-root, sarsaparilla-root, wild-cherry bark, green of alder, bay-bush leaves, bloodwort, water, and alcohol, in the proportions specified.

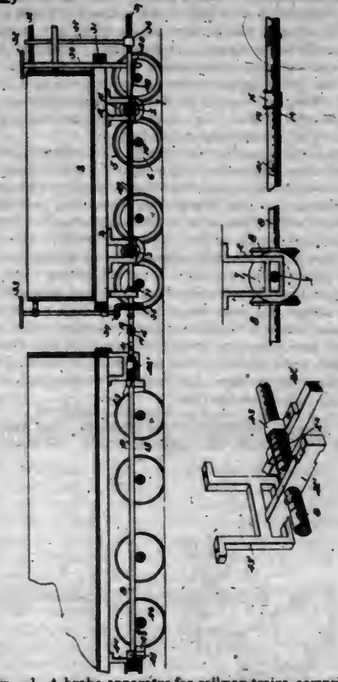
408,186. CALF-WEANER. ERNST H. GEBLER, Deshler, Nebr., and MOSES SIMPSON, Meaden, Kans. Filed Aug. 1, 1888. Serial No. 281,632. (No model.)



Claim.—1. A weaner, substantially as described, comprising a number of wire rods bent to form a halter-like frame and united at a point near their forward ends, such wires being extended forward beyond the point of their connection to form prongs, substantially as set forth.

2. A weaner, substantially as described, consisting of a wire bent to form the connecting-rods C and the side wires, A, and provided with a fastening arranged to connect the opposite side rods at the juncture of same with the connecting-rods C, and the crown rod or wire B, united at its rear end with the rods C at the crown of the arch *e*, formed thereby, the said rods A and B being twisted together at a point near their forward ends and extended beyond said twist, forming prongs or barbs, substantially as set forth.

3. The herein-described weaner consisting of the wire halter-like frame having its side and connection bars looped, forming eyes, and provided with the fastening-link held to one of said eyes and arranged to engage the other eye, substantially as set forth.



4. The improved calf-weaner consisting of the side wires or rods having the connecting-rods bent therefrom and looped, forming eyes, the fastening-link connected with one of said eyes and arranged to engage the other, and the crown-rod connected with the connecting-rods, the crown-rod and side rods being twisted together and extended, forming prongs, substantially as set forth.

403,187. STEAM-ACTUATED VALVE. JOHN W. GREEN, Astoria, Oreg. Filed Feb. 2, 1889. Serial No. 298,450. (No model.)

Claim.—In reciprocating-piston engines for steam-pumps and other purposes in which the reciprocating action of the piston within its cylinder is controlled by a steam-thrown valve, which in its turn is controlled by valves actuated by the engine-piston, the combination, with the engine or main valve having opposite end piston-heads, *h h*, and opposite terminal reduced cylindrical extensions *i i*, of the valves H H, arranged to work within cylinders G G for direct action by the engine-piston, as described, said cylinders having steam and exhaust ports *r s*, and the valve-chest constructed with a cylindrical body portion, *g*, and cylindrical end chambers, *k k*, and having steam-passages *n n*, with branch passages *o o*, arranged to connect with the cylinders G G, substantially as and for the purposes herein set forth.

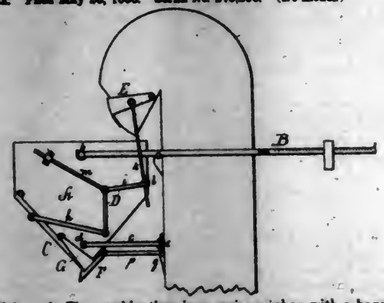
408,188. BRAKE FOR RAILWAY-TRAINS. JAMES K. HARDWICK, Marshall, N. C. Filed Sept. 14, 1888. Serial No. 285,260. (No model.)

Claim.—1. A brake apparatus for railway-trains, comprising the following elements in combination, to wit: a rotary shaft extending from end to end of a train and coupled between the cars, the brake-frames of the cars having a screw-threaded connection with the rotary shaft, the hand brake mechanism of the several cars geared with the rotary shaft, and a brake-adjusting mechanism consisting of sliding shafts with friction-pulleys located between the wheels of the tender, an adjustable gearing connecting the sliding shafts with the main rotary shaft, and an operating crank mechanism connected with the sliding shafts for throwing the friction-pulleys reversely in and out of engagement with the car-wheels, substantially as described.

2. A brake apparatus for railway-trains, consisting of the combination, with the brake-frames of a train, of a rotary shaft extending from end to end of the train, having a screw-threaded connection with the brake-frames and coupled between the cars, and a brake-adjusting mechanism consisting of sliding shafts with friction-pulleys located between the wheels of the tender, an adjustable gearing connecting the sliding shafts with the main rotary shaft, and an operating crank mechanism connected with the sliding shafts for throwing the friction-pulleys in and out of engagement with the car-wheels of the tender, substantially as described.

3. In a brake apparatus for railway-trains, the combination, with a rotary shaft mounted in the bottom of a tender, of a brake-adjusting mechanism consisting of rotary shaft 9, extending lengthwise of the tender and having the bevel gear-wheels 8, the sliding shafts 1, mounted in supports 2 and having at one end pulleys 4, located between car-wheels 5 and pulleys 6 thereon, and at their inner end bevel gear-wheels 7, located between bevel gear-wheels 8, rods 27, connecting the shafts 1 on each side of shaft 9, and the double-ended lever 29, having its ends connected by rods 28 with the forward shafts, 1, and provided with the vertical shaft 30 and hand-wheel 32, substantially as described.

4. In a brake apparatus for railway-cars, a rotary-shaft extending lengthwise of a car and mounted in sliding supports having a screw-threaded connection therewith, in combination with brake-frames loosely mounted on the rotary shaft and having an elastic connection with the sliding supports, substantially as described.



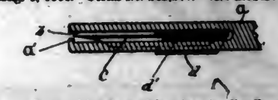
5. In a brake apparatus for railway-trains, a rotary shaft extending from end to end of a train and coupled between the cars, and brake-frames having a screw-threaded connection with the rotary shaft, in combination with a horizontally-movable indicator having a threaded connection with the rotary shaft, substantially as described.

6. In a brake apparatus for railway-trains, the combination, with rotary shaft 9, mounted in the bottom of tender 3 and having the threaded portion 37, and sliding brake-frames having a threaded connection with shaft 9, of a vertical indicator-rod, 35, with a threaded sleeve, 36, engaging the threaded portion 37 of shaft 9 and movable in a guide, 38, and mechanism, substantially as described, for operating the rotary shaft 9, substantially as described.

7. In a brake apparatus for railway-cars, a rotary shaft, 9, and bars 22', sliding in supports 23', in combination with brake-bars 22, loosely mounted on shaft 9 and connected by a coiled spring, 24, with sliding bars 23', substantially as described.

8. A brake apparatus for railway-trains, consisting of a rotary shaft extending from end to end of the train and coupled together between the cars, bevel gear-wheels thereon meshing with hand brake mechanisms on the cars, sliding brake-bars loosely mounted on the rotary shaft, sliding bars joined to the sliding brake-bars by an elastic connection and having a screw-thread connection with the main rotary shaft, and a reversible brake-operating shifting-gear mechanism consisting of forward and rear sets of sliding shafts mounted between the forward and rear axles of a car and connected together on each side of the main rotary shaft, with friction-pulleys on their outer ends located between the adjacent car-wheels, and bevel gear-wheels on their inner ends located between bevel gear-wheels on the main shaft, and a double-ended lever pivotally connected by rods to the forward sliding shafts and having a vertical shaft and hand-wheel, substantially as described.

408,189. AUTOMATIC GRAIN-WEIGHER. JOHN HENRY, Ardoch, Dak. Filed May 28, 1888. Serial No. 275,296. (No model.)



Claim.—1. The combination, in a grain-weigher, with a hopper-shaped receiver mounted between the arms of a bifurcated scale-beam and having one section of its angular bottom hinged at its upper edge, so as to swing outwardly upon pressure from within the receiver, and a self-closing cut-off on the supply-spout, of a bell-crank lever journaled upon the side of the receiver, a rod connecting one arm of the said lever with the valve, the other arm of the lever having a slot near its extremity, a rod connected with the cut-off and passing through the said slot, a stop or collar upon said rod above the said slotted arm to limit the movement of the arm upon the rod, and a weighted arm attached to the bell-crank lever to operate the same, substantially as described, whereby the closing of the valve raises and opens the cut-off, and the opening of the valve allows the cut-off to close.

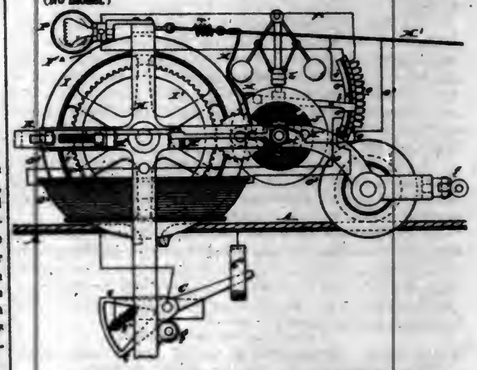
2. The combination of the forked scale-beam, hopper-shaped receiver suspended between the arms thereof and having one section of its angular bottom hinged at its upper edge so as to swing outwardly, a lip or shelf, G, having arms extending upwardly on the sides of the receiver and pivoted thereto, the edge of the lip or shelf projecting outwardly beyond the sloping fixed bottom of the receiver opposite the valve, and means for automatically closing and retaining the valve after each discharge, substantially as and for the purpose herein specified.

3. The combination of the forked scale-beam, hopper-shaped receiver pivotally mounted between its arms and having one section of its angular bottom hinged at its upper edge so as to swing outwardly, a self-closing cut-off on the supply-spout, a bell-crank lever journaled upon the side of the receiver, having one of its arms connected with the valve and the other arm of the lever having a slot near its extremity, in which a rod connected with the cut-off is adapted to slide, a stop on the said rod above the slot to limit the upward movement of the slotted arm thereon, a weighted arm attached to the other arm of the bell-crank lever at the point of its connection with the valve-rod, the said weighted arm having a longitudinal slot therein engaging with a pin upon the side of the receiver, whereby the arm may have both a turning and a sliding movement upon the said pin, substantially as and for the purpose herein specified.

408,190. PEN-HOLDER. ALGERNON S. HUSSELL, Norwich, Conn. Filed Aug. 8, 1888. Serial No. 282,277. (No model.)

Claim.—In combination with a longitudinally-slotted holder, a pen-support formed with a barrel portion movably located on one limb of said holder and provided with an inturned spring-lip that bears frictionally against the other of said limbs, as set forth, said holder being formed with a stop-lug, *a'*, at its open end adapted to engage and check the pen-support, substantially as and for the object specified.

408,191. CHILL-CORE FOR CASTING SASH-WEIGHTS. CHARLES S. HUMPHREY and HENRY H. GOOD, Bellefontaine, Ohio. Filed Sept. 26, 1888. Serial No. 286,469. (No model.)



Claim.—1. The combination of the pattern, the plug or core support H, and the molding-box having a hole in the end for the withdrawal of the pattern, with the horn-shaped core A, having the rounded smooth face D, as and for the purpose set forth.

2. The combination, with box K, having a hole in its end for the withdrawal of the pattern, of the horn-shaped core A, having the smooth face D and stem or neck E, as and for the purpose set forth.

3. The combination of the pattern, the box K, having a hole in its end for the withdrawal of the pattern, the movable gate L, the horn-shaped core A, and the plug H, as and for the purpose set forth.

408,192. ELECTRIC RAILWAY. RUDOLPH M. HUNTER, Philadelphia, Pa. Original application filed May 22, 1886, Serial No. 202,950. Divided and this application filed Dec. 13, 1888. Serial No. 293,484. (No model.)

Claim.—1. The combination of a sectional working-conductor, the end sections thereof being curved and all the sections being arranged end to end, but insulated from each other to form a mechanically-continuous but electrically-interrupted conductor like a severed loop, switches at all the breaks but one to normally bridge from one section to the next and close the breaks, an electric generator, and connecting-conductors connecting the working-conductor sections on each side of the unclosed break in the looped portion with the two poles of the generator, substantially as and for the purpose specified.

2. The combination of the end sections of two lines of working-conductors arranged end to end to form a mechanically-continuous conductor, but having the adjacent ends of said sections electrically insulated from each other, a traveling electric motor receiving electricity therefrom, an electric generator, and connecting-conductors connecting the respective working-conductors with the opposite poles of the generator, whereby the electric motor coming in on one line may run out on the other line without interruption, substantially as and for the purpose specified.

3. In the herein-described system of telpherage, the combination of a conductor divided into sections, switches which normally bridge from one section to the other and are adapted to be actuated by a passing train or vehicle, traveling trains or vehicles, one or more electric motors on the trains or vehicles by which they are driven, and devices operated by the trains or vehicles to move said switches successively and divert the current through the motors on said trains or vehicles, so that the motors are connected in series through the sectional conductor, and a locking device to lock said switch in either of its extreme positions, substantially as and for the purpose specified.

4. In the herein-described system of telpherage, the combination of a conductor divided into sections, switches which normally bridge from one section to the other, traveling trains or vehicles, one or more electric motors on the trains or vehicles by which they are driven, and devices operated by the trains or vehicles to move said switches successively and divert the current through the motors on said trains or vehicles, so that the motors are connected in series through the sectional conductor, and a spring device to assist in the movement of the switch and then retain it in the position assumed, substantially as and for the purpose specified.

5. The combination of a support or roadway, electrically-actuated trains or vehicles traveling along said support or roadway, an electric circuit, a source of electric energy, and one or more motors on the trains or vehicles for driving them connected in series in said circuit, a governor carried by the motor, and a variable resistance in the armature-circuit controlled by the governor, substantially as and for the purpose specified.

6. The combination of a support or roadway, electrically-actuated trains or vehicles traveling along said support or roadway, an electric circuit, a source of electric energy, and one or more motors on the trains or vehicles for driving them connected in series in said circuit, a governor carried by the motor, and a variable resistance in the armature-circuit controlled by the governor, and a short-circuiting device, also controlled by the governor, to short-circuit the armature, substantially as and for the purpose specified.

7. The combination of a support or roadway, electrically-actuated trains or vehicles traveling along said support or roadway, an electric circuit, a source of electric energy, and one or more motors on the trains or vehicles for driving them connected in series in said circuit, a governor carried by the motor, and a variable resistance in the armature-circuit controlled by the governor, and means, also controlled by the governor, to short-circuit the armature and vary the resistance of the armature-circuit, substantially as and for the purpose specified.

8. The combination of a support or roadway, electrically-actuated trains or vehicles traveling along said support or roadway, electric circuit, a source of electric energy, and one or more motors on the trains or vehicles for driving them connected in series in said circuit, a governor carried by the motor, a variable resistance in the armature-circuit controlled by the governor, means, also controlled by the governor, to short-circuit the armature and vary the resistance of the armature-circuit, and a danger-signal located in said armature-circuit, substantially as and for the purpose specified.

9. The combination of a support or roadway, electrically-actuated trains or vehicles traveling along said support or roadway, an electric circuit, a source of electric energy, and one more motors on the trains or vehicles for driving them connected in series in said circuit, a governor carried by the motor, a varible resistance in the armature-circuit controlled by the governor, means, also controlled by the governor, to short-circuit the armature and vary the resistance of the armature-circuit, a danger-signal located in said armature-circuit, and a switch controlled by the speed of the motor to actuate the danger-signal, substantially as and for the purpose specified.

10. The combination of a support or roadway, electrically-actuated trains or vehicles traveling along said support or roadway, an electric circuit, a source of electric energy, and one or more motors on the trains or vehicles for driving them connected in series in said circuit, a governor carried by the motor, a variable resistance in the armature-circuit controlled by the governor, means also controlled by the governor, to short-circuit the armature and vary the resistance of the armature-circuit, a danger-signal consisting of an electric lamp, and a switch controlled by the speed of the motor to put it into circuit, substantially as and for the purpose specified.

11. The combination of a support or roadway, electrically-actuated trains or vehicles traveling along said support or roadway, an electric circuit, a source of electric energy, and one or more motors on the trains or vehicles for driving them connected in series in said circuit, a governor carried by the motor, a variable resistance in the armature-circuit controlled by the governor, means, also controlled by the governor, to short-circuit the armature and vary the resistance of the armature-circuit, a danger-signal consisting of an electric lamp arranged to be connected with armature-circuit, and a switch controlled by the speed of the motor to put it into circuit with the armature, substantially as and for the purpose specified.

12. In an electric railway, the combination of a traveling vehicle, an electric motor carried thereon for actuating it, a danger-signal, and means controlled by the speed of the vehicle to display the danger-signal, substantially as and for the purpose specified.

13. In an electric railway, the combination of a traveling vehicle, an electric motor carried thereon for actuating it, an electric danger-signal, a switch, and means controlled by the speed of the vehicle to close the switch and display the danger-signal, substantially as and for the purpose specified.

14. In an electric railway, the combination of a traveling vehicle, an electric motor carried thereon to actuate it, a governor, a variable resistance, and circuit switches and connections, substantially as set forth, controlled by said governor during a gradually-increased speed of the vehicle to perform the following duties, viz: cut the armature out of line-circuit, put it into a closed or short circuit, and increase the resistance of the closed armature-circuit, substantially as and for the purpose specified.

15. In an electric railway, the combination of a traveling vehicle, an electric motor carried thereon to actuate it, a governor, a variable resistance, and circuit switches and connections, substantially as set forth, controlled by said governor during a gradual increased speed of the vehicle to perform the following duties, viz: increase the resistance of the line armature-circuit, cut the armature out of line circuit, put it into a closed or short circuit, and increase the resistance of the closed armature-circuit, substantially as and for the purpose specified.

16. In an electric railway, the combination of a traveling vehicle, an electric motor carried thereon to actuate it, a governor, a variable resistance, a danger-signal, and circuit switches and connections, substantially as set forth, controlled by said governor during a gradual increased speed of the vehicle to perform the following duties, viz: increase the resistance of the line armature-circuit, cut the armature out of line-circuit, put it into a closed or short circuit, increase the resistance of the closed armature-circuit, and interpose in the armature-circuit an electric danger-signal, substantially as and for the purpose specified.

17. In an electric railway, the combination of a traveling vehicle, an electric motor carried thereon to actuate it, a governor, a variable resistance, and circuit switches and connections, substantially as set forth, controlled by said governor during a gradual increased speed of the vehicle to perform the following duties, viz: increase the armature-circuit resistance and then cut the armature out of line-circuit, substantially as and for the purpose specified.

18. In an electric railway, the combination of a traveling vehicle, an electric motor carried thereon to actuate it, a governor, a variable resistance, an electric danger-signal, and circuit switches and connections, substantially as set forth, controlled by said governor during a gradual increased speed of the vehicle to perform the following duties, viz: increase the armature-circuit resistance, then cut the armature out of line-circuit, and interpose an electric danger-signal in the armature-circuit, substantially as and for the purpose specified.

19. In an electric railway, the combination of a traveling vehicle, an electric motor carried thereon to actuate it, a traction-increasing helix, a governor, a variable resistance, and circuit switches and connections, substantially as set forth, controlled by said governor during a gradual increased speed of the vehicle to perform the following duties, viz: reduce the traction-power of the vehicle by cutting out the traction-helix and then increase the resistance of the armature-circuit, substantially as and for the purpose specified.

20. In an electric railway, the combination of a traveling vehicle, an electric motor carried thereon to actuate it, a traction-increasing helix, a governor, a variable resistance, and circuit switches and connections, substantially as set forth, controlled by said governor during a gradual increased speed of the vehicle to perform the following duties, viz: reduce the traction-power of the vehicle by cutting out the traction-helix, then increase the resistance of the armature-circuit, and finally short-circuit the armature, substantially as and for the purpose specified.

21. In an electric railway, the combination of a traveling vehicle, an electric motor carried thereon for actuating it, a magnetizing-coil around the traction-wheel, and a switch controlled by the speed of the vehicle to put said coil in and out of circuit, whereby it shall always be in circuit at slow speeds or when starting, but out of circuit at high speeds, substantially as and for the purpose specified.

22. In an electric railway, the combination of a traveling vehicle, an electric motor carried thereon for actuating it, a magnetizing-coil around the traction-wheel, a switch, and a governor controlled by the speed of the vehicle to operate the switch and put said coil in and out of circuit, whereby it shall always be in circuit at slow speeds or when starting, but out of circuit at high speeds, substantially as and for the purpose specified.

23. In an electric railway, the combination of a traveling vehicle, an electric motor carried thereon for actuating it, the field-magnets and armature being arranged in multiple-arc connection, a variable resistance in the field-magnet circuit, and an automatic resistance-changer adapted to vary the resistance in accordance with changes in the current strength, substantially as and for the purpose specified.

24. In an electric railway, a traveling vehicle, an electric motor carried thereon for actuating it, the field-magnets and armature being arranged in multiple-arc connection, a variable resistance in the field-magnet circuit, and an automatic resistance-changer adapted to vary the resistance inversely in accordance with changes in the current strength, in combination with a variable resistance located in the armature-circuit, substantially as and for the purpose specified.

25. In an electric railway, a traveling vehicle, an electric motor carried thereon for actuating it, the field-magnets and armature being arranged in multiple-arc connection, a variable resistance in the field-magnet circuit, and an automatic resistance-changer adapted to vary the resistance inversely in accordance with changes in the current strength, in combination with a variable resistance located in the armature-circuit and a switch to short-circuit the armature, substantially as and for the purpose specified.

26. In an electric railway, a traveling vehicle, an electric motor carried thereon for actuating it, the field-magnets and armature being arranged in multiple-arc connection, a variable resistance in the field-magnet circuit, and an automatic resistance-changer adapted to vary the resistance inversely in accordance with changes in the current strength, in combination with a variable resistance located in the armature-circuit, and a switch to short-circuit the armature and increase the resistance in the short-circuit of the armature, substantially as and for the purpose specified.

27. In an electric railway, the combination of a traveling vehicle an electric motor carried thereon for actuating it, the field-magnets and armature being arranged in multiple-arc connection, an automatic resistance-changer interposed in the field-magnet circuit, and a resistance-changer located in the armature-circuit, substantially as and for the purpose specified.

28. In an electric railway, the combination of a traveling vehicle, an electric motor carried thereon for actuating it, the field-magnets and armature being arranged in multiple-arc connection, a resistance-changer interposed in the field-magnet circuit, and a resistance-changer located in the armature-circuit, and a switch to short-circuit the armature, substantially as and for the purpose specified.

29. In an electric railway, the combination of a traveling vehicle, an electric motor carried thereon for actuating it, the field-magnets and armature being arranged in multiple-arc connection, a resistance-changer interposed in the field-magnet circuit, and a resistance-changer located in the armature-circuit, a switch to short-circuit the armature, and a governor to actuate said switch, substantially as and for the purpose specified.

30. In an electric railway, the combination of a traveling vehicle, an electric motor carried thereon for actuating it, the field-magnets and armature being arranged in multiple-arc connection, a resistance-changer interposed in the field-magnet circuit, and a resistance-changer located in the armature-circuit, and a governor to actuate said armature-resistance changer, substantially as and for the purpose specified

31. In an electric railway, the combination of a traveling vehicle an electric motor carried thereon for actuating it, the field-magnets and armature being arranged in multiple-arc connection, a resistance-changer interposed in the field-magnet circuit, and a resistance-changer located in the armature-circuit, a switch to short-circuit the armature, and a governor to actuate said armature-resistance changer and switch, substantially as and for the purpose specified.

32. In an electric railway, the combination of the traveling vehicle, an electric motor carried thereon for actuating it, a buffer and lever mechanism actuated by said buffer to change the relative position of the commutator-sections with the brushes to reverse the motor, and a lock to retain said parts in their new relative position, substantially as and for the purpose specified.

33. In an electric railway, the combination of the traveling vehicle, an electric motor carried thereon for actuating it, a buffer and lever mechanism actuated by said buffer to change the relative position of the commutator-sections with the brushes to reverse the motor, and a circuit-breaker controlled by the backward travel of the vehicle to cut the motor out of circuit to arrest its movement, substantially as and for the purpose specified.

34. In an electric railway, the combination of the traveling vehicle, an electric motor carried thereon for actuating it, a buffer and lever mechanism actuated by said buffer to change the relative position of the commutator-sections with the brushes to reverse the motor, a lock to retain said parts in their new relative position, and a circuit-breaker controlled by the backward travel of the vehicle to cut the motor out of circuit to arrest its movement, substantially as and for the purpose specified.

35. The combination of a traveling vehicle, an electric motor carried thereon for actuating it, and a circuit-breaker controlled by the backward movement of the vehicle or motor to cut the motor out of circuit, substantially as and for the purpose specified.

36. The combination of a traveling vehicle, an electric motor carried thereon for actuating it, a circuit-breaker consisting of the thread *j*, the loose nut Q, and contacts Q', controlled by the backward movement of the vehicle or motor to cut the motor out of circuit, substantially as and for the purpose specified.

37. The combination of a traveling vehicle, an electric motor carried thereon for actuating it, and a circuit-breaker consisting of the thread *j*, the loose nut Q, contacts Q', and spring *q*, controlled by the movement of the vehicle or motor to cut the motor out of circuit, substantially as and for the purpose specified.

38. The combination of a traveling vehicle, an electric motor carried thereon for actuating it, a governor controlled by the speed of the vehicle and adapted to cut the motor-armature out of line-circuit and put it in a short or closed circuit, a reversing device, and a switch controlled by the reversing device to couple the armature into line-circuit, substantially as and for the purpose specified.

39. The combination of a traveling vehicle, an electric motor carried thereon for actuating it, a governor controlled by the speed of the vehicle and adapted to cut the motor-armature out of line-circuit and put it in short or closed circuit, a reversing device, and a switch controlled by the reversing device to couple the armature into line-circuit again, and a circuit-breaker to break the line-circuit after the motor has run back a short distance, substantially as and for the purpose specified.

40. The combination of a traveling vehicle, an electric motor carried thereby for actuating it, a spring-buffer attached thereon, and motor-reversing devices actuated thereby to reverse the motor automatically upon a collision, substantially as and for the purpose specified.

41. The combination of a traveling vehicle, an electric motor carried thereby for actuating it, a spring-buffer attached thereon, and motor-reversing devices actuated thereby to reverse the motor automatically upon a collision, an armature-circuit closer also actuated by said buffer, and a lock to keep said circuit closed, substantially as and for the purpose specified.

42. The combination of a traveling vehicle, a motor carried thereon for actuating it, the brushes K' and commutator K, having part *k*, constructed, as set forth, for reversing, said commutator being movable longitudinally upon the armature-shaft, a spring-buffer, and intermediate connections to move said commutator, substantially as and for the purpose specified.

43. The combination of a traveling vehicle, an electric motor carried thereon for actuating it, armature-resistances normally in circuit, means to reverse the motor, and a switch to automatically cut out the armature-resistances upon reversing the motor, substantially as and for the purpose specified.

44. The combination of a sectional working-conductor, a train of vehicles of a length equal to or greater than one of the sections of the conductor, electric motors on said train for propelling it, switches for bridging the sections of the working-conductors and actuated by the passing train, and a motor-circuit extending from the front to the rear of the train and connecting with the working-conductors, and springs to keep said motor-conductor taut and yet allow for movement of the cars or vehicles of the train, substantially as and for the purpose specified.

45. The combination of the conductor-sections A A, supports D^2, and clamps D^3, substantially as and for the purpose specified.

46. The combination of the conductor-sections A A, supports D^2, insulation E, and clamps D^3, substantially as and for the purpose specified.

47. The combination of the conductor-sections A A, supports D^2, rollers *d*, and clamps D^3, substantially as and for the purpose specified.

48. In the herein-described system of telpherage, the combination of a conductor divided into sections, switches which normally bridge from one section to the other, traveling trains or vehicles, one or more electric motors on the trains or vehicles by which they are driven, and devices operated by the trains or vehicles to move said switches successively and divert the current through the motors on said trains or vehicles, so that the motors are connected in series through the sectional conductor, and a spring device to assist the movement of the switch, substantially as and for the purpose specified.

49. The combination, with conductor-sections insulated from each other, a traveling motor receiving electricity from said conductor, a pivoted switch, C, to connect said sections together, a spring, *c*, connecting said switch with its support and placed so as to be under compression in the two extreme positions of said switch to assist both in opening and closing the switch, and a trip carried by the traveling motor to shift the switch as it passes from one section to the next.

50. The combination of a stationary working-conductor arranged along the railway, a traveling vehicle, a motor carried thereon to propel the same and receiving electricity from said conductor, a magnetizing-coil surrounding the lower part of one of the wheels of said vehicle, and a circuit in connection with line-working conductor to pass a current through said coil, substantially as and for the purpose specified.

51. The combination of a stationary working-conductor arranged along the railway, a traveling vehicle, a motor carried thereon to propel the same and receiving electricity from said conductor, a magnetizing-coil surrounding the lower part of one of the wheels of said vehicle, a circuit in connection with the motor-circuit to pass a current through said coil, and a switch to open or close said circuit, substantially as and for the purpose specified.

52. The combination of a stationary working-conductor arranged along the railway, a traveling vehicle, a motor carried thereon to propel the same and receiving electricity from said conductor, a magnetizing-coil surrounding the lower part of one of the wheels of said vehicle, a circuit to pass a current through said coil, and a variable resistance in the magnetizing-circuit, substantially as and for the purpose specified.

53. The combination of two terminals of conductors brought close together, a pivoted switch adapted to close or interrupt the circuit between said conductors, and a spring to resist the movement of the switch on starting to shift it, the said spring being positively connected with the switch.

54. The combination of two terminals of conductors brought close together, a pivoted switch adapted to close or interrupt the circuit between said conductors, and a spring to resist the movement of the switch on starting to shift it, the said spring being positively connected with the switch, and assist it upon the last portion of its movement in being shifted.

408,193. MEANS FOR THE ELECTRICAL PROPULSION OF BOATS. RUDOLPH M. HOSTER, Philadelphia, Pa. Filed Dec. 26, 1888. Serial No. 294,587. (No model.)

Claim.—1. A canal having two portions thereof at different levels and a lock for transferring boats from one level to the other, in combination with a water-power motor operated by the difference in level of the water of the canal, an electric generator operated by the water-power motor, a line-conductor arranged along the canal, or substantially parallel thereto, receiving electric current from said electric generator, an electrically-propelled boat, and a collector carried by the boat and making a traveling contact with the line-conductor.

2. A canal having two portions thereof at different levels and a lock for transferring boats from one level to the other, in combination with a water-power motor operated by the difference in level of the water of the canal, an electric generator operated by the water-power motor, a line-conductor arranged along the canal, or substantially parallel thereto, receiving electric current from said electric generator, an electrically-propelled boat, a collector carried by the boat and making a traveling contact with the line-conductor, and a regulator on the boat for controlling the current passing to the motor thereon to govern the speed of the boat.

3. A canal having two portions thereof at different levels and a lock for transferring boats from one level to the other, in combination with a water-power motor operated by the difference in level of the water of the canal, a water-way for supplying water to the motor, leading from the canal above the lock and discharging into the canal below the lock, an electric generator operated by the water-power motor, a line-conductor arranged along the canal, or substantially parallel thereto, receiving electric current from said electric generator, an electrically-propelled boat, and a collector carried by the boat and making a traveling contact with the line-conductors.

4. The combination of a canal or water-way having different water-levels, locks for transferring boats from one level to another, electric conductors arranged along the canal or water-way, an electrically-propelled boat, and a detachable current-collecting device connected to the boat for making a detachable electrical connection between the electric conductor and motor on the boat.

5. The combination of a canal or water-way, a line supply-conductor insulated from the earth, arranged along or over the water-way, a return-conductor normally connected with the ground, an electrically-propelled boat, and current-collecting devices carried or moved with the boat for making traveling contact with the supply and return conductors and supplying electric current to the motor on the boat.

6. The combination of a canal or water-way, a line supply-conductor insulated from the earth, arranged along or over the water-way, a return-conductor normally connected with the ground and lying upon the bottom of the water-way, an electrically-propelled boat, and current-collecting devices carried or moved with the boat for making traveling contact with the supply and return conductors and supplying electric current to the motor on the boat.

7. The combination of a canal or water-way, a line supply-conductor insulated from the earth, arranged along or over the water-way, a return-conductor normally connected with the ground and lying upon the bottom of the water-way, an electrically-propelled boat, and current-collecting devices carried or moved with the boat for making traveling contact with the supply and return conductors and supplying electric current to the motor on the boat, the said collecting devices consisting of wheels running in contact with the conductors.

8. The combination of a water-way, a line-conductor arranged parallel to the water-way and insulated from the ground, a line-conductor arranged to lie normally in electrical contact with the bottom of the water-way, and an electric generator for supplying electricity of different polarities to said conductors.

9. The combination of an electric conductor normally resting upon the bottom of a water-way with an electrically-propelled boat and a current-collecting device connected to the boat for making a traveling contact with said conductor, and means for supplying current to the motor on the boat.

10. The combination of an electric conductor normally resting upon the bottom of a water-way with an electrically-propelled boat and a current-collecting device connected to the boat for making a traveling contact with said conductor, consisting of a contact-wheel which travels under the conductor, and means for supplying current to the motor on the boat.

11. The combination of a water-way and a line-conductor insulated from the ground and in the line of travel of the boat with a boat having a propeller acting on the water, an electric motor to rotate said propeller to propel said boat, and a current-collecting device connected to the boat and making a traveling contact with the conductor for supplying electricity to the motor.

12. The combination of a water-way and a line-conductor insulated from the ground and in the line of travel of the boat with a boat having a propeller acting on the water, an electric motor to rotate said propeller to propel said boat, and a flexible current-collecting device connected to the boat and making a traveling contact with the conductor for supplying electricity to the motor and allowing of irregular movements in the line of travel of the boat.

13. The combination of a water-way and a line-conductor insulated from the ground and in the line of travel of the boat with a boat having a propeller acting on the water, an electric motor to rotate said propeller to propel said boat, and a jointed current-collecting device connected to the boat and having a vertically-arranged grooved current-collecting wheel making a traveling contact with the conductors for supplying electricity to the motor.

14. The combination of a water-way and a line-conductor insulated from the ground and in the line of travel of the boat with a boat having a propeller acting on the water, an electric motor to rotate said propeller to propel said boat, and a flexible current-collecting device connected to the boat and supported at its free end by the conductor, and making a traveling contact with the conductor for supplying electricity to the motor.

15. The combination of a line-conductor, an electrically-propelled boat having a propeller acting on the water, an electric motor to rotate said propeller, and a current-collecting device between the boat and conductor, consisting of an arm extending substantially horizontally from the boat, and having a contact device consisting of a vertically-arranged current-collecting wheel, which rests against the horizontal surface of the conductor to collect current and supply it to the motor.

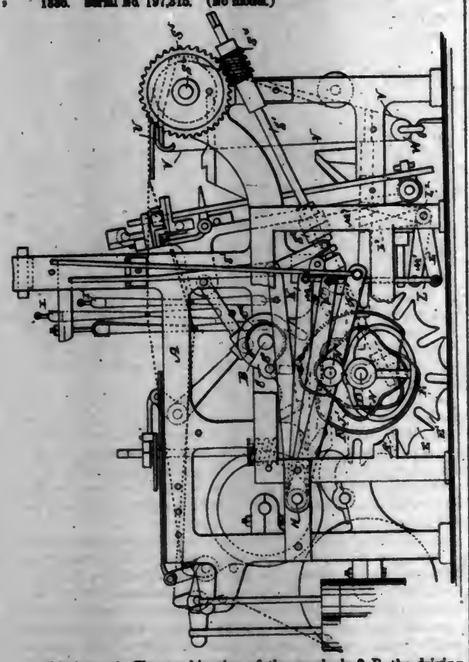
16. The combination of a line-conductor, an electrically-propelled boat having a propeller acting on the water, an electric motor to rotate said propeller, and a current-collecting device between the boat and conductor, consisting of an arm extending substantially horizontally from and movably connected with the boat, and having a vertical grooved wheel contact device, which rests against the horizontal surface of the conductor to collect current and supply it to the motor.

17. The combination of a line-conductor, an electrically-propelled boat, and a current-collecting device between the boat and conductor consisting of an arm extending laterally and substantially horizontally from the boat, having a contact device, which rests against the conductor, and a second arm hinged to the first-mentioned arm at one end and to the boat at the other end.

18. The combination of a line-conductor, an electrically-propelled boat, a current-collecting device between the boat and conductor, consisting of an arm extending laterally and substantially horizontally from the boat, and having a contact device which rests against the

conductor, a second arm hinged to the first-mentioned arm at one end and to the boat at the other end, and a tie connecting the lateral arm with the boat.

19. The combination of a water-way, a line-conductor arranged in line with the path of travel of a boat, having a propeller acting upon the water and driven by an electric motor on said water-way, an electrically-propelled boat, and a flexible current-collecting device between the conductor and boat, which, while maintaining an electrical connection, shall permit the free lateral movement of the boat with respect to the line-conductor to compensate for irregularities in the boat's travel.



20. A water-way, in combination with an electrically-propelled boat having a propeller acting upon the water and driven by an electric motor, a supporting-wheel on the boat, a line-conductor arranged in the path of travel of said boat and supported by said wheel, an electrical connection between said wheel and motor, a regulating device to control the speed of the motor, and an electric generator to supply electricity to said line-conductor.

21. The combination of a water-way, a line-conductor, a traveling electrically-propelled boat having a propeller acting upon the water and driven by an electric motor, and a current-collecting device between the line-conductor and boat and connected to the boat at or close to its rear or stern part.

22. The combination of a water-way, two line-conductors insulated from each other, an electric generator, an electrically-propelled boat having a propeller acting upon the water and driven by an electric motor, and current-collecting devices for contact with the two conductors carried with the boat.

23. The combination of a water-way, two line-conductors insulated from each other, an electric generator, an electrically-propelled boat having a propeller acting upon the water and driven by an electric motor, and current-collecting devices for contact with the two conductors carried with the boat, and having independent contact parts.

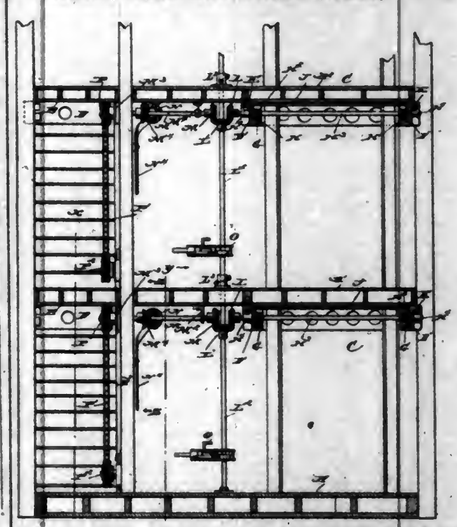
408,194. LOOM. JOSEPH JAGGER, Glenham, N.Y. Filed Mar. 31, 1886. Serial No. 197,315. (No model.)

Claim.—1. The combination of the crank-shaft B, the driving and locking wheel C, and the section-wheel E, with the fine chain-cams F and F', the levers G and G', provided with the friction-rollers G^2, the heads and intermediate devices between the heads and levers, substantially as shown and described.

2. The combination of the crank-shaft B, the driving and locking wheel C, and the section-wheel E, with the working-cams J and J', the levers K and K', provided with the friction-rollers K^2, the picking-shafts O and P, and intermediate mechanism between the said shafts and levers, substantially as shown and described.

3. The combination of the section-wheel E, the driving and locking wheel C, the crank-shaft B, and the working-cams J and J', having cam-grooves J^3, with the shafts O P, the levers K and K', having the friction-rollers K^2, the connecting-links L and M, the arms L' and M', the shaft L^2, having the arm L^3, and the sleeve M^2, having the arm M^3, substantially as herein shown and described.

4. The combination of the working-cams J and J', having cam-grooves J^3, the levers K and K', provided with friction-rollers K^2, the links L and M, and the arms L' and M', with the shaft L^2, provided with the arm L^3, the picking-shaft O, the sleeve M^2, provided with the arm M^3, and the picking-shaft P, substantially as shown and described.



5. The combination, with the shaft D, the shaft S^2, the breast-roller S, and means for operating the shaft S^2 from the shaft D, of the roller T, provided with the pegs T', and the endless belt V, substantially as herein shown and described.

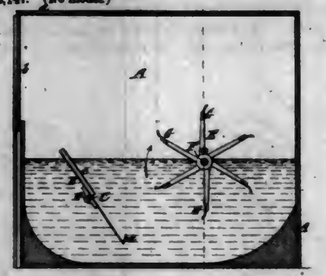
408,195. APPARATUS FOR OPERATING RAILWAY-SWITCHES. ARTHUR H. JOHNSON, Jersey City, N. J. Filed July 31, 1888. Serial No. 281,504. (No model.)

Claim.—The combination, with two switches adapted to be moved between railway-rails, of two rods connected one to each of said switches, an equalizing-lever interposed between and connected with the said rods, and an operating-rod connected with said lever between the points of connection of the rods first named, substantially as herein described, whereby the movement of said operating-rod will cause the two switches to be always moved to predetermined limits and both to be brought to their normal positions, substantially as herein set forth.

408,196. HATCHWAY. JOHN P. KETTERINGHAM, Natchez, Miss., assignor of one-half to Stephen Duncan, same place. Filed May 20, 1885. Renewed Apr. 10, 1889. Serial No. 306,754. (No model.)

Claim.—1. The combination, with the rectangular frame D, constructed to be attached to the ceiling around a hatchway, and having opposite and inwardly projecting guide-rails G, of rack-bars sliding on said guideways, a cut-off door secured to the said bars, a transverse shaft journaled in the frame, and pinions on the said shaft meshing with the said rack-bars, substantially as described.

2. The combination, with the floor of a building having a hatchway, of plates D', depending from the ceiling on opposite sides of the hatchway and having parallel inward-projecting guide-rails G, a pair of rack-bars, H, having their teeth on their upper faces mounted to slide on the respective rails G and carrying one door-section, pinions H^3, engaging the respective rack-bars, a transverse shaft, H^2, carrying the pinions, another pair of rack-bars, K, having their teeth on their lower faces riding on the pinions H^3 and carrying the opposite door-section, and means for rotating the shaft H^2, substantially as described.



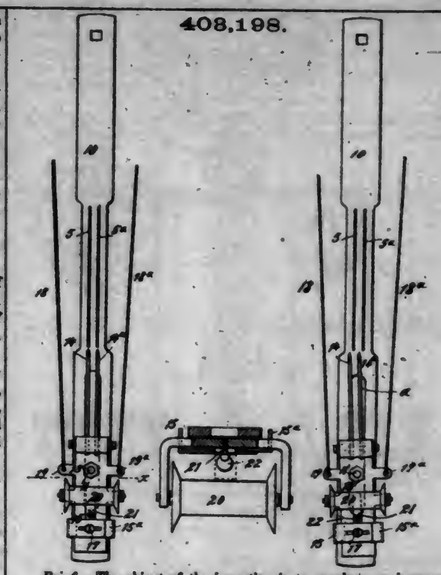
3. The combination, with the floor of a building having a hatchway, of plates D', depending from the ceiling beneath said floor on opposite sides of the hatchway, and formed with shaft-bearings H^6 H^4 and parallel inwardly-projecting guide-rails G, bars H, mounted to slide lengthwise on the respective rails G, having elevated supports 1 on one end carrying a door and rack-teeth H' on their other ends, pinions H^3, engaging the respective rack-teeth H', a shaft, H^2, carrying the pinions H^3 and journaled in the bearings H^4, and means for rotating the shaft H^2, substantially as described.

4. The combination, with a building having hatchways, of sliding cut-off doors for the respective hatchways, a transverse shaft, H^2, across each hatchway, and gearing for operating the said cut-off doors therefrom, a vertical shaft, L^2, extending through the several floors of the building, gearing connecting the shaft L^2 with each of the shafts H^2, and a reverse ratchet-lever for turning the shaft L^2 in either direction, substantially as described.

5. The combination, with a building having a hatchway, of cut-off doors for the hatchway, a transverse shaft across the hatchway, gearing for operating the doors from the said shaft, sprocket-wheels, endless chains or bands passing over the said sprocket-wheels, and intermediate gearing between one of the sprocket-wheels and the said transverse shaft, substantially as herein shown and described.

6. The combination, with a building having hatchways B C and sliding sectional doors J J' for each hatchway, provided with racks, of the transverse shafts H, provided with the pinions engaging the said racks and with bevel gear-wheels, the vertical shaft L^2, provided with bevel gear-wheels, the horizontal shaft M', provided with bevel gear-wheels on its ends, the counter-shaft N', provided with bevel gear-wheels, and means for operating the shaft L^2, substantially as herein shown and described.

408,197. APPARATUS FOR METALLIZING ELECTROTYPE-MOLDS. SILAS P. KNIGHT, Brooklyn, N. Y. Filed June 5, 1888. Serial No. 276,147. (No model.)



Claim.—1. In an apparatus for metallizing electrotype-molds, the combination, with a tank for containing a liquid, and a holder therein for the reception of the mold, of a spray or current wheel arranged within said tank, substantially as described, to dip into the liquid therein for the purpose of taking up said liquid and throwing it in currents or spray against the face of the mold, as herein set forth.

2. In an apparatus for metallizing electrotype-molds, the combination, with a tank and an adjustable holder therein for the reception of the molds, of a spray or current wheel by the revolutions of which fluids contained in the tank may be driven in currents or spray against the face of the mold, substantially as herein described and set forth.

3. In an apparatus for metallizing electrotype-molds, the combination, with a tank and a holder therein for the reception of the mold, of a spray or current wheel having digitated blades or buckets by the revolutions of which fluids contained in the tank may be driven in currents or spray against the face of the mold, substantially as herein described and set forth.

4. In an apparatus for metallizing electrotype-molds, the combination, with a tank and a holder therein for the reception of the mold, of a spray or current wheel having interchangeable digitated and brush buckets by the revolutions of which the face of the molds may be brushed and the fluids contained in the tank may be driven in currents or spray against the face of the mold, all substantially as herein described and set forth.

408,198. LOOM ATTACHMENT FOR WEAVING CENTER SELVAGES. FRED LACEY, Adams, Mass., assignor of one-half to Alfred R Mole, same place. Filed Dec. 21, 1888. Serial No. 294,258. (No model.)

Brief.—The object of the invention is to produce an improved attachment for weaving center selvages upon looms on which splits are woven.

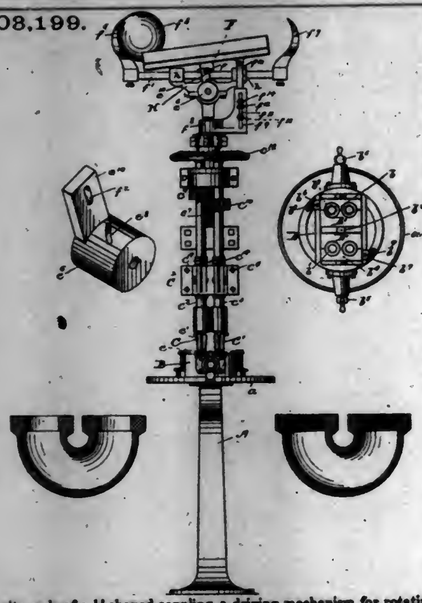
Claim.—1. The combination, with the longitudinally-slotted plate adapted to be connected to a loom-frame, of a tilting needle-carrying slide, a bolt extending through said slide and slot, and laterally-extending stops projecting from opposite sides of the slide and embracing the said plate to limit the tilting of the slide without interfering with its sliding movement, substantially as set forth.

2. The combination, with the slotted plate, of the needle-carrying slide thereon, having spool-bearings, substantially as set forth.

3. The combination, with the plate 10, having a longitudinal slot, *a*, and parallel thread-slots 5 5^a, of the tilting needle-carrying slide, through which and the said slot *a* a bolt, 11, passes, and the laterally-adjustable stops on the slide embracing the sides of the plate, and the lugs or ears 19 19^a projecting from opposite sides of the slide for connection with selvage harness or levers, substantially as set forth.

4. The combination, with a slotted plate arranged for connection with a loom-frame, of a tilting needle-carrying slide mounted to move vertically upon said plate and adapted to carry a spool, and stop-plates carried by the slide, substantially as described.

5. The combination, with a slotted plate arranged for connection with a loom-frame, of the needle-carrying slide mounted to move vertically on said plate and arranged for connection with a harness, stop-plates carried by the slide, spool-bearings upon the slide, and a spring projecting between the said bearings, substantially as described.



6. The combination, with a plate, 10, arranged for connection with a loom-frame and formed with slots 5, 5^a, and *a*, of a slide, a bolt connected to the slide and passing through the slot *a*, needles carried by the slide, plates 15 and 15^a, formed with lugs or ears 16, and a set-screw by which said plates are connected to the slide, the slide being arranged for connection with selvage harnesses or levers, substantially as described.

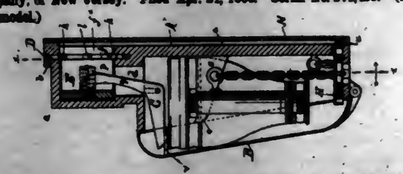
408,199. MACHINE FOR TAPPING ELBOWS AND RETURN-BENDS. DANIEL G. LADELAUTE and OTIS E. MOULTON, Dover, N. H., assignors to the Somersworth Machine Company, same place. Filed Nov. 7, 1887. Serial No. 254,572. (No model.)

Claim.—1. In a tapping-machine, the combination, with a work support or table, of a work-holder pivotally mounted thereon and having two clamps for holding a coupling and two rotating and reciprocating tap-carrying spindles arranged side by side and parallel to each other, and separated a proper distance to cause their taps to enter the opposite ends of a U-shaped coupling, said spindles moving simultaneously in the same direction toward and from the said table, substantially as set forth.

2. In a tapping-machine, the combination, with a work support or table, of a work-holder pivotally mounted thereon and having two clamps for holding a coupling, two rotating and reciprocating tap-carrying spindles arranged side by side and parallel to each other, and separated a proper distance to enable their taps to enter the op-

408,199.

posite ends of a U-shaped coupling, a driving mechanism for rotating and simultaneously reciprocating said spindles to cause them to move toward and from the said table in the same direction together, and an automatic reversing mechanism for the said driving mechanism, substantially as set forth.



3. In a tapping-machine, the combination, with the taps and their spindles and driving-gearing, of a driving-shaft carrying a clutch, two reversely-driven loose pulleys on said shaft, a tilting table, a weight or ball to roll on said table, a sliding bar having two stops to be engaged by said weight or ball, and connections between said sliding bar and the said driving-gearing and clutch, whereby when the tap-spindles have traveled endwise a certain desired distance in one direction the said table will be tilted, the clutch moved, and the direction of rotation of the said driving-shaft thus automatically reversed, as set forth.

4. The combination, in a machine for tapping couplings, elbows, &c., of the taps C C', their spindles c^4, the nuts c^5, the long pinion c^9, and the pinions c^8 c^{10}, as and for the purposes described.

5. The combination of the taps C C', spindles c^4, the shaft c^{12}, connected with the spindles, substantially as specified, the nuts c^5, the pulleys D D', the clutch E, and a traveling nut, f^6, connected with the clutch E by means of the tilting table F, the slide-rod c^4, cam c^6, link f^{10}, arm f^9, and pin f^8, and the ball f^7, substantially as described.

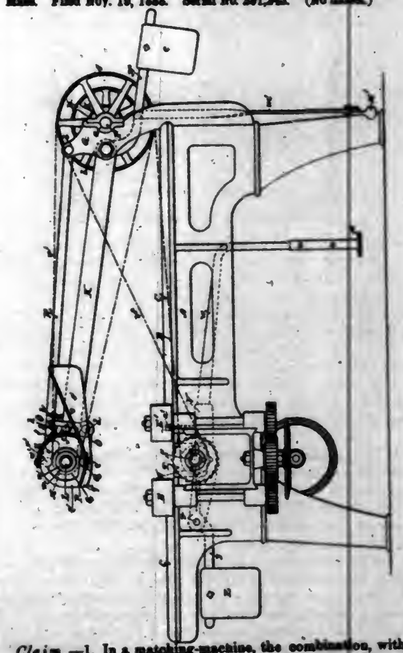
6. The combination of the spindle c^4, the taps C C' carried thereby, the shaft c^{12}, connected with the spindle c^4, substantially as specified, the pulleys D D', slide-clutch E, the rod c^4, cam c^6, tilting table F, connected with the cam, the nut f^6, the arm f^9, having the long slot f^{11}, the link f^{10}, its stop f^{13}, the stops f^{12} f^{14} upon the arm f^9, and the weight f^7, substantially as described.

408,200. COIN-OPERATED LOCK. FRANK M. LEAVITT, Brooklyn, N. Y., assignor, by mesne assignments, to the Opera Glass Supply Company, of New Jersey. Filed Apr. 21, 1888. Serial No. 271,453. (No model.)

Claim.—1. A coin-operated lock consisting of the combination, with the locking-catch, of a casing having a coin-receiving chamber into which the coin is inserted, a stop or detent arranged to project into said chamber and adapted to be displaced by direct contact with the coin when the latter is forced in, and a spring-pressed plunger connected to said catch and normally restrained from moving by said stop, whereby it holds the lock fastened, and constructed to be released by the displacement of said stop, whereby it effects the withdrawal of the catch.

2. A coin-operated lock consisting of the combination, with a locking-catch, of a casing having a coin-receiving chamber, a spring-pressed plunger to which said catch is connected, and stops or detents consisting of spring-pressed pawls mounted to enter the coin-receiving chamber in advance of the plunger and arranged to prevent the movement of the plunger until they are displaced by the insertion of a coin.

3. In a coin-operated lock, the combination of a casing having a coin-receiving chamber and formed with a recess communicating with said chamber for receiving the spent operating-coin, a plunger adapted to enter said chamber and arranged on opposite sides thereof from said recess, a spring pressing said plunger toward said chamber, and a stop or detent arranged to normally project into the chamber and adapted to restrain the plunger, whereby the insertion of a coin displaces the stop and releases the plunger, and the latter then moves into the chamber and expels the coin therefrom into said recess.



4. A coin-operated lock consisting of the combination, with the locking-catch and a casing having a coin-receiving chamber, of a spring-pressed plunger, restraining-stops therefor, consisting of spring-pressed pawls mounted to project into the coin-receiving chamber in advance of the plunger, and a lever pivotally connected at one side of the coin-receiving chamber, substantially as described.

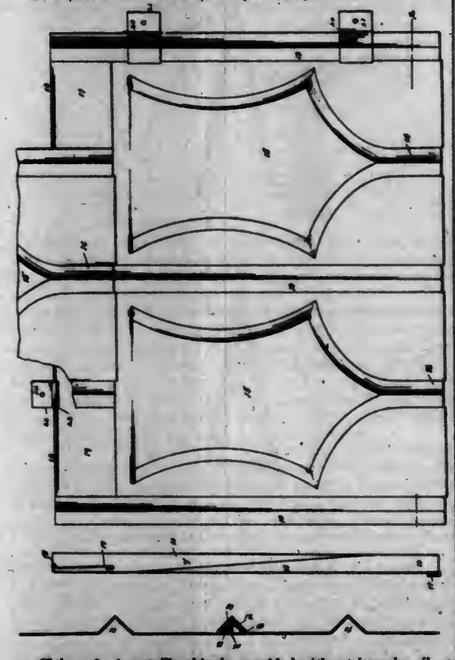
5. A coin-operated lock consisting of the combination, with a casing having a coin-receiving chamber, of a spring-pressed and slotted plunger, spring-pressed pawls mounted to enter the coin-receiving chamber in advance of the plunger, and a catch provided with an arm that rides in the plunger-slot, substantially as described.

6. A case and a lid hinged thereto, in combination with a catch adapted to hold said lid, a spring-pressed plunger co-operating with said catch and tending to release the same, and a stop serving to arrest said plunger and arranged to be displaced from the path thereof by the insertion of a coin.

7. A case and a lid hinged thereto, in combination with a spring-pressed plunger, a pivoted catch adapted to hold said lid closed and engaging said plunger, whereby the plunger may be restored by moving said catch, and a stop serving to arrest said plunger and arranged to be displaced from the path thereof by the insertion of a coin.

408,201. MATCHING-MACHINE. BENJAMIN G. LUTHER, Worcester, Mass. Filed Nov. 19, 1888. Serial No. 291,943. (No model.)

Claim.—1. In a matching-machine, the combination, with the feeding-rollers and the table or support for one edge of the board, of a pivoted frame located above the table or support, a saw or cutter held upon a shaft in the pivoted frame, and an adjustable guide pivoted to the pivoted frame for gaging the depth of the cut to be made in the edge of the board, substantially as described.



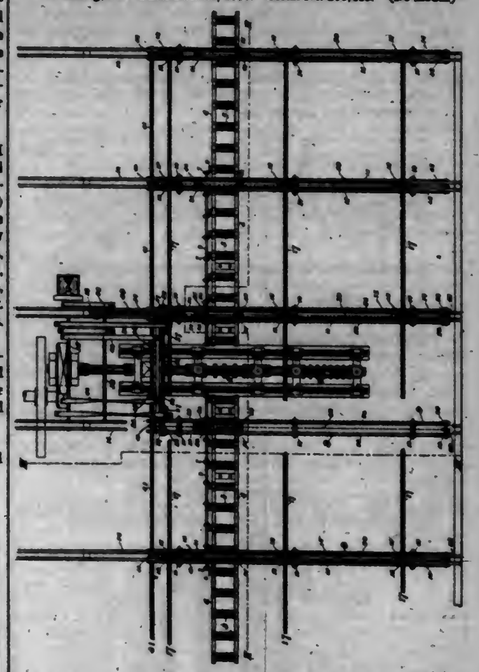
2. In a matching-machine, the combination, with the feeding-rollers and the table or support for one edge of the board, of a pivoted frame, a saw or cutter held upon a shaft in the pivoted frame, the adjustable guide pivoted to the pivoted frame and adapted to gage the depth of the cut to be made in the edge of the board, and the rod which forms the parallel movement for preserving the proper relation of the guide and the table or support for the board at the varying inclination of the pivoted frame, substantially as described.

3. In a matching-machine, the combination, with the feeding-rollers and a table or support for one edge of the board, of a pivoted frame, a saw or cutter held upon a shaft in the pivoted frame, the adjustable guide adapted to gage the depth of the cut to be made in the edge of the board, the pivoted lever and screw-bolt for adjusting the guide, and the connecting-rod which forms the parallel movement for preserving the proper relation of the guide and the table or support for the board, substantially as described.

408,202. PROCESS OF OBTAINING GOLD AND SILVER FROM ORES. JOHN S. MACARTHUR, Pollokshields, County of Renfrew, and ROBERT W. FORREST and WILLIAM FORREST, Glasgow, County of Lanark, Scotland. Filed Nov. 9, 1887. Serial No. 254,699. (No specimens.) Patented in England Oct. 19, 1887, No. 14,174; in Cape of Good Hope Jan. 7, 1888, No. 6/101; in Victoria Jan. 19, 1888, No. 5,573; in New South Wales Jan. 21, 1888, No. 463; in South Australia Jan. 23, 1888, No. 948; in Tasmania Jan. 24, 1888, No. 589; in New Zealand Feb. 1, 1888, No. 2,775; in Canada Feb. 6, 1888, No. 28,471; in France Apr. 6, 1888, No. 189,906; in Belgium July 24, 1888, No. 82,673; in Brazil Aug. 23, 1888, No. 619; in Portugal Aug. 30, 1888, No. 1,373; in Italy Sept. 30, 1888, No. 23,833, and in Spain Oct. 3, 1888, No. 8,533.

Claim.—The process of separating precious metal from ore containing base metal, which process consists in subjecting the powdered ore to the action of a cyanide solution containing cyanogen in the proportion not exceeding eight parts of cyanogen to one thousand parts of water.

408,203. METALLIC SHINGLE. JOSHUA MILLS, Ottawa, Ill. Filed Feb. 2, 1889. Serial No. 298,472. (No model.)



Claim.—1. A metallic shingle provided with a triangular rib at each longitudinal side, the edge of one rib being carried horizontally inward and the edge of the opposite rib horizontally inward and vertically upward, substantially as shown and described.

2. A metallic shingle provided with a triangular rib at each longitudinal side, the edge of one rib being carried horizontally inward and the edge of the opposite rib horizontally inward and vertically upward, and a central triangular rib located at one end of the body of the shingle, substantially as shown and described.

3. A metallic shingle provided with a triangular rib at each longitudinal side, the edge of one rib being carried horizontally inward and the edge of the opposite rib horizontally inward and vertically upward, and having a short loop at one end upon the under face and a longer loop upon the opposite end upon the outer face, and the said latter loop provided with an outer longitudinal bead, substantially as shown and described.

408,204. FEED-TABLE FOR ROLLING-MILLS. JAMES MORGAN, Pittsburg, Pa. Filed Feb. 11, 1889. Serial No. 299,415. (No model.)

Claim.—1. The combination, with a rolling-mill feed-table, of elevated supports from which it is suspended, substantially as and for the purposes described.

2. A rolling-mill feed-table, in combination with a laterally-movable elevated support from which it is suspended, substantially as and for the purposes described.

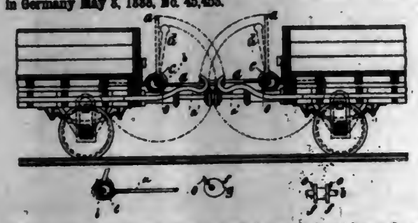
3. A rolling-mill feed-table, in combination with a vertically-movable elevated support from which it is suspended, substantially as and for the purposes described.

4. In a rolling-mill plant, the combination of elevated tracks or ways, carriages mounted thereon, feed-tables suspended from the carriages, and a power-engine for moving the carriages on the tracks, substantially as and for the purposes described.

5. In a rolling-mill plant, the combination of elevated tracks or ways, carriages mounted thereon, feed-tables suspended from the carriages, a power-engine for moving the carriages on the tracks, and lifting mechanism by which the tracks are elevated vertically, substantially as and for the purposes described.

6. In a rolling-mill plant, the combination of elevated tracks or ways, carriages mounted thereon, feed-tables suspended from the carriages, a power-engine for moving the carriages on the tracks, a driving-shaft leading from one at least of the carriages to the feed-rollers, and a traveling power-connection in gear with the said driving-shaft, whereby power is transmitted thereto in any position of the carriage, substantially as and for the purposes described.

7. In a rolling-mill plant, the combination of elevated tracks or ways, carriages mounted thereon, feed-tables suspended from the carriages, a power-engine for moving the carriages on the tracks, lifting mechanism by which the tracks are elevated vertically, and arched yokes connecting the tracks with the suspending mechanism, substantially as and for the purposes described.



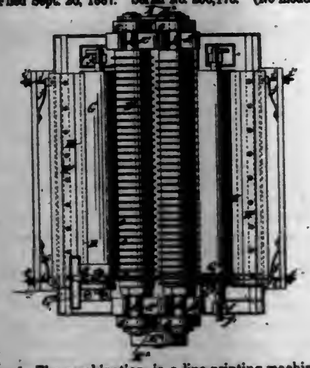
8. The combination, with a rolling-mill feed-table, of hangers or stirrups open at one side and connected with the table, and elevated supports from which the said hangers or stirrups and the table are suspended, substantially as and for the purposes described.

9. The combination, with a feed-table and lifting mechanism by which it is movable vertically, of upright movable bars carried by the

table and extending below the same, whereby on descent of the table said bars shall engage the floor or other support, and shall thereby be elevated relatively to the table to turn the metal thereon, substantially as and for the purposes described.

10. The combination, with a feed-table and lifting mechanism by which it is movable vertically, of upright movable bars carried by the table and extending below the same, whereby on descent of the table said bars shall engage the floor or other support, and shall thereby be elevated relatively to the table to turn the metal thereon, and vertically-movable stop-bars also carried by the table, substantially as and for the purposes described.

403,205. CAR-COUPLING. PAUL R. MÖLLER, Sorau, Prussia, Germany. Filed Feb. 6, 1889. Serial No. 299,798. (No model.) Patented in Germany May 8, 1888, No. 45,453.



Claim.—1. The combination of shaft *b*, cam *c*, hand-lever *d*, and collars *f* with the link *a*, having shoulders *n*, and with hook *a'*, substantially as specified.

2. The combination of shaft *b*, cam *c*, and collars *f* with link *a*, sliding bar *l*, having cam *k*, and with hook *a'*, substantially as specified.

3. The combination, in a car-coupling, of the following elements: shaft *b*, having cam *c* and hand-lever *d*, link *a*, having shoulders *n*, collars *f*, having stops *o*, and rod *l*, having cam *k*, substantially as specified.

403,206. LINE-PRINTING MACHINE. JOHN MCADAMS, Brooklyn, N. Y. Filed Sept. 20, 1887. Serial No. 250,170. (No model.)

Claim.—1. The combination, in a line-printing machine, of pairs of rollers, those of each pair being arranged one above another and all provided with disks *c*, and which are interchangeably fitted in the machine, so that either of each pair may serve as a printing-roller and its companion as a supporting-roller, and of inking apparatus for supplying color to the disks of the printing-rollers, substantially as herein described.

2. The combination, with pairs of line-printing and supporting rollers arranged side by side and those of each pair one above another, of friction-wheels applied to their journals and bearing one on another, and a driving-shaft having friction-wheels in contact with those upon the lower rollers of the pairs, whereby the rollers are driven and held out of contact and at the proper distance apart for printing, substantially as herein described.

3. The combination, with the printing-rollers and their opposite supporting-rollers, all supplied with disks *c*, of ink fountains and rollers for supplying color to the disks of the printing-rollers, and separate ink fountains and wheels or ink-rollers for supplying color to certain of the disks of the supporting-rollers, substantially as herein described.

4. In a line printing or ruling machine, the combination, with printing-rollers provided with series of disks for line-printing, of color-rollers and color or ink fountains arranged at an inclination toward the printing or pen rollers and made self-adjusting relatively thereto, substantially as herein described.

5. In a line printing or ruling machine, the combination, with the line printing or ruling devices, of tapes or cords, which carry the paper on its way to the said printing or ruling devices, and brushes or beaters past which the tapes or cords travel, and which serve to clean the paper while it is carried by the tapes or cords, substantially as herein described.

6. In a line printing or ruling machine, the combination, with the printing or ruling devices, of pairs of tapes or cords between which the paper is carried on its way to said devices, a beater for knocking or beating the tapes or cords and paper to clean the under surface of the paper, and an air-blast pipe for cleaning the upper surface of the paper, substantially as herein described.

7. In a line-printing machine, the combination, with printing and supporting rollers and color wheels or rollers, of an ink or color fountain having compartments formed by transverse partitions, wherein wheels operate to deliver one or more colors upon certain of the printing-disks, and having the remaining portions in communication by a passage or passages leading beneath the first said compartment or compartments, substantially as herein described.

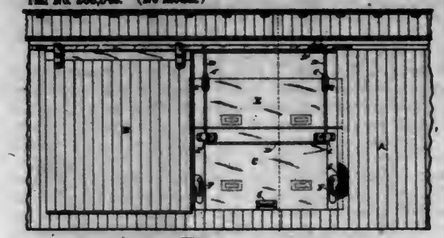
8. The combination, in a line-printing machine, with a printing-roller and a supporting-roller, of an ink-fountain and an inking-roller turning therein for supplying the disks of the printing-roller, and a wiper of india-rubber, arranged approximately tangential to the inking-roller and operating thereon, substantially as herein described.

9. The combination, in a line-printing machine, with a printing-roller provided with printing-disks and the oppositely-arranged supporting-roller, of the ink-fountain and an inking-roller, a sliding holder carrying a wiper, which is arranged approximately tangential to the inking-roller, and which bears thereon, and devices whereby said holder is adjustable to vary the lap of the wiper on the inking-roller, substantially as herein described.

403,207. FLOATING LIFE-LINE CARRIER. ARARIAH D. NEWELL, New Brunswick, N. J. Filed Oct. 4, 1888. Serial No. 287,243. (No model.)

Claim.—1. A floating carrier consisting of a tapering floating body provided with a rear annular flange extending in a backward and outward direction from the carrier and forming a tapering chamber adapted to catch the wind and waves and to be propelled thereby, substantially as described.

2. A floating carrier consisting of a tapering floating body provided with a rear annular flange extending in a backward and outward direction from the carrier and forming a tapering chamber adapted to catch the wind and waves and to be propelled thereby, and also provided with a center rod, G R, or equivalent guiding device, substantially as described.



3. Two or more floating carriers consisting of tapering floating bodies, each provided with guide-rods and a rear annular flange extending in a backward and outward direction from the carrier and forming a tapering chamber to catch the wind and waves and to be propelled thereby and connected by a line, C L, the two extremities of which are attached, as shown, respectively, to the rear end of the guide-rod of the first and to the front of the guide-rod of the following carrier, as and for the uses and purposes set forth.

4. A floating carrier consisting of a tapering floating body with rear flange and center rod extending beyond base of carrier and provided at the rear of the same with a life-line, R, as and for the uses and purpose set forth.

5. A floating carrier consisting of a tapering floating body with rear flange and center rod extending beyond apex and base of carrier, and provided with a steering-line, G L, and a life-line, R, attached, respectively, to the front and rear end of the guide-rod, substantially as and for the uses and purpose set forth.

6. Two or more floating carriers consisting of tapering floating bodies and provided with guide-rods and with a rear annular flange extending in a backward and outward direction from the carrier and forming a tapering chamber adapted to catch the wind and waves and to be propelled thereby, and connected together by a line, C L, the two extremities being attached, as shown, respectively, to the rear end of the guide-rod of the first and to the front of the guide-rod of the second, the rear carrier being provided with a life-rope, R, as and for the uses and purposes set forth.

403,208. GRAIN-DOOR FOR FREIGHT-CARS. JOHN S. PATTERSON and JOHN R. LAWRENCE, Cincinnati, Ohio. Filed Oct. 19, 1888. Serial No. 288,542. (No model.)

Claim.—1. The combination, substantially as specified, of the car-body, the yoke D, suspended therefrom, the door C, the loops coupling it to the yoke, and the hook for catching over the lower bar of said yoke and retaining the door and yoke in the upper position.

2. The combination, substantially as hereinbefore set forth, of the two door-sections, a swinging yoke suspended in the upper timbers of the car-body for carrying the same, the links connecting the upper section to the yoke, whereby it is movable independently of the lower section, hooks hung from the car-roof to catch over the lower bar of said yoke and sustain the sections in the upper position, locking-levers pivoted on the lower door-section, and catches in the posts to receive the locking ends of the levers, for the purpose specified.

3. The combination of the car-body, the swinging door carrier D, having its upper ends bent, as shown, the loops D', by which the yoke is hinged to the roof-timber of the car, the door C and loops coupling it to the swinging frame, the levers F, pivoted upon the door and having their locking ends beveled and cam-shaped, as shown, and the locking-plates *f*, recessed in the upright door-stiles, substantially as specified.

4. In a grain-door composed of two sections hung upon a swinging yoke, the combination of the upper section, E, the swinging links coupling the same upon the swinging yoke, whereby the said upper section is adapted to be pushed up and swung against the roof of the car independent of the lower section, the inwardly-bent ends of the yoke for sustaining the lower edge of the door in its upper position, and the hooks pivoted upon the roof-timber for sustaining the opposite edge, substantially as specified.

403,209. DROP-PERCH FOR VEHICLES. HENRY W. PELL, Rome, N. Y. Filed July 3, 1888. Serial No. 278,902. (No model.)

Claim.—1. A vehicle having a drop-perch provided substantially at its extremities, with braces secured thereto, rigidly securing the perch at one extremity to one axle and pivoting the perch at its opposite extremity to a saddle or saddles rigidly secured to the opposite axle, substantially as and for the purpose set forth.

403,209.

2. A vehicle having a drop-perch provided, substantially at its extremities, with braces or perch-irons secured thereto and formed concave in cross-section, one of which is attached directly to one axle and the other pivoted to a saddle or saddles rigidly secured to the opposite axle, substantially as and for the purpose set forth.

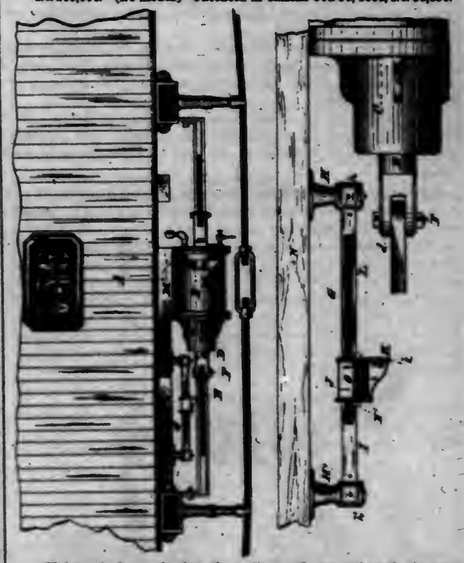
3. The combination of one circle of a fifth-wheel secured to the axle of the vehicle with the other circle pivoted thereto, bearing thereupon, and formed integral with the drop-perch braces secured to one extremity of the perch, substantially as and for the purpose set forth.

4. The combined drop-perch brace *a* and fifth-wheel circle *c*, substantially as and for the purpose set forth.

5. The combination of the axle A, saddles *s s*, fifth-wheel circles *c c'*, pivots *b b'*, and strap *a*, whereby the fifth-wheel is secured to the axle without a king-bolt, substantially as and for the purpose set forth.

6. The combination, with the axle A, perch B, and perch-brace *a*, of the fifth-wheel having one circle secured to the axle and provided with the pivot-bolt *b*, and the opposite circle formed integral with the perch-brace *a*, substantially as and for the purpose set forth.

7. The concavo-convex fifth-wheel circles *c c'*, having the section *e* thereof formed integral with the drop-perch iron, substantially as and for the purpose set forth.

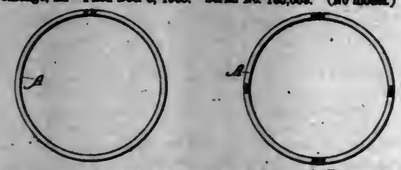


8. The concavo-convex fifth-wheel circles *c c'*, having the upper section thereof formed in one piece with a drop-perch iron concave in cross-section, substantially as and for the purpose set forth.

9. The concavo-convex fifth-wheel circles *c c'*, in combination with a drop-perch, substantially as and for the purpose set forth.

10. A fifth-wheel for vehicles, composed of concavo-convex circles, saddles *s s'*, pivot *b*, formed integral with the lower half of the fifth-wheel circle and the clips C, substantially as and for the purpose set forth.

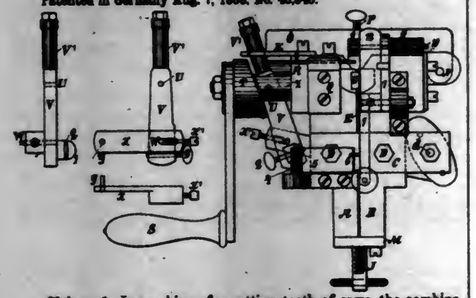
11. A fifth-wheel for vehicles, composed of concavo-convex circles, saddles *s s'*, pivot *b*, and clips C, substantially as and for the purpose set forth.



403,210. REGISTERING-GAGE FOR RAILWAY-CAR BRAKES. ROBERT POTTS, St. Thomas, Ontario, Canada. Filed Oct. 25, 1888. Serial No. 288,196. (No model.) Patented in Canada Oct. 20, 1888, No. 30,080.

Claim.—1. In car-brakes, the indicator G, secured to the bottom of the car-body and provided with a slide actuated by the piston-rod of the brake-cylinder in one direction only, said slide indicating the maximum motion of said brake-piston up to the time of inspection, it being independent of and disconnected from said brake mechanism, as and for the object set forth.

2. The combination, in brake-indicators, with the base N, of the standards H H', having heads *h h'*, the bar I, having scale-indications L, as described, and the slide K, retained in sliding position upon said rod by the feather and spring, as and for the purpose set forth.

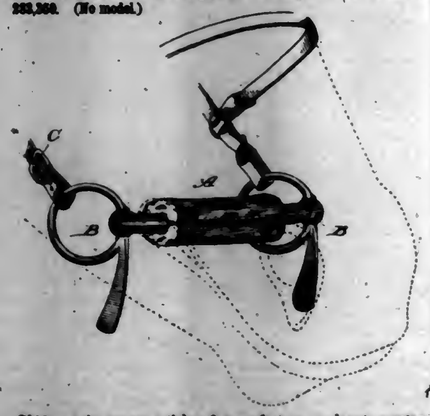


408,211. MAGNETIC SHIELD FOR WATCHES. HARRY P. PRATT, Chicago, Ill. Filed Dec. 3, 1885. Serial No. 185,059. (No model.)

Claim.—1. A watch-movement partially or wholly surrounded by a permanently-magnetic shield whereby a magnetic current flows constantly around the movement, substantially as and for the purpose set forth.

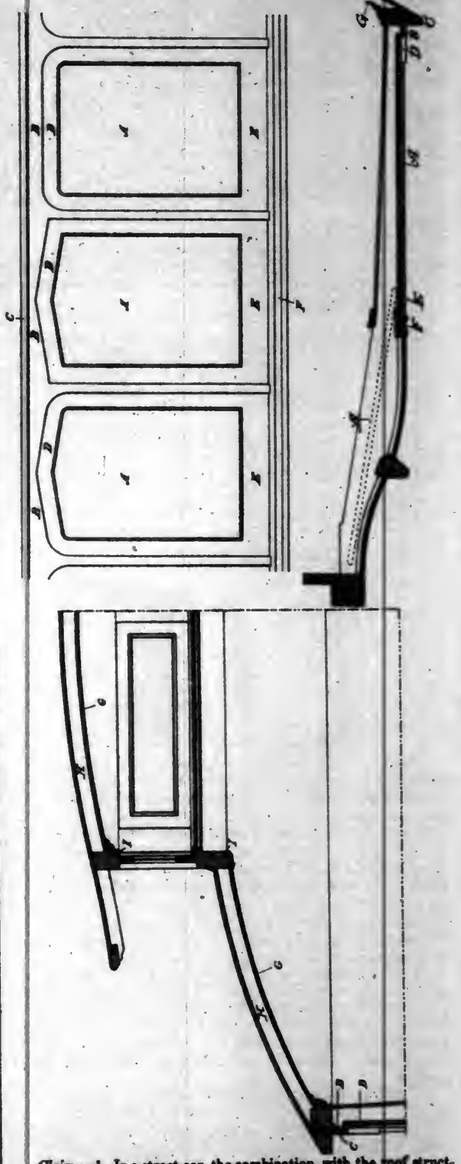
2. A watch-movement surrounded by a permanently-magnetic continuous ring, A, substantially as and for the purpose set forth.

408,212. SAW-SETTING MACHINE. MORITZ PISCHNER, Görlitz, Prussia, Germany. Filed Mar. 13, 1888. Serial No. 267,143. (No model.) Patented in Germany Aug. 7, 1883. No. 46,345.



Claim.—1. In machines for setting teeth of saws, the combination of the frames A B, joined together by bar C, leaving a space, E between said frames, the handle S, turning loosely on stud Z, provided with a hub having at its end the oblique plane T, the lever V, levers *x*, *b*, *h*, and *l*, with the setting-tool bearers *r* and *s*, and setting-tools *q*, substantially as specified.

2. In machines for setting teeth of saws, the combination of frames A B, connected together to leave space E, with plate F, bolt K, and hollow screw J, and with lever O, provided with screw P, substantially as specified.



3. In machines for setting teeth of saws, in combination with a lever, V, the screw 2, angle-levers 3 and 5, lever 7, with adjusting-screw 8 and pin or projection 6, and latch 9, as and for the purpose described.

408,213. DEVICE FOR ADMINISTERING MEDICINE TO ANIMALS. PHILIP GUTHAN, Chicago, Ill. Filed Aug. 21, 1888. Serial No. 283,269. (No model.)

Claim.—As a new article of manufacture, a closed envelope formed of porous fabric containing veterinary medicine and of dimensions permitting it to be secured to a bit and inserted within the mouth of the animal to be treated, substantially as described.

408,214. STREET-CAR. ASHBY RAFF, Pullman, assignor to George M. Pullman, Chicago, Ill. Filed Feb. 3, 1887. Serial No. 226,405. (No model.)

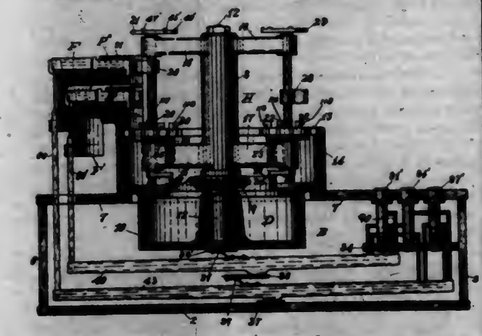
Claim.—1. In a street-car, the combination, with the roof structure, of a narrow longitudinal strip, B, set edgewise into the bottom of the roof-timbers, and windows A, extended upward approximately to the roof and resting, when raised, against said strip B, substantially as set forth.

2. A street-car having its roof-timbers re-enforced by a continuous sheet or thin layer of wood attached to the under side of the carlings of the roof, the margins of said sheet being attached to the longitudinal timbers of the car, substantially as described.

408,215. ATTRITION-MILL. GEORGE RAYMOND and ALBERT RAYMOND, Chicago, Ill. Filed June 27, 1883. Serial No. 278,260. (No model.)

Claim.—1. In an attrition-mill having a circular pulverizing-chamber, one or more recessed heads mounted within said chamber upon a rotatable shaft, a feed-opening communicating with one side of the pulverizing-chamber, a separating-chamber communicating with the side of said pulverizing-chamber opposite the feed-openings, and an air-duct communicating with the pulverizing-chamber, substantially as described.

2. In an attrition-mill having a circular pulverizing-chamber, rotatable recessed heads mounted upon a common shaft within the chamber, feed-hoppers communicating with one side of the pulverizing-chamber, and a separating-chamber communicating with the side of said pulverizing-chamber opposite the feed, and air-ducts communicating with the pulverizing-chamber, substantially as described.



3. In an attrition-mill having a circular pulverizing chamber or chambers, a rotatable shaft mounted centrally within said chambers and carrying heads recessed to receive material to be operated upon and adapted by their rotation to pulverize such material by its attrition upon the stationary material within the pulverizing-chamber, and a separating-chamber communicating with the pulverizing-chamber, said chamber having a hard metallic lining to receive the impact of the flying particles, substantially as described.

4. In an attrition-mill having a circular pulverizing-chamber within which are mounted upon the same shaft rotatable recessed heads of less diameter than said chamber, flanged linings bridging the space between said heads and the wall of the chamber, feed-hoppers communicating with one side of the pulverizing-chamber, a separating-chamber communicating with the side of the pulverizing-chamber opposite the feed-entrance, and air-ducts communicating with the pulverizing-chamber, substantially as described.

5. In an attrition-mill having a circular pulverizing-chamber within which are mounted upon the same shaft rotatable recessed heads of less diameter than said chamber, flanged linings secured to the peripheral wall of the chamber between the heads, the flanges bridging the vertical space between the heads and the wall, whereby passages are formed between the heads and the wall, and air-ducts communicating with said passages, substantially as described.

6. A head for attrition-mills, double-cone-shaped in form, whereby to provide a pocket or recess to contain material to be operated upon, substantially as described.

408,216. TYPE-WRITING MACHINE. FRANCIS H. RICHARDS, Springfield, Mass., assignor to Darius W. Dodson, Wilkes-Barre, Pa. Filed Nov. 24, 1886. Serial No. 218,784. (No model.)

Claim.—1. The combination, in a type-writer, of a revoluble turret, two revoluble shafts carried on said turret, two tiers of shaft-starting latches, a starting-arm on the first shaft operated by one tier of latches, and a starting-arm on the second shaft operated by the other tier of latches, substantially as described.

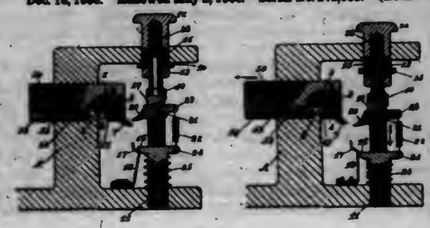
2. The combination, in a type-writer, of a paper-carriage having a ratchet, the type-shaft carrying a type-wheel and having feed-pins corresponding to the types on said wheel, and feed devices, substantially as described, actuated by said pins and actuating said carriage, all substantially as set forth.

3. In a type-writer, the combination, with the printing mechanism, of a key-board having separate duplicate keys for the printing of one character, and these keys interspersed among the keys for other characters, all of said duplicate keys for the same character being operatively connected with said mechanism through a single connecting device, all substantially as described.

4. The combination, in a type-writer key-board, of perforated plates, as 7 and 34, a key, as 80, having a sliding movement in bearings in the plates, a key-lever, as 40, and the arm 90, projecting laterally from said key and resting on said lever, substantially as described.

5. The combination, in a type-writer, of a revoluble type-wheel having an orbital movement and provided with a starting-arm, and a series of independent reciprocating latches set alongside of the orbit of said type-wheel, each latch being constructed and located to properly start said wheel for the printing of a particular character, and said latches being each operated from a finger-key through a tripping-rod connected therewith, substantially as described.

6. The combination, in a type-writer having a revolable turret carrying two revoluble type-wheels situated in the same plane, of substantially duplicate type-wheel-operating mechanisms, substantially as described, each mechanism operating one type-wheel to the exclusion of another wheel, substantially as described.



7. The combination, in a type-writer having a paper-carriage and a revoluble turret, of a revoluble shaft mounted on said turret at a distance from the axis thereof, a rack or internal gear concentric with said turret outside of said shaft, a segmental gear fixed on said shaft and adapted to mesh with said rack, and a segmental type-wheel fixed on said shaft and adapted to roll against said carriage, said type-wheel and gear corresponding in circumferential position on said shaft, and the types on said wheel corresponding to the teeth of the gear, substantially as described.

8. In a type-writer of the class described, the combination and arrangement, with the revoluble turret thereof having upper and lower bearings for a type-shaft at a distance from the axis of said turret, of the type-shaft journaled in said bearings, the starting-arm fixed on said shaft between said bearings, latches acting on said arm to start and revolve said shaft, and the type-wheel fixed on said shaft above said upper bearing, substantially as described.

9. In a type-writer, the combination of a printing mechanism having two revoluble type-wheel shafts carried on a revoluble turret, a shaft-starting arm on one shaft at one point and another starting-arm on the other shaft at another point longitudinally of said shafts, one series of starting-latches located to operate on one starting-arm and another series of starting-latches located to operate on the other starting-arm, (whereby one type-shaft may be started to the exclusion of the other shaft,) two tiers of key levers, and connections from the first tier of levers to the latches of the first series of latches, respectively, and from the second tier of levers to the second series of latches, respectively, substantially as described.

10. In a type-writer, the combination of a printing mechanism having two revoluble type-shafts carried on a revoluble turret, a shaft-starting arm on each shaft and located, respectively, at different points longitudinally of said shafts, two series of shaft-starting latches located to operate on said arms, respectively, one set of key-levers connected to operate latches of one series of latches and another set of levers connected to operate latches of the other series of latches, and a key-board in which the several keys of one row of keys are connected some to one set of levers and some to the other set of levers, whereby one key in one row serves to start one type-shaft and an adjacent key in the same row of keys serves to start the other type-shaft, substantially as described.

408,217. MECHANICAL MOVEMENT. FRANCIS H. RICHARDS, Springfield, Mass., assignor to Darius W. Dodson, Wilkes-Barre, Pa. Filed Dec. 18, 1886. Renewed May 2, 1888. Serial No. 272,893. (No model.)

Claim.—1. The combination, in a latch mechanism of the class described, of the latch carrying a pawl that terminates in an arm whereby it is operated, a carrier having a movement crosswise to the latch-movement, and an arm projecting from said carrier, to strike and unhook said pawl, said carrier being operated from a key, all substantially as set forth.

2. The combination of the latch and its pawl, a carrier having a snap-pawl, 20, a detent resisting the first movement of said carrier, and a key and springs operating in connection with the detent to impart a sudden movement to said carrier, all substantially as set forth.

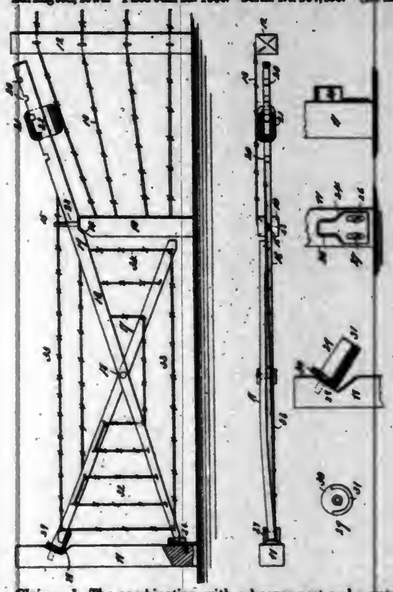
3. The combination of a reciprocating carrier having a detent-arm, a spring having a corresponding detent-notch, a key, and a spring intermediate to said key and carrier, all operating substantially as and for the purpose set forth.

4. The combination of carrier 10, having arm 16, spring 18, having notch 17, spring 25, key 12, and spring 28, all constructed and operating substantially as shown and described.

408,218. FOUNTAIN WINDOW-CLEANER. HENRY C. ROSE, Leadville, Colo. Filed Aug. 15, 1888. Serial No. 282,943. (No model.)

Claim.—1. In a fountain window-cleaner, the combination of the framing provided with a water-receptacle at its upper end, a jet-tube connected with the water-receptacle, an elastic roller journaled in the sides of the frame, arranged to normally close the apertures in the jet-tube, and a receiving-chamber arranged below said roller, substantially as described.

2. The combination, with the frame A, provided with a water-receptacle at its upper end, a jet-tube connected with and disposed below said receptacle, and a receiving-chamber formed in the lower end of said frame provided with extensions, of an elastic roller adjustably journaled in the sides of the frame between the extensions, said roller adapted to normally close the apertures in the jet-tube, substantially as and for the purposes described.



3. In a fountain window-cleaner, the combination, with the frame A, provided with a water-receptacle at its upper end, a jet-tube connected with and disposed below said receptacle, and a receiving-chamber formed in the lower end of said frame, provided with lateral extensions at one side thereof, of an elastic roller journaled in the sides of said extensions, and horizontal scrapers mounted in the outer ends of said extensions, their outer ends arranged slightly within the outer line of the peripheral face of the said roller, all arranged substantially as shown and described.

4. In a fountain window-cleaner, the combination, with the main frame provided with a water-receptacle at its upper end, a jet-tube arranged transversely in said frame, disposed below and connected with the said receptacle, and a receiving-chamber formed in said frame below the water-receptacle, having extensions *a' a'*, of an elastic roller adjustably journaled in the frame to the upper and lower edges of said roller, disposed with the extensions *a' a'*, and horizontal scrapers mounted in the outer ends of said extensions, said scrapers inclined toward the outer periphery of said roller, said extensions forming ways for leading the waste or dirty water to the receiving-chamber, substantially as shown and described.

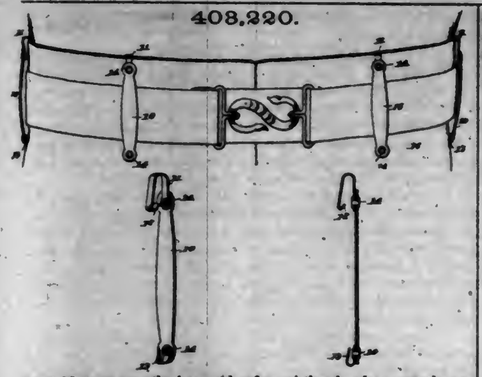
5. In a fountain window-cleaner, the combination of the framing provided with a water-receptacle at its upper end, a jet-tube disposed below and connected with the water-receptacle, an elastic roller journaled in the sides of the frame, arranged to normally close the apertures in the said jet-tube, a receiving-chamber arranged below said roller, and a depending tube connected to the receiving-chamber, said tube adapted to form a receptacle for the waste or dirty water, and a socket for the reception of the operating-handle, substantially as shown and described.

6. The hereinbefore-described improvements in fountain window-cleaners, consisting of the main frame provided with a water-receptacle, B, at its upper end, a supplemental scraper, M, arranged at the upper rear edge thereof, a receiving-chamber arranged below said water-receptacle, a transverse jet-tube arranged therein, said tube connected with water-receptacle, an elastic roller, F, journaled in the front edge of said frame, extensions *a' a'*, formed on the side walls of the receiving-chamber and extended one over and the other under the roller F, horizontal scrapers mounted in the outer ends of extension, their outer ends inclined toward the roller, and a depending tube projected from the lower end of said receiving-chamber, said tube forming a receptacle for the waste or dirty water, and a socket for the operating-handle, substantially as shown and described.

408,219. BARBED-WIRE-FENCE GATE. TRUMAN M. SAMPSON, Burlington, Iowa. Filed Jan. 22, 1889. Serial No. 297,152. (No model.)

Claim.—1. The combination, with a keeper-post and a gate-post of less height than the former, of a gate consisting of crossed diagonal beams, one of which beams is pivoted upon the gate-post and made to extend upwardly and rearwardly beyond the same, a counterpoise-weight adjustably held upon the upper extending end of the pivoted beam, and vertical and horizontal wires secured to both of the said beams, all combined for operation substantially as shown and described.

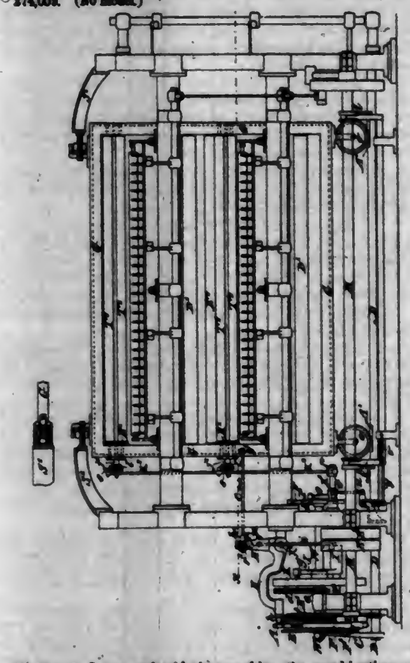
2. The combination, with a keeper-post and a gate-post of less height than the former and provided with a beveled upper end, of a gate consisting of a long beam recessed to fit upon the top of the gate-post, having one end projecting beyond the post and provided with an adjustable weight, a pin securing the said beam to the gate-post, a short beam diagonally crossing the longer beam and attached thereto at the point of intersection, vertical and horizontal wires attached to the two beams, and means, substantially as shown and described, for locking the gate to the keeper-post, as and for the purpose specified.



3. The combination, with a keeper-post and a shorter gate-post provided with a beveled top, of a diagonal beam pivoted upon the gate-post and extending beyond the same, a counterpoise-weight adjustably held upon the upper extending end of the beam, a shorter beam crossing the weighted beam and attached thereto, and vertical and horizontal fence-wires secured to both of the said beams, substantially as shown and described.

4. The combination, with a keeper-post provided with an adjustable keeper and a pivoted scoop-like latch, and a gate-post provided with a beveled top and of less height than the keeper-post, of a diagonal beam pivoted upon the gate-post, and capable of a slight vertical movement, having one end projecting upward beyond the said gate-post, a counterpoise-weight adjustably held upon the upper projecting end of the beam, a second shorter beam crossing the weighted beam between the keeper and gate posts, and vertical and horizontal wires secured to said beams, substantially as set forth.

408,220. SUPPORTER FOR BELTS. LOUIS SANDERS, Brooklyn, N. Y. Assignor, by mesne assignments, to ELIZA SANDERS, of same place. Filed Mar. 13, 1888. Serial No. 302,123. (No model.)



Claim.—As an improved article of manufacture, a belt-support for waistbands, consisting in a flexible strip having hooks 11 and 13 on its ends extending toward each on the inner side of the strip, the lower extremity or free end of the upper hook being bent upward,

408,220.

as at 12, to engage the inner side of a waistband and prevent the upper hook from moving upwardly.

408,221. EMBROIDERING-MACHINE. ADOLPH SAURER and ERNST LEUTHOLD, St. Gallo, Switzerland. Filed May 16, 1888. Serial No. 274,059. (No model.)

Claim.—1. In an embroidering-machine, the combination, with a frame, of intermittently-rotating rollers upon which the material is wound, driving mechanism, a shaft driven therefrom, pattern-cams operated from said shaft to cause movements of the said frame in planes at right angles to each other, another cam on said shaft, mechanism operated by said cam to cause said intermittent rotation of the feed-rollers, a second shaft, a cam on said second shaft, and levers operated from said second-named cam for causing the movement of said frame simultaneously with and in a direction at right angles to the direction of forward feed of the goods, substantially as specified.

2. In an embroidering-machine, the combination, with a frame, of intermittently-rotating rollers upon which the material is wound, driving mechanism, a shaft driven therefrom, pattern-cams operated from said shaft for causing movements of the said frame in planes at right angles to each other, another cam upon said shaft, mechanism operated by the last-named cam to cause said intermittent rotation of the feed-rollers, a second shaft, a cam on said second-named shaft, a connection between said second-named cam and the frame for moving said frame simultaneously with and in direction at right angles to the direction of forward feed of the goods, and a speed-regulator for automatically changing the speed of the machine during the forward feed of the goods, substantially as specified.

408,222. KNOB ATTACHMENT. SIMON SCHRAM, Buffalo, N. Y. Filed Jan. 26, 1889. Serial No. 297,730. (No model.)

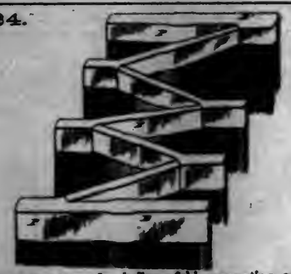
Claim.—1. In door-knob fasteners, the combination, with the knob having the pivoted dog, of the door-plate having the notched movable collar, and the serrated spindle, as and for the object stated.

2. The combination, with the knob of the pivoted dog having the projection *f*, of the spindle C, provided with the serrations H, the plate B', having the annular projection *a'*, and the movable notched collar J upon said annular ring *a'*, the whole being constructed and combined in the manner as and for the purpose stated.

408,223. KNOB ATTACHMENT. SIMON SCHRAM, Buffalo, N. Y. Filed Feb. 6, 1889. Serial No. 298,865. (No model.)

Claim.—1. In door-knobs, the combination, with the door A, of the door-plate D, the spindle C, having near one end the holes *i i'*, for the reception of a pin for fastening the knob B, and at the other end a series of teeth, *h*, the knob B', having a shank, *b*, provided with an opening, *a*, the pivot *e*, the V-shaped dog E, journaled upon said pivot and engaging the serrations *h* of the spindle C, and the door-plate D, having a circular recess provided with the spiral spring I, said dog being held in mesh with the serrations in the spindle by said spring pressing upon the knob B and disengaged therefrom by pushing said knob toward the knob B', all as hereinbefore described.

2. In door-knob fasteners, the knob B', having the V-shaped dog pivoted at the point of the angle, in combination with the serrated spindle and the spiral spring in the door-plate, said dog being held in mesh with the serrations by the said spring acting upon the shank of the knob B, in the manner as and for the purpose set forth.



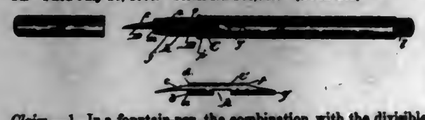
3. The combination, substantially as described, with the serrated spindle C, of the door-knob B, affixed to said spindle by the pin *i'*, the door-plate D, having the annular projecting ring L, fitted with the spiral spring I, and the door-knob B', having the shank *b*, fitted with the pivoted V-shaped dog E, engaging said serrations in the spindle, said dog being locked in position by its thumb-piece F bearing upon the shank *b* through the intervention of the spiral spring I, as stated.

408,224. BELLOWS-FOLD COUPLING. HENRY H. SESSIONS, Pullman, assignor to the Pullman's Palace Car Company, Chicago, Ill. Filed Nov. 19, 1887. Serial No. 255,660. (No model.)

Claim.—1. As an element in the construction of vestibules or inclosures between adjacent ends of railway-cars, the bellows-fold connection consisting of alternate layers of textile fabric and rubber and formed in folds in which the series of said folds are joined one to another by adhesion of layers throughout a portion of their breadth, re-enforced by layers external and internal to the angles of intersection of said folds.

2. In railway-cars, the combination, with a timber or plate, *b*, attached to the end of the platform, and an adjustable buffer-plate, *d'*, adapted for extension or contraction with relation to said por-

408,224.



manent timber or plate, of a bellows-fold connection consisting of alternate layers of textile fabric and rubber and formed in folds, in which the series of said folds are joined one to another by adhesion of layers throughout a portion of their breadth, re-enforced by layers external and internal to the angles of intersection of said folds.

3. As a new article of manufacture, a bellows-fold device consisting of a series of folds that are composed of alternate layers of textile fabric and rubber, said folds being united one to another by adhesion of layers throughout a portion of their breadth, effected by heating, and re-enforced by layers of like construction external to the primary layers, and further re-enforced by rubber gussets at the inner angles of intersection, which gussets are made an adhesive part of the folds by heating or pressure.

4. As a new article of manufacture, a bellows-fold device consisting of a series of folds that are composed of alternate layers of textile fabric and rubber, said folds being united one to another by adhesion of layers throughout a portion of their breadth, effected by heating, and re-enforced by layers of like construction external to the primary layers, and further re-enforced by gussets at the inner angles of intersection.

408,225. FOUNTAIN-PEN. LAFORREST A. SHATTUCK, Bloomsburg, Pa. Filed July 28, 1888. Serial No. 281,243. (No model.)

Claim.—1. In a fountain-pen, the combination, with the divisible case A B and the pen D, of the adjustable automatic stopper C, which is provided with the pen-seat *a*, the central ink-duct, *o*, the lip or feed-bar *c* in contact with the pen, and the peripheral air-vent groove *e*, independent of the ink-feeding channel and pen, substantially as described.

2. In a fountain-pen, the combination, with the divisible case A B and the pen D, of the adjustable automatic stopper C, having the lip *c* in contact with the pen, pen-seat *a*, the bilateral arms or ink-abducers *g g*, the capillary space *k*, the peripheral groove *e*, completing, in union with the case, an air-vent, and an ink-feeding channel or channels, substantially as described.

3. In a fountain-pen, the combination, with the divisible tubular case A B and the pen D, of the adjustable automatic stopper C, having the lip *c* in contact with the pen, the pen-seat *a*, the peripheral air-vent groove *e*, independent of the ink-feeding channel and pen, the central ink-feeding channel, *o*, and one or more supplementary channels, substantially as described.

4. In a fountain-pen, the combination, with the divisible case A B and the pen D, of the adjustable automatic stopper C, having the lip *c* in contact at its sides and point with the back of the pen, and the pen-seat *a*, the central ink-feeding channel, *o*, the supplementary channels *i* and *j*, the storage-chamber *h*, the bilateral arms or ink-abducers *g g*, the capillary space *k*, the recess *m*, and the peripheral air-vent groove *e*, independent of and arranged above the ink-feeding channel and pen, substantially as described.

5. In a fountain-pen, the combination, with the divisible case A B and the pen D, of the adjustable automatic stopper C, having the lip *c* resting flat upon the back of the pen, the ink-feeding channel *o*, the pen-seat *a*, the supplementary channels *i* and *j*, the storage-chamber *h*, the bilateral ink-abducers *g g*, the capillary space *k*, and the peripheral air-vent groove *e*, independent of and arranged above the ink-feeding channel and pen, substantially as described.

6. In a fountain-pen, the combination, with the divisible tubular case A B and the pen D, of the adjustable automatic stopper C, having the lip *c* in contact with and extending over the pen to its point, the pen-seat *a*, the ink-feeding channel *o*, the supplementary channels *i* and *j*, and chamber *h*, arranged on the upper side, the bilateral arms *g g*, the capillary space *k*, and the peripheral air-vent groove *e*, independent of and arranged below the ink-feeding channel and pen, substantially as described.

7. In a fountain-pen, the combination, with the divisible case A B and the pen D, of the adjustable automatic stopper C, having the lip *c* in contact with and extending over the pen to its point, the pen-seat *a*, the ink-feeding channel *o*, the supplemental channels *i* and *j*, the storage-chamber *h*, the bilateral ink-abducers *g g*, the capillary space *k*, and the peripheral air-vent groove *e*, outwardly independent of and arranged either above or below the ink-feeding channel and pen terminating in the storage-chamber, substantially as described.

8. In a fountain-pen, the combination, with the divisible case A B and the pen D, of the adjustable automatic stopper C, having the lip *c* in contact with and extending under the pen, the pen-seat *a*, the ink-feeding channel *o*, the supplemental ink-channels *i* and *j*, and the chamber *h*, arranged on the upper side, the bilateral arms *g g*, the capillary space *k*, and the peripheral groove *e*, completing in union with the case an air-vent independent of and arranged below the ink-feeding channel and pen, substantially as described.

9. In a fountain-pen, the combination, with the case A B and the pen D, of the adjustable automatic stopper divisible in two parts, as C C', having the anterior lip *c* in contact with the pen, the pen-seat *a*, the ink-channel *o*, the supplementary channels *i* and *j*, the storage-chamber *h*, the shelf *w*, the peripheral air-vent groove *e*, and the integral ink-abducing arms *g g*, extending into the reservoir, substantially as described.

10. A fountain-pen provided with a stopper, as C, fitting the bore of the nozzle and having an ink-passage through it, and a bifurcated peripheral groove, as *e*, completing in union with the case an air-vent independent of the ink-passage to a point in rear of the heel of the pen, substantially as described.

11. A fountain-pen provided with a stopper fitting the bore of the nozzle and having an ink-passage through it, a peripheral air-vent groove, as *e*, independent of the ink-passage, a forward extension for a feed-bar, as *c*, a rear double-armed extension, as *g g*, and a reduced section, as at *k*, substantially as described.

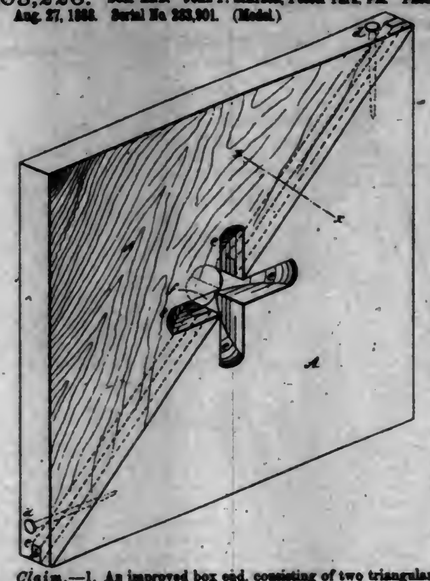
12. A fountain-pen provided with a tubular ink-stopper, as C having two integral ink-abducing arms, as *g g*, separated by a tapering space, as *k*, substantially as described.

13. An ink-stopper for fountain-pens, forming a combined automatic stopper and pen-seat of a diameter equal to that of the bore of the nozzle, and having a peripheral groove, as *e*, for air-vent purposes only, and a separate channel for an ink-passage, independent of the air-passage, to a point in rear of the heel of the pen, a pen-seat slot, and a reduced section for a storage-chamber, for the purpose and substantially as described.

14. In a fountain-pen, the tubular stopper transversely divisible in two parts, as C C', having two integral horizontally-arranged ink-abducing arms, as *g g*, extending into the reservoir, substantially as described.

15. An ink-stopper for fountain-pens, as C, having a section of its body cut away to form a semi-cylindrical storage-chamber, as *h*, within the upper end of the nozzle, and having a semi-cylindrical bridge or shelf, as *w*, extending across said chamber to convey air by means of the groove *e*, formed in said shelf, independent and to a point in rear of the storage-chamber, substantially as and for the purposes described.

16. A fountain-pen provided with an ink-storage chamber, as *h*, within the nozzle-section and an air-vent, as *e*, which is independent of the ink-passage, to a point backward of the chamber, substantially as described.



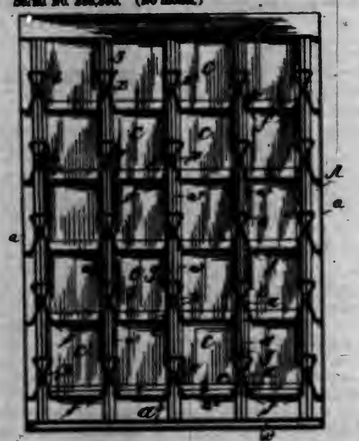
17. In a fountain-pen wherein the ink is prevented from descending too freely by an automatic stopper, as C, closely fitting the bore of the nozzle, aided by a partial vacuum at the upper end of the reservoir, the bifurcated air-vent groove, as *e*, formed in the periphery of the stopper, said groove forming with the wall of the nozzle lying over it an air-vent separate and distinct from the ink-passage to a point entering directly into the reservoir-section of the case, substantially as described.

18. In a fountain-pen wherein the ink is prevented from descending too freely by a stopper closely fitting the bore of the nozzle, as C, aided by a partial vacuum at the upper end of the reservoir, a feed-bar arranged to convey ink from the stopper over the back of the pen to its point, as *c*, and a peripheral groove, as *e*, completing in union with the nozzle-section of the case an air-vent independent of the ink-passage to a point in rear of the heel of the pen, substantially as described.

19. In a fountain-pen, the bifurcated groove *e* cut in the periphery of the stopper, said groove having two external mouths arranged at the sides of the pen in line with the pen-slot, but converging upward and backward into one groove on the upper side, and entering the reservoir by one internal mouth, substantially as shown, and for the purposes described.

20. The fountain-pen provided with an air-passage, said air-passage having two external mouths or openings and but one internal mouth or opening, substantially as described.

408,226. BOX END. JOHN F. SIMPSON, Foster Park, Fla. Filed Aug. 27, 1888. Serial No. 283,901. (Model.)



Claim.—1. An improved box end, consisting of two triangular sections secured together with their meeting surfaces in a plane diagonal to the box end, each section having the grain of the wood parallel with the said meeting surfaces, substantially as described.

2. An improved box end, consisting of two triangular sections tongued and grooved together at their meeting surfaces in a plane diagonal to the end, and provided with intersecting grooves at the center of the said end, each section having the grain of the wood parallel with the said meeting surfaces, substantially as described.

3. As an improved article of manufacture, a box end consisting of two triangular sections, A, tongued and grooved together at their meeting surfaces in a plane diagonal to the end, and provided with cross-grooves *e*, intersecting each other at the center of the end and forming a ventilating-aperture, *f*, each section having the grain of the wood parallel with the said meeting surfaces, as set forth.

408,227. SKYLIGHT. JOHN H. SMITH, Dublin, Ga. Filed Dec. 12, 1888. Serial No. 293,395. (No model.)

Claim.—1. The combination of the bars a^2, having the longitudinal grooves a^3, the panes resting on the edges of said bars adjacent to said grooves, the studs in said bars, and the clips mounted on said studs and engaging the panes, as set forth.

2. The combination of the bars a^2, the studs B, the panes resting on the bars, and the clips mounted on the studs and having the bearing-loops *b*, as set forth.

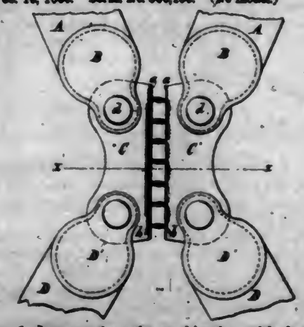
3. The combination of the bars a^2, the studs B, the panes resting on the bars, and the clips mounted on said studs and having the arms *c*, engaging the panes, as set forth.

4. The combination of the bars, the studs, the panes, and the clips having the loop *b*, coil *d*, arms *c*, and hooks *f*, all arranged and operating substantially as specified.

408,228. DOOR-HANGER. WILBER W. SMITH, Grand Rapids, Mich. Filed May 29, 1888. Serial No. 276,490. (No model.)

Claim.—1. In a door-hanger, the combination, with a door having a recess in its upper edge, of an angular bracket having its horizontal arm slotted, a screw for securing the said bracket to the door, and a dog pivoted to one edge of the horizontal arm of the said bracket, substantially as and for the purpose set forth.

2. The combination, with a door having an inclined recess in the top and screws or bolts provided with flat rectangular heads secured in the upper edge of said door near the ends, of angular brackets having a slot cut in one side of the horizontal arm thereof to receive the screws or bolts, a dog pivoted to the horizontal member of the said brackets adapted to enter the recess in the door, a horizontal hanger-bar connecting the several brackets at their upper ends, a track supported parallel with the hanger-bar above the screws in the door, a longitudinal guide-rib formed centrally upon the upper face of said track, and trucks consisting of an axle and wheels united thereby, rotating in engagement with the said track and hanger-bar, one wheel of said trucks traveling upon each side of the track guide-bar, substantially as and for the purpose specified.

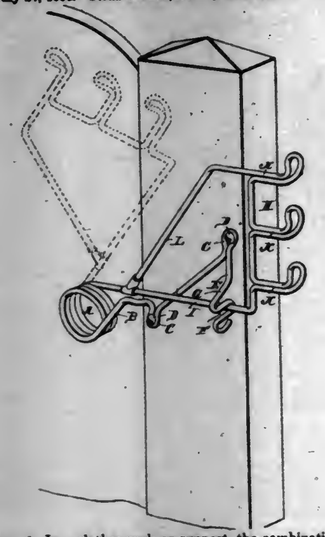


408,229. BRAKE-SHOE FOR CAR-TRACKS. JOHN STEPHENSON New York, N. Y. Filed July 30, 1888. Serial No. 280,511. (No model.)

Claim.—1. A car-track brake-shoe with a wood sole and an integral member projecting a distance from the side of the shoe and uprising to contact with stops adapted to prevent displacement of the shoe when operating on the tram-rail, substantially as and for the purpose described.

2. A track brake-shoe having a channeled under side suitable for receiving and holding a wood sole, and on the upper side of the shoe lugs fitted for the actuating-rods, and projecting sidewise from one of the shoe-walls one or more uprising members integral with the shoe and adapted to guide-channels controlling the vertical motions of the shoe, substantially as and for the purpose described.

408,230. SUSPENDERS. ROWIN B. STIMPSON, Brooklyn, N. Y. Filed Feb. 16, 1888. Serial No. 300,188. (No model.)



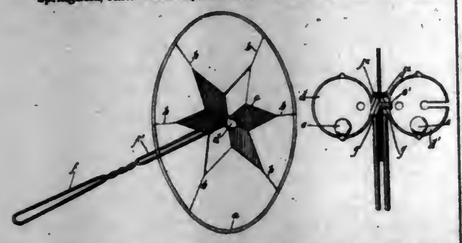
Claim.—1. In suspenders, the combination, with shoulder-straps and back button-hole tabs, of connecting-pieces between the shoulder-

straps and tabs with which the shoulder-pieces are pivotally united, said connecting-pieces being connected together along their adjacent edges by two or more flexible connections, substantially as specified.

2. In suspenders, the combination, with shoulder-straps and back button-hole tabs, of connecting-pieces with which both the shoulder-straps and the button-hole tabs are pivotally united, said connecting-pieces being connected together along their adjacent edges by flexible connections, substantially as specified.

408,231. WARDROBE-HOOK. William Watson, Jr., Ilion, N. Y.

Filed July 27, 1888. Serial No. 281,196. (No model.)



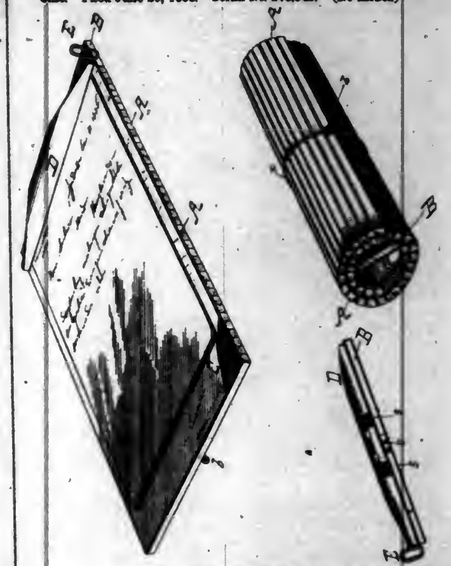
Claim.—1. In a clothes rack or support, the combination of the supporting-arm provided with a catch or loop, F, and the spring-actuated bracket provided with hooks and adapted to engage the said catch or loop, substantially as specified.

2. In a clothes rack or support, the combination of the spring-coil, the supporting-arm connected to one end of the coil, and the bracket provided with hooks and connected to the other end of the coil, substantially as specified.

3. In a clothes rack or support, the combination of the stationary supporting-arm, the catch-arm integral with the supporting-arm and provided with a catch or loop, F, and the bracket provided with the hooks K K and connected to one end of the supporting-arm by the spring-coil A, the said bracket being provided with an arm, 1, to engage the catch or loop F when the bracket is in its operative position, substantially as specified.

408,232. TOY. Frank K. Way, Dayton, and William T. Parker, Springfield, Ohio.

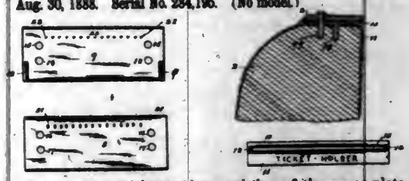
Filed Sept. 21, 1888. Serial No. 286,046. (No model.)



Claim.—1. A hoop having a centrally-located star suspended at the center of said hoop by means of small resilient wires and spherical projecting bells secured rigidly to either side of said star at the center, substantially as set forth.

2. The combination, with a hoop having a centrally-located star suspended at the center by resilient wires, of the spherical projecting bells secured rigidly to either side of said star, and a handle journaled on the inner portion of said bells and projecting beyond the periphery of said wheel, substantially as specified.

3. A hoop of resilient metal, having the centrally-located star suspended therefrom by means of resilient wires which pass transversely through the body of said hoop, leaving the periphery free, and projecting bells at the center of said hoop, one of said bells being provided with a screw-threaded stud and the other being provided with an opening adapted to screw onto said stud, substantially as specified.



408,233. FOLDING CLIP-BOARD. William G. Weagly, Galion, Ohio. Filed June 29, 1888. Serial No. 278,545. (No model.)

Claim.—1. As a new article of manufacture, a folding clip-board consisting of narrow slats flexibly connected with each other and provided with a suitable clamping device, as D, as and for the purposes set forth.

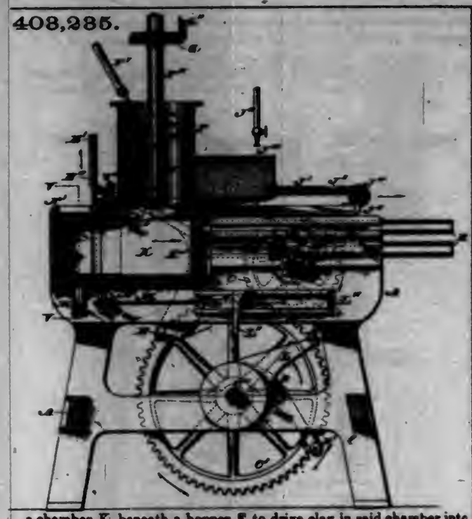
2. The combination, in a folding clip-board, of a series of narrow slats, a flexible facing for said slats, and a clamping device, as D, substantially as set forth.

408,234. TICKET-HOLDER. John G. Webb, Rye, N. Y. Filed Aug. 30, 1888. Serial No. 284,195. (No model.)

Claim.—1. A ticket-holder consisting of the upper plate, the lower plate, and the abutments 12, arranged between said plates to define the width of opening, in combination with a seat-back and binding-strip, as set forth.

2. A ticket-holder consisting of the upper plate and the lower plate, in combination with a seat-back, a binding-strip, and the retaining-screws 18 beneath said binding-strip, as and for the purposes set forth.

3. A ticket-holder consisting of a sheet of metal bent upon itself to form an upper and a lower plate with a space between them, and provided with a transverse row of teeth at the mouth or front, the said plates being rigid or inflexible and the said space constant, so that it is impossible to push a ticket into the space between the plates without scoring the surface of the same, substantially as set forth.



4. A ticket-holder consisting of an upper plate and a lower plate, and having an opening between them and provided with blades 22 at the rear end of said opening, arranged in vertical planes to indent the edge of a ticket when pushed against the same, as set forth.

408,235. BRICK-MACHINE. William Webber, Philadelphia, Pa.

Filed Dec. 17, 1888. Serial No. 293,234. (No model.)

Claim.—1. The combination of compressor H, adapted to traverse

408,235.

a chamber, K, beneath a hopper, F, to drive clay in said chamber into a mold, water-tank J‴, shifting water-pipe J′, provided with opening J″ and attached to pipe J×, which is perforated near its end and attached to said compressor, whereby as the latter is moved forward the said pipe is drawn with it until pipe J′ moves forward sufficiently to bring opening J″ within said water-tank, whereby water will flow from said tank through pipes J′ and J× and find exit through the perforations in the latter to spray the walls of said chamber K behind said compressor, substantially as described.

2. The combination of shaft C′, actuating-wheel C, said shaft being provided with an arm, L, lug L″, attached to block L‴, sliding in guide L×, cord M, attached to said block, pulleys N N, slide O, engaging with the mold-box and moving in a guide, and to which slide one end of said rope is attached, cord O′, attached to slide O, and weight O″, attached to said cord O′, whereby when the arm L strikes lug L″ the block L‴ is shifted to draw cord M and slide O, and the mold is removed from its casing and is returned to place by the weight O″ and cord O′, substantially as described.

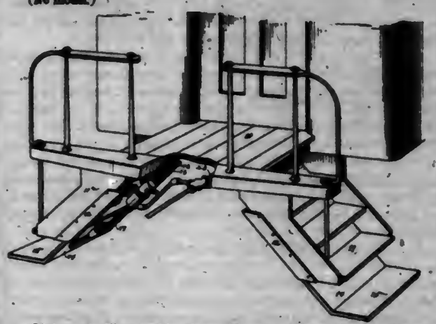
3. A compressor, H, adapted to traverse a chamber, K, rack-frame H′ H″, attached to the rear of said compressor, provided with end-beveled teeth H×, and arms H‴ H⁴, sliding freely in side slots in the frame of the machine, cog-wheel H², adapted to engage with the lower rack of the said frame, and a cog-wheel, H×, adapted to engage on the other side with the upper rack of said frame, both of said wheels being mounted on a shaft, B′, whereby when cog-wheel H× drives said rack forward it finally strikes the beveled tooth on the rear of the upper rack and shifts the latter sidewise, throwing its rack out of gear with it and the lower rack into gear below with cog-wheel H², whereby the rack is moved backward until wheel H² strikes the beveled cog on the lower rack, when the operation is reversed, thus giving a reciprocating motion to the compressor, substantially as described.

4. The combination of compressor H, slanted arms T, secured thereto, bellows P×, sand-boxes P P, each provided with an air-chamber, P″, connected with said bellows by openings P×, exit sand-pipes Q, and die J, part of said pipes being arranged, substantially as shown, to direct the sand-blast in front of said die to strike the clay coming through it above and the others being arranged to strike the clay from below, whereby all the sides of the clay will be coated, all arranged and operating substantially as described.

408,236. VEHICLE-POLE TIP. George T. Wilson, Lowville, N. Y., assignor to John D. Hough and Samuel Garber, same place. Filed Jan. 30, 1888. Serial No. 296,070. (No model.)

Claim.—1. A device for the purpose described, comprising a main portion, a flat spring arranged within the same, and a hook pivoted to said portion with one end bearing on said spring and the other end having a flattened portion concaved upon its under side, substantially as shown and described, and for the purpose specified.

2. As an improved article of manufacture, a combined pole-tip and clip formed integral, said tip being provided with a pivoted hook the forward end of which extends below its pivot and is flattened and concaved upon its under side, substantially as and for the purpose specified.

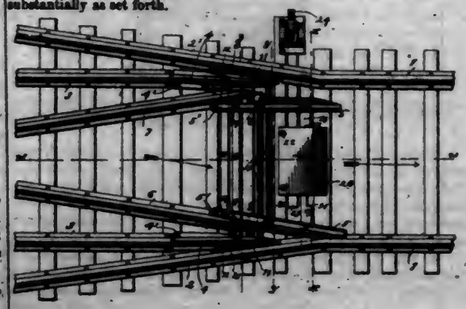


3. As an improved article of manufacture, the pole-tip described,

408,236.

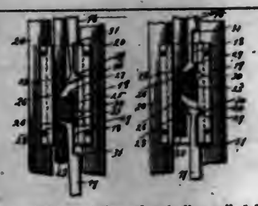
consisting of the tip B, formed with ring A and chambered portion, and the hook pivoted within said portion and having a flat portion bearing on said spring, and its other end concaved on its under face to correspond with the curvature of the tip B, and with its free end when in engagement with the tip on a plane between the tip and the pivot of said hook, substantially as shown and described.

408,237. EXTENSIBLE CAR-STEP. James F. Wood and John F. Wood, Wilmington, Del. Filed Mar. 5, 1888. Serial No. 302,488. (No model.)



Claim.—1. The combination, with a tread formed with a diagonal leaf, of an arm connected to said leaf, a piston carried by the arm, a spring arranged in connection with the piston, a cylinder, and connections between the cylinder and the compressed-air reservoir, substantially as described.

2. The combination, with the permanent steps of a car, of a tread adjustably connected thereto, a cylinder, a piston arranged therein, connections between the piston and the tread, and connections between the cylinder and the compressed-air reservoir, substantially as described.



3. The combination, with the permanent steps of a car, of castings formed with ways connected thereto, treads having diagonal leaves which carry anti-friction rolls, said rolls resting within the ways, arms connected to the leaves, pistons connected to the arms, cylinders within which the pistons ride, springs arranged in connection with the pistons, and connections between the cylinders and the compressed-air reservoir, substantially as described.

408,238. THREE-THROW OPEN SPLIT SWITCH. George L. Worth and John B. Wyatt, Wymore, Nebr. Filed Oct. 22, 1888. Serial No. 288,309. (No model.)

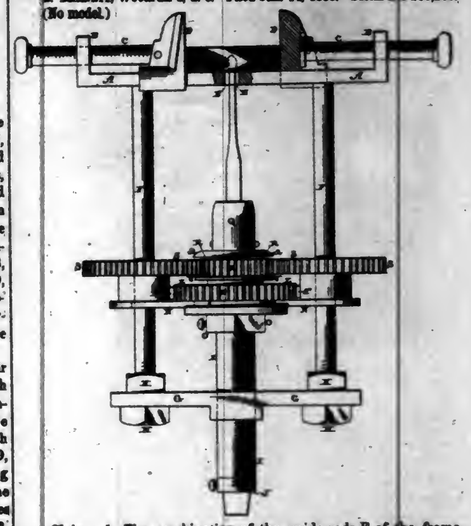
Claim.—1. The combination, with two pairs of switch-points pivoted, respectively, to the straight main-line and inner rails of a right and left hand siding, of the throw-bars having laterally-projecting heads, an operating-bar having recesses arranged for a timed engagement with the heads of the throw-bars, and an operating-lever, substantially as set forth.

408,238.

2. A railway-switch consisting of main-line rails 1 1 and 3 3, side rails, 2 2', branching outwardly from rails 1 1, fixed siding-rails 6 7, inner switch-points, 4 4, pivoted at the ends of main-line rails 3 and located between the ends of siding-rails 6 7, and outside siding-rails, 2 2', outside or main switch-points, 5 5, pivoted at the ends of fixed siding-rails 6 7, and bars 15, connecting the inner switch-point, 4, on one side of the track with the outer switch-point, 5, on the opposite side of the track, in combination with throw-bars 16 and 17, connected at one end to switch-points 5 5, and having inclined heads 28, with rear projections, 29, located in a groove, 18, in a casing, 19, having V-shaped recesses 30 in the side of groove 18 adjacent to projections 29, and an operating-bar, 23, located in groove 18, and having outwardly-inclined recesses 26, with which the heads 28 are adapted to engage, substantially as shown and described.

3. The combination, with throw-bars 16 and 17, having their inner ends formed with heads 28, inclined toward each other, with rear wedge-shaped projections, 29, and shoulders 31, limiting their inward movement, and a guide-frame having a groove, 18, in which the inner ends of throw-bars 16 and 17 rest and are adapted to slide, with V-shaped recesses in the side of groove 18 adjacent to projections 29, of a sliding operating-bar, 23, projecting into groove 18, and having a lateral projection, 25, with inclined sides 27 and bearing against the side of groove 18, and diagonal slots 26, adjacent to the inclined sides 27 of projection 25, with which the heads 28 are adapted to engage, substantially as shown and described.

4. A three-throw railway-switch, consisting of main rails 1, bent and extended diagonally to form the outside siding-rails, 2 2', the continuation main rails 3 3, inside siding-rails, 6 7, with pointed ends 10 and tapered flange portions 9 and 14, inner switch-points, 4 4, pivoted at the ends of rails 3 3, and having narrowed portion 11 and tapering flange portions 12 adjacent to tapering inside flange portions, 13, on the outside siding-rails, 2 2', and outside switch-points, 5, with tapering portions 8, pivoted at the ends of rails 6 and 7, and adapted to bear against the ends of inside siding-rails, 6 and 7, the outer ends of points 5 being adapted to bear against the main rails 1, and cross-bars 15, connecting each inside switch-point 4 with the switch-point 5 on the opposite side of main track, in combination with a throw-bar mechanism which successively acts to throw to position one inside switch-point and one outside switch-point on the opposite side of the main track, and then the other inside switch-point and the other outside switch-point on the opposite side of the main track, substantially as shown and described.



408,239. DINNER-PAIL. JOHN H. YARNELL, Somerset, Ohio. Filed Feb. 26, 1889. Serial No. 301,196. (No model.)

Claim.—1. An improved dinner-pail composed of a lower receptacle for liquid and an upper receptacle for solid food set into the top of the liquid-receptacle, combined with a tube for conveying liquid from the liquid-receptacle, opening at its upper part out of the top of said liquid-receptacle and communicating with the interior of the latter, as described.

2. The combination, with the liquid-receptacle B and the solid-food receptacle F, set into the top of the liquid-receptacle, of the tube H, opening at its upper end out of the top of the liquid-receptacle and communicating at its lower end with the interior of the liquid-receptacle through the medium of a strainer, as set forth.

408,240. MACHINE FOR BORING AND DRILLING. BARNARD R. BARNETT, Woodruff's, S. C. Filed Jan. 14, 1888. Serial No. 296,366. (No model.)

Claim.—1. The combination of the guide-rods F of the frame, the end piece G, for securing their ends together, the sleeve I, the wheel L, secured to the end of the sleeve, a cross-piece, N, the wheels S, provided with projections for operating the wheel L, and the drill shaft provided with a pinion for operating the wheels S, substantially as specified.

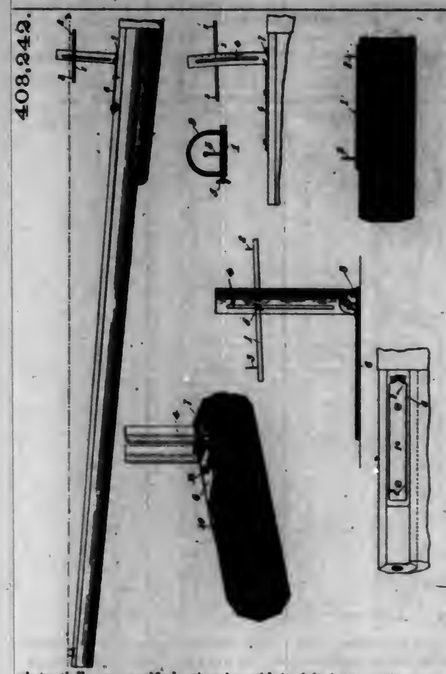
2. The combination of the frame composed of the two end pieces and the two guiding-rods which connect the end pieces together, the drill-rod, a sleeve through which the rod passes, a pinion upon the rod, and the intermediate operating-wheels for feeding the screw-threaded sleeve forward, substantially as shown.

408,241. END-GATE FOR WAGONS. ALBERT E. BRANCH, Audubon, Iowa. Filed Mar. 5, 1889. Serial No. 301,969. (No model.)

Claim.—1. A wagon end-gate having wings at its ends, a rod having a hook at its center and cranks on its diverging end portions hinged to the rear side of the gate, bars having notches in their top edges fixed to the sides of a wagon-box, and movable loops on said bars connected with cranks of the ends of the rod and hook, arranged and combined to operate in the manner set forth.

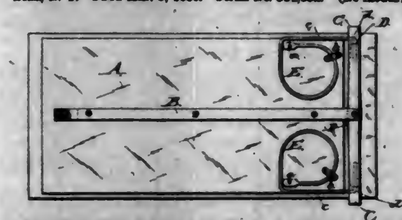
2. The rod C, having a hook, *d*, at its center and cranks *d'* on its ends, the end-gate A, having wings A^3 and projections *b* at the corners of the wings, the bars *g*, having notches *i*, the loops *k*, and the connecting-rods *k*, arranged and combined with a wagon-box having a fixed cross-piece, *m*, substantially as shown and described, to operate in the manner set forth, for the purposes stated.

408,242. SIGHT FOR FIRE-ARMS. JOHN S. BLANCHAR, Washington, D. C. Filed Jan. 10, 1889. Serial No. 296,907. (No model.)



Claim.—1. In combination with a gun or like implement, two sight-pins secured to a laterally-adjustable plate, substantially as specified.

2. In combination with a gun or like implement, two sight-pins secured to a laterally-adjustable plate provided with a scale to indicate the lateral adjustment, substantially as specified.



3. In combination with a gun or like implement, two sight-pins secured in a plate having a set-screw or journal, the U-shaped sight leaf having two members provided with slots to receive the screw and having their feet in contact laterally with a plate secured to the gun and having a hinge-connection with said plate, substantially as specified.

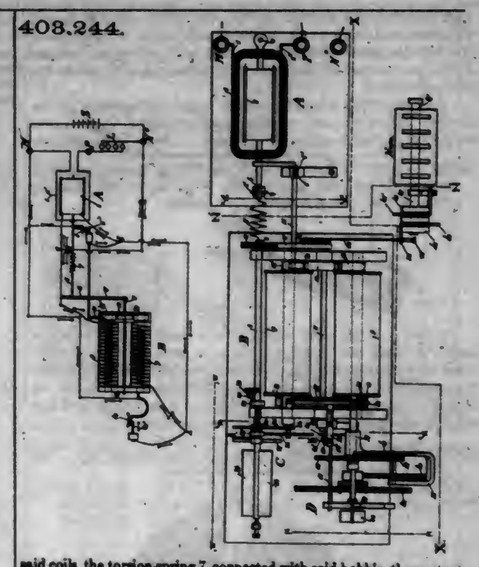
4. In combination with a gun or like implement, a vertically-adjustable plate carrying sight-pins, and a sight-leaf hinged to a plate secured to the gun and bearing against the side or edge of said plate, substantially as specified, whereby said leaf is held against lateral movement.

408,242.

408,243. VEHICLE-SPRING. CHARLES M. BLYDENBURGH, Riverhead, N. Y. Filed Mar. 5, 1889. Serial No. 301,852. (No model.)

Claim.—1. Torsion-springs for vehicles, having one end bent inwardly parallel with the bolster or head-block, in combination with a bolster having recesses for the bent ends of the springs, whereby a pivot-connection is formed, substantially as herein described.

2. The combination of a bolster or head-block having its ends bored lengthwise, and torsion-springs having their front ends bent inwardly and passed into the bored ends of the bolster, substantially as described.



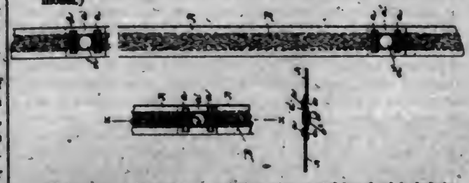
3. The combination of a bolster or head-block having its ends bored lengthwise, and torsion-springs secured to the body of the vehicle and provided with vibrating or free arms, which are bent at right angles at their front portions and inserted into the bored ends of the bolster, whereby a pivoted connection is formed between the springs and bolster, substantially as described.

408,244. APPARATUS FOR REGISTERING THE CONSUMPTION OF ELECTRIC ENERGY. LUCIEN BELLIÉ, Paris, France. Filed Dec. 29, 1888. Serial No. 294,962. (No model.) Patented in France Apr. 14, 1888, No. 189,949.

Claim.—1. A meter or apparatus for measuring the strength of continuous or alternating electric currents, consisting of a torsion electro-dynamometer, an electromotor acting on said dynamometer, a clock-movement operated by the electromotor and controlling the intervals between each measuring operation, a speed regulator or governor for said torsion-dynamometer and electromotor, and a counter operated by the electromotor, substantially as set forth.

2. In a meter or apparatus for measuring the strength of continuous or alternating currents, the combination, with a torsion-dynamometer composed of fixed coils 1 1', the movable bobbin 3 within said coils, the torsion-spring 7, connected with said bobbin, the contact-pieces 6 6', for closing the circuit between the dynamometer and other parts of the apparatus, an electromotor acting on said dynamometer, a clock-movement operated by the electromotor, a speed-regulator for the dynamometer and electromotor, and a counter operated by said electromotor, substantially as set forth.

408,244.



3. In a meter or apparatus for measuring the strength of continuous or alternating currents, the combination, with a torsion electro-dynamometer, of an electromotor, B, containing the magnets *g g*, the pole-pieces 12 12', connected with the magnets 9 9, the oscillating bar 13 at the ends of the magnets, the pawl 44, the shaft 16, the tappet 15 on one end of the same, which tappet is operated by the contact-piece on the dynamometer, which can establish contact with the contact-piece 6', a clock-work driven by the electromotor, a speed-regulator for the dynamometer and electromotor, and a counter operated by the electromotor, substantially as set forth.

4. In a meter or apparatus for measuring the strength of continuous or alternating currents, the combination, with a torsion electro-dynamometer, of an electromotor acting on said electro-dynamometer, a counter operated from the electromotor by a friction-clutch, a clock-movement operated by the motor, and a speed-regulator for the dynamometer and electromotor, substantially as set forth.

5. In a meter or apparatus for measuring the strength of continuous or alternating electric currents, the combination, with a torsion electro-dynamometer, an electromotor, a friction-clutch, a clock-movement containing the wheels 39 and 40, the contacts 43 43', the levers 60 63 65, and the screw 64', of a speed regulator and governor and a counter, substantially as set forth.

6. In a meter or apparatus for measuring the strength of continuous or alternating currents, the combination, with a torsion electro-dynamometer, an electromotor, a frictional brake or clutch, a clock-movement, a speed regulator or governor containing the satellite-wheels 26 and 27, the swinging frame 28, the driving-wheel 25, and the counter, substantially as set forth.

408,245. METAL STRAP FOR BOXES. SPENCER C. CARY, Baldwin, N. Y., assignor, by mesne assignments, to the Cary Manufacturing Company, of New York. Filed Oct. 22, 1888. Serial No. 288,788. (No model.)

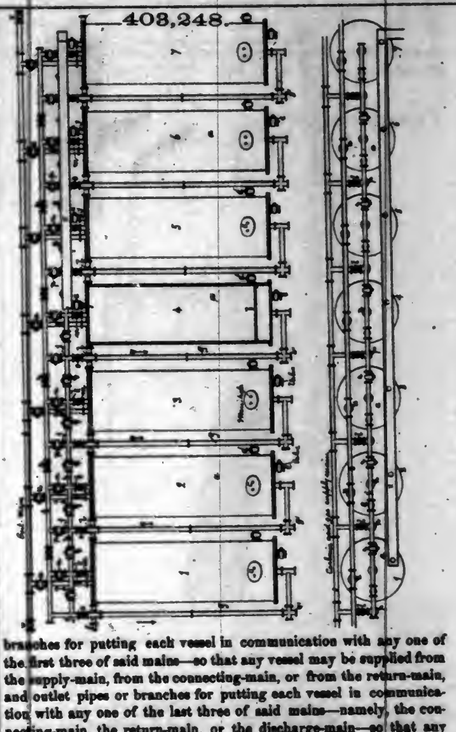
Claim.—1. A box-strap consisting of a metal band of indefinite length, composed of strips or sections of similar width having at their ends the oblong corrugations *a*, extending laterally of the sections between the side edges thereof, said sections being lapped upon

each other endwise successively, with the said corrugations thereon fitted into each other at the laps, and an eyelet or rivet, a^2, passed through the lapped ends alongside said corrugations and clamped down upon the faces of the band-sections, substantially as and for the purpose set forth.

2. A metal box-strap of indefinite length, having upon its face along its central line and extending longitudinally of the strap the roughened surface B, substantially as and for the purpose set forth.

408,246. BOX-STRAP. SPENCER C. CARY, Baldwin, assignor to William H. Vanderbilt, Brooklyn, N. Y. Filed July 25, 1887. Renewed Dec. 14, 1888. Serial No. 293,058. (No model.)

Claim.—A box-strap composed of a metal band of indefinite length, provided with a strip of textile or felted fabric of coequal length and imposed flatwise upon one face of the metal band, with the longitudinal side edges of the band turned around and over the respective side edges of the strip and down upon the outward face thereof, as described, and for the purposes set forth.



408,247. BOX-STRAP. SPENCER C. CARY, Baldwin, N. Y. Filed Jan. 31, 1888. Serial No. 298,173. (No model.)

Claim.—1. A reel for metal box-straps, consisting of a spool, C, adapted to have the metal strap coiled upon it, a hollow axle, c, upon which said spool is journaled to turn freely, and by which the reel may be secured upon a support, and a frame, D, composed of the parallel arms d and d', in which the said axle is mounted, and which extend radially therefrom alongside of and beyond the rim of said spool, as described, and are united at their outer ends, and therein have the corresponding openings, d^3, adapted to receive a fastening-pin, substantially as and for the purpose specified.

2. A reel for metal box-straps, consisting of a spool, C, adapted to have the metal strap coiled upon it, an axle, c, upon which said spool is journaled, and a frame, D, composed of parallel arms d and d', in which said axle is mounted, and which extend diametrically across said spool and reach in opposite directions beyond the rim thereof, as described, and are united at their outer ends, and therein have the respective corresponding openings, d^3 and d^3, adapted to receive fastening-pins, substantially as and for the purpose set forth.

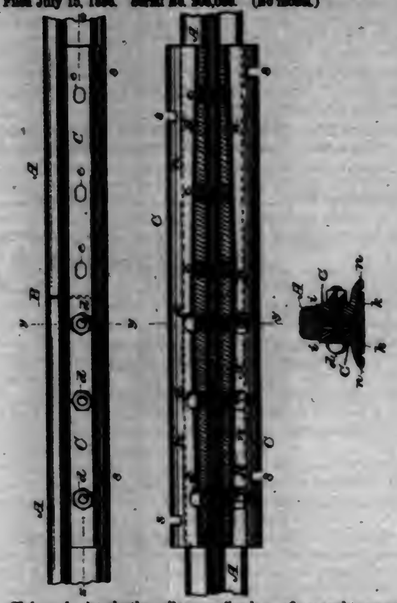
408,248. APPARATUS FOR OBTAINING SULPHURETED HYDROGEN FROM ALKALI. ALEXANDER M. CHANCE and JAMES F. CHANCE, Oldbury, County of Worcester, England. Filed Dec. 14, 1888. Serial No. 293,526. (No model.) Patented in England June 16, 1887, No. 8,066; in France Sept. 6, 1887, No. 185,677, and in Belgium Sept. 7, 1887, No. 73,790.

Claim.—1. Apparatus for obtaining sulphureted hydrogen separated from a large portion of other gases, such apparatus consisting of a number of vessels for containing the alkali waste and water, a supply-main for the carbonic acid, a connecting-main for establishing connection between the vessels, inlet-pipes for conveying the carbonic acid into the bottom of said vessels, two branches for each of said inlet-pipes, one putting the inlet-pipe in communication with the supply-main and the other in communication with the connecting-main, and both provided with taps or valves, a discharge-main for the products of decomposition, provided with two outlets and taps, whereby the gases may be discharged from either outlet, and pipes connecting the upper part of each vessel with the connecting-main and the discharge-main and provided with taps or valves intermediate the said vessel and each of the said mains, substantially as described.

2. In combination with a number of vessels, a supply-main, a connecting-main, a return-main, and a discharge-main provided with branch pipes and taps or valves as follows, whereby said vessels can be connected in series in any order—that is to say, inlet pipes or branches for putting each vessel in communication with any one of the first three of said mains—so that any vessel may be supplied from the supply-main, from the connecting-main, or from the return-main, and outlet pipes or branches for putting each vessel in communication with any one of the last three of said mains—namely, the connecting-main, the return-main, or the discharge-main—so that any vessel may discharge into any one of them, substantially as described.

3. Apparatus composed of a number of upright vessels, a main with a branch to each vessel for supplying liquid to the same, a gas-inlet pipe communicating with the lower part of each vessel, a draw-off tap or taps at the bottom of each vessel, a supply-main, a connecting-main, a return-main, branches and taps for putting the said gas-inlet pipes in communication with any one of the three last-mentioned mains, a discharge-main provided with two outlets and taps therefor, and branch pipes and taps for putting the upper part of each vessel in communication with said connecting-main, with said return-main, or with said discharge-main, substantially as described.

408,249. OBTAINING HYDROGEN SULPHIDE FROM ALKALI WASTE. ALEXANDER M. CHANCE and JAMES F. CHANCE, Oldbury, County of Worcester, England. Filed Dec. 14, 1888. Serial No. 293,526. (No specimens.) Patented in England June 16, 1887, No. 8,066; in France Sept. 6, 1887, No. 185,677, and in Belgium Sept. 7, 1887, No. 73,790.



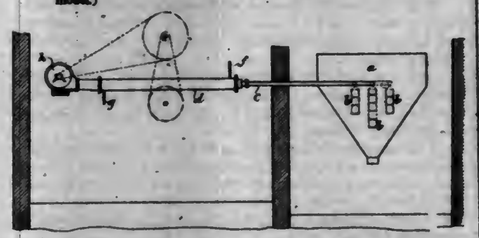
Claim.—1. The process of obtaining sulphureted hydrogen from alkali waste by decomposing such waste with gases containing carbonic acid, passing the resultant gases containing sulphureted hydrogen in contact with fresh alkali waste, so that the said sulphureted hydrogen unites therewith, and afterward decomposing with gases containing carbonic acid the composition or product formed by the union of the sulphureted hydrogen and alkali waste and collecting apart the rich gases from such decomposition, substantially as described.

2. The process of obtaining sulphureted hydrogen from alkali waste by passing gases containing carbonic acid through a mixture of alkali waste and water in a series of vessels, afterward, when the sulphureted hydrogen from the waste in the first vessel or vessels of the series has been transferred to the waste in succeeding vessels, drawing off apart the gases rich in sulphureted hydrogen from an intermediate vessel in the series, and when these gases have become poor in that material conducting the gases containing carbonic acid through the waste and water in the intermediate and succeeding vessels of the said series and fresh waste and water in an additional vessel or vessels, thus constituting a new series, with which the operations are repeated, substantially as described.

408,250. METHOD OF REDUCING AND SEPARATING MAGNETIC ORES. JOHN D. CHEEVER, New York, N. Y. Filed Feb. 20, 1888. Serial No. 300,610. (No specimens.)

Claim.—The method of treating magnetic ore for the separation of the magnetic from the non-magnetic particles by first heating the ore; second, reducing or disintegrating it while hot, and, third, separating the magnetic from the non-magnetic particles by bringing both together into and through a magnetic field, substantially as described.

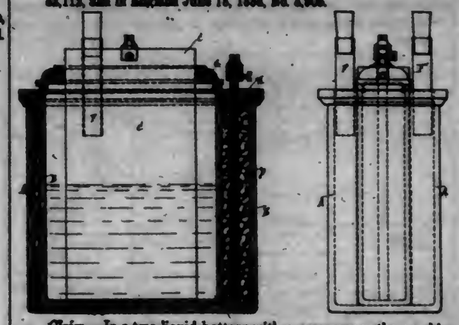
408,251. RAILWAY SPLICE-BAR. JAMES T. CLARK, Milwaukee, Wis.; Mary P. Clark administratrix of said James T. Clark, deceased. Filed July 15, 1886. Serial No. 208,092. (No model.)



Claim.—1. An elastic railway splice-bar, of wrought or rolled metal, tapering uniformly, or nearly so, from its center to its extremities, and provided with the usual means of fastening to the rails, substantially as and for the purposes set forth.

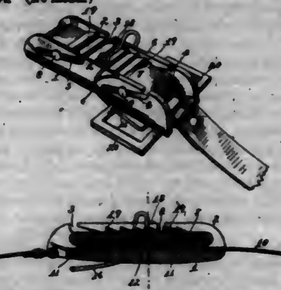
2. The combination of two railway-rails and one or more elastic splice-bars, tapering uniformly, or nearly so, from their center to their extremities, so as to make the wave of deflection of continuously uniform depth, or nearly so, and provided with the usual means of attachment to the rails, substantially as and for the purposes set forth.

3. An elastic railway splice-bar, of wrought or rolled metal, tapering uniformly, or nearly so, from its center to its extremities, and provided with the usual means of fastening to the rails, and having its inner wall straight, substantially as and for the purposes set forth.



408,252. APPARATUS FOR BREWING. CHARLES CLINCH, Leeds, County of York, England. Filed July 5, 1887. Serial No. 243,394. (No model.)

Claim.—1. The hereinbefore-described apparatus for treating malt in brewing, consisting of the combination of the hopper for containing the malt, the heater, a fan which drives air through the heater, the perforated air-distributer in the hopper, adapted to be immersed in the malt, and through which the hot air is distributed into the malt, substantially as set forth.



2. The hereinbefore-described apparatus for treating malt in brewing, consisting of the combination of the steam-jacket, its inlet and outlet pipes, the fan, the air-conduit connected with the fan and inclosed in the steam-jacket, the transverse steam-tubes in the air-conduit, the air-main, the hopper, and the perforated air-cylinders in the hopper, connected with the air-conduit, through which the heated air is delivered to the malt, substantially as set forth.

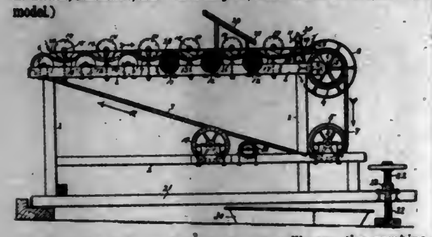
408,253. GALVANIC BATTERY. CHARLES CHAS, Lille, France, assignor to Hector Lebrasse & Co., same place. Filed Oct. 1, 1888. Serial No. 286,949. (No model.) Patented in Belgium June 6, 1888, No. 83,113, and in England June 16, 1888, No. 8,905.

Claim.—In a two-liquid battery with a porous cup, the combination of a solution of bisulphate of mercury and concentrated nitric acid in suitable proportions and a zinc plate in one cell, with granular-retort carbon and ordinary carbons and nitric acid in the other cell, substantially as herein set forth.

408,254. BUCKLE. LOYAL M. DOSSINGER, Stanton, Mich., assignor of one-half to Hiab Ely, same place. Filed Feb. 9, 1889. Serial No. 299,234. (No model.)

Claim.—1. A harness-buckle consisting of a frame having the curved ribs or flanges 6 at its sides, the clamping-slide fitted between the sides of the frame and connected thereto, so as to be capable of movement laterally of the frame and in the direction of its length, said slide having serrations on its lateral faces, and the lever 16, having the bail which embraces the frame and is curved to fit closely against the curved ribs of said frame, said bail having the tongue 18, which is arranged between the sides of the frame and is adapted to take into the serrations on the outer face of the slide, substantially as and for the purpose described.

2. A harness-buckle consisting of a frame having the diagonal slots in its side flanges, and the curved flanges 6, on opposite sides thereof, at points between the slots, the serrated clamping-slide provided with pins or studs which fit in said slots, and a lever having a curved bail fitted on the frame to bear against the curved flanges 6 thereof and bent upon itself to form a tongue, 18, which fits between the side flanges of the frame and is adapted to engage the serrations on the clamping-slide, all arranged and combined for service, as herein shown and described.

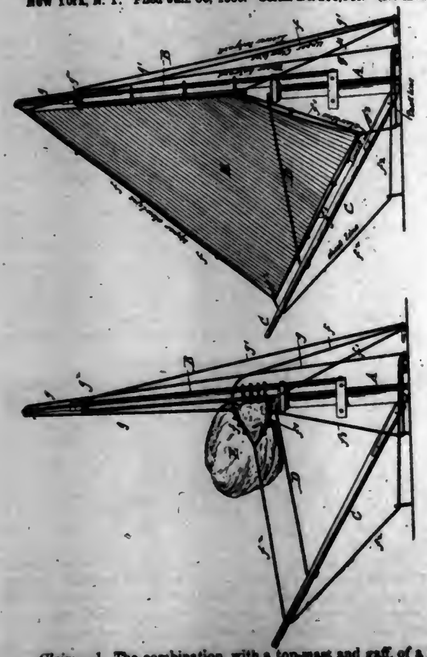


408,255. ROCKING OR SHAKING GRATE-BAR. CHARLES J. DORRANCE, Chicago, Ill. Filed July 2, 1888. Serial No. 170,444. (No model.)

Claim.—In a grate, a series of bars, B B', provided with pivots or trunnions located on one side of a line drawn vertically through the center of the grate-surface of said bars, said bars being provided with depending arms B^2 B^3, two bars, C C, one of which bars is connected with the arms B^2 of the alternate bars B, and the other with the arms B^2 of the intermediate bars, B', a rock-shaft provided with opposite lugs severally connected with the said bars C C, whereby the

alternate grate-bars will be oppositely moved when the rock-shaft is oscillated, and means for actuating the rock-shaft, substantially as described.

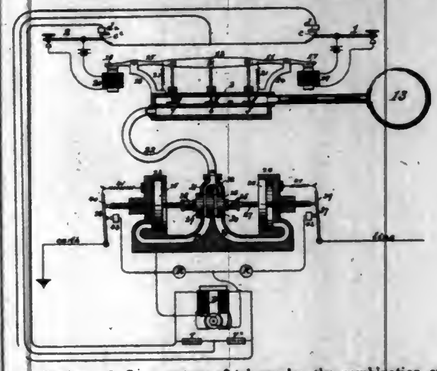
403,256. DEVICE FOR COLLECTING METALLIC ORES. HENRY H. HAHN, Baltimore, Md. Filed May 14, 1888. Serial No. 273,767. (No model.)



Claim.—1. In a device for collecting metallic ore, the combination of a moving endless bed provided with the metallic plates 26, means for causing an electric current to pass through the said plates, and means for causing a stream of water to flow over the said bed, for the purpose set forth.

2. In a device for collecting metallic ores, the combination of an endless bed, 7, provided with the raised sides 17, rollers 12, for supporting said bed, intermediate rollers, 14, provided with the flanges 16 thereon, in which move the raised sides 17 of the bed, and whereby an undulating movement is imparted thereto, means for causing a stream of water to flow over the said bed, and means for imparting movement to the said bed, for the purpose set forth.

3. In a device for collecting metallic ores, the combination of an endless bed, 7, provided with the metallic plates 26, means for causing an electric current to pass through the said plates, consisting of the rods 28, connected, respectively, to the negative and positive poles of a dynamo or galvanic battery, the swinging arms 29, suspended from the said rods and placed in the path of the said plates 26, whereby the electric current will be caused to pass therethrough, the said arms and rods being placed over the upper surface of the said bed 7, whereby, when the bed leaves this upper surface, the current of electricity through the plates 26 will be broken, means for causing a stream of water to flow over the said bed, and means for imparting movement to the said bed, for the purpose set forth.



403,257. GAFF-TOPSAIL FOR VESSELS. LAWRENCE W. FALCK, New York, N. Y. Filed Jan. 30, 1889. Serial No. 298,046. (No model.)

Claim.—1. The combination, with a top-mast and gaff, of a gaff-topsail, an upper clew-line extending along the outer edge of the sail, a lower clew-line extending along the lower and inner edges of the same, an upper halyard applied to the upper corner of the sail, a lower halyard attached to the gaff-sail near the lower mast-hoop, a sheet-line applied to the outer corner, and a tack-line applied to the inner corner of the sail, substantially as set forth.

2. The combination, with a top-mast and gaff, of a gaff-topsail, an upper clew-line extending along the outer edge of the sail, an upper halyard attached to the upper corner of the sail, a sheet-line attached to the outer corner, a tack-line attached to the inner lower corner, a lower clew-line extending along the lower and inner edges of the sail up to the lowest mast-hoop, and a lower halyard attached to the sail near the lower mast-hoop and passing over a sheave or pulley of the top-mast, substantially as set forth.

403,258. VIBRATORY-TELEGRAPHY. STEPHEN D. FIELD, Stockbridge, Mass. Filed Nov. 21, 1888. Serial No. 291,477. (No model.)

Claim.—1. In a system of telegraphy, the combination of a source of current, a line, and a single main-line vibratory transmitting-key comprising contacts and a controlling-vibrator therefor having a variable periodicity of vibration.

2. In a system of telegraphy, the combination of a source of current, a line, a single main-line vibratory transmitting-key comprising contacts, and a controlling-vibrator therefor having a variable periodicity of vibration, and means for varying the same operated by subsidiary keys in local circuits.

3. In a system of telegraphy, the combination of a source of current, a line, a single main-line vibratory transmitting-key comprising contacts, and a controlling-vibrator therefor having a variable periodicity of vibration, subsidiary keys in local circuits, and interposed controlling devices for said main-line key and dependent for operation on the subsidiary keys.

4. In a system of telegraphy, the combination of a source of current, a line, a single main-line vibratory transmitting-key comprising contacts, and a controlling vibrator therefor having a variable periodicity of vibration, and a single receiver responsive to all the transmitted vibratory impulses.

5. In a system of telegraphy, a main-line transmitting-key comprising a vibrator having a variable periodicity of vibration, and contacts operated by said vibrator and controlling the direction of currents in the line.

6. In a system of telegraphy, a main-line transmitting-key comprising a vibrator having a variable periodicity of vibration, a source of current, and contacts arranged to reverse the current on the line at each change of phase in the vibrator.

7. In a system of telegraphy, a main-line transmitter comprising a reciprocating rod adapted to reciprocation at variable rates of speed and having line-contacts, in combination with devices for controlling the rate of speed, subsidiary manipulating or make-and-break keys in local circuits, and magnets in the local circuits operating said controlling devices.

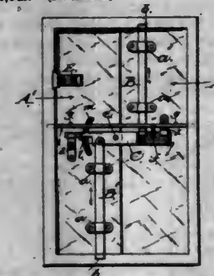
8. In a system of telegraphy, a main-line transmitter comprising a reciprocating device arranged in operative relation to the line-contacts and capable of variations in its rate of vibration, a source of energy for effecting the movement of the reciprocating device, and a group of subsidiary make-and-break keys controlling the amounts of energy applied to the reciprocating device.

9. In a system of multiplex telegraphy wherein the signals are made by makes and breaks in sets of vibrations of different rates, a source of current, a vibratory transmitting-key capable of varying rates of vibrations, and a group of subsidiary manipulating-keys controlling the vibration of said transmitting-key, and having extra contacts arranged in operative connection with the source of current and automatically governing its electro-motive force.

10. In a system of multiplex telegraphy wherein the signals are made by makes and breaks in sets of vibrations of different rates, the combination of a single source of current, an inharmonious vibratory transmitting-key, and a group of subsidiary manipulating-keys controlling the vibration of said transmitting-key, each subsidiary key having extra contacts arranged in local circuits controlling the source of current of the main line and in operative connection with the source of energy of the transmitting-key, whereby the potential of the current source is raised with increase of vibratory rate and the motive power of the transmitter is increased correspondingly.

11. In a system of telegraphy, a main-line transmitter comprising a neutral or inharmonious vibratory key, in combination with a tuned fork adapted to be placed in controlling connection with said key, whereby the latter is forced to vibrate in unison with the fork.

12. In a system of telegraphy, a main-line transmitter comprising a neutral or inharmonious vibratory key, in combination with two or more tuned forks adapted to be severally or jointly placed in controlling connection with said key, whereby the latter is forced to vibrate in unison with any one fork separately connected to it, and in unison with a multiple of the several rates of vibration when more than one fork is connected to it.



13. In a system of telegraphy, a main-line key comprising a pair of pistons connected by a rod and having suitable line-contacts and a valve and ports for effecting the reciprocation of the rod, in combination with a source of pressure and interposed admission-valves controlled by subsidiary keys in respectively independent local circuits, each including electro-magnetic devices for operating one of the said admission-valves.

14. In a system of telegraphy, a receiving-instrument comprising a magnet, a magnetic plug adapted to reciprocate in the field of the magnet, and an inharmonious compensating-spring opposing the attractive force of the magnet.

15. In a system of telegraphy, a receiving-instrument comprising a magnet, a magnetic plug adapted to reciprocate in the field of the magnet, and an inharmonious spring of spherical form whose resistance under compression increases in an increasing ratio.

16. In a system of telegraphy, the relay consisting of a magnet, a magnetic plug adapted to reciprocate in the field of said magnet, an inharmonious retractile spring, and local-circuit contact-points between the plug and magnet.

403,259. SHUTTER-FASTENER. MICHAEL FITZPATRICK, St. Louis, Mo., assignor to Annie M. Fitzpatrick, same place. Filed Nov. 2, 1888. Serial No. 289,845. (No model.)

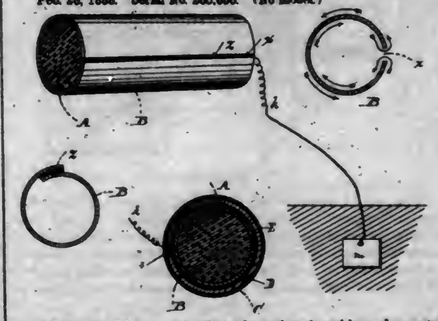
Claim.—An improved shutter-fastener consisting of a lever pivoted to the inside of the shutter and provided with the hook-shaped bar, a vertically-arranged bar attached to the lever and having its lower end seated in a socket in the window-frame, a second vertically-arranged bar loosely seated upon the opposite end of the lever and having its upper end adapted for engagement with a socket in the upper portion of the window-frame, a bar, *g*, passing transversely across said frame and engaged by the hook-shaped bar, and a lever, D, mounted on the pivot of the lever C and the spring E, said lever D having a flange, *h*, and a pin, *l*, which projects through a curved slot in the shutter and rests under one end of the lever C, as herein described.

403,260. ATTACHING DEVICE FOR WHIP-SOCKETS. DANIEL D. FRASER, Boston, Mass. Filed Feb. 13, 1889. Serial No. 299,999. (No model.)

Claim.—1. In a whip-socket attaching device, the combination of an encircling band or ring terminating in an arm and perforated, as described, with a binding-bracket having at one end a solid wall and a projection, each perforated for the reception of a binding and clamping screw, respectively, and at the other end a cross-bar, substantially as specified.

2. In a whip-socket attaching device, the clamp-bracket E, having the perforated projection E', the adjacent solid end perforated, as at E^4, and the opposite open end provided with a cross-bar, E^2, in combination with an encircling spring, substantially as specified.

403,261. AIR-EJECTOR FOR CASKS. JOHN W. FUSON, Stapleton, N. Y. Filed Feb. 15, 1889. Serial No. 300,014. (No model.)

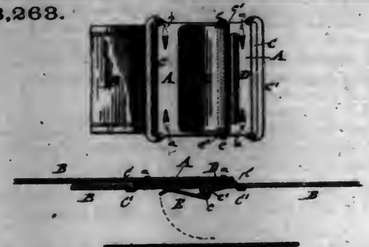


Claim.—1. An air-ejector for preventing explosions in casks when varnishing the same, consisting of a main tube inserted into the bung-hole of the cask, a flanged collar for supporting said main tube on the cask, and an air-supply tube having a nozzle at the interior of the main tube, substantially as set forth.

2. An air-ejector for preventing explosions in casks while varnishing the same, which consists of a main tube that is inserted into the bung-hole of the cask, a flanged collar for supporting the same on the cask, and an air-supply tube passing through a boss of said collar into the interior of the main tube, said air-tube having a nozzle and discharge-orifice in line with the axis of the main tube, substantially as set forth.

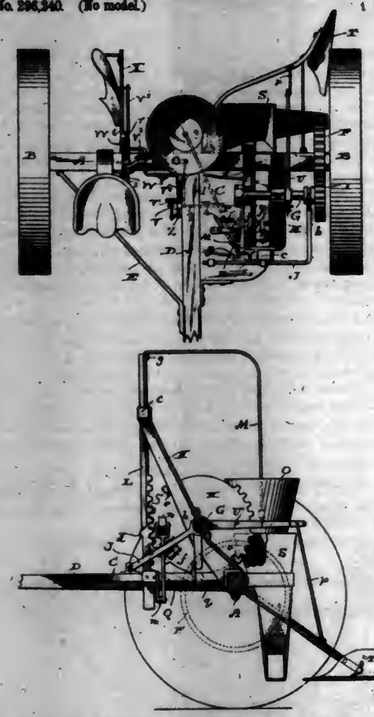
3. An air-ejector for preventing explosions in casks when varnishing the same, which consists of a main tube inserted into the bung-hole of the cask, a flanged collar for supporting the main tube, and an air-supply tube having a nozzle and discharge-orifice at the interior of the main tube, said air-tube being connected with a suitable supply of compressed air, the flanged collar being provided with bosses, one boss serving for attaching the air-tube, while the other boss is provided with openings for inserting conducting-wires for an incandescent lamp, substantially as set forth.

403,262. COVERING FOR ELECTRIC CABLES. REES F. GARLAND, Lynn, assignor of one-half to Solomon H. Holbrook, Salem, Mass. Filed Feb. 28, 1888. Serial No. 265,690. (No model.)



Claim.—1. The combination of an electric cable and a metallic pipe inclosing said cable, said pipe being slit longitudinally and its slit edges separated from each other by a water-proof strip of insulating material.

2. The combination of an electric cable, a metallic pipe inclosing said cable, said pipe being slit longitudinally and its slit edges separated from each other by a water-proof strip of insulating material, a coating of insulating material surrounding said pipe, and a second pipe of larger diameter inclosing said coated pipe, said second pipe being also slit and having its slit edges insulated and an insulating covering surrounding said outer pipe.



403,263. BELT-BUCKLE. AUGUST GOERTZ, Newark, N. J. Filed Nov. 23, 1888. Serial No. 292,066. (No model.)

Claim.—A buckle for belts, composed of a main plate provided with guide-slots at both ends, fastening-prongs made integral with said plate, a raised rib in said plate parallel with said slots, bent-up ears, also made integral with the plate, and a cam-plate pivoted to said ears close to said rib, substantially as set forth.

408,268.

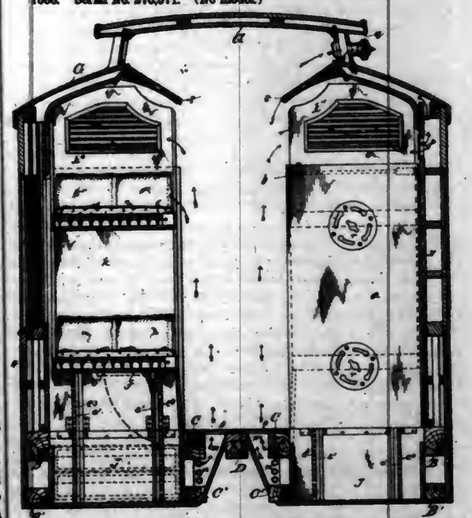
408,264. POTATO-PLANTER. SAM GIBSON, Hurley, Wis., assignor of one-half to Charles F. La Clair, same place. Filed Jan. 14, 1889. Serial No. 296,340. (No model.)

Claim.—1. A potato-planter comprising a carriage, a hopper and delivery-trough secured to the carriage, a vertically-moving bar actuated at predetermined intervals, a rod loosely connected to the bar to move therewith, and means, substantially as described, for imparting a partial rotation to the rod and for suddenly arresting its downward movement independent of said bar, as and for the purpose set forth.

2. A potato-planter comprising a carriage, a hopper and delivery-trough secured to the carriage, a vertically-moving bar actuated at predetermined intervals, a rod loosely connected to the bar to move therewith, means, substantially as described, for imparting partial rotation to the rod and for suddenly arresting its downward movement independent of said bar, and a coverer secured to said carriage to follow the delivery-trough, as and for the purpose set forth.

3. A potato-planter comprising a carriage, a hopper and delivery-trough secured to the carriage, a vertically-moving bar actuated at predetermined intervals, a rod loosely connected to the bar to move therewith, means, substantially as described, for imparting a partial rotation to the rod and for suddenly arresting its downward movement independent of said bar, a coverer secured to said carriage to follow the delivery-trough, and a plow, also secured to the carriage, as and for the purpose set forth.

4. A potato-planter comprising a carriage, a hopper and delivery-trough secured to the carriage, a vertically-moving bar actuated at predetermined intervals, a rod loosely connected to the bar to move therewith, means, substantially as described, for imparting a partial rotation to the rod and for suddenly arresting its downward movement independent of said bar, a coverer shackled to the carriage-axle, and a lever mechanism for raising and lowering said coverer, as set forth.



5. A potato-planter comprising a carriage, a hopper and delivery-trough secured to the carriage, a vertically-moving bar actuated at predetermined intervals, a rod loosely connected to the bar to move therewith, means, substantially as described, for partially rotating the rod and for suddenly arresting its downward movement independent of said bar, a coverer arranged to follow the delivery-trough, a pivotally-adjustable plow secured to said carriage, and a lever mechanism for adjusting said plow, as set forth.

6. A potato-planter comprising a carriage, a hopper and delivery-trough secured to the carriage, a vertical rack-bar, a mutilated pinion arranged to actuate the rack-bar, a plain pinion splined on the shaft of the mutilated one, a gear-wheel fast to the adjacent carriage-wheel, a sliding lever connected to the plain pinion, a rod loosely connected to said rack-bar to move therewith, and means, substantially as described, for imparting a partial revolution to the rod and for suddenly arresting its downward movement, as and for the purpose set forth.

7. A potato-planter comprising a carriage, a hopper and delivery-trough secured to the carriage, a vertical rack-bar, a mutilated pinion provided with detachable teeth and arranged to actuate the rack-bar, a plain pinion splined on the shaft of the mutilated one, a gear-wheel fast to the adjacent carriage-wheel, a sliding lever connected to the plain pinion, a rod loosely connected to said rack-bar to move therewith, and means, substantially as described, for imparting a partial revolution to the rod and for suddenly arresting its downward movement, as and for the purpose set forth.

8. A potato-planter comprising a carriage, a hopper and delivery-trough secured to the carriage, a vertical rack-bar, a mutilated pinion arranged to actuate the rack-bar and having one of its sides provided with a cam-lug, a plain pinion splined on the shaft of the mutilated one, a gear-wheel fast to the adjacent carriage-wheel, a sliding lever connected to the plain pinion, a bent rod loosely connected to said rack-bar and having a right-angular foot-piece, a vertical spring-controlled lever pivoted to the carriage-platform and having a curved upper end, a pivotal arm linked to the vertical lever and carrying an anti-friction roller arranged to come in the path of said cam-lug, a vertical post arranged adjacent to said vertical lever, a flat spring impinged against the post, and a stop for the foot-piece on said bent rod, all arranged to operate substantially as and for the purpose set forth.

408,265. RAILWAY-CAR. LOUIE J. HARRIS, Boston, Mass., assignor of one-fourth to Arthur W. Greenley, same place. Filed Apr. 13, 1888. Serial No. 270,571. (No model.)

Claim.—1. A railway passenger car or coach provided on each side with a series of berth-storage apartments beneath the floor, removable coverings to each of said apartments forming the floor of the car, a berth in each of said apartments independent of the cover thereof, and means for lowering the berth into and raising it out of the storage-apartment, substantially as set forth.

2. A railway passenger car or coach having that portion of its body between the trucks extended or carried down therebetween, and provided on each side with a series of berth-storage apartments or wells in said downwardly-extended portion and beneath the floor, removable coverings to each of said apartments, forming the floor of the car, a berth in each of said apartments independent of the cover thereof, and means for lowering the berth into and raising it out from the storage-apartment, substantially as set forth.

3. A railway passenger car or coach provided with berth-storage apartments beneath the floor, removable sections of the flow covering said apartments, constructed and arranged to be placed in vertical position between the berth-sections, to form partitions therebetween, and berths in said apartments adapted to be raised out of and lowered into said apartments, substantially as set forth.

4. A railway passenger car or coach having that portion of its body between the trucks extended or carried down therebetween, berth-storage apartments formed in said downwardly-extended portion, removable sections of the floor covering said apartments, constructed and arranged to be placed in vertical position between the berth-sections to form partitions therebetween, and berths in said apartments adapted to be raised out of and lowered into said apartments, substantially as set forth.

5. A railway passenger car or coach provided with berth-storage apartments beneath the floor, berths in said apartments adapted to be lowered therein and raised out therefrom, and removable sections of the floor hinged at one end to the frame of the car and adapted to be raised into vertical position and secured to the stationary frame of the car to form partitions between the berth-sections, substantially as set forth.

6. A railway passenger car or coach provided with berth-storage apartments beneath the floor, a berth stored in each of said apartments and adapted to be lowered into and raised out of said apartments and supported in position for occupancy, and gearing connected with the berth and engaging corresponding devices connected with the berth-support for raising and lowering the same, substantially as set forth.

7. A railway passenger car or coach provided along the side with a series of storage-apartments beneath the floor, and two removable sections of the floor covering each of said apartments, each hinged at one of its ends to the frame of the car and adapted to be raised into vertical position and secured to the stationary frame to form partitions at intervals in the car, substantially as set forth.

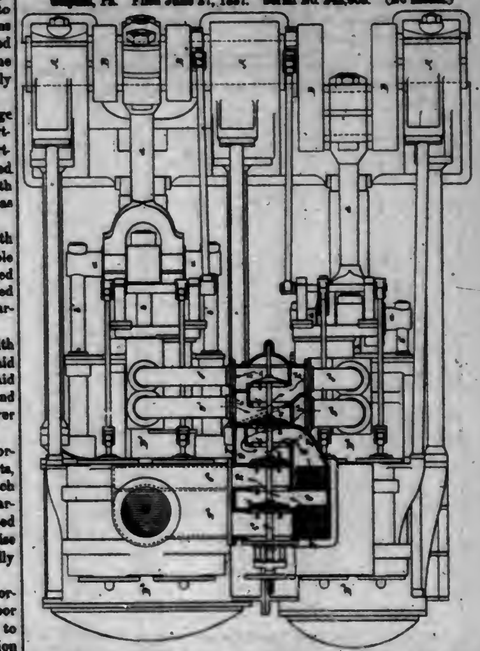
8. A railway passenger car or coach provided at the side with berth-storage apartments beneath the floor, partitions between said apartments, berths in said apartments, gearing connected with said apartments, a rack and guideway connected with said partitions, and means for operating said gearing to raise said berths out of and lower them into said apartments, substantially as set forth.

9. A railway passenger car or coach provided with berth-storage apartments beneath the floor, partitions between said apartments, two berths in each of said apartments, gearing connected with each of said berths, devices, substantially as set forth, to connect said gearing to operate the same in unison, a rack and guideway connected with said partitions, and means for operating said gearing to raise said berths out of and lower them into said apartments, substantially as set forth.

10. A railway passenger car or coach provided with berth-storage apartments beneath the floor, two removable sections of the floor covering each of said apartments, each hinged at one of its ends to the frame of the car and adapted to be raised into vertical position and secured to the stationary frame to form partitions at intervals in the car, berths in said apartments adapted to be raised out therefrom and supported in position between said partitions, and foot and head boards hinged to the frames of said berths and adapted to be folded down thereover or raised against said partitions, substantially as set forth.

11. A railway passenger car or coach provided with sleeping-berths, foot and head boards hinged to the frames of said berths, and a curtain-supporting rod removably connected with said foot and head boards, substantially as set forth.

12. A railway passenger car or coach provided with a series of berth-storage apartments on each side of the car beneath the floor, and chambers M, running longitudinally of the car between said berth-storage apartments, substantially as set forth.



13. In a railway passenger car or coach, the combination, with a sleeping-berth, of a board secured to the forward part of the berth-frame and a lock or latch for locking or latching said board or door to the frame of the car, whereby baggage, &c., may be locked beneath the berth, substantially as set forth.

14. A railway passenger car or coach provided with a berth-storage apartment coextensive with a berth-section beneath the floor, a complete berth and its equipment substantially coextensive with said apartment removably arranged therein, means for lowering the berth into and raising it out of the storage-apartment, and a section of the floor independent of said berth removably arranged over said apartment, substantially as set forth.

15. A railway passenger car or coach provided with a berth-storage apartment coextensive with a berth-section beneath the floor, a movable berth, with means for lowering the berth into and raising it out from said apartment and supporting it in position for occupancy, and a removable section of the floor independent of said berth, constructed and arranged to cover said apartment when the berth is stored therein, and to be removed to permit the berth to be moved therefrom, substantially as set forth.

16. A railway passenger car or coach having a body normally unobstructed, with a berth or berth-supports above the floor, and provided with a berth-storage apartment coextensive with a berth-section beneath the floor, movable upper and lower berths, with means for lowering the berths into and raising them out of the storage-apartment and supporting them in position of occupancy, and a removable section of the floor independent of said berths, constructed and arranged to cover the apartment when the berths are stored therein and be removed to permit the berths to be raised out therefrom, substantially as set forth.

408,266. QUADRUPLE-EXPANSION ENGINE. JOHN HAUG, Philadelphia, Pa. Filed June 27, 1887. Serial No. 242,603. (No model.)

Claim.—1. The combination, in a quadruple engine, of four cylinders of differential diameter, a live-steam inlet, an exhaust-outlet, passages for connecting the cylinders either in a continuous series or in simultaneously-operating pairs, and valves for controlling the flow through said passages, all substantially as specified.

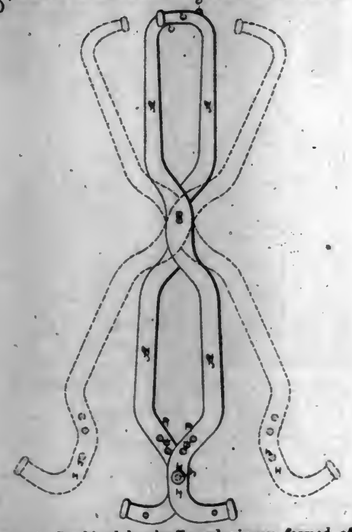
2. The combination, in a quadruple engine, of four cylinders of differential diameter, passages connecting the first and second cylinders of the set with the steam-inlet, passages connecting the first cylinder with the second and third, passages connecting the second cylinder with the third and fourth, passages connecting the third cylinder with the fourth and with the final outlet, a passage connecting said fourth cylinder with said final outlet, and valves for opening and closing said passages, as described, whereby live steam may be directed to the first cylinder only and worked in the series of cylinders in succession before reaching the final outlet, or said live steam may be simultaneously admitted to the first and second cylinders, the first cylinder exhausting into the third, the second cylinder into the fourth, and the third and fourth into the final outlet, all substantially as specified.

3. The combination, in a quadruple engine, of four cylinders of differential diameter, passages for connecting the cylinders either in a continuous series or in pairs, and duplex valves located in the eduction-chambers communicating with the first, second, and third cylinders, all substantially as specified.

4. The combination, in a quadruple engine, of four cylinders of

differential diameter, passages for connecting the cylinders either in continuous series or in pairs, duplex valves located in the eduction-chambers communicating with the first, second, and third cylinders, and a single valve controlling the communication between the induction-chambers of the first and second cylinders, all substantially as specified.

5. The combination, in a quadruple engine, of four cylinders of differential diameter, a directing-chest having passages for connecting the cylinders either in a continuous series or in pairs, and a series of valves carried by a single stem and controlling the flow through said passages, all substantially as specified.



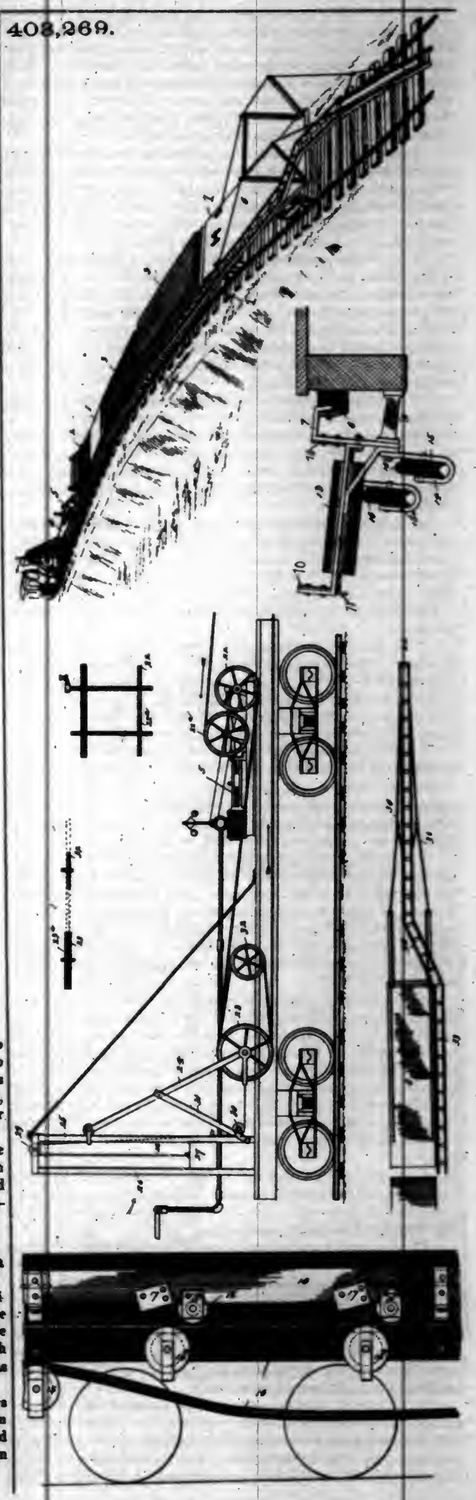
408,267. INSULATED WIRE. SALOMON HEIMANN, New York, assignor of five-twentieths to Frank L. Pommer, Stapleton, N. Y. Filed Mar. 27, 1888. Serial No. 304,966. (No model.)

Claim.—1. An insulated wire composed of an electric wire, a layer of cotton thread on the same, a coating of soluble glass and glycerine, and a layer formed of pulverized pumice-stone and plumbago, substantially as set forth.

2. An insulating-covering for electric wires, composed of soluble glass and glycerine and a coating of pulverized pumice-stone and plumbago, substantially as set forth.

408,268. COMBINED HANDCUFFS AND NIPPERS. WILLIAM A. HICKS, Rankin Station, Pa. Filed Nov. 23, 1888. Serial No. 291,672. (No model.)

Claim.—1. Combined handcuffs and nippers formed of two jaws, which are pivoted together at a point between their ends, so that all four ends of the two jaws can be opened outward, the ends of the jaws being turned inward toward each other so as to overlap, in combination with a fastening device which is passed through or applied to the jaws at one end, substantially as shown.



2. In combined handcuffs and nippers, the combination of the two jaws A, shaped as shown, the pivot B, which is passed through the jaws nearer to one end than the other, and which are provided with turned-out handles at one end and the turned-in points or projections C at the other, substantially as set forth.

408,269. CONVEYER. ROBERT B. HURLEY, Des Moines, Iowa. Filed May 17, 1888. Serial No. 274,136. (No model.)

Claim.—1. In a conveyer for ties or other materials, the combination of a guideway having a series of rollers each of which has one end vertically adjustable, whereby the superimposed weight of the article moved thereon shall depress said roller, and a cable upon which the depressed roller bears and by which it is rotated, substantially as described.

2. In a conveyer for ties, &c., the combination, with guideways provided with rollers, one end of which is vertically adjustable, of an endless cable adapted to be brought into frictional contact with said rollers when the latter are depressed, and an engine for giving motion to said cable, substantially as described.

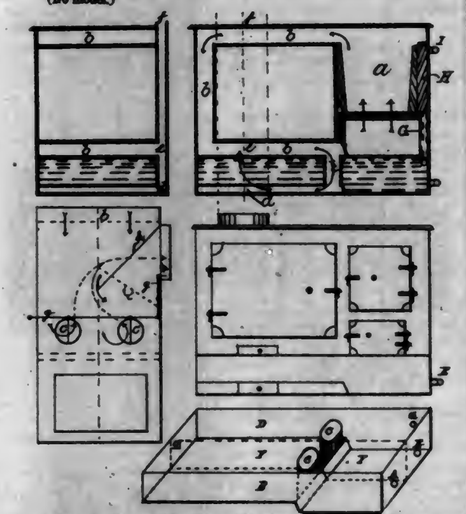
408,269.

3. In a conveyer, the combination, with guideways having rollers rotatably secured therein, said rollers having one of their ends vertically adjustable in its bearings, of an endless cable adapted to be brought into frictional contact with the rollers when depressed, and sheaves to sustain said cable in such frictional contact, substantially as described.

4. In a conveyer for railway-ties, the combination, with guideways consisting of brackets 7, rails 10, and brace 9, of rollers 13, journaled therein and having one end vertically adjustable, cable 16, and sheaves 15^a, substantially as described.

5. A roller for conveyers consisting of a cylindrical shell, separable heads therefor having a flanged circumference and a sunken central portion with a hub to form a journal-bearing for an axle, an axle extended through the shell and journaled in the heads, and bolts or rivets having their heads and securing-nuts seated upon the sunken portion of the heads, substantially as described.

6. The combination, with an endless cable, of a device for taking up the slack of such cable, comprising a sheave, 23, connected to a swinging arm, 24, and a weight connected by a cord with said sheave, whereby the slack of the cable is taken up by the descent of the weight and the drawing back of the sheave, substantially as described.

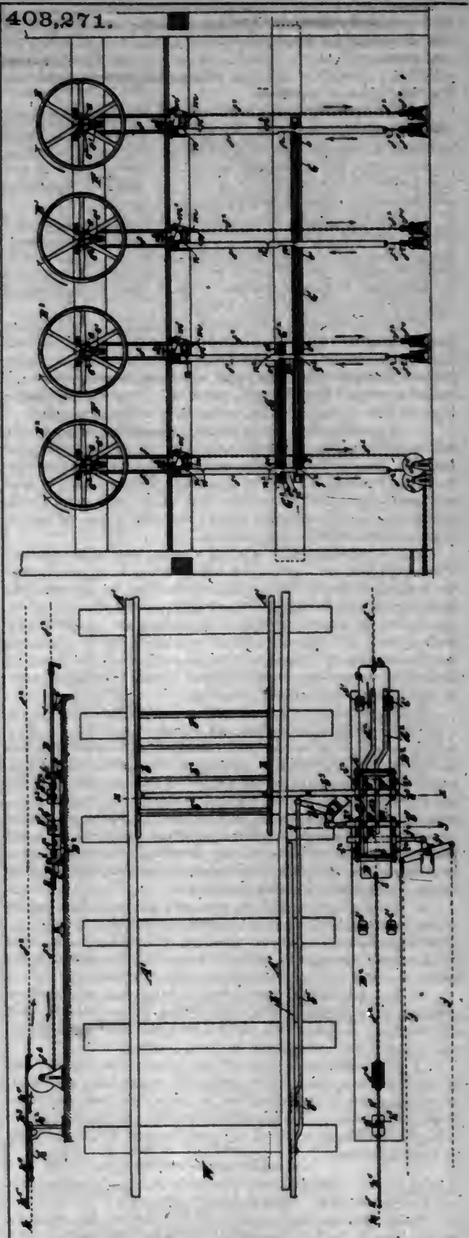


7. In a slack-take-up device, the combination, with an endless cable, of a system of pulleys over which the cable is passed, two of said pulleys being secured to rotate upon a common axis, and being movable, substantially as described.

8. The combination, with an endless cable, of a slack-take-up device comprising a movable pulley over which the cable is passed, a swinging and endwise-movable arm to which said pulley is connected, and a weight connected to said pulley, whereby to move it to take up the slack of the cable, substantially as described.

9. In a track-laying apparatus, the combination, with a car, of a guideway affixed to the side of said car and inclined upwardly from rear to front thereof, a section of guideway projecting from the side of the car to near the middle of its width, and a downwardly-inclined section of guideway projecting out over the middle of the road-bed and in front of the train, said sections constituting a continuous guideway whereby the ties are carried from the side of the car to the middle of the road-bed, substantially as described.

10. In a track-laying apparatus, the combination of a guideway comprising the sections 33 34 35, with a suitable suspending medium, 36 37 38, substantially as described.



408,270. HOT-WATER RESERVOIR FOR RANGES OR STOVES. ABRAHAM HURST, Philadelphia, Pa. Filed Mar. 2, 1889. Serial No. 302,422. (No model.)

Claim.—The combination, with a stove or range having an oven and fire-pot arranged side by side, of a water-reservoir extending the entire length of the stove or range and under both oven and fire-pot, and provided with a passage for the products of combustion, the said stove or range having suitable flues communicating with the passage in the water-reservoir.

408,271. RAILWAY SWITCH AND SIGNAL OPERATING AND INTERLOCKING DEVICE. HENRY JOHNSON and CHARLES B. JOHNSON, Pittsburg, Pa. Filed Aug. 18, 1886. Serial No. 211,134. (No model.)

408,271.

Claim.—1. The combination, with two or more systems of connections for moving switches, switch-locks, and signals, and purchase-wheels or equivalent handles for operating said systems, of notched locking-bars movable by the purchase-wheels or handles, a positive lock for each bar under manual control of the operator, and interlocking devices between the several bars, whereby the purchase-wheels or handles and the systems which they operate are controlled automatically one by another, substantially as herein described.

2. The combination, with two or more systems of connections, each for moving a switch and signal or signals and each formed in part by a notched locking-bar, of purchase-wheels or equivalent handles corresponding in number to the number of said systems and each arranged and connected in permanent operative relation with one of

said systems, but having no operative connection with the other system or systems, and interlocking devices between the bars of the several systems, whereby the purchase-wheels or handles and the systems which they operate are controlled automatically one by another, substantially as herein described.

3. The combination, in a grade crossing, of a facing-switch with its accompanying switch-lock and signal or signals, and a trailing switch on the opposite side of the crossing, and a single purchase-wheel or equivalent handle, and connections through which it operates both the facing-switch with its lock and signal or signals, and also the trailing switch, substantially as herein described.

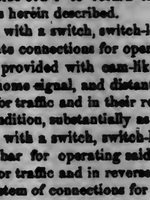
4. The combination, with a switch, switch-lock, and signal, and separate connections for operating them, of a sliding motion-plate or bar provided with cam-like devices for moving the switch, switch-lock, and signal separately and in the order named to prepare them for traffic and in the reverse order to return them to their normal condition, substantially as herein described.

5. The combination, with a switch, switch-lock, home signal and distant signal, and separate connections for operating them, of a sliding motion-plate or bar provided with cam-like devices for moving the switch, switch-lock, home signal, and distant signal in the order named to prepare them for traffic and in their reverse order to return them to their normal condition, substantially as herein described.

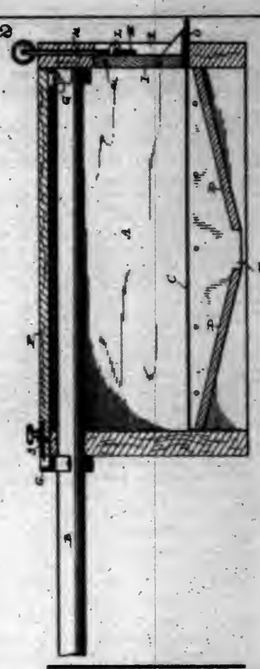
6. The combination, with a switch, switch-lock, and signal, of a sliding motion-plate or bar for operating said devices in the order named to prepare them for traffic and in reverse order to return them to normal condition, a system of connections for moving said plate or bar, and a purchase-wheel or equivalent handle arranged and connected in permanent operative relation with said system of connections, substantially as herein described.

7. The combination, in a grade crossing, with a facing-switch with switch-lock and signal, and a trailing switch on opposite sides of the crossing, of sliding motion-plates or bars, one for operating the facing-switch with its switch-lock and signal and the other for operating the trailing switch, a system of connections for operating both motion-plates or bars, and a single purchase-wheel or equivalent handle arranged and connected in permanent operative relation with the system of connections and serving to operate both motion-plates or bars, substantially as herein described.

8. The combination, with a switch, switch-lock, and home signal, of a single motion-plate or bar and system of connections, and a purchase-wheel or equivalent handle arranged and connected in permanent operative relation to said system for shifting said switch, switch-lock, and signal in the order named to prepare them for traffic, and in the reverse order to return them to normal condition, a distant signal and devices for operating it from the motion-plate, connections whereby the distant signal will be moved to "safety" as the said plate completes its movement in one direction, and will be returned to "danger" as said plate commences its movement in the other direction, substantially as herein described.



9. The combination, with the connected point-rail of a switch or with a switch-lock, of duplicate connections for shifting it, and a single sliding motion-plate or bar operating upon both connections for simultaneously transmitting motion through both connections to the switch or switch-lock, substantially as herein described.

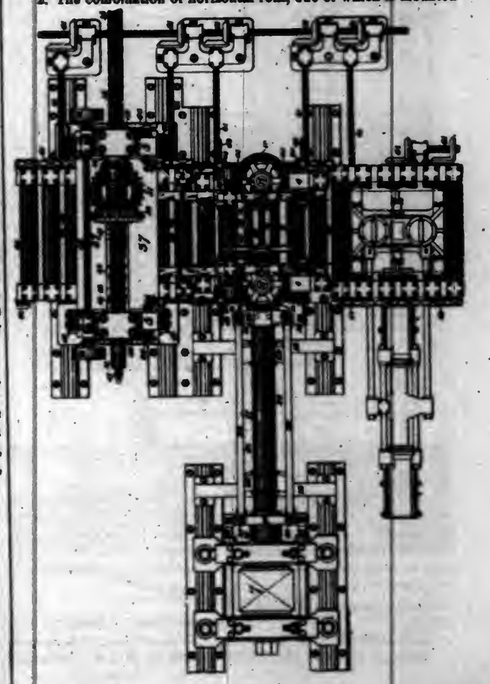


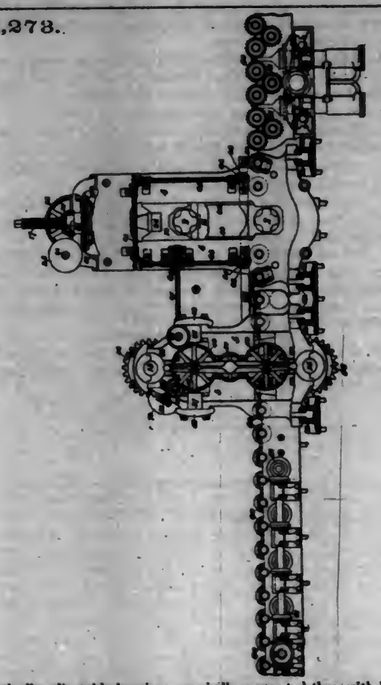
10. The combination, with a switch or switch-lock and duplicate connections for shifting it, of a single sliding motion-plate provided with duplicate cam-slots with which said connections are engaged, one with each slot, substantially as herein described.

11. The combination, with the two point-rails of a switch, and tie-rods connecting them and insuring their simultaneous movement, of operating rods or bars connected one with each point-rail, and a single motion-plate or bar by which equal and simultaneous motion is transmitted through said rods or bars to the two rails, substantially as herein described.

408,272. ASH-SIFTER. WILLIAM J. KATNER, Milwaukee, Wis. Filed Feb. 11, 1889. Serial No. 299,410. (No model.)

Claim.—The combination, in an ash-sifter, of the box and handle passing through one end thereof and secured in the other end, and the sliding top provided with loops through which the handle passes, one of which loops is located outside and the other inside the box, substantially as set forth.





408,273. UNIVERSAL ROLLING-MILL. JULIAN KENNEDY and HENRY AIKEN, Homestead, Pa. Filed Mar. 16, 1888. Serial No. 267,406. (No model.)

Claim.—1. In a universal mill, the combination of the vertical and horizontal rolls and separate reversible engines by which they are driven independently, substantially as and for the purposes described.

2. The combination of horizontal rolls, one of which is mounted

in vertically-adjustable bearings, a spindle connected therewith by a coupling-box, and a cradle supporting the spindle, said cradle being suspended by connections attached at substantially the centers of pivotal motion of the spindle ends in the coupling-boxes, substantially as and for the purposes described.

3. The combination, with the rest-bars which carry the vertical rolls, of the housings between which the rest-bars are mounted, each of the said housings having a window at the end of one of the lower rest-bars, through which the rest-bar may be inserted and withdrawn longitudinally, and fastening devices, substantially as described, by which the rest-bar is secured to the housing, substantially as and for the purposes described.

4. In a universal mill, the combination of the rest-bars which carry the vertical rolls, the housings between which the rest-bars are mounted, the said housings having openings or windows in which the lower rest-bars are fastened and through which they may be withdrawn longitudinally, and wedges for securing the rest-bars in said housings, substantially as and for the purposes described.

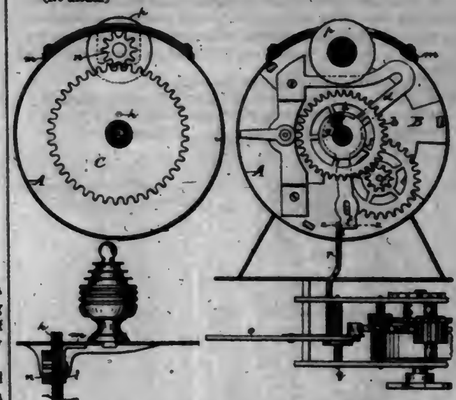
5. The combination, with the vertical roll, its carrier, and the screw mechanism by which the carrier is adjusted, of a hydraulic cylinder and its piston, which exert force on the carrier against the force of the screw mechanism, substantially as and for the purposes described.

6. The combination, with the laterally-adjustable vertical roll and the driving-shaft, of a movable pinion on said shaft connected with a pinion on the roll, and a cylindrical bearing encircling the end of the roll, which projects on the outer side of the pinion and movable with the pinion on the shaft, substantially as and for the purposes described.

7. The combination, with the laterally-adjustable vertical roll and its driving-shaft, of a pinion having a sleeve encircling the shaft and movable lengthwise thereon, and a collar loosely encircling the sleeve and having a tubular bearing which encircles the end of the vertical roll which projects on the outer side of its pinion, substantially as and for the purposes described.

8. In a universal mill, the combination, with the vertical and horizontal rolls, of guides extending from the vertical rolls between the horizontal rolls, substantially as and for the purposes described.

9. In a universal mill, the combination, with the horizontal rolls and laterally-adjustable vertical rolls, of guides extending from the vertical to the horizontal rolls, and screws which move the guides laterally, said screws being geared to move simultaneously with the adjusting-screws of the vertical rolls, substantially as and for the purposes described.

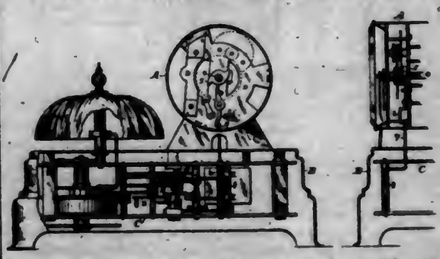


10. The combination, with the horizontal roll and its adjusting-screws, housings, and bearings, of a bar which extends across the housings and is interposed between the screws and the said bearings, said bar being made separate from the bearings, though held against the same by the pressure of the adjusting-screws, substantially as and for the purposes described.

11. The combination of horizontal rolls, a spindle, a carrier for the spindle, and a bar extending across the housings of the rolls and resting on the bearings thereof, said carrier being suspended from the said bar, substantially as and for the purposes described.

12. The combination, with the vertical rolls and their housings, of rest-bars for the rolls, which rest-bars extend between the housings and are notched or offset at the ends and provided with shoulders which bear against the inner and outer sides of the housings, bracing the same in both directions, substantially as set forth.

13. The combination of horizontal rolls, one of which is mounted in vertically-adjustable bearings, a spindle connecting the adjustable roll with its driving-shaft, and a cradle having separate bridge-pieces or supports 29, which support the spindle on both sides of the middle of its length, substantially as and for the purposes described.

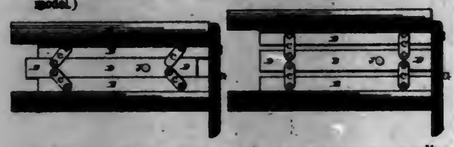


408,274. SETTING MECHANISM FOR ALARM-CLOCKS. ALBERT M. LANE, Meriden, Conn. Filed July 31, 1888. Serial No. 281,583. (No model.)

Claim.—1. In an alarm-clock, the combination of the shouldered cam *g*, revolving with the hour-wheel and sliding on the hour-socket, the setting-wheel C, having the pin *h* for engaging said cam, and the setting pinion and button mounted on an axis which is parallel with the center shaft, substantially as described, and for the purpose specified.

2. In an alarm-clock having a setting-wheel, as at C, the detachable cap *m*, bearing a lug and having pivoted thereon the setting pinion and button for engagement with the setting-wheel, substantially as described, and for the purpose specified.

408,275. CLOCK STRIKING MECHANISM. ALBERT M. LANE, Meriden, Conn. Filed Aug. 13, 1888. Serial No. 282,546. (No model.)

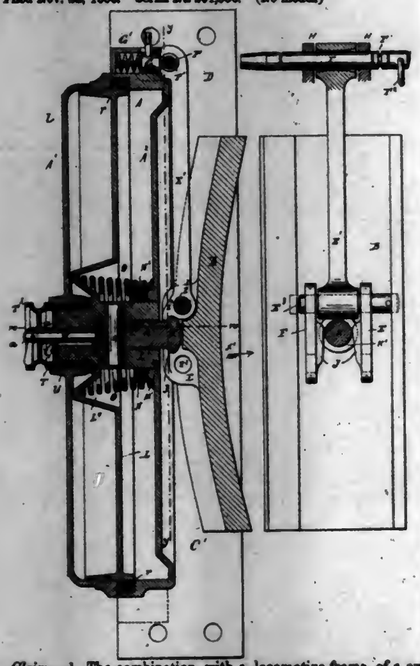


Claim.—1. The herein-described striking-clock, consisting of a clock-case, a time-movement having a strike-tripping mechanism within said case, and a striking-movement outside said case having a rigid arm extending from the warning-wire to a point by the side of the tripping mechanism within the clock-case, substantially as described, and for the purpose specified.

2. The combination of a clock-case, a time-movement within said case, the cam 5, attached to and moving with said time-movement, the tripping-lever 6, having one end in engagement with said cam, and the striking mechanism separate from the time-movement

and having an arm disunited from said lever and extending from the warning-wire to a point by the side of the other end of said lever, substantially as described, and for the purpose specified.

408,276. DEVICE FOR HANDLING GREEN TILES. JOHN W. LAUGHLIN, Parkville, Ill. Filed Jan. 29, 1889. Serial No. 297,956. (No model.)



Claim.—1. The combination of the two supports, an expanding-bar placed between them, the connecting-links, and a stop which is secured to one end of one of the supports, substantially as described.

2. The combination of two supports, an expanding-bar placed between them, connecting-links, and a stop which is secured rigidly to one of the supports and to which the other support is movably attached, substantially as set forth.

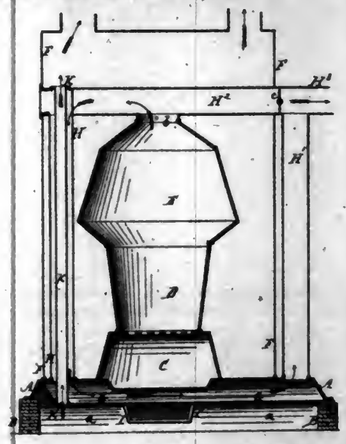
3. The combination of the two supports, an expanding-bar, the connecting-links, and a stop which is loosely attached to one of the supports and rigidly secured to the other and which is made to project at one of its ends beyond one of the supports, substantially as specified.

408,277. LOCOMOTIVE-BRAKE. LOUIS P. LAWRENCE, Passaic, N. J., assignor to the Lawrence Railway Brake Company, New York, N. Y. Filed Nov. 22, 1888. Serial No. 291,536. (No model.)

Claim.—1. The combination, with a locomotive-frame, of a cylinder projecting laterally from said frame adjacent to the rim of the wheels, the open end of said cylinder facing the rim of the wheel, and the said cylinder being flattened to have approximately the width of the wheel-rim, the long axis of said cylinder being parallel with one of the diameters of the wheel, a piston in said cylinder, and a brake-shoe connected with said piston and located between said piston and the rim of the wheel, substantially as set forth.

2. The combination, with a locomotive-frame, of a cylinder projecting laterally from the same, the open end of said cylinder facing the rim of the wheel, a piston in said cylinder, a brake-shoe operated by said piston and located between the piston and the rim of the wheel, and a link pivoted to the brake-shoe and to the top of the cylinder containing the piston that operates the shoe, substantially as set forth.

3. The combination, with a cylinder, of a piston in the same provided with a screw-threaded stem, and a cylindrical nut screwed on the stem and mounted to slide in an aperture in one head of the cylinder, substantially as set forth.



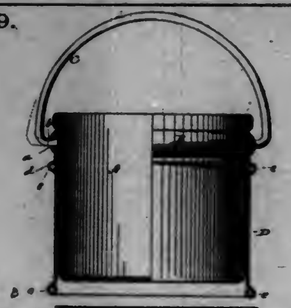
4. The combination, with a cylinder, of a piston having a screw-threaded stem, a cylindrical nut screwed on said stem and mounted to slide in an aperture in one head of the cylinder, and a bolt for locking the nut on said stem, substantially as set forth.

5. The combination, with the cylinder A, of the piston L, having the projection L', the link K, pivoted in the bore of said projection L', and having the head K' on its outer end, and the brake-shoe B, having the flanged lugs E, substantially as set forth.

6. The combination, with the cylinder A, of the piston L, having the projection L', the brake-shoe B, the spring O, the packing N, and the flanged ring N', substantially as set forth.

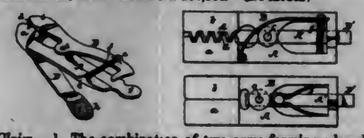
7. The combination, with a cylinder projecting from a plate and having a wing on that side of the cylinder opposite the one connected with the plate, of a brake-shoe between said plate and wing, and a piston in the cylinder connected with the brake-shoe, substantially as set forth.

408,278. HOT-AIR FURNACE. JAMES B. LONG, Rochester, N. Y., assignor to Rebecca B. Long, same place. Filed Oct. 1, 1887. Serial No. 251,220. (No model.)



Claim.—1. In a hot-air furnace, an air-chamber, a cold-air inlet, a combustion-chamber, a flue for products communicating with the combustion-chamber and extending downwardly, and having vertical and horizontal parts within the hot-air chamber, and the air-pipe located within the vertical part of said flue and communicating at its top and bottom with the air-chamber, whereby both the exterior and the interior of the current of escaping products are utilized to heat the air and the escaping products thoroughly cooled within the casing, and an updraft-pipe located outside the furnace, whereby said pipe and the interior of the horizontal part of the flue within the casing are made conveniently accessible, substantially as specified.

2. A hot-air furnace having a combustion-chamber, an ash-pit, an indirect-draft flue including a downdraft-pipe located in the air-space and an updraft-pipe outside the casing, the two being connected by a horizontal flue supporting the bottom of the ash-pit and supported by the masonry on which the furnace stands, said furnace having a direct flue connecting an upper horizontal part of the downdraft-pipe with the combustion-chamber, and also with the top of the exterior updraft flue or pipe, said part being at its opposite end extended through the furnace and provided with a cap, all as shown and described, whereby the exterior flue is made accessible, and whereby both horizontal flues may be easily cleaned, and the several parts so connected as to support each other, substantially as specified.



408,279. COOKING-VESSEL. HENRY A. MANNING, New York, N. Y. Filed Oct. 17, 1887. Serial No. 252,534. (No model.)

Claim.—The herein-described cooking-vessel, consisting of the vessel A, constructed with an annular shoulder, *d*, upon its outside near its upper edge, and also provided with a bail, combined with a jacket, D, made from sheet metal of ring shape and of a depth greater than the depth of the kettle from said shoulder to the bottom, the internal diameter of the jacket at both its upper and lower ends corresponding substantially to the diameter of the kettle at the said shoulder, substantially as described, and whereby the said jacket is not only made detachable from the kettle, but is also adapted to be inverted.

408,279.

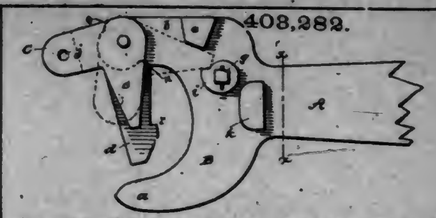
408,280. CUFF-RETAINER. JACOB M. MARCH, Phœnixville, Pa. Filed Jan. 24, 1888. Serial No. 297,261. (No model.)

Claim.—1. The combination of two arms forming a longitudinal clamp for engagement with a cuff, a jaw at the inner end of one of said arms, a lever having a jaw at its inner end, a spring acting on said lever, and a transverse pivot-pin, whereby said lever is hung to the arm of the longitudinal clamp so as to swing laterally, whereby its jaw forms, in connection with that of the arm, a laterally opening and closing clamp for engagement with the sleeve of a coat or other garment, substantially as specified.

2. The combination of two arms forming a longitudinal clamp for engagement with a cuff, a jaw at the inner end of one of said arms, a lever having a jaw at its inner end, a spring acting on said lever, a transverse pivot-pin, whereby said lever is hung to the arm of the longitudinal clamp, so as to swing laterally, whereby its jaw forms, in connection with the jaw of the arm, a laterally opening and closing clamp, one of said jaws being provided with a projecting needle-point and the other jaw having an orifice for the reception of said needle-point, substantially as specified.

3. A cuff-holder consisting of two clasps secured together with their clamping-jaws at reverse ends, the one comprising a fixed arm and a laterally-movable arm pivoted to the fixed arm near the end thereof, and the other clasp having arms pivoted together midway, or thereabout, of their length and provided with laterally-movable jaws, substantially as described.

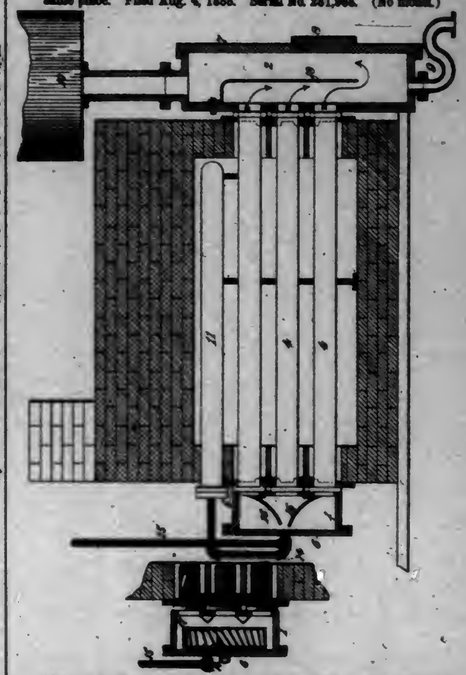
408,281. PLOW. ORLAN S. MEEKS, Evansville, and JOHN C. BROWN, Eureka, Ind. Filed Oct. 17, 1888. Serial No. 288,376. (No model.)



Claim.—A plow having a half-dovetail abutment, *c*, inclined obliquely backward, and a broad vertical bearing-surface, *s*, extending from said abutment to the heel of the landside, in combination with a broad-base colter beveled to interlock with said shoulder both vertically and laterally, and secured by transverse bolts to the plow, whereby the colter forms the main portion of the landside and is positively locked in its place, as specified.

408,282. CAR-COUPLING. ABNER J. MCGEHEE, Jackson, Tenn., assignor to himself and HENRY W. MCCORRY, same place. Filed Jan. 23, 1888. Serial No. 297,267. (No model.)

Claim.—1. The draw-head B, having the arms *a b*, the arm *b* being provided on its upper face with the stop *e* and on its lower face with the stop *f*, in combination with the jaw C, pivoted to the arm *b*



408,282.

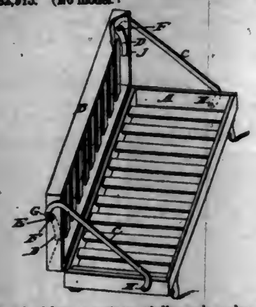
and provided with the arms *c d*, and the sliding bolt *g*, provided with the collar *i*, substantially as described.

2. The draw-head B, having the arms *a b*, the arm *b* being provided with the stop *e* on its upper face, the recessed stop *f* on its lower face, and the shoulder *n* on its inner face, in combination with the jaw C, pivoted to the arm *b* and provided with the arm *c d*, the arm *d* being provided with the projection *l*, and the sliding pin *g*, having the beveled lower end, *k*, and provided with the collar *i* at its upper end, substantially as herein shown and described.

408,283. APPARATUS FOR THE PRODUCTION OF GAS. ROBERT HAYSMITH, Pittsburg, Pa., assignor of one-half to Arthur J. Wilkinson, same place. Filed Aug. 4, 1888. Serial No. 281,968. (No model.)

Claim.—1. In a gas-producing apparatus, the combination of a furnace, a feeding-box and a delivery-box fixed, respectively, on opposite sides of said furnace, a multiple series of tubular retorts passing through the furnace and communicating at their opposite ends with the feeding and delivery boxes, and an oil-pipe, a steam-pipe, and an air-pipe each leading into the feeding-box, and frames fixed to the sides of the furnace and supporting said retorts adjacent to their ends and independently one of the other, substantially as set forth.

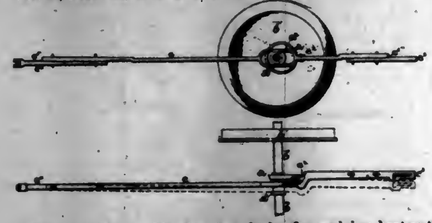
2. In a gas-producing apparatus, the combination of a furnace, a feeding-box and a delivery-box fixed, respectively, on opposite sides of said furnace, a multiple series of tubular retorts passing through the furnace and communicating at their opposite ends with the feeding and delivery boxes, an oil-pipe, a steam-pipe, and an air-pipe, each leading into the feeding-box, and frames fixed to the sides of the furnace and supporting said retorts with the capacity of independent insertion and removal upon the detachment of the feeding-box, substantially as set forth.



3. In a gas-producing apparatus, the combination of a furnace, a feeding-box and a delivery-box fixed, respectively, on opposite sides of said furnace, a multiple series of tubular retorts passing through the furnace and communicating at their opposite ends with the feed-

ing and delivery boxes, an oil-pipe, a steam-pipe, and an air-pipe, each leading into the feeding-box, and a mixer and distributer located within the feeding-box, substantially as set forth.

4. In a gas-producing apparatus, the combination of a furnace, a feeding-box and a delivery-box fixed, respectively, on opposite sides of the furnace, a multiple series of tubular retorts passing through the furnace and communicating at their opposite ends with the feeding and delivery boxes, an oil-pipe, a steam-pipe, and an air-pipe, each leading into the feeding-box, a discharge-pipe leading out of the upper portion of the delivery-box, and a deflecting-plate projecting downwardly in the delivery-box between the ends of the retorts and the discharge-pipe, substantially as set forth.



5. In a gas-producing apparatus, the combination of a furnace, two separate series of tubular retorts passing through the furnace, the retorts of each series communicating at their opposite ends with a feeding-box and a delivery-box, respectively, steam and air superheaters located in the furnace and communicating by pipes with the feeding-boxes of both series of retorts, and oil-pipes leading into said feeding-boxes, substantially as set forth.

408,284. BED-LOUNGE. CASEY NEWHOUSE, Los Angeles, Cal., assignor of one-half to Henry O. Bell, same place. Filed Nov. 16, 1885. Serial No. 182,913. (No model.)

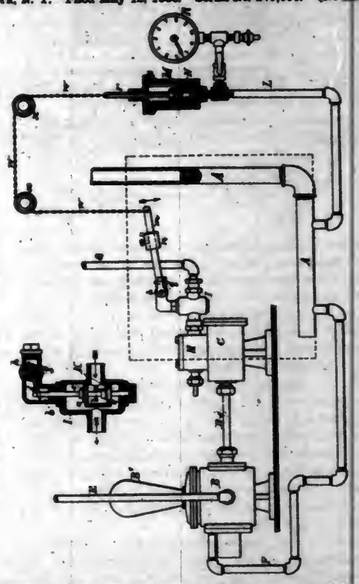
Claim.—In a bed-lounge substantially such as described, the combination, as set forth, of the back of the lounge, the seat-frame of the lounge, the brace C, pivoted by one end to the seat-frame, the arm E, pivoted to the other end of the brace C, the bolt F, rigidly secured to the arm E and pivoted in the back of the lounge, and the leg D, rigidly secured to the bolt F.

408,285. CAR-BRAKE. FRANK D. PARADISE, Chicago, Ill. Filed Dec. 26, 1888. Serial No. 294,573. (No model.)

Claim.—1. The combination, in a device for applying brakes to railroad and other cars, of a cam-wheel with a bevel-face and a sleeve and collars fixed to the axle of the truck, all substantially as set forth.

2. The combination, in a device for applying brakes to railway and other cars, of a pivoted sliding bar with adjustable ends and yoke for securing same to the sleeve of the cam-wheel on the sleeve or axle, and a friction-roller on the sliding bar, substantially as described.

3. The combination, in a device for applying brakes to railway and other cars, of a pivoted hand-lever provided with a friction-thimble on its end, and the pivoted sliding lever provided with a slot, all substantially as set forth.

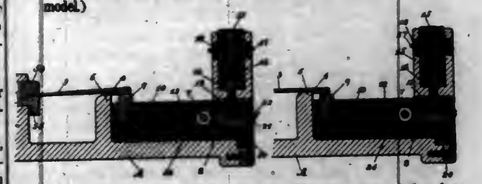


408,286. CALL-BELL. EUGENE H. PECK, Meriden, Conn., assignor to the Meriden Bronze Company, same place. Filed Apr. 16, 1888. Serial No. 270,849. (No model.)

Claim.—In a call-bell substantially such as described, the post B, constructed with a hammer opening through it and with laterally-projecting cheeks each side said opening, and the cheeks constructed with notches *a a*, opening laterally from the post and of a depth greater than the diameter of the trunnions on the hammer, the hammer constructed with a trunnion projecting each side its head and set into said notches, and the cheeks closed upon the trunnions, substantially as described.

408,286.

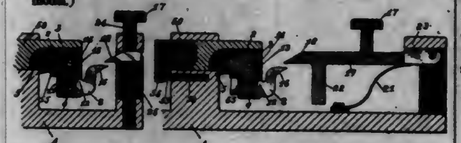
408,287. STEAM-HEATING APPARATUS. JOHN T. PEEK, New York, N. Y. Filed May 12, 1888. Serial No. 273,690. (No model.)



Claim.—1. The combination, with the steam-pump, steam-supply pipe, and valve for the same, of the reservoir for receiving the water of condensation, the separate cylinder M, and the pipe L, leading from the same to the reservoir, and a piston within the cylinder M, and a connection from the same to the lever of the steam-valve, substantially as and for the purposes set forth.

2. The combination, with the receptacle for the water of condensation, of a pump and connecting-pipe, a steam-engine, and a valve for controlling the supply of steam for the same, a separate cylinder, M, and a pipe, L, connecting from the cylinder to the reservoir, a cup-leather piston within the cylinder, and a chain connecting the piston-rod to the lever of the steam-valve, substantially as set forth.

3. The combination, with the reservoir or vessel for the water of condensation, of a steam-pump, a pipe connecting the reservoir to the pump, a steam-supply pipe and valve for the engine, the separate cylinder M, and the pipe L, connecting the cylinder to the reservoir, a piston within the cylinder, a piston-rod, a chain passing over the pulleys, and the lever for moving the steam-valve, substantially as set forth.



408,288. MECHANICAL MOVEMENT. FRANCIS H. RICHARDS, Springfield, Mass., assignor to Darius W. Dodson, Wilkes-Barré, Pa. Filed Dec. 18, 1886. Renewed May 2, 1888. Serial No. 272,532. (No model.)

Claim.—1. The combination, in a latch mechanism of the class described, of a latch having a hook engaging with a fixed notch, a key, and a hammer operated by said key and having an overthrow movement for disengaging the hook, all substantially as described.

2. The combination, with the latch and hook and a fixed notch for engaging said hook, of a divided key and an intermediate spring, the overthrow-hammer, and a detent resisting the first movement of said hammer, substantially as described.

408,289. MECHANICAL MOVEMENT. FRANCIS H. RICHARDS, Springfield, Mass., assignor to Darius W. Dodson, Wilkes-Barré, Pa. Filed Dec. 18, 1886. Renewed May 2, 1888. Serial No. 272,534. (No model.)

Claim.—1. The combination, in a latch mechanism of the class described, of a reciprocating latch, a compound latch-pawl carried thereon, the two parts of which pawl have a slack connection, a key, and a tripping device intermediate to said key and pawl, all substantially as specified.

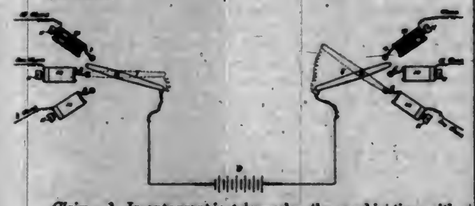
2. The combination, with a reciprocating latch, of pawl 4, carried thereon and constructed to carry lever 8, the lever 8, carried on said pawl and adapted to have a movement limited by stops, and a tripping-point, substantially as described, for operating said lever, substantially as specified.

3. The combination of the latch, a compound latch-pawl carried thereon, the two parts of which pawl have a slack connection, a key, and a rotary tripping device actuated by said key and intermediate to said key and pawl, all substantially as specified.

408,290. ROLLING-MILL. JAMES ROBERTSON, Birmingham, County of Warwick, England. Filed Aug. 31, 1887. Serial No. 248,302. (No model.) Patented in England Nov. 21, 1885. No. 14,290.

Claim.—1. The combination of an elongated channel-housing with rolls traversing said housing, a guide for the rolls, and means for forcibly passing the material through between the rolls and thereby traversing the latter in the housing.

2. The combination of an elongated channel-housing with a pair of rolls traversing said housing, a guide for the two rolls, and means for applying power to the material to forcibly pass it through between the rolls and thereby traverse the latter in the housing.



3. The herein-described machine for rolling metal and other objects, said machine comprising a pair of rolls between which the material is operated on and a guide for the rolls, in combination with elongated channel-housings in which bearing-surfaces of the rolls traverse and are revolved by frictional contact.

4. The combination of an elongated channel-housing with grooved rolls traversing said housing, a guide for the rolls, and means for applying power to the material to pass it through between the rolls and thereby traverse the latter in the housing.

5. The combination of an elongated channel-housing with grooved rolls traversing the housing, a guide for the rolls, and a mandrel to be passed with the metal through between the rolls, substantially as described.

6. The combination of an elongated channel-housing with two pairs of grooved rolls at right angles to each other and traversing said housing, a guide for the rolls, and means for applying power to the material to pass it through between the rolls and thereby traverse the latter in the housing.

408,291. EXCHANGE SYSTEM FOR TELEGRAPHS. JAMES H. ROBERTSON, Rutherford, N. J. Filed Nov. 23, 1886. Serial No. 219,561. (No model.)

Claim.—1. In autographic telegraphy, the combination, with a number of conductors of different resistances extending from the subscribers' instruments to and terminating in a central office, of switching means for electrically connecting any two of said conductors, and equalizing-resistances, whereby the combined resistance of any two conductors that may be connected with each other is made approximately the same, substantially as described.

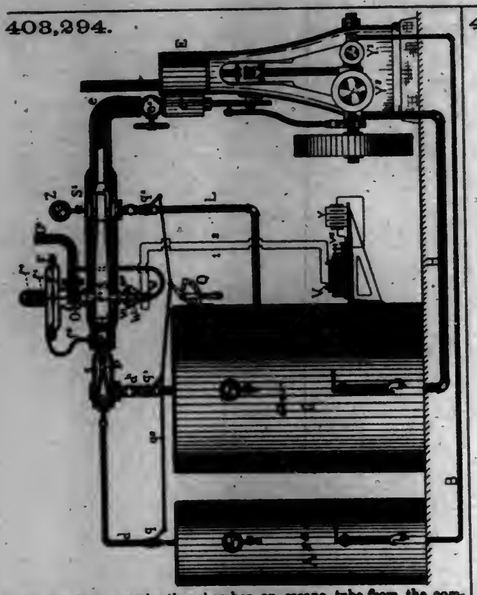
2. The combination, with a number of conductors of varying resistance terminating in a central or exchange office, of a pile of carbon disks inserted in each conductor, each pile being provided with an adjusting-screw for adjusting the resistance thereof, whereby the combined resistance of any two conductors that may be connected with each other is made approximately the same, substantially as described.

408,292. COMBINED TELEPHONY AND TELEGRAPHY. JAMES H. ROBERTSON, Rutherford, N. J. Filed Jan. 6, 1887. Serial No. 223,537. (No model.)

Claim.—The combination, with an autographic telegraph, of a telephone the secondary circuit of which is arranged in inductive proximity to the receiver electro-magnets of the autographic telegraph, substantially as described.

408,293. TOOL FOR REMOVING SHELL-CROWNS FROM TEETH. CHARLES H. ROSENTHAL, Cincinnati, Ohio, assignor of one-third to Louis W. Wyler. Filed Mar. 13, 1889. Serial No. 303,063. (No model.)

Claim.—In a device for removing shell-crowns from teeth, the elongated internal screw-threaded nut N, adapted to receive a screw-thread shaft, S, in combination with the clamp C, loosely journaled on the nut N, having the flanges *c*, substantially as shown and described.



408,294. AIR AND GAS ENGINE. ALBERT SCHMID and J. CHARLES BECKFELD, Allegheny, Pa. Filed May 17, 1886. Serial No. 274,194. (No model.)

Claim.—1. The combination of a gas-reservoir, an air-reservoir, a mixing-chamber, a combustion-chamber into which the mingled gas and air is delivered and in which it is burned, and an automatic pressure-regulating device determining an unchangeable excess of pressure in the mixing-chamber above that in the combustion-chamber.

2. In an air and gas engine, a mixing-chamber, a combustion-chamber, and an outlet from the combustion-chamber to the atmosphere, in combination with a regulating device for determining the relative opening of the outlet from the combustion-chamber to the atmosphere.

3. The combination of an air-reservoir, a gas-reservoir, a mix-

408,294.

ing-chamber, a combustion-chamber, an escape-tube from the combustion-chamber, a movable body, connections from the mixing-chamber to one side of the movable body and connections from the combustion-chamber to the other side of the movable body, and a valve for the escape-tube whose position is controlled by the relative pressures upon the two sides of the movable body.

4. In an air and gas engine, a combustion-chamber and a pressure-regulator therefor, consisting of a movable body, a chamber including the same, a spring exerting a tension in one direction upon the movable body, an outlet from the combustion-chamber controlled by the position of the movable body, and openings upon opposite sides of the chamber from the combustion and the air and gas chambers, respectively.

5. The combination of an air-reservoir, a gas-reservoir, a mixing-chamber, tubes leading from the reservoirs to said mixing-chamber, a combustion-chamber, an escape-tube from the combustion-chamber, a diaphragm, connections from the mixing-chamber to one side of the diaphragm, connections from the combustion-chamber to the other side of the diaphragm, a valve for the escape-tube whose position is controlled by the relative pressures upon the two sides of the diaphragm, and a spring exerting its pressure upon one side of the diaphragm.

6. In an air and gas engine, a mixing-chamber receiving air and gas, a combustion-chamber, and an intervening perforated wall or burner, in combination with a regulating device for predetermining a fixed and constant excess of pressure on the mixing-chamber side.

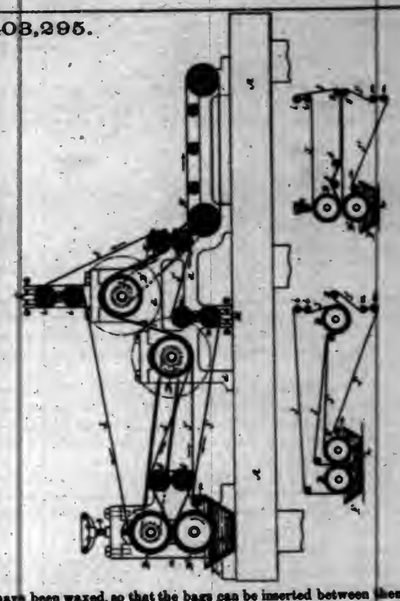
7. In an air and gas engine, the combination, with the combustion-chamber and the tubes supplying air and gas to the same, of an independent air-supply tube terminating in the combustion-chamber, and a regulating device operating to permit a continuous flow of air to the combustion-chamber through the independent air-supply tube.

8. In an air and gas engine, the combination of the air and gas reservoirs, the mixing-chamber, the tubes leading thereto from the air and gas reservoirs, the cooling-chamber, and the tube leading from the air-reservoir to the cooling-chamber, with a regulating device operating to permit a continuous flow of air to the cooling-chamber and thence through the regulator-valve to the atmosphere.

9. In an air and gas engine, the combination of air and gas reservoirs, the mixing-chamber, the tubes leading thereto from the air and gas reservoirs, the cooling-chamber, the tube leading from the air-reservoir to the cooling-chamber, valves for controlling the openings of the respective tubes, and a lever for controlling the position of all of said valves simultaneously.

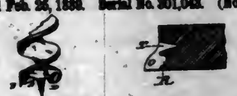
408,295. MACHINE FOR COATING OR IMPREGNATING BAGS WITH WAX. ADOLPH SMAL, Camden, N. J. Filed Mar. 20, 1888. Serial No. 267,736. (No model.)

Claim.—1. The combination of the two aprons, rolls for guiding and feeding the same, means for applying wax to the contiguous faces of the aprons, and a spreader for separating the aprons after they have been waxed, so that the bags can be inserted between them, substantially as specified.



2. The combination of the two aprons, rolls for guiding and feeding the same, means for applying wax to the contiguous faces of the aprons, and one or more heated rolls for imparting pressure to the waxed aprons after the bags have been inserted between them.

3. The combination of the two aprons, rolls for guiding and feeding the same, means for applying wax to the contiguous faces of the aprons, a spreader for separating the aprons after they have been waxed, and one or more heated press-rolls for acting upon the aprons after the spreading of the same, all substantially as specified.



4. The combination of the two aprons, heated rolls around which said aprons pass, means for applying wax to the aprons as they pass around said heated rolls, rolls for holding the aprons in contact with each other after they have passed around the heated waxing-rolls, and means for imparting movement to the rolls, so as to cause the traversing of the aprons, substantially as specified.

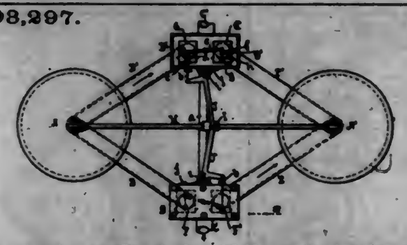
5. The combination of the two aprons, guide-rolls therefor, heated waxing-rolls, one or more press-rolls, means for applying wax to one of the aprons as it passes around its heated waxing-roll and before it comes in contact with the apron passing around the other waxing-roll, a spreader for the aprons, located between the waxing-rolls and press-roll, and means for driving the rolls so as to traverse the aprons, substantially as specified.

408,295.

408,296. DIE FOR FORMING AUGER-HEADS. HENRY I. SHALER, Deep River, Conn., assignor of one-half to Simeon H. Jennings, same place. Filed Feb. 26, 1889. Serial No. 301,042. (No model.)

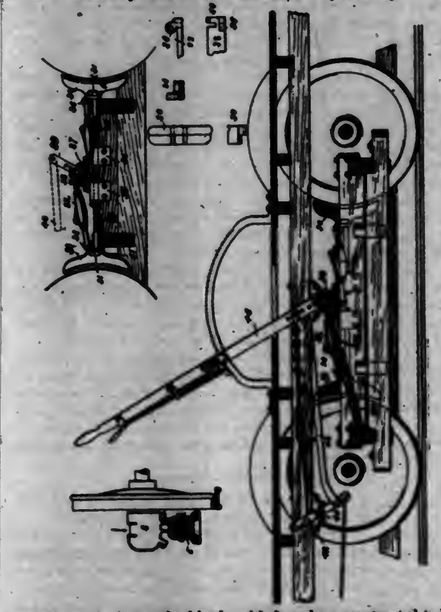
Claim.—The herein-described dies for forming the heads of augers, the said dies consisting of two parts, each part constructed with a longitudinal cylindrical groove of a diameter corresponding to the diameter of the auger to be headed, the said grooves constructed with diagonal ribs I, corresponding to one twist of the auger back of the head, and the one part, F, constructed with a similar diagonal rib, having its face of the shape desired for the inside of the gouge-lip, the corresponding rib, L, of the other part presenting a flat face, M, upon the opposite side of the groove to the projection K, and a cylindrical follower having its end constructed with two projections, O P, corresponding to the face of the auger-head, the one projection P having a cavity, R, formed therein corresponding to the exterior surface required for the gouge-lip, and the other projection, O, having a surface corresponding to the flat surface M of the other die.

408,297. GAS-METER. WILLIS Y. STANBROUGH, Brooklyn, N. Y. Filed Jan. 8, 1888. Serial No. 255,773. (No model.)



Claim.—1. A gas-meter comprising in its structure a pair of bellows, valves for controlling the flow of fluid, centrally-pivoted toggle-levers connected with said valves, a beam connected with the bellows and engaging with the toggle-levers, and springs acting on the toggle-levers for completing the movement of the latter to actuate the valves, substantially as described.

2. A gas-meter comprising in its structure a pair of bellows, receiving and discharge pipes, valves controlling the same, toggle-levers connected with said valves, a beam vibrated by the movement of the bellows, an arm on said beam engaging with the joint of the toggle-levers, and springs engaging with cam-surfaces on the ends of said toggle-levers for actuating the valves, substantially as described.



3. In a gas-meter, the combination of a pair of bellows, separate receiving and discharge chambers having pipe-connections with the bellows, as described, four valves controlling the said pipe-connections, a beam vibrated by the movement of the bellows, toggle-levers engaged by the beam, the two members of the toggle-levers being connected, respectively, with two of the valves, and a connection between each of said valves and its companion valve, substantially as described.

4. A gas-meter comprising in its structure a pair of bellows, separate receiving and discharge chambers, two receiving-pipes connected with the receiving-chamber and leading to the respective bellows, two discharge-pipes leading from the respective bellows and terminating in the discharge-chamber, and four valves—one for each pipe—located in the respective chambers, substantially as and for the purpose set forth.

408,297.

408,298. CAR-TRUCK BRAKE. JOHN SCHAMMEL, New York, N. Y. Filed July 20, 1888. Serial No. 280,609. (No model.)

Claim.—1. A car-wheel brake with four shoes constructed to be slipped sidewise on four tenons of four slide-bars, supported by four cross-rails of a truck, with four wheels on two axles, having four journals outside of the four wheels, with four axle-boxes having four pendent limbs, to which are connected the four corners of the car-truck, substantially as and for the purpose described.

2. A car-brake shoe having a lug at one side of the center of the back, provided with a polygonal mortise and adapted to fit a laterally-extended polygonal tenon at the end of the brake-shoe bar, and having a fastening device to retain the shoe in an invariable vertical position, substantially as described.

3. A wheel-brake shoe with a transverse mortise or eye in part of its thickness, and a recess in the remaining part of its thickness, the mortise and recess adapted to the tenon and shoulder of a brake-shoe bar to hold the shoe perpendicular in its movements to and from the car-wheel, substantially as and for the purpose described.

4. A wheel-brake-shoe bar with part of its head forming a shoulder against which the brake-shoe rests, and another part extended to form a tenon adapted to occupy a correspondingly-shaped mortise in the brake-shoe, whereby the combination of the shoulder with the tenon is adapted to maintain the brake-shoe in a vertical position when moved to and from the car-wheel, substantially as described.

5. A car-wheel brake having a slide shoe-bar, with a lug fitted to receive the end of an extensible bar connected with an arm of the truck rock-shaft, substantially as and for the purpose described.

6. A car-wheel-brake-shoe bar resting on a section of a cross-bar between the wheel-faces, and carrying a shoe at the head of the bar, with the tail of the bar free to slide through a keeper secured to the inner side of the truck-sill, substantially as and for the purpose described.

7. A car-wheel brake with its shoe-sliding bar in a guide-box on the truck cross-rail and the end of said bar in a guide secured to the truck-sill, substantially as and for the purpose described.

8. A car-wheel-brake rock-shaft with ends journaled to the sills and sub-sills sustained below the axles and pedestals by pendants integral with the axle-box shells, each rock-shaft having an arm with articulated rod adapted to transmit the energy of the operator to the brake mechanism, substantially as and for the purpose described.

9. A car-truck with its four corners carried by four integral pendants of four axle-boxes on four journals of two axles having on them four wheels, the sills and sub-sills of the truck sustaining the bearings of four journals of two rock-shafts, with their arms and connecting-rods adapted to communicate the energy of the operator to move the four brake-shoes to and from the four car-wheels of the truck, substantially as shown and described.

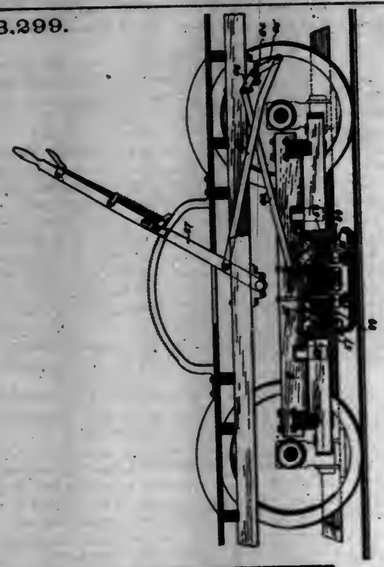
10. A car-wheel brake having at each side of the car-truck an arm on opposite sides of a rock-shaft, each arm having an articulated bar capable of expansion and contraction lengthwise between the arm and the lug of the sliding shoe-bar, which, with its shoe, is borne by a cross-rail of the truck, substantially as and for the purpose described.

11. A car-wheel-brake mechanism carried by a truck borne by its four corners beneath four pendants integral to four axle-box shells on four axle-journals of two car-axles with four wheels, the two truck rock-shafts having four arms connected by four articulated adjustable rods with four lugs on four sliding bars resting on four cross-bars of the truck and carrying four brake-shoes adapted to be moved horizontally to and from the wheels by the energy of the operator transmitted through a floor rock-shaft secured to the car-body beneath its floor, and an arm on each end of the floor rock-shaft having rod-connections with the rock-shaft at each side of the truck, substantially as and for the purpose described.

12. A wheel-brake rock-shaft arm holding a recoil-rod on which is a spring adapted to retract the brake, substantially as and for the purpose described.

13. A car-wheel-brake mechanism composed of brake-shoes, shoe-bars supporting the same, guides for said bars, articulated bars directly or indirectly connecting the shoes to the rock-shafts, recoil-rods connected to retract the brake, parallel rods connecting the floor and truck rock-shafts, and an operator's lever-handle connected with the rock-shaft by an operator's energy-transmitting rod, all arranged to operate substantially as and for the purpose described.

408,299. TRACK-BRAKE FOR CARS. JOHN SCHAMMEL, New York, N. Y. Filed July 20, 1888. Serial No. 280,610. (No model.)



Claim.—1. The within-described car-track-brake mechanism, consisting of twin rock-shafts with their arms connected by an articulated bar, substantially as and for the purpose described.

2. The within-specified car-track-brake mechanism at each side of a car, with an articulated bar connecting twin rock-shafts, which shafts are connected by articulated bars with the track-brake shoe, substantially as and for the purpose described.

3. Car-track-brake mechanism with an arm of its rock-shaft and a stop on the housing arranged to be struck by the arm before a dead-center is reached by the connections between the shoe and rock-shaft, substantially as and for the purpose described.

4. Car-track-brake mechanism with articulated bars connecting the track-shoes and coupled twin rock-shafts, one of which shafts has an elongated arm, with an articulated rod for transmitting the energy of the brake-operator to the brake mechanism, substantially as and for the purpose described.

408,299.

408,300. CAR-TRACK-BRAKE HOUSING. JOHN STEPHENSON, New York, N. Y. Filed July 30, 1888. Serial No. 280,512. (No model.)

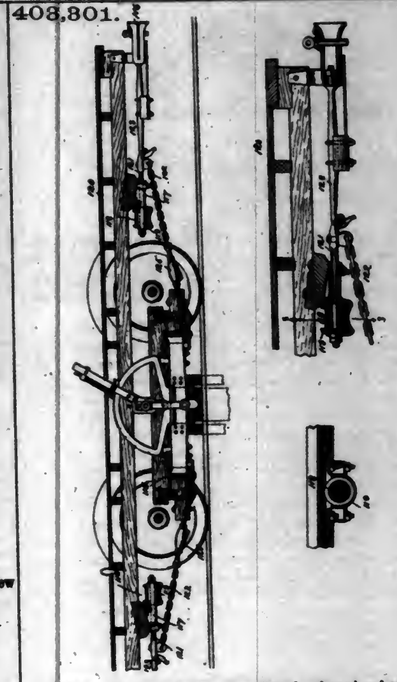
Claim.—1. A track-brake housing consisting of a rigid frame secured to the car truck or carriage at one side of the car and constructed with bearings for horizontal rock-shafts, and with vertical guides to support the working parts of the car track-brake, substantially as and for the purpose described.

2. A track-brake housing having vertical guides adapted to vertical members of the track-shoe to control the motion thereof, and with a vertical wall with sockets or bearings for the ends of horizontal rock-shafts, substantially as and for the purpose described.

3. A track-brake housing having at the under side of its head-plate one or more rock-shaft journal-bearings for horizontal rock-shafts, substantially as and for the purpose described.

4. A track-brake housing with bearings for twin rock-shafts having arms with articulated bars coupled to the shoe, substantially as and for the purpose described.

5. A track-brake housing having bearings for a rock-shaft, and having a stop adapted to limit the revolution of the rock-shaft, substantially as and for the purpose described.



6. A track-brake housing supporting a rock-shaft united to the brake-shoe by an articulated bar, and an arm of the rock-shaft with an articulated bar connected with the hand-lever and adapted to convey the energy of the operator to the brake mechanism, substantially as and for the purpose described.

7. A track-brake housing supporting a track-shoe with two articulated bars connecting the shoe with twin rock-shafts united by an articulated bar, and each rock-shaft having its two journals in bearings in the housing-walls, one of the rock-shaft arms connected with a rod capable of conducting the energy of the brake-operator to the track-shoe, substantially as and for the purpose described.

8. A track-brake housing with shaft-bearings and guides holding in assemblage the mechanism of a brake and constructed for attachment to the car, substantially as and for the purpose described.

9. A track-brake housing having on its rear wall guides for vertical members of the track-shoe, substantially as and for the purpose described.

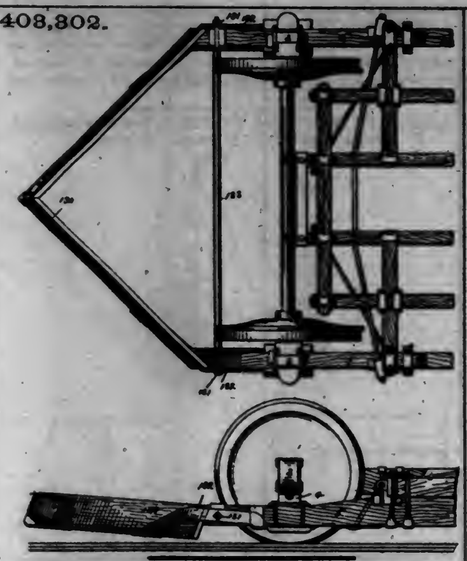
408,301. DRAW-GEAR FOR CABLE CARS. JOHN STEPHENSON, New York, N. Y. Filed July 30, 1888. Serial No. 280,513. (No model.)

Claim.—1. A car having at each end a draw-head connected by a stiff bar with the head of a slide-bar having its smaller end passing through a spring in a socket or housing secured to the bottom of the car-body, the slide-bar being connected by a chain with a grip-carrier capable of end motion affecting only the spring and draw-head behind the grip-carrier, substantially as described.

2. A cable car with a draw-head at each end of the car, each draw-head having a stiff bar-connection with a slide-bar extending through a spring in a socket or housing secured to the car-bottom, the slide-bar having a chain-connection with a grip-carrier, which grip-carrier, with the two chains, two springs, two slide-bars, two stiff connecting-bars, and two draw-heads, are all arranged to be moved when either of the draw-heads is pulled, substantially as described.

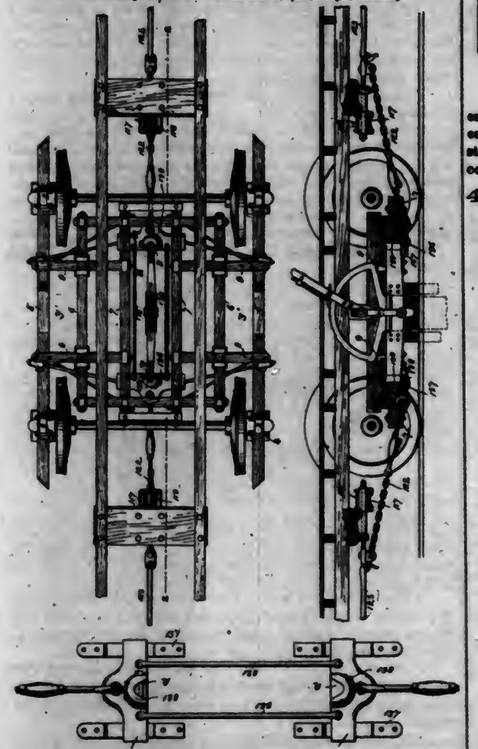
3. A cable car having a draw-head system with a chain-connection between the spring slide-bars and the grip-carrier adapted to let the cable control only the grip-carrier and the part of the system behind it, substantially as shown and described.

4. A cable car with a chain connecting the grip-carrier with the slide-bar, and a spring attached to the floor of the car-body at a place intervening between the draw-head and the grip-carrier, the chain being extensible and adapted to adjust the distance between the draw-head and the grip-carrier, substantially as shown and described.



5. A car having a system of draw-heads containing the following elements, to wit: two draw-heads with two stiff bars connecting the draw-heads with two spring slide-bars having on their tails two springs with four spring-cups in two spring-sockets, and two chains connecting the two slide-bars with one grip-carrier, all connected and adapted to co-operate in performing functions of the car service, substantially as shown and described.

408,302. CAR-TRACK GUARD. JOHN STEPHENSON, New York, N. Y. Filed July 30, 1888. Serial No. 280,514. (No model.)



Claim.—1. A car having a truck-frame supported at the ends of the axles by pendants integral with the axle-box shells, and having the truck-sills extending endward before the car-wheels, with a car-track guard pivoted to the ends of the truck-sills and adapted to automatically push from the track accidental obstructions and overcome surmountable obstacles, substantially as described.

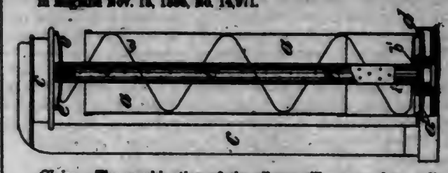
2. A car-track guard extending across the track in advance of the car-wheels and jointed to the sills, the wings of the guard provided with metal joint-plates extending beyond the wings and joint-bolts and continuing along the truck-sills, with the ends of the joint-plates bent under the sills and adapted to contact with the sills to counterpoise the track-guard and hold its guard at its desired elevation above the road-surface, substantially as shown and described.

408,302.

408,303. CABLE-GRIP CARRIER. JOHN STEPHENSON, New York, N. Y. Filed July 31, 1888. Serial No. 280,630. (No model.)

Claim.—1. A cable-grip carrier consisting of two end bars and two articulated rods, forming a four-sided frame capable of assuming variable angles as it is controlled by the grip, each end bar having at its external edge an eye or hook suitable to be connected with the draw-head spring, adapting the grip-carrier to be put in motion by the cable while the car is quiescent, substantially as and for the purpose described.

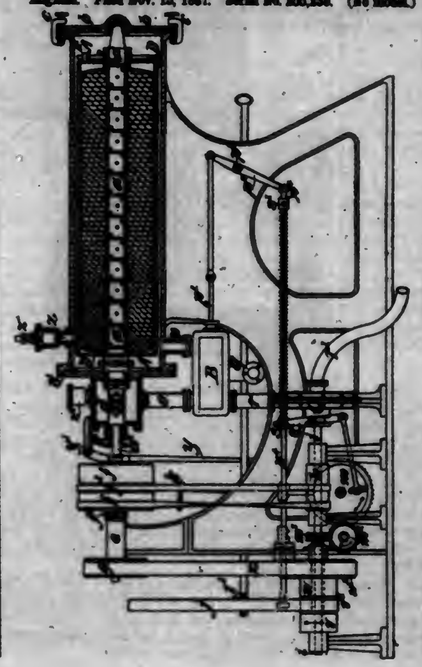
2. A cable-grip carrier with its two end bars having each a grip-lodge in form of a cove adapted to receive the upper corners of the grip, the walls of the lodge rising above the grip, and a key passing through both walls and crossing the grip and adapted to keep the same in place, substantially as and for the purpose described.



3. A cable-grip carrier with each end bar provided with a grip-lodge holding the corners of a cable-grip, kept in place by a key with its bit in a horizontal plane, passed through the lodge-walls above the grip, and the key-bit provided with a handle, so as by its gravity when in place, to assume a position preventing the escape of the key, substantially as and for the purpose described.

4. In a car-truck, the combination of a truck-frame rigidly supported from the axle-box shells by pendants thereof and provided with plates for the brake mechanism, and a cable-grip carrier adapted to said frame and movably supported therein below the axle-journals outside of the wheels, substantially as described.

5. A cable-grip carrier adapted to a truck-frame having its supports outside of the car-wheels, the carrier being in the central part of the truck and supported by keepers to permit endwise and lateral motion, substantially as described.



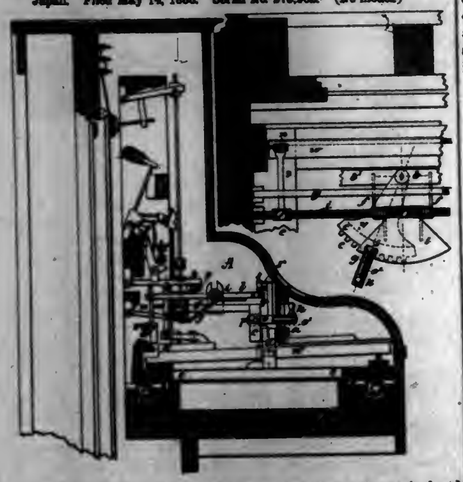
6. In a car-truck, a truck-frame rigidly supported from the axle-box shells by pendants and provided with a central wall, *x*, for the cable-grip mechanism, and also provided with two walls, *y y*, for brake mechanism, one on each side of the truck-frame, substantially as described.

408,304. SILVER-COILING CAN FOR CARDING-MACHINES. ELY SUTCLIFFE and GEORGE H. SUTCLIFFE, Halifax, County of York, England. Filed Nov. 15, 1887. Serial No. 255,292. (No model.) Patented in England Nov. 15, 1886, No. 14,971.

Claim.—The combination of the silver-coiling can of a carding-engine with a perforated tube removably mounted therein, a movable end plate upon the tube, and a spring supporting the plate, all substantially as described, whereby the silver from the engine will be coiled upon the perforated tube, as set forth.

408,305. APPARATUS FOR WASHING, BLEACHING, AND DYEING. ELY SUTCLIFFE and GEORGE H. SUTCLIFFE, Halifax, County of York, England. Filed Nov. 15, 1887. Serial No. 255,293. (No model.)

Claim.—1. An apparatus for washing, bleaching, or dyeing textile materials, said apparatus comprising a closed chamber and a hollow perforated shaft therein adapted to be surrounded by the materials to be treated, in combination with driving-pulleys, belts, and a belt-shifter for reversing, supply-pipes communicating with the interior of the shaft and the interior of the chamber to allow a flow of liquid through them, and a valve for reversing the direction of the flow at intervals, all substantially as set forth.



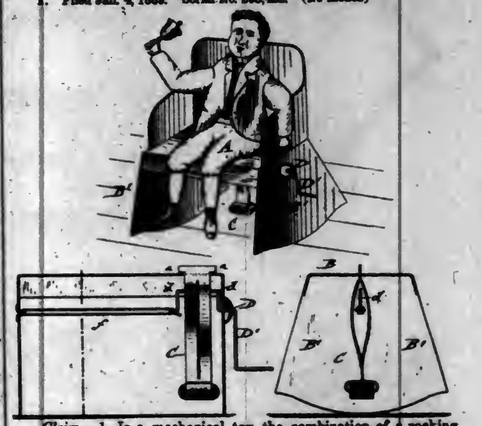
2. An apparatus for washing, bleaching, or dyeing textile materials, and comprising a closed chamber, a hollow perforated shaft therein provided with collars, and a perforated inclosing-tube to fit over the collars on the shaft, in combination with driving-pulleys, belts, and a belt-shifter for reversing, supply-pipes communicating with the shaft and chamber, and a valve for reversing the direction of the flow of liquid, all substantially as set forth.

3. An apparatus for washing, bleaching, or dyeing textile materials, and comprising a chamber and a hollow perforated shaft to carry the said materials in the form of a package around the shaft, in combination with driving-pulleys, belts, and belt-shifter for reversing, supply-pipes communicating with the shaft and chamber, a valve for reversing the flow of liquid, and an additional set of driving belts and pulleys to give more rapid revolution to the shaft when the liquid is to be discharged from the package, all substantially as specified.

4. An apparatus for washing, bleaching, or dyeing textile materials, and comprising a closed chamber and a hollow perforated shaft inclosed within the materials and contained in the said chamber, in combination with a four-way valve connecting with the interior of the shaft, the interior of the chamber, and with a liquor-pump and a discharge-pipe, mechanism to reverse the direction of revolution of the hollow shaft at intervals during the operation, and devices, substantially as described, for operating the valve at intervals to reverse the direction of the current of liquid, all substantially as set forth.

5. An apparatus for washing, bleaching, or dyeing textile materials, and comprising a closed chamber, a hollow perforated shaft provided with collars, and a perforated inclosing-tube to carry the said materials and to fit on the shaft, in combination with mechanism for forcing or drawing liquid through the materials, substantially as set forth.

408,306. TRANSPOSING KEY-BOARD. SHOMÉ TANAKA, Awaji, Japan. Filed May 14, 1888. Serial No. 273,902. (No model.)

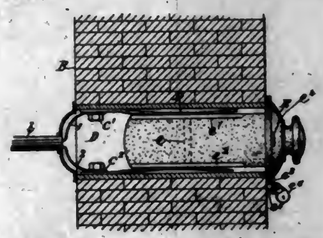


Claim.—1. In a transposing device for pianos, the rack *d* and the key-board frame carrying the same, combined with the lever *y*, having a toothed sector. *c*, engaging said rack, and with the wall *a*, having notches in which the lever can rest to retain the key-board, substantially as shown and described, and for the purpose set forth.

2. In a transposing device for pianos, the combination of the key-board that is movable sidewise and a lever, *y*, having a toothed sector, *c*, with the rack *d*, fastened to the key-board frame, and with means, substantially as described, for lifting the feet *m* from the felts *s* of the key-beams prior to the displacement of the key-board, as specified.

3. The combination of the movable key-board *c*, lever *y*, for actuating same, and means for retaining said lever, upright *g*, lever *l*, engaged thereby, shaft *i*, carrying said lever, arms *t* on said lever, cross-bar *g* on said arms, springs *f*, wings *h*, and feet *m*, substantially as shown and described, and for the purpose set forth.

4. In a transposing device for pianos, the key-board adapted to be shifted, in combination with the swinging bar *w*, to prevent the rising of the key-beams, and with means, substantially as described, for actuating said bar *w*, substantially as shown and described, and for the purpose set forth.



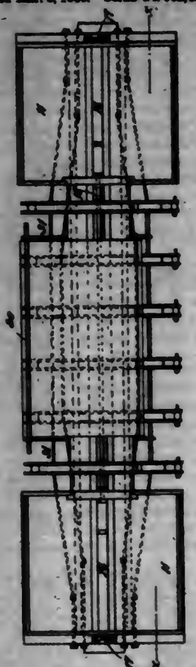
408,307. MECHANICAL TOY. RICHARD THOMMANN, Brooklyn, N. Y. Filed Jan. 4, 1889. Serial No. 295,422. (No model.)

Claim.—1. In a mechanical toy, the combination of a rocking frame, a pendulum provided with a slot or opening and pivoted to said platform in the plane of the center of gravity of the same, a crank-shaft journaled to said rocking frame and engaging by its crank the slot of the pendulum, and a torsion-spring attached at one end to the crank of the crank-shaft and at the opposite end to the rocking frame, substantially as set forth.

2. In a mechanical toy, the combination of a rocking-frame, a pendulum pivoted to said rocking frame at a point in the plane of the center of gravity of the same, said pendulum being made of two concave-convex sections, a crank-shaft journaled to said rocking frame and engaging by its crank the sections of said pendulum, and a torsion-spring connected to the crank and to a fixed point of the rocking frame, substantially as set forth.

408,308. SYSTEM OF ELECTRICAL DISTRIBUTION. EDWARD P. THOMPSON, Elizabeth, N. J. Filed Mar. 18, 1887. Serial No. 231,374. (No model.)

Claim.—1. The combination, with an electric converter, of a circuit-closing plug carried thereby, contact-plates upon said plug connected with the respective terminals of one of the coils of the converter, and a short-circuiting contact carried by said plug.



2. The combination, with an electric converter, of a circuit-closing plug carried thereby, contact-plates upon said plug connected with the respective terminals of one of the coils of the converter, and an electric-lamp socket carried by said converter.

3. An electric converter, means for forming electrical connections with the primary coil of the same, and an electric-light socket carried upon the converter in which the terminals of the secondary coil terminate.

4. The combination, with the wall of a building having an aperture and the terminals of an electric circuit placed within said aperture and insulated from each other, of a sliding plug between the terminals and a covering for the aperture closing the same, said wall having a second aperture beneath the first for receiving said plug when pushed from between said terminals.

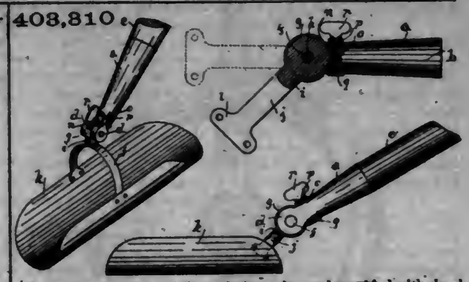
5. The combination, with an electric converter, of an electric-light socket supported thereby and connected therewith and a regulator serving to modify the length of one of the coils of the converter.

408,309. RAILWAY-CAR. JAMES J. THEARDE, Hastings-upon-Hudson, N. Y. Filed Mar. 5, 1888. Serial No. 302,412. (No model.)

Claim.—1. A car provided with end platforms and with a central longitudinal girder which rests upon said platforms, substantially as described.

2. A car provided with end platforms, a central longitudinal girder, A-frames carried by the end platforms, and a horizontal shaft supported by said frames, substantially as described.

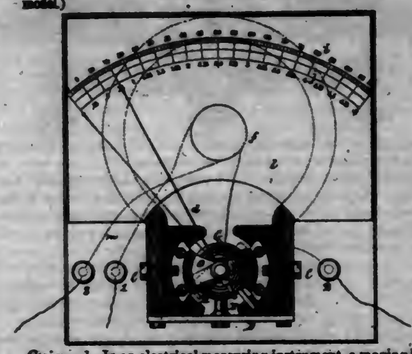
3. In a car, the combination, with the end platforms, of a central longitudinal girder, A-frames carried by the platforms, struts arranged in connection with the frames, a horizontal shaft carried by the frames, intermediate A-frames supported by the girder and supporting the shaft, knees mounted upon said shaft and formed with hooked lower ends and with laterally-extending sections, and skids carried by the knees, substantially as described.



4. In a car, the combination, with the end platforms, of a longitudinal girder carried thereby, A-frames carried by the platforms, a horizontal shaft supported by the frames, intermediate A-frames supported by the girder and supporting the shaft, knees mounted upon the shaft, skids carried by the knees, and bars connected to the intermediate A-frames and arranged for connection with lateral extensions from the knees, substantially as described.

5. In a car, the combination, with the end platforms, of a longitudinal girder carried thereby, A-frames carried by the platforms, a horizontal shaft supported by the frames, intermediate A-frames supported by the girder and supporting the shaft, knees mounted upon the shaft, skids carried by the knees, bars connected to the intermediate A-frames and arranged for connection with lateral extensions from the knees, links 31, and a bar or rail, 30, substantially as described.

408,310. HANDLE ATTACHMENT FOR SHOVELS, &c. ROBERT TRIMBLE, Chattanooga, Tenn. Filed June 16, 1888. Serial No. 277,230. (No model.)



Claim.—The combination, with the ball or shank of a shovel or other implement provided with a circular projecting portion, *g*, having on its periphery worm-screw teeth, a handle-socket provided on one end with ear-pieces placed on each side of the said portion *g*, and a pin, *f*, passed through the said ear-pieces and the portion *g*, of an

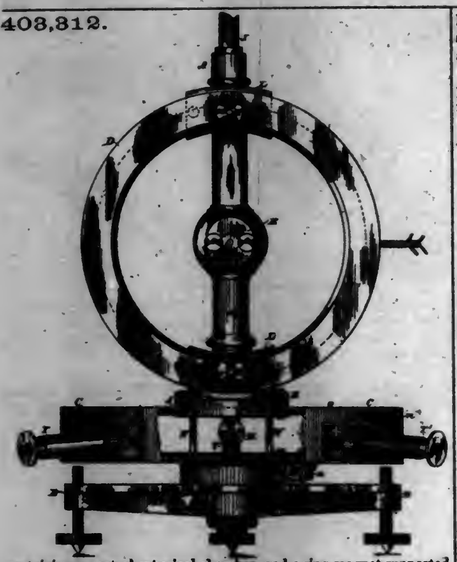
adjusting-screw, *e*, passed through the socket and provided with shoulders *p* and *q* above and below the socket, and with the thread on its body portion between the shoulders engaging with the teeth on the said portion *g*, substantially as set forth.

408,311. ELECTRICAL MEASURING-INSTRUMENT. EDWARD WESTON, Newark, N. J. Filed Feb. 28, 1888. Serial No. 301,500. (No model.)

Claim.—1. In an electrical measuring-instrument, a moving index or pointer and two scales in proximity to and indicating the extent of movement of said pointer, the said scales being similarly and uniformly divided, and corresponding divisions on said scales being marked, and representing on one scale a unit or number of units and on the other scale a certain fraction of said unit or number of units, substantially as described.

2. In an electrical measuring-instrument, a moving index or pointer and two parallel scales in juxtaposition in proximity to said pointer and indicating the extent of movement of said pointer, the said scales being similarly and uniformly divided, and corresponding divisions on said scales being marked, and representing on one scale a unit or number of units and on the other scale a certain fraction of said unit or number of units, substantially as described.

3. A magnet, an electrical conductor in coil or loop form supported and vibrating in the field of force of said magnet, a resilient body interposed between said coil and an abutment, a pointer or index connected to and moved by said coil, two bodies of relatively different electrical resistances in branch circuit with said coil, and two scales disposed in proximity to said pointer for indicating the extent of movement thereof, the said scales being similarly and uniformly divided, and corresponding divisions on said scales being marked, and representing on one scale a unit or number of units and on the other scale a certain fraction of said unit or number of units, substantially as described.



408,312. PORTABLE TANGENT GALVANOMETER. EDWARD WESTON, Newark, N. J. Filed May 10, 1888. Renewed Mar. 18, 1889. Serial No. 303,818. (No model.)

Claim.—1. In a galvanometer, in combination with a hollow standard and a vibrating magnet, a removable body of diamagnetic metal supported in said standard and having a central chamber wherein said magnet is supported, substantially as described.

2. In a galvanometer, a damping device for the magnet, consisting of two separable pieces of diamagnetic metal with a recess formed in one face of each piece, the said recesses, when said pieces are in contact, forming a chamber for the reception of the magnet, substantially as described.

3. In a galvanometer, in combination with a hollow standard, a removable body of diamagnetic metal supported in said standard and

408,812.

containing a central spherical chamber, and a ring-magnet supported within said chamber, substantially as described.

4. In a galvanometer, in combination with a hollow standard containing a cylindrical transverse opening, two cylindrical bodies of diamagnetic metal placed end to end in said opening and having a chamber formed in their meeting faces, and a magnet supported in said chamber, substantially as described.

5. In a galvanometer, in combination with a hollow standard containing a cylindrical transverse opening, two cylindrical bodies of diamagnetic metal placed end to end in said opening and having a chamber formed in their meeting faces, a means—such as screws—of connecting said cylindrical bodies together, and a magnet supported in said chamber, substantially as described.

6. In a galvanometer, in combination with a hollow standard, a body of diamagnetic metal supported in said standard and containing a chamber, a ring-magnet supported in said chamber, and a sight-aperture extending through said body in line with the center of said chamber, substantially as described.

7. In a galvanometer, in combination with a hollow standard, a body of diamagnetic metal supported in said standard and containing a central chamber, a ring-magnet supported in said chamber, and two sight-apertures extending through said body in line with the center of said chamber and relatively disposed at an angle, substantially as described.

8. In a galvanometer, a ring-magnet needle having a sight disk or ball supported at its center, substantially as described.

9. In a galvanometer, in combination with a hollow standard, a body of diamagnetic metal supported in said standard and containing a chamber, a sight-aperture extending through said body in line with the center of said chamber, and a ring-magnet having at its center a sight disk or ball and supported in said chamber, substantially as described.

10. In a galvanometer, in combination with a standard having a spherical chamber, a ring-magnet supported in said chamber, the outer contour of the cross-section of said magnet being concentric with the periphery of the said chamber, substantially as described.

11. In a galvanometer, in combination with a standard having a spherical chamber, a ring-magnet supported in said chamber, the outer contour of the cross-section of said magnet being concentric with the periphery of said chamber, and the inner contour of said cross-section being the arc of a circle struck from the middle point of the arc forming the outer contour and joining the ends of said arc, substantially as described.

12. In a galvanometer, a ring-magnet needle, a clamp embracing the body of said magnet, and a support for said magnet connected to said clamp, substantially as described.

13. In a galvanometer, a central hollow standard, a magnet suspended in said standard, a body rigidly connected to and suspended from said magnet, and a scale surrounding said body, substantially as described.

14. In a galvanometer, a base, a circular scale-chamber supported thereon and having a scale marked on its inner periphery, a central hollow standard supported on said chamber, a magnet suspended in said standard, and a mirror in said scale-chamber and connected to and vibrated by said magnet, substantially as described.

15. In a galvanometer, a central hollow standard, a magnet suspended in said standard, a mirror rigidly connected to and suspended from said magnet, and a circular scale-chamber surrounding said mirror, disposed below said standard, and having on its inner periphery a scale for showing the mirror deflections, substantially as described.

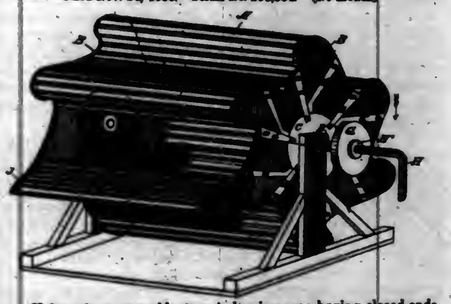
16. In a galvanometer, a central hollow standard, a magnet therein, a mirror vibrated by said magnet, and a scale-chamber secured to said standard and concentric therewith and extending around said mirror, substantially as described.

17. In a galvanometer, a central hollow standard, a magnet therein, coils secured in parallel planes on opposite sides of said standard, and a scale-chamber secured to and surrounding said standard and concentric therewith and arranged below said coils, substantially as described.

18. In a galvanometer, a hollow vertical standard, a circular horizontal scale-chamber concentric therewith, a magnet suspended in said standard, a mirror suspended from said magnet and entering said chamber, and a base, in combination with means for rotating said standard and chamber about a vertical axis, substantially as described.

19. In a galvanometer, a hollow standard, parallel coils supported on opposite sides thereof, a circular scale-chamber supporting said standard and concentric therewith, a magnet suspended in said standard, a mirror in said scale-chamber and rigidly connected to and suspended from said magnet, a base, and a central pivot on the lower side of said scale-chamber entering said base, in combination with means—such as a tangent-screw and segment—for rotating said standard and scale-chamber upon said pivot, substantially as described.

20. In a galvanometer, a central standard, coils supported thereon, a circular scale-chamber below said standard, and in said chamber a central support upon which said standard rests, substantially as described.



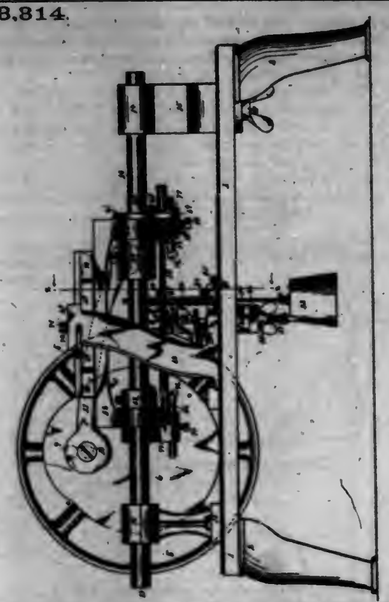
21. In a galvanometer, the combination of the central hollow standard, A, having brackets or supports L, coils secured upon said supports, scale-chamber C, having upper plate, S, and means for connecting standard A and plate S, substantially as described.

22. In a galvanometer, the combination of the central hollow standard, A, having brackets or supports L, coils secured upon said supports, scale-chamber C, plate S, and means for connecting said standard and said plate, and an independent support extending upward from the bottom of said chamber for said plate S, substantially as described.

23. In a galvanometer, the combination of the magnet F, rod c, having clamping-arms c, rod d, and suspension fiber I', substantially as described.

24. In a galvanometer, the combination of the magnet F, rod d', having clamping-arms d', rod d', rod K, and mirror H, substantially as described.

408,813. CARPET-CLEANER. WILLIAM P. WHITE, Cincinnati, Ohio. Filed Nov. 24, 1883. Serial No. 291,804. (No model.)



Claim.—1. A rotatable carpet-cleaning cage having closed ends, in combination with the hollow journals and flanges, the frame-work of the ends of said cage being connected to said flanges, and suitable blow-pipes for forcing air into the cage through said hollow journals and flanges, substantially as set forth.

2. In combination with a carpet-cleaning cage having closed ends, the hollow journal D and flange C, said journal having the collars E and E' and band-wheel G, and blow-pipe H, substantially as set forth.

408,814. MACHINE FOR FILING, SETTING, AND STRAIGHTENING SAWS. CHARLES E. WRIGHT, Waterbury, Conn. Filed Nov. 16, 1888. Serial No. 290,641. (No model.)

408,814.

Claim.—1. In a machine of the class described, disk 6, having a cam, 8, and clamping-plates whereby the saw is held, in combination with cam-plates 34 and 37, one of which is provided with an arm, 38, rock-lever 42, one arm of which engages the disk and cam, the other arm engaging arm 38, and means, as a cord and weight, whereby the upper arm is held in contact with the disk and cam.

2. The clamping-plates, one of which is provided with a threaded pin, 25, cam-plates 34 and 37 on said pin, one of said cam-plates having an arm, 38, and means—for example, the disk, cam, rock-lever 42, and a weight—whereby said arm is oscillated to alternately open and close the clamping-plates.

3. The clamping-plates and the cam-plates by which they are operated, one of said cam-plates having an arm, 38, in combination with the rock-lever connected to said arm, and disk 6, having a cam whereby the rock-lever is oscillated.

4. The disk having cam 8 and clamping-plates and cam-plates 34 and 37, one of which is provided with an arm, 38, in combination with a rock-lever, the upper arm of which engages the disk and cam, the lower arm of said lever being loosely connected to arm 38, and a pawl pivoted to the lower arm of said lever, which is adapted to engage the teeth of a saw held by the clamping-plates.

5. The combination, with the disk, cam, and rock-lever, of the clamping-plates, cam-plates 34 and 37, one of said plates having an arm which loosely engages the rock-lever, a pawl pivoted to the rock-lever and adapted to engage the teeth of a saw being operated upon, and a weight connected to arm 38, whereby when the swinging lever is held in contact with the disk the clamping-plates are held closed, and when said lever is engaged by the cam the clamping-plates are loosened and the pawl is moved forward to perform the feeding operation.

6. In a machine of the class described, disk 6, having a cam upon its face, and a rock-lever, in combination with clamping-plates for the saw to be operated upon, cam-plates 34 and 37, an arm, 38, rigidly connected to one of the cam-plates and loosely connected to the swinging lever, and a weight connected to arm 38, whereby the clamping-plates are held closed and the swinging lever held in engagement with the cam.

7. Disk 6, having cam 8, and a rock-lever adapted to engage said cam, in combination with stationary and movable clamping-plates, cam-plates 34 and 37, which act on the movable clamping-plate, and an arm, 38, rigidly connected to one of the cam-plates and loosely connected to the rock-lever, whereby when said lever is moved by the cam the clamping-plates are loosened, as and for the purpose set forth.

8. Disk 6, having a cam upon its face, and a rock-lever, the upper arm of which is adapted to engage said cam, in combination with a stationary cam-plate, 21, having a threaded stud, 25, a clamping-plate, 22, moving on said stud, a cam-plate, 34, fixed on said stud, and a clamping-plate, 37, adapted to turn thereon and having an arm, 38, which engages the lower arm of the rock-lever, and a weight connected to arm 38, which holds the cam-plates at their closed position until the rock-lever is lifted by the cam.

9. Disk 6, having a cam upon its face, and a rock-lever, the upper arm of which is adapted to engage said cam, in combination with a stationary clamping-plate, 21, having a threaded stud, 25, a clamping-plate, 22, moving on said stud, a cam-plate, 34, fixed on said stud, and a cam-plate, 37, adapted to turn thereon and having an arm, 38, which engages the lower arm of the rock-lever, and a pawl pivoted to the lower end of said lever and adapted to engage the teeth of the saw being operated upon, said pawl being moved forward to feed the saw at the instant the clamping-plates are loosened by the engagement of the cam with the rock-lever.

10. The combination, with the disk having a cam, 8, a rock-lever, and the stationary and movable clamping-plates, of cam-plates 34 and 37, one of which is provided with an arm engaging the rock-lever, and springs 22', whereby the movable clamping-plate is held in position at the instant it is loosened by the engagement of the cam with the rock-lever.

11. The combination, with the disk having a cam upon its face, the clamping-plates, and cam-plates 34 and 37, one of which is provided with an arm, 38, of a rock-lever, 42, which is engaged by arm 38 and is provided with a contact portion, 45, which engages the cam, and a set-screw, 46, which bears against the contact portion, as and for the purpose set forth.

12. The combination, with the disk having a cam upon its face, the clamping-plates, and cam-plates 34 and 37, one of which is provided with an arm, 38, of a rock-lever, 42, which is engaged by arm 38 and engages the cam, a pawl pivoted to said lever, which is adapted to engage the teeth of the saw that is being operated upon, and a set-screw, 47, which engages lever 42 and determines its forward movement, thereby controlling the feed of the saw.

13. The combination, with the clamping-plates having grooves 30, one being provided with lugs 26, of plate 19 between the clamping-plates to support the saw in use, and adjusting-screws 27, which pass through said lugs and engage plate 19, whereby said plate may be raised or lowered for different widths of saws.

14. The stationary clamping-plate having lugs 26, in combination with the movable clamping-plate resting on said lugs and engaging the stud, cam-plates 34 and 37, whereby the clamping-plates are closed together, and an adjustable plate, 19, between the clamping-plates, upon which the saw rests while being operated upon.

15. The stationary cam-plate having lug 26 and threaded stud 25, in combination with the movable clamping-plate resting on said lugs and engaging the stud, cam-plates 34 and 37, whereby the clamping-plates are closed together, plate 19, upon which the saw rests and which is provided with hubs 33, and adjusting-screws 27, threaded to engage the lugs and whose upper ends engage hubs 33.

16. The combination, with the clamping-plates, the cam-plates, and arm 38, of the feeding-pawl, rock-lever 42, and means, as a disk and cam, whereby said lever is oscillated to open and close the clamping-plates, thereby straightening a saw.

17. The clamping-plates, one of which is provided with lugs 26 and the other with flanges 29, in combination with a plate, 19, which supports the saw, adjusting-screws for raising or lowering the blade, and means, substantially as described and shown, for closing the clamping-plates upon the saw.

18. The combination, with the clamping-plates and cam-plates 34 and 37, whereby they are operated, of supporting-plate 19, which lies between the clamping-plates and is provided with blocks at its ends, and adjusting-screws 27, whereby said plate is raised or lowered.

19. The combination, with the slide-rods and the oscillating file-frame having a stump, 73, of guide-bar 70, switch-cam 68, and spring 74, which holds the saw-frame in operative position, except when the stump is engaged by the switch-cam.

20. The slide-rods and an oscillating file-frame having a stump, 73, in combination with bracket 65, carrying guide-bar 70, switch-cam 68, spring 69, acting to hold the switch-cam in contact with the guide-bar, and spring 74, acting to hold the frame in operative position.

21. The slide-rods, frame 54, carrying the file and having stump 73, and spring 74, acting as described, in combination with the guide-bar, the switch-cam, and spring 69, which holds the point of the switch-cam against the guide-bar, so that in the forward movement the stump rests against the guide-bar, passing within the switch-cam, thereby holding the file in operative position, and during the return movement the stump rides over the switch-cam, thereby oscillating the frame and throwing the file out of operative position.

22. The combination, with the slide-rods, the file, and the oscillating frame by which it is carried, said frame having a stump, 73, of adjustable bracket 65, a guide-bar, and a switch-cam carried by said bracket, and springs acting to hold the point of the switch-cam in contact with the guide-bar and to hold the file-frame in the operative position, substantially as described.

23. In a machine of the class described, the combination, with the guide-rods, of adjustable guides secured thereto and setting-punches carried by the guides.

24. In a machine of the class described, the slide-rods, frame 54, having stump 73, and the file-bracket 65, the switch-cam and the guide-bar on said bracket, and a block, 75, adapted to engage the top of the bracket and the switch-cam, so that stump 73, in both backward and forward movements, will pass along the outer face of the block and the switch-cam, but cannot pass within the switch-cam, thereby holding the frame in such position that the file is retained out of operative position.

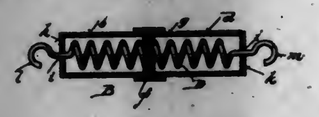
25. In a machine of the class described, the slide-rods, frame 54, having stump 73, the file, the guide-bar and the switch-cam which are engaged by stump 73, and a block, 75, placed over the guide-bar and switch-cam to be engaged by stump 73 when it is desired to hold the file out of operative position.

26. The combination, with the guide-rods, crank-rod, and disk 6, having cams 8, of feeding mechanism, substantially as described, actuated by said cams, and setting-punches carried by the guide-rods, which set a tooth each time the mechanism is actuated.

27. The combination, with the slide-rods, frame 54, having stump 73, the guide-bar, and the switch-cam, of the clamping-plates, the feeding mechanism, and disk 6, having a crank-rod connected to the slide-rods, and a cam whereby the clamping-plates and feeding mechanism are operated.

28. The combination, with the slide-rods, file, and frame 54, having stump 73, of the switch-cam, the guide-bar, the clamping and feeding mechanism, and disk 6, having a crank-rod pivoted to the slide-rods, and a cam by which the feeding and the clamping mechanism is operated.

29. The combination, with the slide-rods, the setting-punches, and the file-frame having stump 73, of the guide-bar and the switch-cam engaged by said stump, as described, disk 6, having inner and outer holes 9, and a crank-rod connected to the slide-rods and adapted to be pivoted in either of said holes, so that the filing operation may be performed either with or without the setting operation.

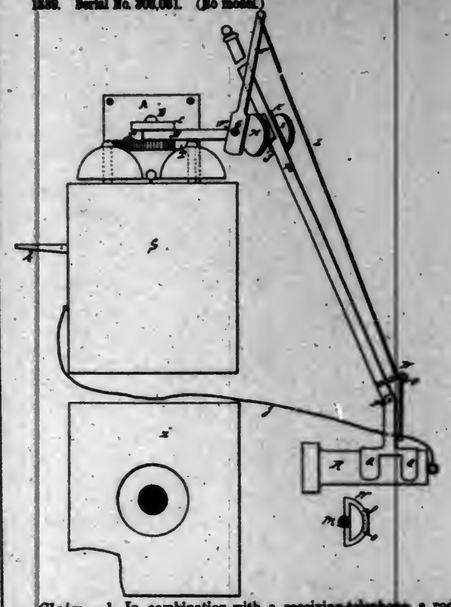


30. In a machine of the class described, the slide-rods, setting-punches, file-frame having stump 73, the guide-bar and switch-cam engaged by said stump, and a block, 75, adapted to engage the switch-cam and guide-bar and to be engaged by stump 73 as it passes off from the switch-cam, so that the file-frame is held out of operative position when it is desired to set without filing.

31. The combination, with the slide-rods, the file-frame having stump 73, and the switch-cam and guide-bar engaged by said stump to throw the file into and out of operative position, of the clamping-plates, feeding-pawl, disk 6, having a crank-rod connected to the slide-rods, and a cam, 8, and intermediate mechanism, substantially as described and shown, whereby the clamping-jaws are loosened and the feeding operation performed at the instant that the file is out of operative position.

32. The combination, with the slide-rods, the setting-punches, and cam-plates 34 and 37, one of which is provided with arm 38, of disk 6, having a crank-rod connected to the slide-rods, and a cam, 8, swinging lever 42, adapted to engage said cam and engaged by arm 38, a feeding-pawl pivoted to said lever, and a set-screw, 47, which engages the lever to limit the throw of the feed-pawl, as set forth.

33. The combination, with the slide-rods, setting-punches, file, and frame 54, having stump 73, of the guide-bar and the switch-cam engaged by said stump, disk 6, having a crank-rod connected to the slide-rods, and a cam, 8, and feeding and clamping mechanism, substantially as described, operated by said cam.

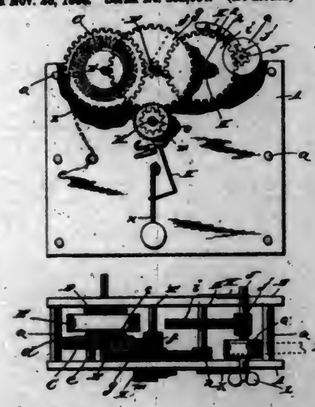


408,315. HAMMOCK. HORACE M. YORK, Keansburk, Ma. Filed Dec. 26, 1888. Serial No. 294,622. (No model.)

Claim.—1. The improved hammock-hook herein described, consisting of a cylinder formed in separable sections and a coiled spring disposed in said cylinder, the ends of said spring projecting through the heads thereof and being bent to form hooks proper, substantially as set forth and described.

2. In a hammock-hook, the combination of a cylindrical body comprising separable sections having central openings in their heads, a coiled spring disposed in said cylinder, and hooks proper secured to the ends of said spring, and said ends projecting through and fitted to work in said opening, whereby said spring may act to impart vertical motion to the hammock when in use, substantially as described.

408,316. DEVICE FOR HOLDING TELEPHONES. SAMUEL J. ADAMS, Detroit, Mich., assignor of three-fourths to Monroe Rosenfield, Jacob Brown, and Arthur Brown, all of same place. Filed Mar. 12, 1888. Serial No. 266,661. (No model.)

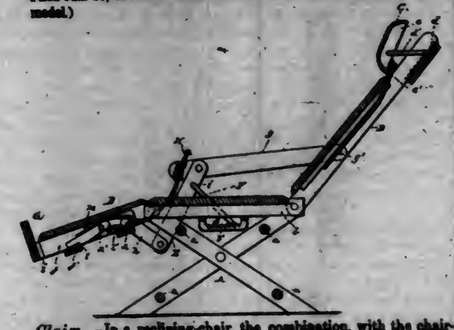


Claim.—1. In combination with a receiving-telephone, a rod having on one end a clip to engage with the telephone, a pair of movable jaws adapted to engage with said rod, a swinging arm carrying said jaws, an arc and a locking-dog at the pivotal end of the swinging arm, and a lever connected with said arm and adapted to simultaneously lock said arm and jaws, substantially as shown and described.

2. In a telephone-supporting device, the combination, with the supporting-plate A, of the pivoted arm D, toothed arc E, jaws H and I, rod M, lever F, and cord L, substantially as shown and described.

3. In combination with the supporting-plate A, carrying the toothed arc E, the pivoted arm D, having thereon the fixed jaw H, the movable bar U, carried by the arm D, having on one end the jaw I and on the other end a dog, T, the movable clamps J and K, carried by said jaws H and I, and the lever F, provided with the opposite inclined planes W and Z and fulcrumed on a bolt, G, connecting said jaws, substantially as shown and described.

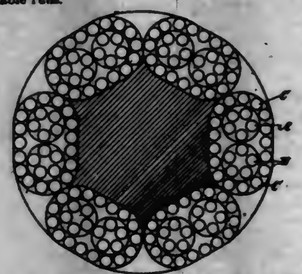
4. In a telephone-supporting device, the combination of the fixed jaw H and movable jaw I with the lever F, having thereon a cam adapted to draw the movable jaw toward the fixed jaw, the cord L, connected with said lever, and the rod M, carrying the cleat O, substantially as shown and described.



408,317. MOTOR. JOHN H. ABEL, Jackson, Greene County, Iowa. Filed Nov. 23, 1888. Serial No. 292,067. (No model.)

Claim.—1. In a motor, the combination of the curved bars having openings, the adjustable shaft J, having threaded openings in its ends, and the thumb-screws, substantially as and for the purpose described.

2. The herein described and shown motor, composed of the sides A and B, the shaft B', having the gear-wheel C, the drum D, and the ratchet-and-pawl connection between the drum and the gear-wheel C, the shaft H, having the pinion h and the gear-wheel i, the shaft J, having a pinion and threaded openings in the shaft ends, the curved bars K, having a series of openings, the thumb-screws L, and the escapement, combined, arranged, and operating substantially as and for the purpose described.

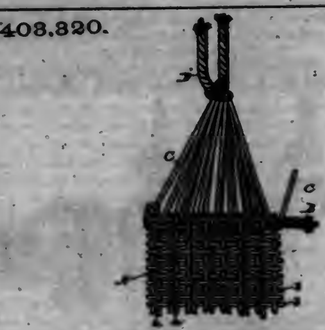


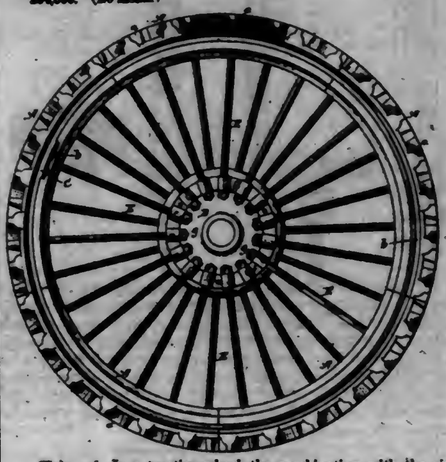
408,318. RECLINING-CHAIR. ROLLIN H. ARNOLD, Rensselaer, N. Y. Filed Jan. 26, 1888. Renewed Dec. 24, 1888. Serial No. 294,517. (No model.)

Claim.—In a reclining-chair, the combination, with the chair-seat, the foot-rest pivoted thereto, having the side rails, f, and the braces f', and the extension portion, of the short arms k', pivoted to the inner face of the bars f' and having the notched free end, the stop-bar k, the springs l', secured thereto and bearing upon the inner arms, k', and the cords or chains secured at one end to the upper side of the arms k', substantially as specified.

408,319. WIRE CABLE. TELFORD C. BATEMAN, West Kensington, County of Middlesex, and ARTHUR LAYCE, South Shields, County of Durham, England. Filed Mar. 6, 1888. Serial No. 266,317. (Specimens.) Patented in England Aug. 25, 1888, No. 12,285.

Brief.—The object of the invention is to provide a cable of such construction that a plurality of wires shall at all times bear uniformly throughout the length of the cable upon the wheel or roller over which the cable runs.





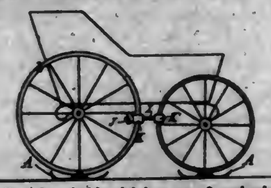
Claim.—1. A wire cable composed of a series of spirally-wound substantially-flattened strands, each strand comprising a core and spiral wires thereupon, substantially as described.

2. A wire cable composed of a central core and a series of spirally-wound substantially-flattened strands thereupon, each strand comprising a wire core and spiral wires thereupon, substantially as described.

3. A wire cable composed of a central core and a series of spirally-wound substantially-flattened strands thereupon, each strand comprising independent cores A B placed side by side, and spiral wires C thereupon, substantially as described.

408,320. TRACTION-WHEEL. EDGAR M. BIRDSALL, Buffalo, N. Y., assignor to Mary Birdsall, same place. Filed Dec. 26, 1883. Serial No. 294,560. (No model.)

Claim.—1. In a traction-wheel, the combination, with the rim composed of segmental sections and provided in its side with an annular groove or depression, of a clamping-band arranged in said groove, whereby the rim-sections are secured together, substantially as set forth.

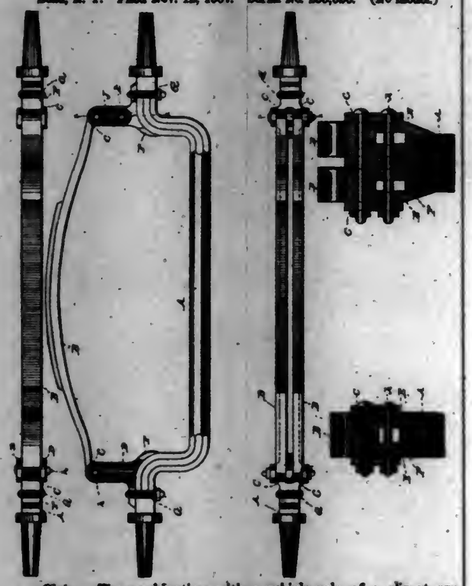


2. In a traction-wheel, the combination, with the rim composed of segmental sections, each of which is provided in its side with a concentric groove or depression, and an endless clamping-band secured in said grooves by being shrunk into the same, substantially as set forth.

3. The combination, with the rim and spokes of a traction-wheel, of a hub, D, provided with perforated radial lugs f, which receive the inner ends of the spokes, screw-nuts g, applied to the inner ends of the spokes and bearing against said lugs, and a locking-plate, H, provided with an annular row of recesses, i, fitting over the outer portions of said nuts, and projections j, formed around the outer edge of said locking-plate and fitting between the lugs f of the hub, substantially as set forth.

408,320. HAMMOCK. AUGUSTUS BEALS, North Weymouth, Mass. Filed May 3, 1888. Serial No. 272,626. (No model.)

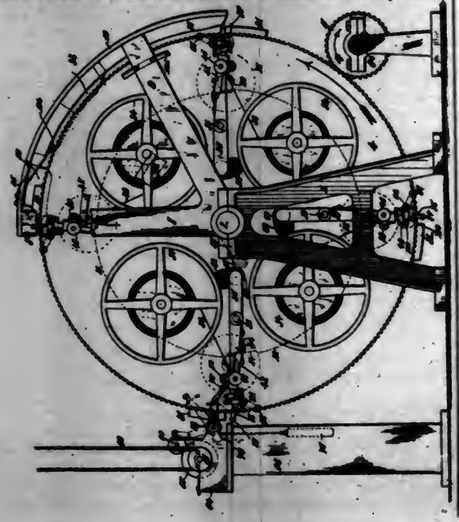
Claim.—In a hammock, the combination of a woven fabric, a stay cord or rod hemmed in place by the entire warp-threads of the fabric, and a supporting-cord looped into the fabric and around the stay rod or cord, its loops passing through the fabric, so as to form bights around the rod or cord, and extending outwardly to a suspension-rope, substantially as described.



408,322. RUNNER FOR WHEELED VEHICLES. JOHN BARKART, Detroit, Mich., assignor of one-half to Simon C. Kerver, same place. Filed Nov. 21, 1888. Serial No. 291,466. (No model.)

Claim.—In a detachable sleigh-runner for wheeled vehicles, the combination of the runners A, provided with the raised bearing C, the stationary jaw D, the movable jaw F, the threaded bolt G and nut H, the wheel-clamping device consisting of the threaded tie-rod

I, the clamping-hooks K and K', and the thumb-screw J, the parts being constructed and arranged to operate substantially as described.

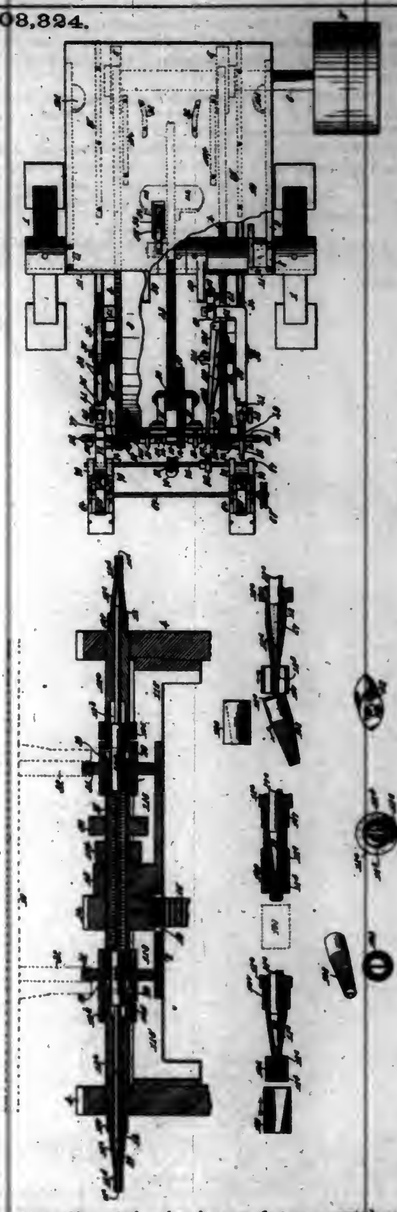


408,323. VEHICLE-SPRING. CHARLES M. RUDENBURGH, Riverhead, N. Y. Filed Nov. 12, 1887. Serial No. 255,028. (No model.)

Claim.—The combination, with a vehicle-axle, of a clip at one end having short lugs perforated transversely to the axle and a clip at the opposite end having long lugs similarly perforated, of an arched vehicle-spring extending lengthwise above said axle and provided with eyes at its ends, a pivot-bolt connecting one end of the spring to the long lugs at one end of the axle, and an upwardly-projecting link connecting the other end of the spring to the opposite short lugs, whereby said spring has its lateral play in the same plane of the axle, substantially as specified.

408,324. MACHINE FOR MAKING CIGARETTE MOUTH-PIECES. SAMUEL BROWN, Seaford Hundred, Del., assignor to Charles G. Emery, Brooklyn, N. Y. Filed Oct. 23, 1888. Serial No. 288,894. (No model.)

Claim.—1. The combination of a rotary mandrel, a reel for supplying paper to said mandrel, a presser-foot for holding the paper in contact with the mandrel as it is coiled thereon, and a rotary carrier



on which said mandrel, reel, and presser-foot are mounted, substantially as described.

2. The combination of a rotary hollow and slotted mandrel, an expander located in said mandrel, means for forcing the expander outward in the mandrel, means, substantially as described, for retracting said expander, a reel for supplying paper to the mandrel, a presser-foot, and a rotary carrier for said mandrel, reel, and presser-foot, substantially as described.

3. The combination of a rotary partly-conical and partly-slotted hollow mandrel having a hollow and slotted shaft, a conically-pointed expander located in said mandrel, a spring for causing the expander to dilate the mandrel, a friction-gear mounted on the mandrel-shaft and connected with the expander, and a cam for engaging said gear to retract the expander and collapse the mandrel, substantially as described.

408,324.

4. The combination of a rotary slotted mandrel, a reel for supplying paper to said mandrel, a rotary carrier on which said mandrel and reel are mounted, a lever pivoted to said rotary carrier and provided with mechanism for engaging the paper and feeding it to the mandrel, a presser-foot for holding the paper in contact with the mandrel as it is being coiled thereon, a cutter carried by the pivoted lever, and means, substantially as described, for tripping said lever to cause the cutter to sever the paper, substantially as described.

5. The combination of a rotary slotted mandrel, a reel for supplying paper to the mandrel, a presser-foot for holding the paper in contact with the mandrel while it is coiled thereon, a rotary carrier for said mandrel, reel, and presser-foot, a tappet on the mandrel-shaft, and a cam to act with said tappet to cause the mandrel to present its slot in position to receive the paper, substantially as described.

6. The combination of a rotary mandrel, mechanism for feeding a paper strip to said mandrel, a cutter for severing the paper strip after it has been partly coiled on the mandrel, means, substantially as described, for applying paste to the uncoiled end of the paper strip on the mandrel, and a rotary carrier, substantially as described.

7. The combination of a rotary partly-conical and partly-slotted mandrel, mechanism for feeding a paper strip into engagement with the slot in said mandrel, a cutter for severing the paper strip after it has been partly coiled on the rotating mandrel, means, substantially as described, for applying paste to the uncoiled end of the paper strip on the mandrel, a die for forming the coiled and pasted strip into a cone on the mandrel, and an ejector for removing the paper cone from the mandrel, substantially as described.

8. The combination of a rotary partly-conical and partly-slotted mandrel, an expander located in said mandrel, mechanism for feeding a paper strip to said mandrel, a presser-foot, a cutter, means, substantially as described, for applying paste to the uncoiled cut end of the paper strip on the mandrel, a die for forming the coiled and pasted paper strip into a cone, an ejector for removing the paper cone from the mandrel, and a rotary carrier for the mandrel and its accompanying cone-forming mechanism, substantially as described.

9. The combination of an intermittingly-rotary mandrel, a presser-foot, a reel, a pivoted lever provided with mechanism for feeding a paper strip from said reel to the mandrel, a spring for holding said lever in place, a cutter attached to said lever, means, substantially as described, for tripping the lever to cause the cutter to sever the paper coiled on the mandrel, mechanism for applying paste to the uncoiled portion of the paper strip on the mandrel, a die for forming the coiled and pasted paper strip into a cone on the mandrel, and an ejector for removing said paper cone, substantially as described.

10. The combination of the rotary carrier 3, the mandrels 12, the reels 34, the pivoted levers 35, each of said levers having guideway 37, yielding finger 42, feed-wheels 39 and 41, and friction-wheel 46, and the cam 47, substantially as described.

11. The combination of the rotary carrier 3, the intermittingly-rotary mandrels 12, having slots 12', the tappets 52 on the mandrel-shafts, the cams 53, the reels 34, and means, substantially as described, for feeding paper strips from the reels to the mandrels, substantially as described.

12. The combination of the rotary carrier 3, the slotted mandrels 12, the expanders 27, the spring 28, the friction-wheels 31, mounted on the mandrel-shafts and connected with the expanders, and the hood 10, having cams 32 to engage said friction-gears, substantially as described.

13. The combination of the mandrel 12, the lug 48, having star-wheel 49, the lever 35, having flange 50 to engage the lug 48, a spring, 51, to hold said lever in place, paper-feeding mechanism, and a cutter carried by said lever to cut the paper strip, substantially as described.

14. The combination of the rotary carrier 3, the mandrel 12, the lug 48, the reel 34, the pivoted lever 35, having a flange, 50, to engage said lug, the spring 51, a paper-feeding mechanism, and a cutter, 57, carried by the lever 35, the roller 60 on an arm of said lever, and the roller 58 to engage the roller 60 and trip the lever, substantially as described.

15. The combination of the rotary carrier 3, the intermittingly-rotary mandrel 12, the pinion 14, gear 15, friction-wheel 20, and stationary friction-disk 23, having arc-cams 21 and 22 and recesses 24 and 25, substantially as described.

16. The combination of the rotary carrier 3, the intermittingly-rotary mandrels 12, paper feeding and cutting mechanisms, substantially as described, a paste-fountain, 64, fountain-roller 65, auxiliary roller 66, and the flexible paster-arm 72, carrying a paste-roller, 77, substantially as described.

17. The combination of the shaft 71, having a pulley, 80, provided with cord and weight, the friction-disk 82, mounted on said shaft, the rotary carrier 3, having wipers 81 to engage said friction-disk, and the flexible paster-arm 72, carrying a paste-roller, 77, substantially as described.

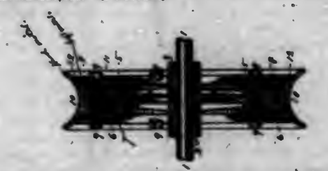
18. The combination of the rotary carrier 3, the mandrel 12, the boss 83, having an angle-arm, 84, the presser-foot 85, pivoted on said arm and provided with a spring, 86, and friction-roller 87, and the hood 10, having cam 88, substantially as described.

19. The combination of the rotary carrier 3, a mandrel, 12, the bracket 89, the shaft 91, having arms 95 and 99, the pin 96, the spring 97, the roller 98, mounted on the arm 95, the cam 104, and the die 100, mounted on the arm 99, substantially as described.

20. The combination of the rotary carrier 3, the bracket 89, the shaft 91, having roller 92 and arm 99, the spring 94, the die 100, and the cam 101, substantially as described.

21. The combination of the rotary carrier 3, having slot 115, the mandrel 12, the sliding cross-head 105, the annular ejector 107, the rods 106, for connecting said cross-head and ejector, the ejector-lever 108, and the spring 110, substantially as described.

22. The combination of the rotary carrier 3, having slot 115, the mandrel 12, the ejector 107, the cross-head 105, connected with said ejector, the lever 108, connected with the cross-head and provided with a friction-roller, 111, and the cam 112, substantially as described.



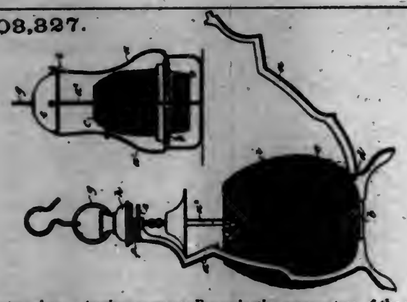
22. The combination of the rotary carrier 3, the mandrel 12, the ejector 107, sliding cross-head 105, lever 108, having friction-rollers 109 and 111, the spring 110, and the cam 112, substantially as described.

408,325. ATTACHMENT FOR ROCKING-CHAIRS. WILLIAM I. BUSKER, La Grange, Ill. Filed Jan. 29, 1889. Serial No. 298,014. (No model.)

Claim.—In a platform rocking-chair, the combination of a rocker and base-rail, at least one of these members being provided with a groove or recess narrowed and deepened toward its end nearest the spring, a spiral spring forming the connection between the rocker and base-rail, and two attaching-brackets securing the spring to the chair, at least one of the brackets having a widened and beveled projecting portion fitted and held in the recess of the chair, whereby the spring is removably attached at one end and its position fixed, substantially as described.

408,326. SHEAVE OR PULLEY FOR CABLE RAILWAYS. THOS. H. BURRIDGE, St. Louis, Mo.; THOMAS J. BURRIDGE, same place, administrator of said Thomas H. Burridge, deceased. Filed Oct. 11, 1888. Serial No. 287,789. (No model.)

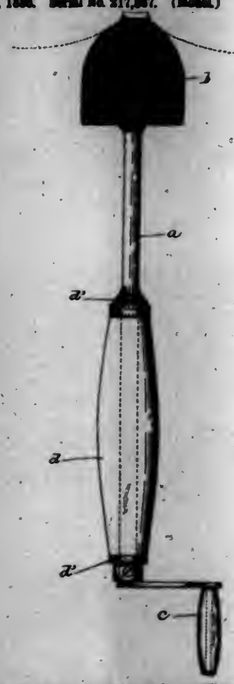
Claim.—1. A sheave or pulley having a body formed with a flanged annular part, a rim distinct from the body having an inner part, 11, entering between the flanges, the bolts connecting the flanges, and the soft metal interposed between the rim and inner part and the flanged annular part, substantially as described.



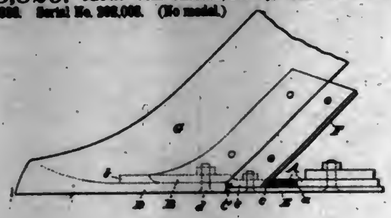
2. A sheave or pulley having a body formed with a flanged annular part, 5 6, and a removable ring, 8, bolts connecting the ring and flange, a rim, 10, distinct from the body and having a part, 11, entering between the flange and ring, and soft metal interposed between the rim and the parts 5 6 8, substantially as described.

408,327. LAMP HOLDER OR FRAME. SAMUEL CLARKE, Childs Hill, County of Middlesex, England. Filed May 21, 1888. Serial No. 274,542. (No model.)

Claim.—The combination, substantially as hereinbefore set forth, of the cup, its removable dome, the cup-support, the uprights secured at their lower ends to the cup-support, a hinge-connection between one of the uprights and the cup-support near the bottom of the cup,

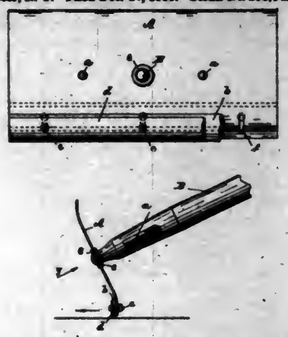


408,327.



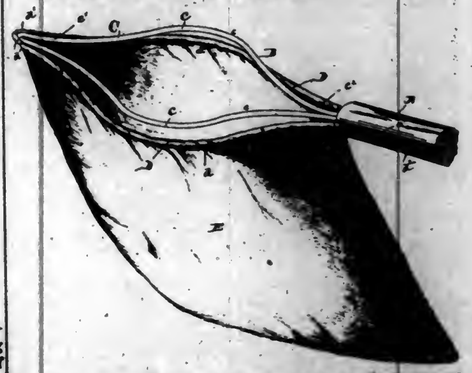
the top piece, *c*, having an upwardly-projecting screw-stem, *f*, the ring *g*, passing through the upper end of the stem, and the cap A, working vertically on the screw-threaded stem of the top piece, *c*, and engaging with the upper end of the hinge upright.

408,328. ROTARY BRUSH. T. HENRY CLARK, Brookline, Mass. Filed Nov. 3, 1888. Serial No. 217,927. (Model.)



Claim.—As an improved article of manufacture, the herein-described rotary brush, comprising the rotary shank or spindle having a central and a lower collar, a tubular handle inclosing a portion of said shank and secured between said collars, the brush-head affixed to one end of said rotary shank or spindle and having its apex or convexed end extending across said end of the shank or spindle, and the crank secured to the end of said rotary shank or spindle, substantially as shown and described, whereby said brush is held by one hand and operated by the other.

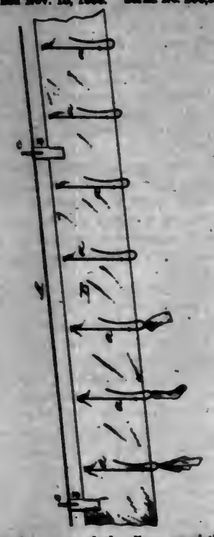
408,329. PLOW. JOSIF GLATTER, Fridley, Minn. Filed Nov. 27, 1888. Serial No. 292,068. (No model.)



Claim.—As an improved article of manufacture, a plow provided with the landside having its forward portion set inward out of alignment with its rear or offset portion, a vertical transverse shoulder being formed thereby, facing forward, and with a share-landside resting upon the said shoulder and provided with a rearward plate-extension resting and secured upon the rearward offset portion of the landside proper, said share-landside having a rearwardly-facing shoulder at its point of conjunction with the forwardly-facing shoulder of the aforesaid landside, substantially as set forth.

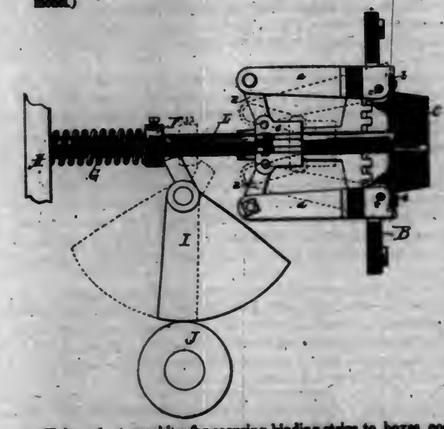
408,330. COMBINED HOE AND SCRAPER. AARON F. COPPER, Rochester, N. Y. Filed Dec. 17, 1888. Serial No. 293,845. (No model.)

Claim.—A scraper consisting of a blade rectangular in form, having two of its opposite edges curved, as shown, and formed with transverse slots near one of its edges, a handle secured to the blade, a strip of soft material, a clamping-strip for said soft strip, and clamping-screws for said strips passing through said slots of the blade, said clamping-strip being curved longitudinally to correspond to the curvature of the opposing face of the blade, substantially as shown.



408,331. FRUIT-PICKER. WILLIAM P. CRAIG, Holden, Mo. Filed Dec. 20, 1888. Serial No. 294,595. (No model.)

Claim.—1. In a fruit-picker, the frame made of a single piece of wire bent into the shape shown to form the diamond-shaped detacher having the converging sides *c c*, which form angles *c'* and *c²*, the tang formed by the inner ends of the said sides, and the sack-holder having the sides *d d*, which are connected at their outer ends to the outer ends of the sides *c c* by the interlaced loops or beads *d' d'*, combined with the handle attached to the tang of the frame, and the sack attached to the sack-holder, substantially as specified.

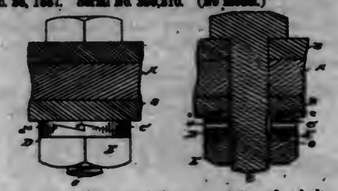


2. In a fruit-picker, the combination, with the handle provided with a socket, *a*, in its end and the grooves *a' a'* in its sides, of the frame comprising the detacher C, having the angles *c'* and *c²* at its outer and inner ends, respectively, and provided with the sides *c c*, which are connected at their inner ends to form a tang, *c³*, fitting in the socket *a* in the end of the handle, and the sack-holder having the sides *d d*, the outer ends of which are integral with the outer ends of the sides *c c*, and provided at their inner ends with extensions *d² d²*, fitting in the grooves *a' a'*, and having detents on their ends fitting in sockets *a² a²* in the sides of the handle, and the sack attached at its upper edge to the holder, substantially as specified.

408,332. CLOTHES-LINE ATTACHMENT. MARSHA DENNIS, Burlington, Iowa. Filed Nov. 15, 1888. Serial No. 290,968. (No model.)

Claim.—An attachment to clothes-lines, consisting of a strip of flexible material provided with hooks which are connected thereto at suitable distances apart throughout the length of said strip, substantially as and for the purpose set forth.

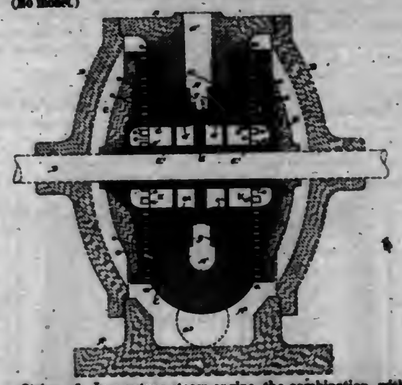
408,333. MANUFACTURE OF WOODEN BOXES. ERVIN DENNOM, Coronado, Cal. Filed Dec. 1, 1888. Serial No. 292,495. (No model.)



Claim.—1. A machine for securing binding-strips to boxes, consisting of a former for the boxes, a pivoted lever on each side of the former, each of said levers having its front end projecting over or beyond the rear edge of the base of the former, whereby said levers are adapted to press the binding-strips securely over the front edges of the box, and means for operating said levers, substantially as described.

2. In combination with a former, pivoted levers *e*, arranged with their forward faces in line with the base of the former, a reciprocating shaft, I, a collar carried on said shaft, and links *d* between the collar and pivoted levers, substantially as described.

3. In combination, a former, pivoted levers with means for operating them, and a face-plate having a concave edge extending across the end of each lever, substantially as described.



4. In combination, a former, pivoted levers having their front edges in line with the base of said former, one of said levers arranged at each side, a reciprocating shaft, toggle-levers between said shaft and pivoted levers, means for moving said shaft in one direction, and a spring for operating the shaft in the other direction, substantially as described.

408,334. NUT-LOCK. JONATHAN DENNIS, Agusta, Ohio. Filed Dec. 26, 1887. Serial No. 259,210. (No model.)

Claim.—A nut-lock consisting, essentially, of a bolt, a nut provided with one or more recesses in its inner face, and a pair of separate independent similar flat circular washers provided with central apertures to receive the bolt, one of the washers forming the inner locking-washer and having one or more lugs on its inner side fitting in recesses in the angle-bar, and radial ratchet-notches on its outer side extending from the aperture to the periphery, and the other similar outer locking-washer having similar corresponding oppositely-inclined notches on its inner side tightly fitting in the notches of the inner washer, the nut being screwed tightly down upon the outer plane face of the outer washer, and one or more lugs on its outer side fitting in the recesses of the nut, as set forth and shown.

408,335. ROTARY STEAM-ENGINE. JOSEPH H. DOW and HERBERT H. DOW, both of Cleveland, Ohio; said Herbert H. Dow assignor to William Chisholm, same place. Filed Aug. 25, 1888. Serial No. 283,751. (No model.)

Claim.—1. In a rotary steam-engine, the combination, with stationary disks with steam-chamber located between the disks and opposing rotating wheels located outside the disks, the wheels being mounted on the engine-shaft, substantially as indicated, of an engine-shaft, and a disk mounted on the engine-shaft between the line of the stationary disks, said rotating disk extending into and dividing the eduction of the said steam-chamber, substantially as set forth.

2. In a rotary engine, the combination of shaft carrying with it two wheels and a disk between them, these wheels being opposed inwardly by stationary disks, the central or revolving disks being opposed on opposite sides by rings connected with the stationary disks, leaving annular spaces between the central disk and rings that act as steam-ports, substantially as set forth.

3. The combination, with a rotary engine of the variety indicated, having stationary disks and movable disk, the latter being mounted on the engine-shaft and extending into the steam-space between the stationary disks, of rings mounted on each stationary disks and adjustable toward and from the rotating disk, substantially as set forth.

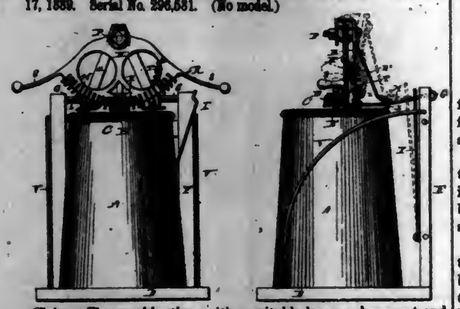
4. The combination, with stationary disks and intervening rotating disk, the latter being mounted on the engine-shaft, substantially as indicated, of screw-threaded rings engaging the stationary disks, each rings being adjustable toward and from the rotating disk, and lock-nuts mounted on the respective rings, substantially as set forth.

5. In a rotary engine, the combination of stationary disks and rotating wheels, the former bearing wings separated so as to form intervening ports and the latter bearing buckets separated so as to form intervening vents, the system of ports and vents being arranged in curved lines deflecting in opposite directions, the aggregate area of the vents being less than the aggregate area of the ports, substantially as set forth.

6. In a rotary engine, the combination, with stationary disks provided with a curved series of ports, and revolving wheels provided with a curved series of vents, the latter being arranged in curved

lines deflecting in opposite directions to those of the ports, said revolving wheels being provided with inwardly-projecting limbs, of a revolving disk located on the shaft between the adjacent ends of said limbs and extending into and dividing the steam-outlet of the steam-chamber, substantially as set forth.

408,836. NECKTIE-FASTENER. JAMES C. DOLIN, Jr., Washington, D. C. Filed Feb. 5, 1889. Serial No. 298,735. (No model.)



Claim.—1. In a necktie-fastener, the combination of the two plates A and B, constructed to clamp the collar-button on opposite sides, guides on one of said plates formed to permit a relative longitudinal movement of the said plates and prevent their lateral separation, the outer end of either plate extending beyond the inner end of the opposite plate, whereby the said outer ends of the plates are free, and are adapted to be connected to the neckbands of a necktie adjacent thereto, and to be operated by said bands.

2. In a necktie-fastener, the plate A, having the opening C for the passage of the collar-button, the upwardly and inwardly turned flanges a', and the lips a^2 on said flanges, in combination with the plate B, having the opening D for the collar-button, and arranged to move between the under face of said flanges and the body portion of the plate A, and stops b on said plate B, constructed to encounter the lips and limit the movement of the plates.

3. In a neckfie-fastener, the combination of the two clamping-plates A and B, guides on one of said plates constructed to confine the opposite plate, said plates having the transverse slots near their outer ends for the passage of the neckbands, and the perforations beyond said slots for fastening threads.

408,837. CHURN. JOHN W. FERRENBURG, Hego, Ind. Filed Jan. 17, 1889. Serial No. 296,581. (No model.)

Claim.—The combination, with a suitable base and support and a churn and dasher-rod, the latter provided with a pinion, of a frame, H, pivoted to the said support, and a standard, M, pivotally attached to the said swinging frame, this standard carrying a pivoted toothed segment adapted to engage the said pinion upon the dasher-rod, the said segment being provided with cogs both upon its face and periphery, as and for the purposes herein set forth.

408,838. TIME-PIECE DIAL. AUGUST FRÖHER, White Hall, Ill., assignor of one-half to James F. Potts, same place. Filed Aug. 26, 1884. Serial No. 141,479. (No model.)

Claim.—1. The combination of a perforated disk, with a movable dial having the hours marked upon it from 1 to 24, with a movable disk which has the hours 12 and 24 alone marked upon it, and a mechanism for moving both the dial and the disk every twelve hours, substantially as shown.

2. In a watch or clock, the combination of the movable dial, having the hours from 1 to 24 marked thereon, with a disk which is used in connection therewith and which has the hours 12 and 24 marked upon it, the disk being provided with an operating-arm, the dial and the disk being connected to the operating mechanism which moves the disk and the dial at different periods every twelve hours, substantially as described.

3. The combination, with a movable dial having the hours from 1 to 24 marked upon it, of a spring, the hour-hand provided with a projection, the hook which is connected to this spring, the spring L, provided with an arm to engage with the hook and a shoulder, the revolving arms which engage with the shoulder, a shaft, the cams or eccentrics placed upon the shaft, the operating-levers, and a spring, substantially as set forth.

4. The combination of the movable dial and the disk with the two springs H I, of unequal length, the hour-wheel provided with a projection, a spring, L, provided with a shoulder, and the mechanism connected with the spring L for shifting the dial and the disk at different periods, substantially as specified.

5. The combination, with a stationary dial or shield having perforations at the hour-points, of a movable dial or disk having a double set of numbers or figures, only one set of which can be seen through the perforation on the dial or shield, and adapted to be automatically shifted every twelve hours, substantially as described.

408,839. BED DRIER AND WARMER. JASPER FORBATT, Ind. Ter. Filed July 5, 1888. Serial No. 279,090. (No model.)

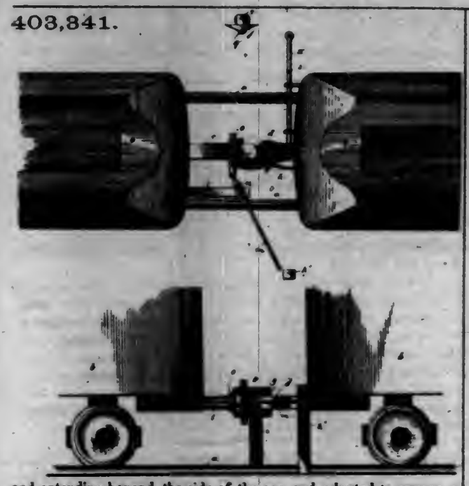
Claim.—1. A bed drier and warmer comprising an elliptical frame, in combination with a fire-pot support suspended within the frame between the upper and lower parts thereof, substantially as described.

2. A bed warmer and drier comprising a frame formed of elliptical side members having transverse upper and lower boards or plates, in combination with a fire-pot holder supported between the top and bottom transverse boards or plates, and a fire-pot in said holder, substantially as and for the purposes set forth.

3. In a bed warmer and drier, the combination, with the elliptical frame consisting of the elliptical side members united at top and bottom by transverse boards and plates, of a fire-pot holder within the frame between its upper and lower boards, and posts interposed between said upper and lower boards to brace the same and form a support for the fire-pot holder, substantially as and for the purposes set forth.

4. The herein-described bed warmer and drier, consisting of the elliptical members 10, joined together at top and bottom by the boards or plates 11, in combination with the posts bracing said boards, the fire-pot holder supported from said posts and having a central seat, 3, and a fire-pot, 14, having a reticulated cover, 15, and resting in said seat, substantially as and for the purposes set forth.

408,840. GLASS KNOB. EDWARD A. FOY, Cincinnati, Ohio. Filed Aug. 13, 1888. Serial No. 282,496. (Specimens.)



Claim.—A hollow amber-colored glass knob coated upon the inside with a solution of silver, as a new article of manufacture.

408,841. CAR-COUPLING APPARATUS. DAVID H. FREEMAN, Brazil, Tenn. Filed Feb. 5, 1889. Serial No. 298,741. (No model.)

Claim.—1. A car-coupling head provided with an uncoupling rod or arm extending laterally from the same beyond the side of the car and adapted to engage and be moved by a post located beside the track, and thereby release the coupling-head from the opposite coupling member, substantially as described.

2. A car-coupling comprising two coupling-heads, a movable yoke to detachably hold the heads coupled, a lever connected to the yoke and extending beyond the side of the car, and adapted to engage a post located beside the track and move the yoke to allow the separation of the heads, and a rod or arm extending from one of the heads and adapted to engage and be moved by a post located beside the track, and thereby unlock the heads, substantially as described.

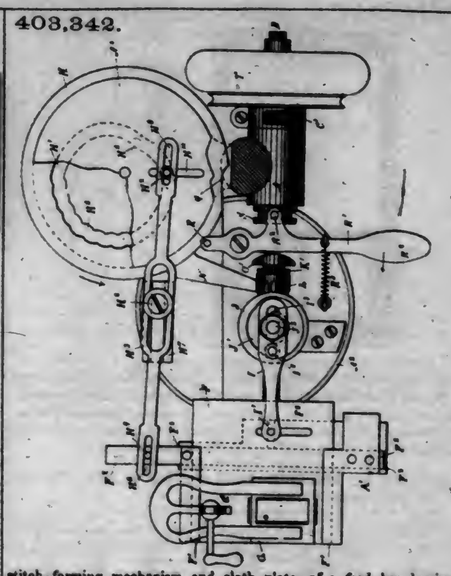
408,841.

3. An automatic car-coupling comprising a coupling-head consisting of a laterally-swinging hook to engage the opposite coupling member, and a longitudinally-movable rod to swing the hook laterally to uncouple the same and adapted to engage and be operated by a post located beside the track and when the car is moving, as set forth.

4. An automatic car-coupling comprising one coupling member consisting of a draw-bar having an open frame or head on its end provided with an end bar, the other member consisting of a hook to engage said bar, and a yoke movable on the draw-bar and adapted to partially close the opening in the head and hold the hook therein, substantially as described.

5. An automatic car-coupling, a coupling member consisting of an open frame or head upon the end of a draw-bar, a yoke movable on the draw-bar and adapted to partially embrace the open head, and a lever pivoted to an arm of the car to operate the yoke and extending beyond the side of the car and adapted to engage a post and be operated thereby, substantially as described.

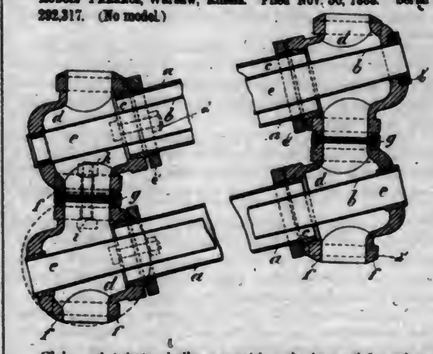
6. Means to automatically uncouple railway-cars, comprising a post hinged at its lower end beside a railroad-track to swing from a vertical position backwardly from the track and provided with a block having inclined faces on its side toward the track, adapted to be engaged by and move longitudinally a rod connected with and adapted to uncouple passing cars, substantially as described.



408,842. BUTTON-HOLE SEWING-MACHINE. JOHN S. FRENCH, Brooklyn, N. Y. Filed May 11, 1886. Serial No. 201,808. (No model.)

Claim.—1. In a button-hole sewing-machine, the combination, of a cloth-plate, F, fitted in parallel guideways F', a feed-bar, F^3, carrying said ways of the cloth-plate, guideways F^4 for said bar on the machine-frame, a feed-wheel, H, having two cam-grooves, H' N', one connected with said feed-bar, a cloth-plate-operating wheel, J, having a cam-groove, J', an operating-rod, I, connecting the cloth-plate with said groove of the operating-wheel, a driving-shaft, D, a driving-wheel, L, on said shaft geared with the operating-wheel, a sliding block, K, on said shaft engaging the driving-wheel, a staff, J^3, on said block, carrying the operating-wheel, and an adjusting-lever, N, connecting the sliding block with the second cam-groove, N', of the feed-wheel, substantially as and for the purpose described.

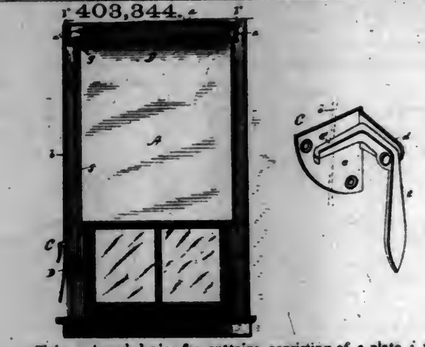
2. In a button-hole sewing-machine, the combination, with the stitch-forming mechanism and cloth-plate, of a feed-bar having mounted thereon guideways F' for said plate, guideways F^4 for said bar on the machine-frame, a feed-wheel having a cam-groove, H', provided with a plain portion of a shape to move the cloth-plate uniformly in reverse directions and to render said plate immovable during one interval between said reverse directions of feed motion, and also provided with a serpentine portion of a shape to move said plate reciprocally in the line of feed during the other interval between said reverse directions of feed motion, said cam-groove of the feed-wheel being connected with the feed-bar, a cloth-plate-operating mechanism, and a driving-shaft connected with the feed-wheel and said operating mechanism, all substantially as herein described, for the purpose set forth.



3. In a button-hole sewing-machine, the combination, with the

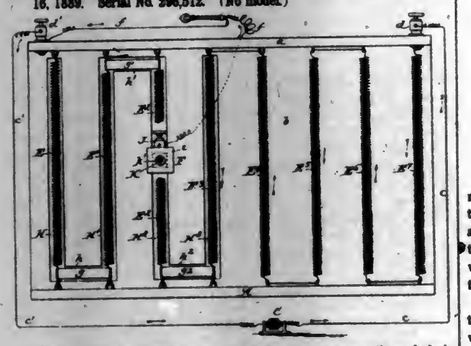
408,842.

stitch-forming mechanism and cloth-plate, of a feed-bar having mounted thereon guideways F' for said plate, guideways F^4 for said bar on the machine-frame, an operating-wheel having a cam-groove, J', connected with the cloth-plate, a feed-wheel having cam-grooves, H' N' in its opposite faces, one, H', partly plain and partly serpentine and of a shape to move the cloth-plate uniformly in reverse directions and reciprocally in the line of feed during one interval between said reverse directions of feed motion, and the other, N', entirely plain and of a shape to move said operating-wheel together with the cloth-plate opposite to the line of feed in one direction during one interval and in the other direction during the other interval between said reverse directions of feed motion, said two cam-grooves of the feed-wheel being connected, respectively, with the feed-bar and the operating-wheel bearing, and a driving-shaft connected with the feed-wheel and operating-wheel, all substantially as herein described, for the purpose set forth.



408,843. BOILER. KONRAD GANPER, Sielce, near Sosnowice, and RUDOLF FABIAN, Warsaw, Russia. Filed Nov. 30, 1888. Serial No. 292,317. (No model.)

Claim.—A tubular boiler comprising the internal fire-tubes, the external inclosing water-tubes, and the separate water-circulating chambers, each pair of fire and water tubes having a pair of separate chambers secured to their opposite ends, the fire-tubes extending completely through the chambers and removably secured to the same, the water-tubes opening into the front sides of the chambers and removably secured thereto, each of said chambers being formed integral and having openings in its top and bottom formed by flanges, said chambers being movably secured together with their upper and lower openings registering, and packing-rings interposed between the adjoining edges of said flanges, as set forth.



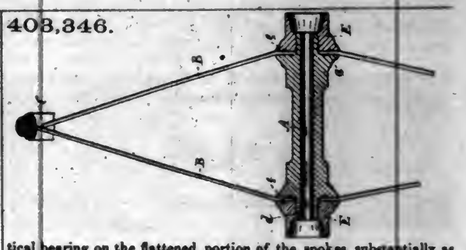
408,844. CURTAIN-FIXTURE. AARON W. GATHART, Washington, Pa. Filed Feb. 9, 1889. Serial No. 299,365. (No model.)

403,344.

Claim.—A reel device for curtains, consisting of a plate, *j*, provided with a circular notched flange, *j'*, and a central spindle, a reel journaled upon this spindle, a screw for holding the reel upon the spindle, and a crank pivoted to the face of the reel and provided with an angular arm, *l''*, this arm being adapted to engage the aforesaid notched flange, and thereby hold the reel against turning.

403,345. RHEOSTAT. JOHN I. GEE, Jackson, Mich. Filed Jan. 16, 1889. Serial No. 296,512. (No model.)

Claim.—1. The combination, with two resistance-coils and their connection, of a movable contact-point and a guide on which the contact-point can be moved along each coil and from one coil to the other along their connection without breaking contact, substantially as set forth.

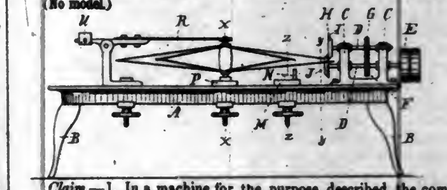


2. The combination, with two resistance-coils and their connection, of a frame provided with a continuous way opposite said coils and their connection, and a movable contact-point arranged in said way and adapted to bear against said coils and their connection, substantially as set forth.

3. The combination, with several resistance-coils having their adjacent ends connected by flat metallic bars, of a frame provided opposite said coils and bars with a continuous slot or way, and a movable contact-point arranged in said slot or way, substantially as set forth.

4. The combination, with a resistance-coil, of a stationary frame provided with a slot or way opposite said coil, a sliding frame, I, arranged in said slot or way, a binding-post, J, provided with a socket, *j*, arranged in said sliding frame, and a contact-bolt, K, and spring *k*, arranged in said socket, substantially as set forth.

5. The combination, with a resistance-coil, of a stationary frame provided with a slot or way opposite said coil, a sliding frame, I, arranged in said slot and provided with a sleeve, i^3, having a slot, j^3, a binding-post, J, provided with a socket, *j*, arranged in the sleeve i^3 and having a projection, j', entering the slot j^3, a contact-bolt, K, provided with an anti-friction roller, K', and having a projection, *l*, entering a groove, *l'*, in the socket *j*, and a spring, *k*, arranged in said socket behind the contact-bolt, substantially as set forth.

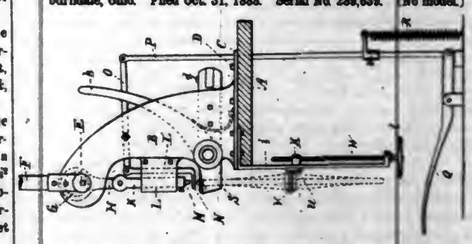


403,346. VEHICLE-WHEEL. FRANK H. HARRIS, Auburndale, Ohio. Filed Oct. 2, 1888. Serial No. 286,943. (No model.)

Claim.—1. A vehicle-wheel composed of the hub provided with the radial spoke-notches *c*, tapered, as described, and slightly shallower than the ends of the spokes, the spokes having their inner ends flattened to form a wedge-shaped dovetail, said dovetail being tapered in two planes at right angles to each other and in inverse directions to each other, and the cap E on the spindle of the hub, and having a flat vertical bearing on the flattened portion of the spokes, substantially as shown and described.

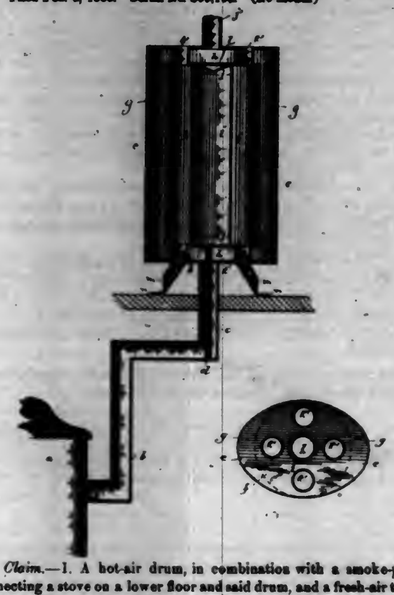
2. In a vehicle-wheel, the combination, with the wire spokes B of the wheel, of a dovetail, *a*, formed on the inner end of the spokes and tapering inversely to each other in two planes at right angles to each other, the hub of the wheel provided upon its end with radial spoke-notches corresponding with the dovetail formed upon the ends of the spokes, or slightly shallower, the cap E, provided with an annular recess, *e*, upon its inner face, and the spindle-box on the hub, as the means for securing and clamping the cap to the hub, substantially as described.

403,347. MACHINE FOR TRIMMING WIRE SPOKES. FRANK H. HARRIS, Auburndale, Ohio. Filed Oct. 29, 1888. Serial No. 289,361. (No model.)



Claim.—1. In a machine for the purpose described, the combination, with the bed, of a slidingly-adjustable wheel-support and of two rotary disks, the lower one being provided with spoke-notches and the upper one with a cutting-edge adapted to cut off the ends of the spokes in conjunction with the lower disk, into the notches of which the ends of the spokes are adapted to be engaged, all substantially as described.

2. The combination, with the frame of the machine and the rotary disks I and K, adapted to cut off the ends of the spokes, of the wheel-support P, slidingly adjustably secured on the bed of the machine and provided with a receiving-socket for the shaft of the wheel, and of the hinged arm R, having a corresponding socket to engage with the upper end of the shaft of the wheel, all substantially as described.

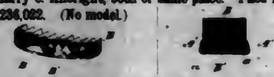


3. In a machine for the purpose described, the combination, with the bed of the machine, of the rotary disks I and J, revolving in opposite directions to each other, the upper disk being provided with the beveled cutting-edge I, and the disk J having its periphery inversely beveled and provided with spoke-notches K, and of one or more wheel-supports, substantially as described, slidingly adjustably mounted upon the bed, substantially as described.

403,348. HAND RIVETING-MACHINE. FRANK H. HARRIS, Auburndale, Ohio. Filed Oct. 31, 1888. Serial No. 289,639. (No model.)

Claim.—In a hand riveting-machine for the purpose described, the combination, with the frame B of the machine, of the vise S, detachably secured thereto and provided with a hand-lever, A, and adjusting-nut *g*, the reciprocating riveting-tool secured in a guide-bearing, L, on the frame of the machine, the actuating hand-lever F and its connections with the riveting-tool, the reciprocating pressure-foot N, secured in vertical guide-bearings of the frame, the actuating foot-lever Q and its connection with said pressure-foot, the frame *i*, provided with the vertical slot *j* and index *m*, the wheel-support U, slidingly mounted in the slot of the frame *i* and provided with the adjusting-screw W, having the hand-wheel *l*, and the stop-shaft V, carried by the wheel-support U, all combined to operate substantially as described.

403,349. HEATING-DRUM. JAMES HENDERSON, Moorhead, Minn. Filed Feb. 8, 1888. Serial No. 263,195. (No model.)



Claim.—1. A hot-air drum, in combination with a smoke-pipe connecting a stove on a lower floor and said drum, and a fresh-air tube longitudinally extending through a portion of said pipe and communicating with the atmosphere of the lower floor and opening into said drum, substantially as described.

2. A hot-air drum having a passage for the hot products of combustion therethrough, and a fresh-air-heating chamber therein having hot-air outlets, in combination with a smoke-pipe connecting a stove and said passage of the drum, and a fresh-air pipe longitudinally located in said pipe and communicating with the atmosphere at one end and opening into the fresh-air-heating chamber of the drum at its other end, substantially as described.

3. A hot-air heating-drum comprising an outer casing through which the products of combustion from a stove pass, a fresh-air-heating chamber in the casing having fresh-air-induction openings and hot-air-eduction openings, and hollow supporting-legs for the drum opening into said induction-openings, and through which fresh air is supplied to the same, substantially as described.

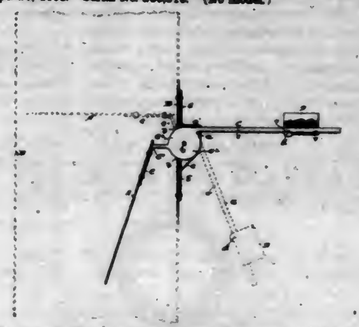
4. A hot-air heating-drum comprising an outer casing, an interior cylinder forming upper and lower spaces communicating by vertical flues outside of the cylinder and inside of the casing, an inner cylinder in the interior cylinder, the interior of the two cylinders communicating, a smoke-pipe opening into said lower space, an exit-pipe from said upper space, fresh-air tubes extending through the casing and said lower space into the interior cylinder, hot-air-exit tubes extending from the interior cylinder through said upper space to the outer air, and a fresh-air tube extending through a portion of the smoke-pipe and lower space into the inner cylinder, substantially as described.

403,350. ADJUSTABLE PAD FOR CLEANSING AND POLISHING TEETH. GEORGE F. HOBBY, Utica, N. Y., assignor to Charles L. Bartlett and Harry C. Allbright, both of same place. Filed Apr. 26, 1887. Serial No. 236,022. (No model.)

Claim.—1. In combination with the piece of felt having the roughened face at right angles to the planes in which its fibers run, the stiffening-back cemented to the side of the piece opposite to the roughened face, substantially as and for the purpose described.

2. A polishing or cleansing pad consisting of a block of felt having its rubbing-face at right angles to the planes in which the fibers of the felt run corrugated transversely, and a layer of stiff material attached to the side of the felt block opposite to the rubbing-face by means of cement, substantially as and for the purpose set forth.

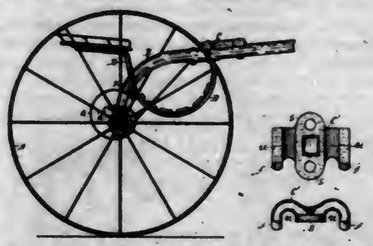
403,351. CHECK-HOOK FOR HARNESS. MARY INGERSOLL, Erie, Pa. Filed Apr. 4, 1888. Serial No. 269,607. (No model.)



Claim.—In a check-hook, the combination of the hook A, sheave B, within said hook, safety-bar C, pivoted at the base of said hook and reaching across its mouth, and a spring, D, acting upon said bar near its pivot.

403,352. COUPLING FOR UNDERGROUND CONDUITS. WILMOT LAKE, Washington, D. C. Filed Oct. 2, 1888. Serial No. 286,906. (No model.)

Claim.—A terra-cotta coupling for electric-wire conduits, consisting of a short rectangular band, collar, or sleeve scored or grooved on opposite sides, substantially as and for the purposes described.



403,353. DAMPER. CHRISTIAN F. LANGE, Cleveland, Ohio. Filed Sept. 27, 1888. Serial No. 286,513. (No model.)

Claim.—1. The combination, with damper, pipe, and damper-lever, the latter being of the bell-crank variety, arranged substantially as indicated, of plate E, having flanges *c* and cap *c'*, the flanges embracing the damper-lever, and the cap serving as a stop for engaging such lever when the damper is depressed, substantially as set forth.

2. The combination, with a damper-lever of the bell-crank variety having a hub for closing the slot in the pipe, of a damper secured to one arm of said lever and a poise secured to the other arm, substantially as set forth.

403,354. TWO-WHEELED VEHICLE. ABNER L. LAY, Battle Creek, Mich. Filed Sept. 5, 1888. Serial No. 284,969. (No model.)

Claim.—1. In a two-wheeled vehicle, the thills, body-bars having their forward ends fulcrumed thereon, and the axle, in combination with coil-springs, the lower extremities of which are secured to said axle, and vertically-adjustable horizontally-vibrating links or rods connecting said springs with the body-bars.

2. In a two-wheeled vehicle, the axle, thills, and seat, in combination with body-bars having series of perforations and fulcrumed at their forward extremities on said thills, coil-springs, one extremity of each of which is secured to the axle, and depending vertically-adjustable horizontally-vibrating rods, one extremity of each of which is secured to the body-bar at any of the points of perforations thereof and its opposite end secured to the upper forward extremity of one of the coil-springs, all substantially as and for the purposes herein set forth.

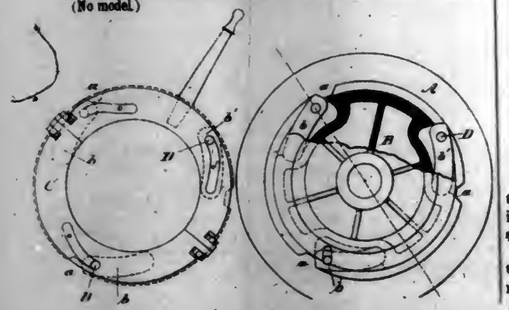
3. In a two-wheeled vehicle, the axle, thills, and seat, in combination with coiled supporting-springs, one extremity of each of which is secured to said axle and its opposite formed as an eye, body-bars having series of perforations and fulcrumed at their forward extremities on said thills, and depending equalizer-links having perforated extremities, pins or bolts for securing said extremities, respectively, to the body-bars at the points of perforations thereof and to the forward extremities of the coil-springs, for the purposes set forth.

4. In a two-wheeled vehicle, the axle, thills, and seat, in combination with bent body-bars having series of perforations and fulcrumed at their forward extremities on said thills, coiled supporting-springs, one extremity of each of which is secured to the axle and its opposite formed as an eye, vertically-adjustable longitudinally-vibrating links, the upper extremities of which are formed to embrace opposite sides of the body-bars and are secured thereto at the points of perforations thereof by bolts or pins, and the lower extremities of which are formed to receive the eyes on the ends of the coil-springs and are secured thereto by pins or bolts, yokes provided with vertical channels for the passage of the coil-springs, and a clasp for firmly securing said springs to the axle, all substantially as and for the purposes herein set forth.

5. In a two-wheeled vehicle, the axle *a'*, the thills B, and cross-bar C, the body-bar D, provided with the adjustable link or equalizer *r*, the circular springs *a a*, and the yoke C', provided with semicircular channels *u u*, lugs *f f*, and perforated ears *s s*, for attaching said springs to the axle by means of a clip or embracing-clamp, substantially as and for the purposes illustrated and described.

6. As a new article of manufacture, a clasp for fastening vertical circular springs to the axles of vehicles, consisting of the clip and its engaging-yoke C', the latter provided with vertical channels *u u*, lugs *f f*, and perforated ears *s s*, constructed, combined, and used substantially in the manner and for the purpose set forth.

403,355. UMBRELLA-TIP RING. EDWIN J. LUBLEY, Washington, D. C., assignor, by direct and mesne assignments, to James A. Bealmear, Baltimore, Md., and Thomas A. Mitchell, Washington, D. C. Filed Aug. 8, 1888. Renewed Mar. 30, 1889. Serial No. 305,500. (No model.)

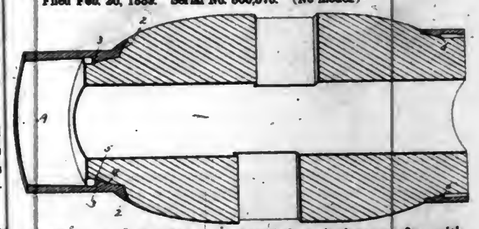


Claim.—1. A ring formed from coiled wire, the end coils of the wire abutting against each other and held in that position by means of a link inside of said coils, substantially as described.

2. A ring formed from coiled wire, the end coils of the wire abutting against each other and held in that position by means of a link provided with an enlargement at each end inside of said end coils, substantially as described.

3. A ring formed from coiled wire, the end coils of the wire loosely abutting against each other and held in that position by means of a link consisting of a shank having a head on each end, the ends of the link being inserted within the end coils and the ends of the wire coiled around the shank, substantially as described.

403,356. LOCKING-GEAR FOR SHIPS' WINDLASSES. FRANK S. MANTON, Providence, R. I. Filed Jan. 30, 1889. Serial No. 298,104. (No model.)



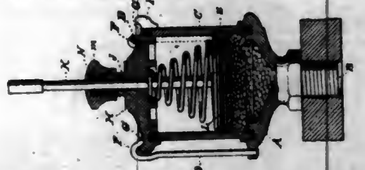
Claim.—1. The combination, with a wildcat loosely mounted on a windlass-shaft, of a driving-head rigidly secured to the shaft and provided with locking-pawls to engage with the wildcat, a portion of them being adapted to drive it in one direction and the other portion being adapted to drive it in the other direction, substantially as described, and a slotted ring for simultaneously moving all the pawls into or out of position to engage with the wildcat.

2. The combination, with a wildcat loosely mounted on a windlass-shaft and provided with thrust-blocks, of a driving-head rigidly secured to said shaft and carrying locking-pawls, some of which are adapted to engage with one face of the thrust-blocks and drive the wildcat in one direction, while the others are adapted to engage with the opposite face of the thrust-blocks and drive the wildcat in the opposite direction, and a slotted ring for simultaneously moving all the pawls into or out of position to engage with the thrust-blocks, substantially as described.

3. The combination, with the driving-head B, having the oppositely-disposed locking-pawls *b b'*, of the ring C, having the cam-slots *c c'*, adapted to throw all the pawls in or out simultaneously, substantially as described.

4. The combination, with the wildcat A, having the thrust-blocks *a*, of the driving-head B, carrying the locking-pawls *b*, engaging with one face of the blocks *a*, and the pawl *b'*, projecting between two thrust-blocks, in position to engage with the opposite face of one of them when the motion of the driving-head is reversed, substantially as described.

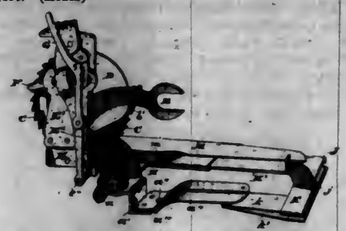
403,357. VEHICLE HUB-BAND. JARED MARIS, Columbus, Ohio. Filed Feb. 20, 1889. Serial No. 300,570. (No model.)



Claim.—1. A metallic band provided on its inner surface with one or more inwardly-projecting ribs, each being elongated in form and sharpened or pointed at its inner end to adapt it to be driven lengthwise through the wood, said ribs extending only partly the width of the band, and thereby insuring an unobstructed space within the outer end of the band, within which the fibers of the wood may expand and close against the outer ends of the ribs.

2. A metallic band provided on its inner surface with one or more inwardly-projecting ribs, each being elongated in form and sharpened at its inner end to adapt it to be driven lengthwise through the wood, the outer end of the rib being blunt, pointed, or shouldered, and located within the band and at such a distance from its outer end as to insure an unobstructed space within the outer end of the band, within which the wood may expand and close against the outer ends of the ribs, substantially as set forth.

3. A metallic band provided at one end with an outwardly-flaring flange, and provided on its inner surface and adjacent to its flanged end with one or more inwardly-projecting ribs, each being elongated in form and sharpened at one end to adapt it to be driven lengthwise through the wood, the rib extending only partly the width of the band, and thereby insuring an unobstructed space within the outer end of the band, within which the fibers of the wood may expand and close around the outer end of the rib, substantially as set forth.



403,358. GREASE-CUP. JOHN MASSETT, North Tarrytown, N. Y. Filed Feb. 15, 1889. Serial No. 299,940. (No model.)

Claim.—1. In a grease-cup, the cylinder and base, in combination with the hooked tie-rods and the marginally-notched cap having inclined arc-shaped bearing-grooves for the hooks of said tie-rods, substantially as specified.

2. The grease-cup comprising the base, notched cap, and hooked tie-rods, the gland and piston-rod packing, the piston, tapered piston-rod, and spiral spring, substantially as specified.

403,359. PLAITING ATTACHMENT FOR SEWING-MACHINES. THOMAS L. MELONE, Chillicothe, Ohio; Juliette S. Melone administratrix of said Thomas L. Melone, deceased. Filed May 17, 1888. Serial No. 95,190. (Model.)

Claim.—1. In a plaiting attachment for sewing-machines, the combination, substantially as hereinbefore described, of the presser-foot having an upwardly and outwardly extending curved arm provided with a cut-away portion and a guide-plate secured to the curved arm, with the pivoted plaiting-blades, substantially as set forth.

2. In a plaiting attachment for sewing-machines, the combination of the presser-foot with the pivoted plaiting-blade of two parts, and a guide-piece whereon both of said parts are fixed, said blade having means of vibration and reciprocation, as described, and adapted to carry the strip between the two portions of the blade and to form alternate plaits against said presser-foot and the bed-plate of the sewing-machine.

3. In a plaiter, the combination of the ratchet-wheel having graduated openings within its circumference, and the pivoted tripping-lever engaging said openings, said lever being pivoted so that it may be swung toward or from the center of the wheel, for the purpose substantially as described.

4. In a plaiting attachment for sewing-machines, a ratchet-wheel provided with openings, and a pin or its equivalent for the purpose of depressing the plaiting-blade, in combination with said blade, and a vibrating guide-plate having a connecting-piece, as set forth.

5. In a plaiter, the combination, with the plaiting-blade, of a ratchet-wheel having graduated openings for the purpose of breaking and restoring connection between working parts of the attachment and provided with a pin or its equivalent for depressing the plaiting-blade, and means for connecting said pin and blade, all substantially as set forth.

6. In a plaiter, the combination of a ratchet-wheel having openings, as described, and a pin for depressing a vibrating guide-plate, with the said vibrating guide-plate provided with a movable bearing-piece for regulating the contact of the pin and the said guide-plate, the plaiting-blade, and their connecting-piece, as and for the purpose set forth.

7. In a plaiter, the combination of a ratchet-wheel having openings within its circumference and a pin upon its side, for the purposes described, with a plaiting-blade connected with a vibrating guide-plate, and said guide-plate provided on its under side with a spring to automatically elevate the said plate, as set forth.

8. In a plaiter, the combination of the vibrating guide-plate M, hinged to the main frame, as described, and provided with spring *m*, and a movable piece, *o*, with the plaiting-blades below and the ratchet-wheel above, the said wheel being provided with means for depressing the vibrating guide-plate, as and for the purpose set forth.

9. In a plaiter, the combination of the ratchet-wheel having means for depressing a vibrating guide-plate, and the said vibrating guide-plate, with the slide having downwardly-projecting lugs, and a pivot-pin for carrying the plaiting-blade, as set forth.

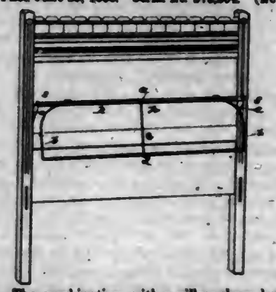
10. In a plaiter, the combination of a ratchet-wheel having its teeth formed on its outer edge, the axis on which it turns, a shield for covering the teeth of said wheel and pivoted on said axis and provided with a tooth or projection, and a series of ratchet-teeth with which said tooth engages to retain the shield in a determined position, with a lever adapted to receive motion from the needle-bar and provided with a pawl having a depressing-spring, so that it may ride upon the shield and turn the wheel when brought into engagement with its teeth and actuate the plaiting-blade, substantially as set forth.

11. The combination, with the plaiting-blade, the ratchet-wheel, and their connecting mechanism, of the main frame A, having an extension, A°, with notches in its upper part, and the shield D, extending above the ratchet-wheel and provided with a tooth, *d*, for engaging in the notches and for regulating the rotation of the ratchet-wheel and the consequent frequency of the plaits.

12. In a plaiter, the combination, with the ratchet-wheel supported on a flexible upright carrying a slotted plate and having openings within its circumference, as described, of mechanism for receiving motion from the needle-bar and transmitting it to the plaiting-blade, with an independent adjustable tripping-lever adapted to ride upon the surface of the wheel and to connect and disconnect the operative portions of the attachment, as set forth.

13. In a plaiter, the combination, with a main frame having means of attachment to the presser-bar and provided with a flexible upright support carrying a slotted plate having a tripping-lever for engaging with the ratchet-wheel, of a lever adapted to receive motion from the needle-bar and provided with a lug for moving in the slotted plate and with means for throwing the plaiting-blades, as set forth.

14. In a plaiter, the combination, with the blades, of the ratchet-wheel C, having openings as described, the flexible support E, the slotted plate E', the tripping-lever F, for bearing against the ratchet-wheel and bending the flexible upright, and the L-shaped lever for receiving motion from the needle-bar and for rotating the ratchet-wheel, and provided with a lug extending through the slotted plate, with the lever E", connected to the plaiting-blade below and adapted to throw the same when connected to operate.



15. In a plaiting attachment for sewing-machines, the combination of the L-shaped lever, which derives its motion from the needle-bar having a pawl, a circular ratchet having an opening within its circumference, for the purpose set forth, a shield for covering the teeth on the ratchet-wheel and preventing their engagement by the pawl, a pivoted lever vibrated by said L-shaped lever, the plaiting-blade, and connections between said pivoted lever and the plaiting-blade, whereby the latter is moved by every stroke of the needle-bar, as set forth.

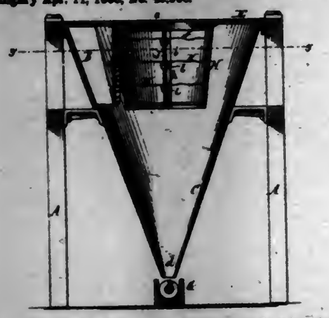
16. In a plaiting attachment for sewing-machines, the combination, with the pivoted lever E", having the toothed rack and direct connection with the ruffling-blade, and the arm G, pivoted to the lever E", and having a tooth for engaging any one of the teeth of said rack, of the pivoted L-shaped lever B, having the projection *b"*, which enters between the lever E" and arm G, and engages therewith at a point between the pivot and tooth of the said arm, substantially as set forth.

17. In a plaiter, the combination, with a lever vibrated by the needle-bar, and a pivoted lever having connection with the plaiting-blade, of a ratchet-disk rotated by the movement of the needle-bar, having a slot or cut-away portion for permitting a projection upon the lever which is vibrated by the needle-bar to engage at intervals with the lever which has connection with the ruffling-blade.

18. In a plaiter, the combination, with the vibrating L-shaped lever, the pawl carried thereby, and the circular ratchet, of a shield for covering any desired number of the teeth of said ratchet, a tooth carried by said shield, and a toothed rack with which the tooth on said shield engages, the teeth of said rack corresponding in number and position to those on the circular ratchet, substantially as and for the purposes set forth.

403,360. PILLOW-SHAM HOLDER. NORMAN C. MOFFETT, Clinton, Iowa. Filed June 26, 1888. Serial No. 278,204. (No model.)

Claim.—The combination, with a pillow-sham holder consisting of the bar and frame attached thereto, of the elastic brackets flexible in the direction of the length of the bar and the screw-eyes passing through the elastic brackets and into the bar, whereby by the tightening of the screw-eyes the brackets are, through their resiliency, utilized to retain the holder in any desired position, substantially as described.



403,361. SASH-CORD FASTENER. HENRY MORGAN, Oakleigh, Isle of Wight, England. Filed May 17, 1888. Serial No. 274,173. (No model.) Patented in England Jan. 9, 1888, No. 334.

Claim.—The combination of the window-sash having a groove extending from end to end of its side rail, the plate secured across the groove and having eyes located in the groove, and the window-

cord provided with a metallic ferrule, *k*, through which the cord passes, and to which cord it is fastened by a transverse rivet, *l*, said ferrule being slidable with the cord out through the open end of the groove at the lower end of the sash-rail, substantially as shown and described.

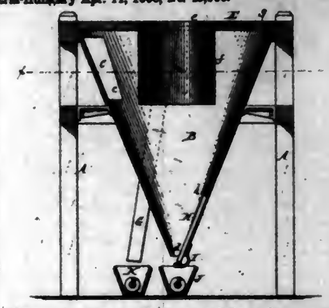
403,362. DUST-COLLECTOR. ORVILLE M. MONEE, Jackson, Mich., assignor to the Knickerbocker Company, same place. Filed Mar. 31, 1888. Serial No. 197,307. (No model.) Patented in England July 30, 1888, No. 4,423; in Germany July 26, 1888, No. 39,219; in France July 27, 1888, No. 177,638; in Belgium July 27, 1888, No. 74,005; in Canada Sept. 3, 1888, No. 34,854; in Italy Dec. 15, 1887, No. 23,535, and in Austria-Hungary Apr. 11, 1888, No. 49,960.

Claim.—1. A dust-collector consisting of a chamber having an imperforate peripheral wall in which the whirling body of air forms a vortex and in which the air moves from the periphery toward the axis of the vortex as it becomes freed from the solid matter, said chamber being provided at one end with a discharge-aperture for the purified air opening into the atmosphere and at its opposite end with a discharge-opening for the separated dust and with a tangential inlet for the dust-laden air, substantially as set forth.

2. The combination, with a dust-collector consisting of a separating-chamber constructed with an imperforate peripheral wall in which the whirling body of air forms a vortex, and which is provided in one end with a discharge-aperture for the purified air opening into the atmosphere and at its opposite end with a discharge-opening for the separated dust, of a tangential inlet-spout and a fan whereby the dust-laden air-current is propelled through said spout into the dust-collector, substantially as set forth.

3. A dust-collector consisting of a tapering separating-chamber constructed with an imperforate peripheral wall, in which the dust-laden air forms a vortex or whirling body, and which is provided in its large end with a central discharge-opening for the purified air, at its small end with a discharge-opening for the separated dust, and with an external inlet-spout for the dust-laden air entering the large portion of the chamber tangentially, substantially as set forth.

4. The combination, with the separating-chamber constructed with an imperforate peripheral wall, in which the dust-laden air forms a vortex or whirling body, and which is provided at one end with a central discharge-opening for the purified air and at its opposite end with a discharge-opening for the separated dust, of an external inlet-spout for the dust-laden air entering the separating-chamber tangentially, and an internal deflector whereby the dust particles are deflected toward the dust-discharge, substantially as set forth.



5. The combination, with the separating-chamber constructed with an imperforate peripheral wall, in which the dust-laden air forms a vortex or whirling body, and which is provided at one end with a central discharge-opening for the purified air and at its opposite end with a discharge-opening for the separated dust, of an external inlet-spout for the dust-laden air entering the separating-chamber tangentially, and a deflector secured to the inner side of the peripheral wall in the rear of the inlet-opening, whereby the dust particles are deflected toward the dust-discharge beyond the inlet-opening, substantially as set forth.

6. The combination, with the separating-chamber in which the dust-laden air assumes a whirling motion and which is provided with a dust-discharge opening and an air-discharge opening, of an auxiliary dust-separator surrounding the air-discharge opening and provided with an outlet through which the dust passes from the auxiliary separator into the main separating-chamber, substantially as set forth.

7. The combination, with the conical separating-chamber C, provided with a dust-discharge opening, *d*, and an air-discharge opening, *e*, of an auxiliary dust-separator, H, provided with a longitudinal skimming-opening, A, substantially as set forth.

8. The combination, with the conical separating-chamber C, having a dust-discharge opening, *d*, and an air-discharge opening, *e*, of an auxiliary separator, H, provided with a dust-discharge opening, *h*, and cleaners K, rotating within the auxiliary separator H, substantially as set forth.

403,363. DUST-COLLECTOR. ORVILLE M. MONEE, Jackson, Mich., assignor to the Knickerbocker Company, same place. Filed June 9, 1886. Serial No. 204,634. (No model.) Patented in England July 30, 1888, No. 4,423; in Germany July 26, 1888, No. 39,219; in France July 27, 1888, No. 177,638; in Belgium July 27, 1888, No. 74,005; in Canada Sept. 3, 1888, No. 34,854; in Italy Dec. 15, 1887, No. 23,535, and in Austria-Hungary Apr. 11, 1888, No. 49,960.

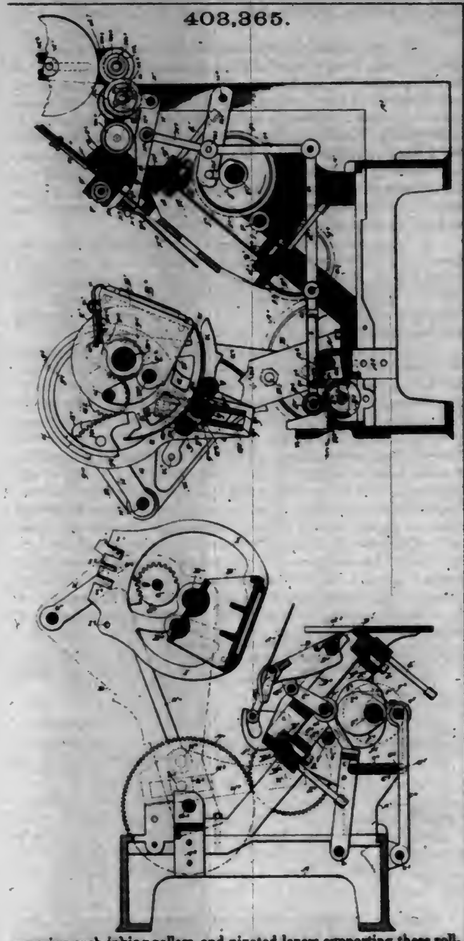
Claim.—1. A dust-collector consisting of a separating-chamber having an imperforate peripheral wall in which the whirling body of air forms a vortex, and in which the air moves from the periphery toward the axis of the vortex as it becomes freed from the solid matter, said chamber having at one end a discharge-aperture for the purified air opening into the atmosphere, and provided with a tubular guard projecting into the separating-chamber, at its opposite end a discharge-opening for the separated dust, and a tangential inlet for the dust-laden air, substantially as set forth.

2. A dust-collector consisting of a tapering separating-chamber having an imperforate peripheral wall in which the whirling body of air forms a vortex, and in which the air moves from the periphery toward the axis of the vortex as it becomes freed from the solid matter, said chamber having at its large end a tangential inlet for the dust-laden air, and a discharge-aperture for the purified air opening into the atmosphere, and provided with a tubular guard projecting into the separating-chamber, and at its small end a discharge-opening for the separated dust, substantially as set forth.

403,364. WHIFFLETREE-HOOK. WILLIAM H. MURPHY, Lowell, Mich. Filed Feb. 26, 1889. Serial No. 301,530. (No model.)

Claim.—1. The combination, with the ferrule A, provided with forwardly-extending walls, the upper wall being provided with a key-hole slot, and a swinging hook secured to the ferrule, provided on its end with an enlarged portion adapted to pass through the key-hole slot to locate the end of the hook within the open-ended box, substantially as shown, and for the purpose set forth.

2. The combination, with a ferrule having horizontal and vertical walls *b*, which project forwardly from said ferrule, the upper wall being provided with a key-hole slot, *c*, and a swinging hook secured to the ferrule so as to encircle the end of the whiffletree, the end of the hook being extended rearwardly beyond the forward portion of the ring and provided with an enlarged end, substantially as shown, and for the purpose set forth.



403,365. PLATEN PRINTING-PRESS. FLEMING W. MUMBTTER, Fostoria, Ohio. Filed Mar. 7, 1888. Serial No. 266,410. (No model.)

Claim.—1. The combination, with bed for holding the form and side pieces or supports for such bed, of two tie-bars for rigidly connecting the bed and such side supports, leaving spaces between the ends of the bed and such supports, substantially as set forth.

2. The combination of form and stationary and reciprocating distributing-rolls, ink-plate composed of a segment of a hollow cylinder, and mechanism, preferably as indicated, for oscillating such ink-plate on its axis past the distributing-rollers, substantially as set forth.

3. The combination, with inking-rollers, oscillating frame for

403,365.

carrying such inking-rollers, and pivoted levers supporting these rollers, said levers having a yielding sliding connection with the oscillating frame, of oscillating inking-plate arranged to meet and overlap the inking-rollers at the termini of the respective strokes thereof, substantially as set forth.

4. The combination, with oscillating inking-plate, substantially as indicated, of reciprocating distributing-rollers and inking-fountain located midway of the stroke of the inking-plate, substantially as set forth.

5. The combination, with inking-rollers, oscillating frame for holding the same, pivoted levers supporting these rollers, said levers having a yielding sliding connection with the oscillating frame, and oscillating inking-plate, substantially as indicated, of distributing-rolls for distributing ink to the said inking-plate with reverse movements of the latter, substantially as set forth.

6. The combination, with stationary and reciprocating distributing-rolls, of oscillating inking-roller frame and oscillating ink-plate, having, respectively, different axes and intergeared, so as to move simultaneously in opposite directions, substantially as set forth.

7. The combination, with stationary and reciprocating distributing-rolls, ink-roller frame, and ink-plate intergeared and arranged to operate simultaneously in opposite directions, of pinion mounted on the axle of the ink-roller frame, a toothed sector for engaging such pinion, and mechanism, preferably as described, for oscillating such sector, the respective movements of the latter being turned to the strokes of the bed, substantially as set forth.

8. The combination, with oscillating ink-roller frame bearing sliding blocks for holding the ink-rollers, of carved levers for engaging an attachment (preferably a roller) of such sliding blocks for supporting the inking-rollers during the lower part of their travel, substantially as set forth.

9. The combination, with roller-frame, inking-rollers, sliding blocks, and curved levers, substantially as indicated, of one or more springs connected with each curved lever for giving an upward pressure to the inking-rollers, substantially as set forth.

10. The combination, with ink-fountain and distributing-rolls, the latter being journaled in frames adapted to reciprocate endwise, of oscillating ink-roller frame having inclined tracks adapted to engage and reciprocate the distributing-roller frame, substantially as set forth.

11. The combination, with a distributing-roller having stationary journal-boxes, and an inking-fountain adapted to move to and from such distributing-roller, of distributing-rollers having reciprocating end movements, substantially as set forth.

12. The combination, with a distributing-roller having stationary journal-bearings and ink-fountain movable to and from such distributing-roller, of reciprocating distributing-rollers and oscillating ink-roller frame, the latter bearing inclines for reciprocating such distributing-rollers, substantially as set forth.

13. The combination, with a vibrating ink-fountain, distributing-roller having stationary journal-boxes, and distributing-rollers having end movement, of inclines on the ink-roller frame, said inclines being arranged in pairs and in reverse order for reciprocating the movable distributing-rolls simultaneously in opposite directions, substantially as set forth.

14. The combination, with bed, supporting-frame, and tie-bars connecting the bed with such support, substantially as indicated, of stationary and reciprocating distributing-rolls, ink-roller frame having an independent shaft with bearings in the side supports, segmental cylindrical ink-plate journaled on one of the tie-bars, and mechanism, substantially as indicated, for oscillating the inking-roller frame and ink-plate simultaneously in opposite directions, substantially as set forth.

15. The combination, with toothed sector for operating the inking mechanism, of tilting link connected by pitman with such sector, a crank for operating the tilting link, and a sliding block mounted on the crank-wrist, said sliding block operating in the slot of the link, substantially as set forth.

16. The combination, with toothed sector, connecting-pitman, tilting link, and crank-wrist, of crank for operating such mechanism, press-driving shaft, and impressional crank-shaft, all three so connected and intergeared that two complete revolutions of the impressional crank-shaft occur during one complete revolution in the inking-mechanism crank, substantially as set forth.

17. The combination, with rock-arm for operating the impression throw-off, of a register and rod for operating the latter, said rod being connected with the said rock-arm, the arrangement of parts being substantially as indicated, whereby the register is made inoperative when the impression throw-off is in use, substantially as set forth.

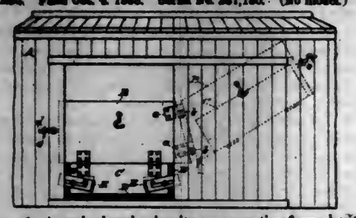
18. The combination, with a platen and an adjustable frame in which the latter is supported and on which it rests during the impression, of toggle-joint for actuating the platen and cam mechanism, preferably as indicated, for operating the toggle-joint, substantially as set forth.

19. The combination, with platen, of sub-platen or frame located back of the platen, such platen and sub-platen being pivoted or hinged together, and retaining-bolts and adjusting-screws for retaining and adjusting the sub-platen with the frame of the press, substantially as set forth.

20. The combination, with co-operating feed-rolls having, respectively, broad and narrow faces, substantially as indicated, of disks mounted on the axle of the narrow-faced feed-roll and on either side of the latter, said disks being adjustable lengthwise of the axle and being less in diameter than the intervening feed-roll, substantially as set forth.

21. The combination, with rack-bars connected with a crank in common for actuating the feed mechanism and delivering paper to and from the platen, of slip-joint had on one of the rack-bars, and mechanism, preferably as described, for regulating the lost motion of such slip-joint, substantially as set forth.

22. The combination, with co-operating feed-rolls arranged the one above the other, the lower roll having stationary journal-boxes and the upper roll being mounted on tilting-lever, of a clamping device for the paper, the upper member of such clamping device being connected with the tilting-lever and the lower member rising against the upper, the parts being arranged substantially as indicated, whereby the paper is clamped and the feed-rolls separated at the same operation, substantially as set forth.



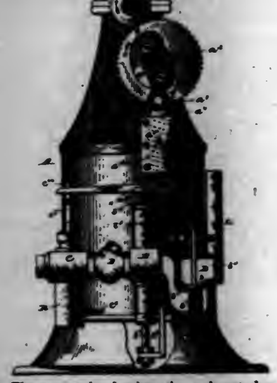
23. The combination, with feed mechanism for feeding paper to the platen and rock-arm for throwing such feed mechanism in and out of gear, substantially as indicated, of grippers connected with a free end of such rock-arm for holding the paper on the platen, substantially as set forth.

24. The combination, with the tilting-levers and feed-rolls mounted thereon, of cam mounted on the crank-shaft for actuating

such tilting-levers, and links connecting such tilting-levers with the respective feed mechanisms, all arranged substantially as indicated, whereby both sets of feed mechanism are simultaneously made operative or inoperative, substantially as set forth.

25. The combination of rock arm or lever for throwing an oscillating roll or gear in and out of mesh with the feed mechanism, said oscillating gear being held by said rock arm or lever and oscillated by a motion independent of the motion had by the rock arm or lever, substantially as set forth.

403,366. DOOR FOR GRAIN-CARS. Grande W. Orosz, Columbus, Ohio. Filed Oct. 4, 1888. Serial No. 287,120. (No model.)



Claim.—1. A grain-door having its upper section formed with an acute-angle hinged end, and provided with an outwardly-swinging lower section folding back upon said upper section, substantially as specified.

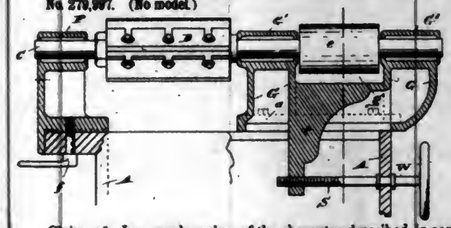
2. In a grain-door for cars, the combination of the upper section having the acute-angle end, the butt-hinges, and the outwardly-swinging lower section having the flexible strips, substantially as specified.

3. In combination with the car, the grain-door adapted to swing on the sockets *b*, placed out of a vertical line with each other, the hinged lower section adapted to swing outwardly through the door-opening, and the locking-plates, substantially as specified.

403,367. GAS OR GASOLINE ENGINE. Lewis C. Parker and Beaumont Parker, Kansas City, Mo. Filed Jan. 11, 1889. Serial No. 296,063. (No model.)

Claim.—1. The gas-engine having the exhaust-chamber and its valve, the power-cylinder having an inlet port or passage, the ignition-chamber having a heated tube or thimble, a valve seated in the mouth or lower open end of said tube or thimble, and the specified means for operating said valves, the check-valve, and the vertically-movable carburetor having a valved lower tubular portion and orifices or apertures feeding the gas from its tubular portion out upon aerially apertured or perforated plates carried by said carburetor, substantially as and for the purpose set forth.

2. In a gas-engine, the combination of the engine, including its power-cylinder, the gear-wheels, one having the cam a^3, and the cams I, I^2, and S, the bar or lever a^4, carrying the roller, the spring a^7, acting upon the bar or lever a^4, the exhaust chamber and valve located over the passage or port b', the valve l', controlling the opening to the thimble or tube l by means of the rod l^2, and spring l^3, operated from the bar a^4, substantially as specified.

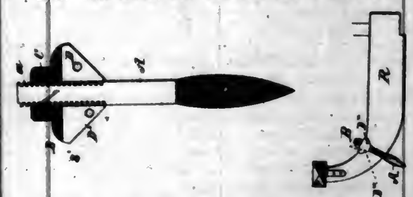


3. In a gas-engine, the combination of the engine, including its power-cylinder, the crank-shaft, the gear a', cam-wheel a^2, gear a^3, for actuating the bar or lever a^4, which causes the rod l^2 to open and close the mouth of the valve-seated thimble or tube l, having a closed outer end, the exhaust-chamber and the port b', and burner N, having gasoline fed to it by means of atmospheric pressure upon its surface to give the gasoline a uniform steady flow, substantially as set forth.

4. In a gas-engine, the combination of the engine with its cylinder, the gear a', cam-wheel a^2, gear a^3, for actuating the bar or lever a^4, which causes the rod l^2 to open and close the mouth of the valve-seated thimble or tube l, having a closed outer end, the exhaust-chamber and the port b', burner N, and the chamber or tank L, having a lower gasoline-compartment, a diaphragm or partition having an orifice around which is secured a tube having an upper open end and surrounded by water, the freely-moving closed-top cylinder, and the tube dipping in the lower gasoline-compartment of said chamber or tank and connecting with the burner tube or pipe, substantially as and for the purpose set forth.

5. In a gas-engine, the combination of the engine, its cylinder, the gears a' a^3, cam-wheel having cams specified, the bar or lever a^4, the valves l' and b, thimble or tube l, the stem or rod carrying plates c^3 and having the passage therein, the orifices c^4, communicating with said passage, and the valve c^5 to the lower part of said passage, spring c^6, inlet-passage c^4, cock c^3, and rod c^{3*}, substantially as set forth.

6. In a gas-engine, the combination of the engine, its cylinder, the actuating gears and cams, the bar or lever a^4, the exhaust-chamber having the passages b' b^2, the thimble l, controlled by the valve upon the rod l', which is actuated by rod l^2 and spring l^3, the burner N, the tank L, having an inverted or open-bottomed and closed-top cylinder exerting atmospheric pressure upon the liquid or gasoline through a tube secured upon a partition or diaphragm in said tank or chamber, tube m', connecting with the burner-pipe, the cock m, the ignition-chamber E, the check-valve D, and the carburetor C, having the horizontal and vertical chambers, one having a narrow downward extension and the stem or rod carrying the serially-apertured plates, and in the lower end of its passage a valve, said stem or rod also having a series of apertures or orifices and a spring applied thereto, itself having connection with the lever or bar a^4 and acted upon by the engine-governor, said downward extension of the vertical chamber of the carburetor having connection with a gas-supply, substantially as and for the purpose set forth.

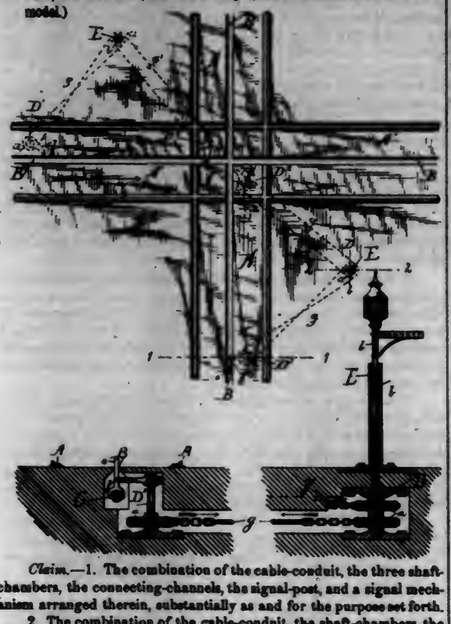


403,368. WOOD-WORKER. George W. Fassel, Cincinnati, Ohio, assignor to J. A. Fay & Company, of Ohio. Filed July 14, 1888. Serial No. 279,997. (No model.)

Claim.—1. In a wood-worker of the character described, in combination with the cutter-arbor, its cutter-head, and driving-pulley, a detachable but relatively-fixed front bearing for said arbor, and two adjustable bearings, one intermediate between the cutter-head and belt-pulley and the other terminal beyond the belt-pulley, said two latter bearings being adjustable upon the bed of the machine to determine the position of the cutter-head, substantially as set forth.

2. In a wood-worker, in combination with the cutter-arbor and its drive-pulley, a yoke-frame affording rigidly-connected bearings for the arbor at each side of the drive-pulley and adjustable upon the supporting-bed in the line of the arbor to vary the position of the latter longitudinally in its front or fixed bearing, substantially as set forth.

403,369. CORN-PLANTER ATTACHMENT. Walter Price, Lyons, Nebr. Filed Oct. 22, 1888. Serial No. 288,870. (No model.)



Claim.—1. In a corn-planter attachment, the tooth A, having the slot S, for bestriding the runner R, in combination with the adjustable cap B, for securing the tooth thereto, substantially as set forth.

2. In a corn-planter attachment, the combination of the slotted tooth A and the cap B, whereby the tooth may be reversed when worn, substantially as described.

3. In a corn-planter-attachment, the slotted tooth A, screw-threaded at the top, in combination with the cap B and nut C, whereby the tooth may be adjusted and reversed when desired, substantially as set forth.

403,370. AUTOMATIC SIGNAL FOR RAILWAYS. Gustave Provost, San Francisco, Cal. Filed July 9, 1888. Serial No. 279,465. (No model.)

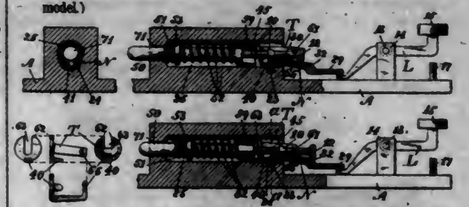
Claim.—1. The combination of the cable-conduit, the three shaft-chambers, the connecting-channels, the signal-post, and a signal mechanism arranged therein, substantially as and for the purpose set forth.

2. The combination of the cable-conduit, the shaft-chambers, the connecting-channels, the three vertical shafts, the sprocket-wheels, the chains *g g'*, the two reciprocating arms, and the gripping mechanism, substantially as and for the purpose described.

3. The combination of the cable-conduit, the shaft-chambers, the connecting-channels, the car-grip, the reciprocating arms, the upright shafts, the sprocket-wheels, the chains *g g'*, the signal-rod, and the protecting-post, all substantially as set forth.

403,371. HORSE-POWER. John C. Prust, El Dorado Springs, Mo. Filed Dec. 14, 1887. Serial No. 257,635. (No model.)

Claim.—In a horse-power, a master-wheel provided at its periphery with inclined teeth which engage with a vertically-arranged bull-pinion, which is threaded to engage with the inclined teeth of the master-wheel, the lower end of the shaft of the bull-pinion carrying a pinion oppositely threaded, the last-mentioned pinion meshing with a spirally-grooved pinion on a horizontal shaft, whereby when the master-wheel is turned the vertical shaft having the oppositely-threaded pinions will be caused to rotate without exerting a tendency to raise or lower said shaft, substantially as shown, and for the purpose set forth.



403,372. HORSE-POWER. John C. Prust, El Dorado Springs, Mo. Filed Jan. 31, 1889. Serial No. 298,203. (No model.)

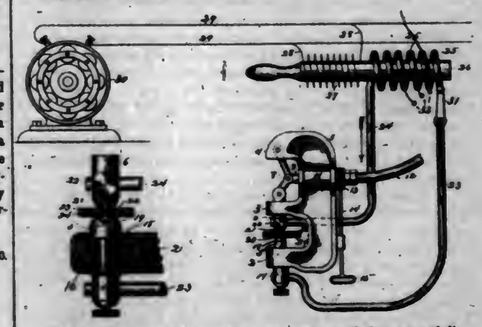
Claim.—1. The combination, substantially as described, of the master-wheel having oppositely-inclined V-shaped grooves 1 and 2 extending from the center of the periphery to the respective edges, two similarly-grooved pinions mounted to mesh with the master-wheel and having the lower ends of their shafts fitted with worm-wheels, a counter-shaft arranged between the worm-wheels and provided with a worm or worms to engage said wheels, and a sweep secured to the upper face of the master-wheel.

2. The combination, substantially as described, of the master-wheel having oppositely-inclined grooves, the two similarly-grooved pinions engaging the master-wheel at diametrically-opposite points and having their shafts fitted near their lower ends with worm-wheels, the counter-shaft mounted between the worm-wheels and fitted with worms to engage therewith, and a sweep secured to the upper face of the master-wheel.

403,373. MECHANICAL MOVEMENT. Francis H. Richards, Hartford, Conn., assignor to The Office Specialty Manufacturing Company, of New York. Filed Apr. 18, 1888. Serial No. 271,074. (No model.)

Claim.—1. In a mechanism of the class specified, the combination of the spring-actuated latch provided with two catches set one in advance of the other, the escapement having two corresponding catches, and a lever pressing said latch against said escapement, said escapement being pivoted at one end thereof and said lever taking its bearing on the escapement between said pivot and said latch, all substantially as described.

2. The combination, in a mechanism of the class specified, of a spring-actuated latch and lever, substantially as described, and the escapement having the notch 41, said lever having the tongue 40, engaging said escapement in said notch, substantially as described.



3. The combination, with the latch, the lever T, and the spring on said latch, of the conical thimble 59, all substantially as described.

4. The combination, with a frame having the bore 25, and the fulcrum-notch 24 in said bore, of the latch 50, escapement N, lever T, spring 52, and thimble 59, substantially as described.

5. The combination of latch 50, having the reduced portion 45, and the lever T, having the vertical slot 63, as and for the purpose set forth.

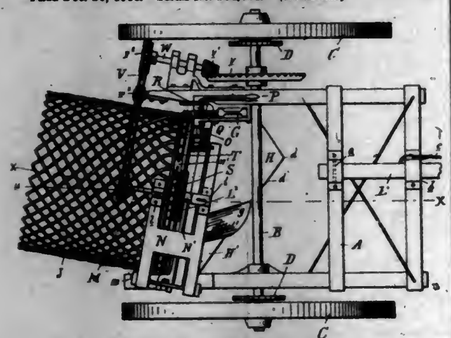
6. The combination, in a mechanism of the class specified, with the spring-actuated latch arranged to be unhooked, substantially as described, and having collar 53, of the spring 51, forward of said collar, all substantially as described, and for the purpose specified.

403,374. ELECTRIC RIVETING APPARATUS. Elias E. Ries, Baltimore, Md. Original application filed Sept. 15, 1888, Serial No. 285,555. Divided and this application filed Mar. 5, 1889. Serial No. 301,914. (No model.)

Claim.—1. An electric riveting apparatus consisting, essentially, of a metallic anvil and a metallic heading-tool, and a charged electric circuit including the anvil and tool, substantially as described.

2. An electric riveting apparatus consisting, essentially, of a metallic anvil, a metallic heading-tool, an electric generator, and conductors leading from the generator and terminating in the anvil and tool, respectively, substantially as described.

3. An electric riveting apparatus consisting, essentially, of a relatively stationary metallic anvil, a reciprocating metallic heading-tool, and a charged electric circuit including the said anvil and tool, substantially as described.



4. An electric riveting apparatus consisting of an insulated and relatively stationary metallic anvil, a reciprocating metallic heading-tool, an electric generator, and conductors leading from the latter to the anvil and heading-tool, respectively, substantially as described.

5. An electric riveting apparatus consisting of an insulated metallic anvil, a metallic heading-tool, an electric generator, conductors leading from the generator to the anvil and heading-tool, and a current-regulator, substantially as described.

6. A riveting apparatus consisting, essentially, of an anvil and a heading-tool, constituting the terminals of an electric circuit, which terminals are adapted to be bridged by a metallic rivet, substantially as described.

7. The combination, with the terminals of a charged electric circuit adapted to pass a heating-current through and exert endwise pressure upon a rivet or rivet-blank, of a current-regulator for controlling the heat of the rivet while under such pressure, substantially as described.

403,375. POTATO-DIGGER. CYRUS ROGERS, Three Rivers, Mich. Filed Dec. 26, 1888. Serial No. 294,721. (No model.)

Claim.—1. In a potato-digger, the combination, with the digging-plow, of the rotary cage consisting of an annular head provided with an outwardly-projecting flange and with rearwardly-projecting tines, and of supporting devices comprising the supporting-roller on the inside of the head and outside rollers upon the sides of the head and on top thereof engaging with the outwardly-projecting flange of the head, substantially as described.

2. In a potato-digger, the combination, with the digging-plow, of the rotary cage consisting of the annular head I, provided with the outwardly-projecting flange and the rearwardly-projecting tines, the supporting-roller K on the inside of the cage at the top thereof, the side bearing-rollers, L and L', and the top roller, L'', said rollers L, L', and L'' engaging with the flange on the head of the cage, substantially as described.

3. In a potato-digger, the combination, with the digging-plow, of the rotary cage consisting of an annular head provided with outwardly-projecting flange and with rearwardly-projecting tines, and of circumferential supporting devices comprising the supporting-roller K on the inside of the head and mounted upon a hinged frame risingly and fallingly supported, the outside rollers, L and L', stationarily secured to the frame of the machine and engaging with the flange A on the head of the cage, and the top rollers, L'', engaging with the flange A on the head of the roller, and risingly and fallingly supported by a hinged frame connected to the hinged frame of the supporting-roller, substantially as described.

4. The combination, with the revolving cage, of a potato-digger provided with the head I and circumferential flange A, the drive-chain passing around the head of said cage, and the sprocket-wheel mounted on top of the cage, and of independent circumferential bearings for said cage, consisting of an inside roller, K, under the head of the cage, the outside rollers, L and L', and the top roller, L'', engaging with the flange on the head of the cage, substantially as described.

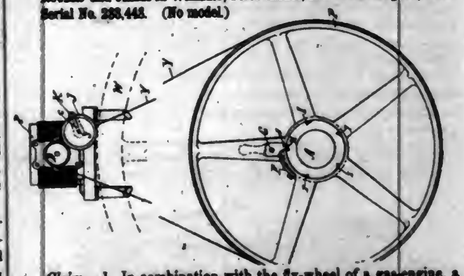
5. The combination of the revolving cage of a potato-digger provided with the head I and the circumferential flange A, the drive-chain passing around the head of said cage, and the sprocket-wheel mounted on the shaft M on top of the cage, the rising and falling frame N, on which the said shaft is mounted, the independent supporting-roller K under the head of the cage, the rising and falling frame N', upon which said roller is mounted, the connection between the frame N and N', the winding-roller o, from which the frame N is supported, the rock-shaft O, upon which said winding-roller is mounted and the lever P, for actuating said rock-shaft, substantially as described.

6. The combination of the revolving cage provided with the head I and the circumferential flange A, the drive-chain passing around the head of said cage, and the sprocket-wheel mounted on the shaft M on top of the cage, the hinged frame N, on which the said shaft is mounted, the independent supporting-roller K under the head of the cage, the hinged frame N', upon which said roller is mounted, the connection between the frames N and N', the stationary outside roller, L'', on the shaft M on top of the cage, the winding-roller o, supporting the hinged frame N, the rock-shaft O, upon which the roller is adjustably secured, the lever P, for actuating the rock-shaft, the toothed segment secured to the rock-shaft, and the digging-plow provided with the rising and falling standard G, provided with the toothed rack j, engaging with the segment Q, all arranged substantially as described.

7. The combination, with the supporting-wheels, axle, and frame of a potato-digger, of the rock-shaft mounted on top of said frame and provided with a raising and lowering lever, and of a digging-plow risingly and fallingly supported by actuating connection with said rock-shaft, and the revolving cage risingly and fallingly supported by actuating-connection with the same shaft, substantially as described.

8. In a potato-digger, the combination of the supporting-wheels, axle, and frame thereof, the rock-shaft on top of said frame and provided with the raising and lowering lever, the toothed segment secured on said rock-shaft, the digging-plow provided with the toothed standard engaging with the said toothed segment, the winding-roller secured upon said rock-shaft, and the revolving cage suspended from said roller, substantially as described.

9. In a potato-digger, the combination of the supporting-wheels, axle, and frame thereof, the rock-shaft mounted on top of said frame and provided with the raising and lowering lever, the toothed segment secured on said rock-shaft, the digging-plow provided with the toothed standard engaging with said toothed segment, the winding-roller adjustably secured upon said rock-shaft, and the revolving cage suspended from said winding-roller, substantially as described.



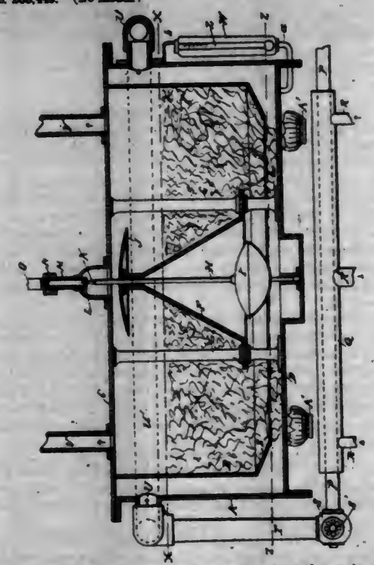
10. In a potato-digger, the combination, with the plow, of the revolving cylindrical cage arranged to the rear of the plow and consisting of the annular head and spiral tines secured thereto and supported at their forward ends only, said cage being adapted to operate as a screw-discharge, substantially as described.

11. In a potato-digger, the combination, with the digging-plow having its discharge end to one side of the center of the plow, of the revolving cage mounted in the rear of said discharge end of the plow at an angle to the line of draft and having its discharge end in the center of the plow, with its teeth arranged spirally with their forward ends only supported, substantially as described.

12. In a potato-digger, the combination, with the revolving cage, of the digging-plow mounted in front of said cage and consisting of the standard G, risingly and fallingly secured to the frame of the plow, the central share, H, having the cutting-edge *d'* and the point *d*, the upturned sides *f* and *g*, and the outside scraper, H', substantially as described.

13. In a potato-digger, the combination, with the digging-plow, of the rotary cage, consisting of an annular head provided with an outwardly-projecting flange, the circumferential bearing-rollers engaging with said head, and the supporting-roller on the inside of the head risingly and fallingly supported from the frame of the machine, substantially as described.

403,376. DYNAMO-SPEEDER FOR GAS-ENGINES. NEWTON ROGERS and JAMES A. WHARRY, Terre Haute, Ind. Filed Aug. 22, 1888. Serial No. 283,442. (No model.)



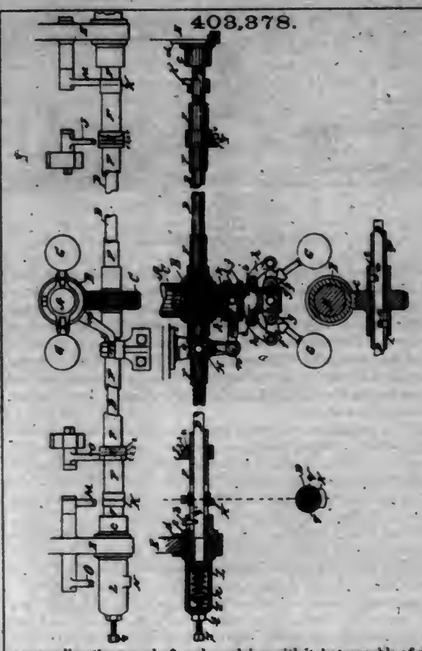
Claim.—1. In combination with the fly-wheel of a gas-engine, a friction-wheel mounted adjustably in a slotted standard, and a speed-pulley on a dynamo-shaft, said friction-wheel being adapted to transmit motion from the fly-wheel to said speed-pulley and to be thrown out of gear by movement in said slot, substantially as described.

2. In a gas-engine, the combination, with the main shaft, fly-wheel thereon, and friction connections between said fly-wheel and the speed-pulley, of a dynamo, a crank screw-threaded into the end of the main shaft by means of which the shaft and dynamo are turned in starting the engine, and which automatically unscrews from the shaft when the engine attains a normal speed, substantially as described.

3. In combination with the main-shaft of a gas-engine, a dynamo operated thereby, and a crank screw-threaded into the end of the shaft, said crank automatically unscrewing itself from the shaft when the speed of the shaft exceeds the speed with which the crank is turned manually, substantially as described.

4. In combination with the main shaft of a gas-engine, a fly-wheel attached thereto, speed-connections between said fly-wheel rim and the spindle of a dynamo, a loose pulley on said shaft held in connection between said pulley and the spindle of the dynamo, a crank for turning the main shaft manually, all arranged substantially as described, whereby, when the shaft is operated manually, the dynamo receives its motion from the rim of the fly-wheel, and when the engine attains its normal speed the dynamo may receive a slower relative speed from the shaft-pulley, substantially as set forth.

408,377. CARBURETOR FOR GAS-ENGINES. NEWTON ROGERS and JAMES A. WHARRY, Terre Haute, Ind. Filed Aug. 22, 1888. Serial No. 283,449. (No model.)



Claim.—1. In a carburetor, the combination of a main closed vessel, an annular partition within the same extending from the top nearly to the bottom of the vessel and inclosing the central portion of the vessel, an annular inwardly-extending ledge around the bottom of the partition, an air-induction pipe entering the outer portion of the main vessel, a vapor-exit from the central portion of the main vessel, an oil-induction pipe to the central portion of the main vessel, and a valve to said oil-pipe provided with a float located within the main vessel and adapted to regulate the flow of oil, substantially as described.

2. In a carburetor, the combination of a main closed vessel, an annular partition within the same extending from the roof nearly to the floor of said vessel and inclosing the central portions of the vessel and provided with an inwardly-extending ledge around its lower portion, an air-induction pipe to the outer portion of the main vessel, an oil-induction pipe to the central portion of the main vessel, a valve to said oil-pipe, a float within the central portion of the main vessel connected to said valve and adapted to regulate the flow of oil, a shield fixed over said float, and a spreader carried by the shield, substantially as described.

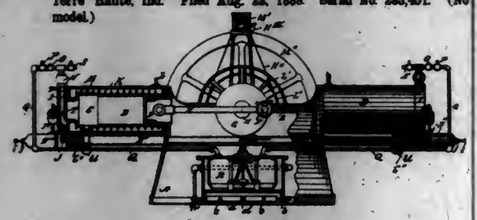
408,378. GOVERNOR FOR GAS-ENGINES. NEWTON ROGERS and JAMES A. WHARRY, Terre Haute, Ind. Filed Aug. 22, 1888. Serial No. 283,450. (No model.)

Claim.—1. In combination with the main shaft of a gas-engine, a worm on said shaft gearing with a worm-wheel on a way-shaft, which operates the engine-valves, a centrifugal governor on the main shaft, bell-crank connections between the governor-sleeve, a sleeve

surrounding the way-shaft and revolving with it, but capable of sliding longitudinally thereon, and a cam rigidly secured to said sleeve for operating the engine inlet-valve, substantially as described.

2. In combination with the main shaft of a gas-engine, a centrifugal governor on said shaft, driving-connections between said shaft, a driving-link between the movable governor-collar and a sliding sleeve on the way-shaft, a connecting-pin between the sleeve and the way-shaft, a slot in said sleeve surrounding said pin; whereby the said sleeve is caused to revolve with the way-shaft and to slide by the action of the governor, and an engine inlet-valve cam on said sliding cam.

3. In combination with the main shaft of a gas-engine, a centrifugal governor on said shaft, a sliding collar on said shaft operated by the governor, a double-forked bell-crank lever, one fork fitting in a groove on said sliding collar, the other fork fitting a grooved collar on a sleeve surrounding the way-shaft, a connection between said sleeve and the way-shaft, a slot in said sleeve surrounding said connection, a driving-connection between the main and way shafts, and a gas-inlet valve-cam on said sliding sleeve, substantially as described.



4. In combination with the main shaft of a gas-engine, a way-shaft operated thereby, a governor on said main shaft, connections between said governor and a sleeve on said way-shaft, a pin for causing the sleeve and way-shaft to revolve together, a slot in said sleeve to slide under the influence of the governor, and a spring pressing on the end of said sleeve to oppose the motion produced by the governor, and a gas-inlet valve-cam on said sleeve, substantially as described.

5. In combination with a way-shaft driven by the engine, a sleeve surrounding said way-shaft, a gas-inlet valve-cam on said sleeve, a pin connecting the sleeve and the way-shaft, a slot for said pin in said sleeve, a spring pressing against the end of the sleeve, an adjusting device for said spring, a speed-governor operated by the engine, and connections between the governor and the sleeve whereby a variation in the speed of the governor produces a sliding motion in the sleeve, substantially as described.

6. The combination of the shaft A, worm-wheel B on said shaft, gearing with a worm-wheel, C, on a shaft, D, a sleeve, F, a pin, *a*, slot *c*, a governor on the main shaft, double-forked bell-crank M O, connecting the governor with sleeve F, a spring, *r*, adjusting-screw *s* at the end of sleeve F, and a cam, I, on the sleeve, substantially as set forth.

7. In a duplex gas-engine, the combination of the valve-actuating way-shaft, a sliding sleeve thereon operated by a centrifugal governor, and two cams on said sleeve for operating the inlet-valves of the two cylinders, said cams being so situated with respect to the valve-levers that one cam operates to cut off the gas-inlet quicker than the other, whereby the power of one cylinder is reduced and finally destroyed in advance of the other, substantially as described.

403,379. GAS-ENGINE. NEWTON ROGERS and JAMES A. WEARRY, Terre Haute, Ind. Filed Aug. 23, 1888. Serial No. 283,451. (No model.)

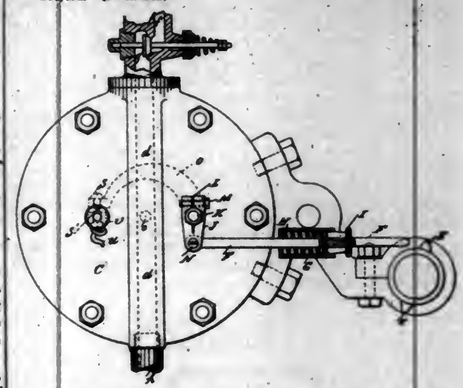
Claim.—1. The combination, with a gas-engine, a main shaft thereof, a worm thereon, a wheel gearing with said worm rigidly secured to a way-shaft, an exhaust-cam on said way-shaft, and a sleeve adapted to move longitudinally on and revolve with the way-shaft, of an inlet-valve cam on said sleeve and revolving bearings in which the ends of the way-shaft are secured and in which the sleeves move longitudinally, and means for shifting the sleeve longitudinally in the bearings and on the way-shaft upon a change of speed of said engine, substantially as described.

2. In a gas-engine, the combination of a way-shaft operated from the main shaft, revolving bearings in which the ends of the way-shaft are secured, a sliding sleeve on said way-shaft and in said revolving bearings, an exhaust-valve cam on the way-shaft, inlet-cam on the sleeve, a cap secured to the end of the revolving bearings, and an ignitor-cam on said cap, substantially as described.

3. In a duplex gas-engine, the combination, with a main shaft, a way-shaft operated thereby, revolving bearings in which the ends of the way-shaft are secured, a sleeve sliding on said way-shaft and in said revolving bearings, exhaust-cams on the way-shaft, inlet-cams on the sleeve, caps secured to said bearings containing springs bearing on the ends of the sleeve, ignitor-cams on said caps, and connections with a governor for sliding said sleeve independently of the way-shaft, whereby the positions of the inlet-cams may be altered without altering the positions of the exhaust-cams, substantially as described.

4. In combination with the way-shaft of a gas-engine operated by worm-gear connection with the main shaft thereof, a governor on the main shaft and connections therefrom to a sliding sleeve on the way-shaft, revolving bearings carried by brackets secured to the ends of the way-shaft in which said sleeve slides, connections between the way-shaft and the sleeve for causing them to revolve together, springs for keeping the sleeve in a normal position longitudinally on the way-shaft and to resist the action of the governor, means for adjusting the compression of said springs, inlet-cams on the sleeve, ignitor-cams attached to the revolving bearings, and exhaust-cams on the way-shaft, substantially as described.

5. In combination with the two gas-engines, connections therewith and with a single crank-pin and crank-shaft, a way-shaft operated by this shaft, two exhaust-cams on the way-shaft, a sleeve on the way-shaft, two inlet-cams on this sleeve, the distance between them being less than the distance between the respective inlet-valve levers operated by said cams, means for shifting the sleeve lengthwise as the speed of the engine varies, whereby the inlet-valve of one engine is rendered inoperative in advance of the other, and revolving bearings and caps secured to the way-shaft in which the sleeve slides having ignitor-cams thereon and operating a reciprocating electric ignitor, substantially as set forth.



6. A gas-engine cylinder provided with heat-radiating surfaces surrounded by a water-jacket, whereby the cooling contact with the air-circulating water is increased, substantially as described.

7. In combination with the two cylinders of a duplex gas-engine, inlet-valves therefor, connections between said valves and a carburetor, exhaust-valves connected with the cylinders and connections therewith and with a jacket surrounding the air suction-pipe of the carburetor, a common outlet from said jacket, and a cold-air valve in said suction-pipe for varying the temperature of the heated air of the carburetor and controlling the temperature of the charge admitted to the cylinders, and air-valves connected with the engine-inlet, substantially as described.

8. The combination, with the main shaft H of a gas-engine, of a worm, A', thereon, a worm-wheel, A^3, gearing therewith, secured by pins *g* to a way-shaft, A^2, a sleeve, D^2, sliding on the shaft A^2, and slots *g'*, to permit this sliding by the pins *g*, said pins causing the shaft A^2 and sleeve D^2 to revolve together, said sleeve and way-shaft serving to carry the inlet and igniter cams and the exhaust-cams, respectively, substantially as described.

9. In combination with a duplex gas-engine, a way-shaft and governor operated thereby, a sliding sleeve on the way-shaft operated by said governor, inlet-cams on the sleeve, exhaust-cams on the way-shaft, revolving bearings for keeping the way-shaft in a fixed longitudinal position, igniter-cams attached to said bearings, adjustable electric igniting devices operated by said cams, and a carburetor heated by the waste heat of the engine for supplying the gas to the inlet-valves, and connections from the exhaust-valves of the cylinders to a heater for the air-inlet of the carburetor, substantially as described.

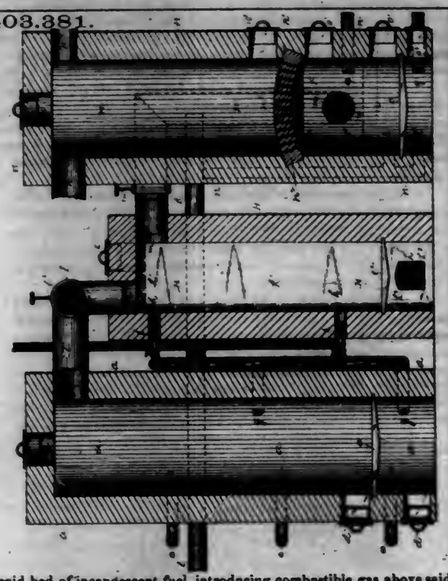
403,380. IGNITOR FOR GAS-ENGINES. NEWTON ROGERS and JAMES A. WEARRY, Terre Haute, Ind. Filed Aug. 22, 1888. Serial No. 283,452. (No model.)

Claim.—1. In a gas-engine igniter, the combination of a reciprocating spring-held rod, a rocker-arm secured thereto, and vibrating electrode attached to said rocker-arm, and a fixed electrode secured to the cylinder, substantially as set forth.

2. In an electric-igniter device, a spring-held rod, means for reciprocating the rod, and a rocker-arm operated by said rod, in combination with an oscillating electrode attached to the rocker-arm inside of the cylinder, a fixed electrode carried by the cylinder, and means for adjusting the position of the oscillating electrode with respect to the rocker-arm, whereby the throw of the reciprocating rod may be altered and the length of passing spark to be changed, substantially as described.

3. The combination of the rod F, spring G, casing H, adjusting-nut I, rocker J, provided with slit L and clamp-bolt M, electrode O, secured to rocker J, and the fixed electrode, substantially as described.

4. The combination, with a shaft operated by the engine and provided with one or more cams, and a rod reciprocated by said cams, of a rock-shaft operated by said rod, said rock-shaft being adapted to oscillate a moving electrode of a gas-engine ignitor, substantially as described.



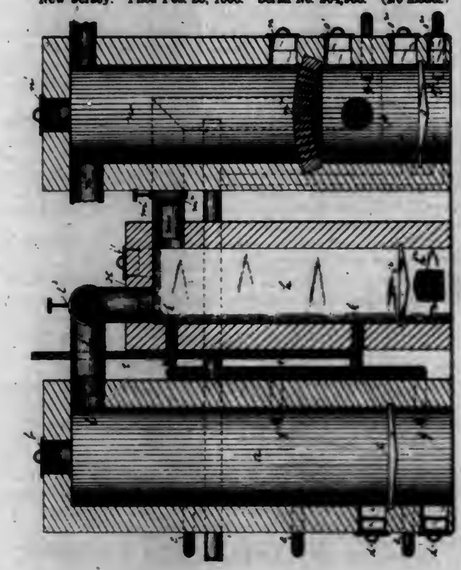
403,381. PROCESS OF MANUFACTURING GAS. JAMES M. ROSE, Allegheny, Pa., assignor, by mesne assignments, to the National Heat and Power Company, of New Jersey. Filed Feb. 23, 1888. Serial No. 264,982. (No model.)

Claim.—1. The herein-described process of manufacturing gas, consisting in raising a mass of coal or coke to incandescence, passing the products of combustion therefrom through a mass of refractory material containing hydrocarbon, burning said products and the hydrocarbon vapors over a second mass or bed of incandescent fuel and passing the heated products therefrom through a mass of fixing material composed of dolomite or other refractory material having solid carbon intermingled therewith to heat the same, and then passing steam into said first mass of incandescent coal and the gases formed through said refractory material, passing steam through said second bed of incandescent fuel, and mixing all the resultant gases and passing them through said fixing material, substantially as and for the purposes set forth.

2. The herein-described improvement in the manufacture of gas, consisting in blasting a mass of carbon to incandescence and passing the products of combustion therefrom through a mass of refractory material, burning the products after such passage over a second mass or bed of incandescent carbon, and passing the heated products therefrom through a mass of fixing material to heat the same, then passing steam into the first mass of incandescent carbon, the gases formed thereby through the refractory material, passing steam through the second mass of incandescent carbon, and mixing all the gases and passing them through the heated fixing material, substantially as and for the purposes set forth.

3. The herein-described steps in the manufacture of gas, consisting in heating and burning unconsumed products of combustion above a bed of incandescent fuel and passing the resultant gases through a mass of fixing material to heat the same, then passing steam through

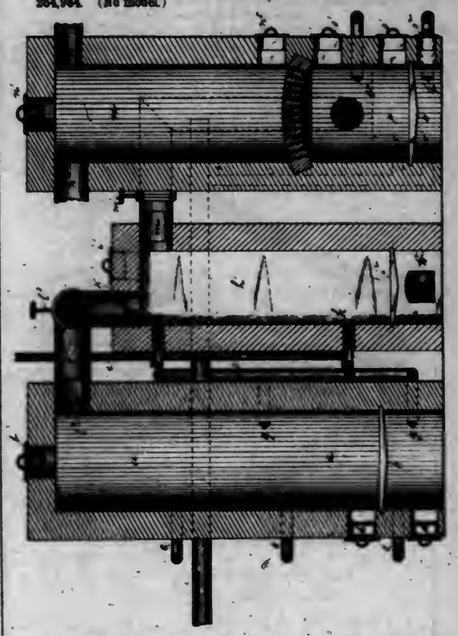
403,381.



said bed of incandescent fuel, introducing combustible gas above said bed of fuel, and intermingling said gases and passing them through said heated fixing material, substantially as and for the purposes set forth.

4. The herein-described steps in the manufacture of gas, consisting in raising a bed of fuel to incandescence and passing the products therefrom through a mass of fixing material composed of dolomite or other refractory material having solid carbon intermingled therewith, and then passing steam through said bed of incandescent fuel and the resultant gas through said mass of fixing material, substantially as and for the purposes set forth.

5. As steps in the manufacture of gas, blasting a mass of carbon to incandescence and passing the products of combustion therefrom through a mass of refractory material, and then burning the products after such passage over a second mass of carbon and passing the heated products therefrom through a mass of fixing material to heat the same, substantially as and for the purposes set forth.



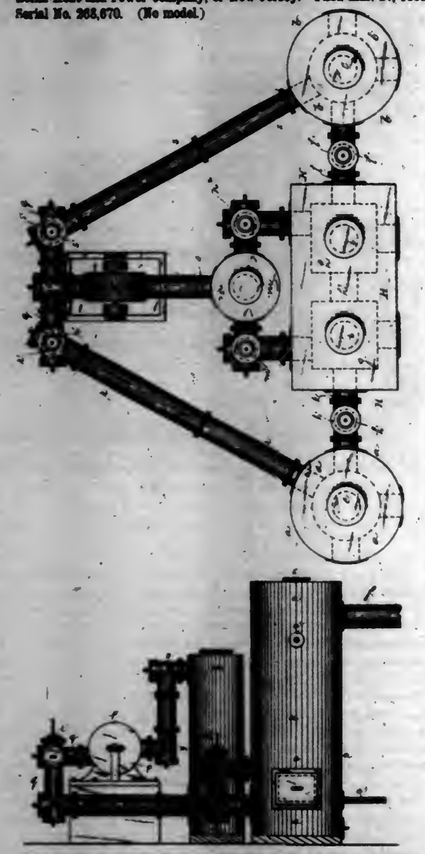
403,382. PROCESS OF MANUFACTURING GAS. JAMES M. ROSE, Allegheny, Pa., assignor to the National Heat and Power Company, of New Jersey. Filed Feb. 23, 1888. Serial No. 264,983. (No model.)

Claim.—1. The herein-described process of manufacturing gas, consisting in raising a mass of coal or coke to incandescence, passing the products of combustion therefrom through a mass of refractory material and during their passage introducing liquid or solid hydrocarbons into said products and said refractory material in such quantity as to coat the refractory material, and burning the said products and the resultant hydrocarbon vapors to heat a body of fixing material, and subsequently passing steam into said mass of incandescent carbon and the gases formed through said coated refractory material and said heated fixing material, substantially as and for the purposes set forth.

2. The herein-described steps in the manufacture of gas, consisting in raising a mass of coal or coke to incandescence, passing the products of combustion therefrom through a mass of refractory material and during their passage introducing solid or liquid hydrocarbons into said products and said refractory material in such quantity as to coat the refractory material, and burning said products and the resultant hydrocarbon vapors to heat a body of fixing material, substantially as and for the purpose set forth.

403,383. PROCESS OF MANUFACTURING GAS. JAMES M. ROSE, Allegheny, Pa., assignor, by mesne assignments, to the National Heat and Power Company, of New Jersey. Filed Feb. 23, 1888. Serial No. 264,984. (No model.)

Claim.—1. The herein-described process of making fuel-gas, consisting in carrying the products of combustion obtained in raising one mass of carbon to incandescence through a mass of refractory material and during their passage introducing a hydrocarbon into said products and said refractory material, and then passing the gases so obtained through a mass of fixing material previously heated by the products of combustion from another mass of ignited carbon and thence to the gas-holder, and subsequently passing steam through both bodies of incandescent carbon, carrying the gases from one such body through the coated refractory material, mixing them with the gases from the other such body, and passing all the gases through the fixing material and into the gas-holder to mingle with those obtained from the first steps of the process, substantially as and for the purposes set forth.



2. The herein-described process of making fuel-gas, consisting in carrying the products of combustion obtained in raising a mass of carbon to incandescence through a mass of refractory material, and during their passage introducing liquid or solid hydrocarbons into said products and said refractory material in such quantity as to coat such refractory material, and then passing the gases so obtained to the gas-holder, and subsequently passing steam through said body of incandescent carbon and the gases obtained through said coated refractory material, and thence to the gas-holder to mingle with those obtained from the first steps of the process, substantially as and for the purposes set forth.

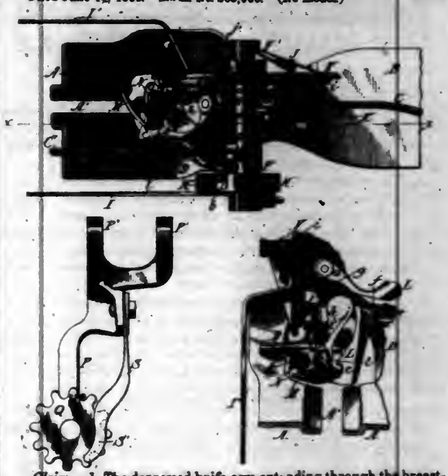
3. The herein-described improvement in the art of making fuel-gas, consisting in raising a mass of carbon to incandescence, carrying the heated products therefrom through a mass of refractory material, and during their passage introducing liquid or solid hydrocarbons into said products and said refractory material in such quantity as to coat such refractory material, and then passing the gases so obtained through a mass of heated fixing material, substantially as and for the purposes set forth.

4. The herein-described process of making fuel-gas, consisting in raising a mass of carbon to incandescence, and carrying the heated products therefrom through a mass of refractory material and during their passage introducing liquid or solid hydrocarbons into said products and said refractory material in such quantity as to coat such refractory material, substantially as and for the purposes set forth.

5. The herein-described steps in the manufacture of fuel-gas, consisting in carrying the products of combustion from one mass of incandescent carbon through a mass of fixing material to heat the same, then raising another mass of carbon to incandescence and carrying the heated products of combustion from said second mass through a mass of refractory material and during their passage introducing a hydrocarbon into said products and said refractory material, and then passing the gases so obtained through said mass of fixing material previously heated, as aforesaid, and thence to the gas-holder, substantially as and for the purposes set forth.

408,884. APPARATUS FOR THE MANUFACTURE OF GAS. JAS M. ROSE, Allegheny, Pa., assignor, by mesne assignments, to the National Heat and Power Company, of New Jersey. Filed Mar. 27, 1888. Serial No. 268,670. (No model.)

Claim.—1. A gas apparatus having two or more cupola-generators with a casing containing a hydrocarbon-chamber connected to each generator, a scrubber connected to said hydrocarbon-chamber, an exhauster connected at one end to said scrubber and at its other end to each of the generators, and suitable valves for controlling said connections, substantially as and for the purpose set forth.



2. A gas apparatus having two or more cupola-generators with a casing containing a hydrocarbon-chamber connected to each generator, an exhauster communicating at one end with said hydrocarbon-chamber and at its other end to each of the generators, and suitable valves for controlling said connections, substantially as and for the purposes set forth.

3. A gas apparatus having a cupola-generator, a casing containing a hydrocarbon-chamber connected thereto, a scrubber connected to said hydrocarbon-chamber, a second cupola-generator, and an exhauster connected at one end to said scrubber and at its other to the bottom of the second generator, substantially as and for the purpose set forth.

4. A gas apparatus having the two cupola gas-generators *a b*, the casing containing the double-compartment hydrocarbon-chamber, H, the two compartments *h g* of which are connected by a flue, *n*, a pipe or flue connecting the generator *a* and compartment *g*, and a pipe or flue connecting the generator *b* and compartment *h*, substantially as and for the purposes set forth.

5. A gas apparatus having two cupola gas-generators, a casing containing a double-compartment hydrocarbon-chamber, the compartments of which are connected, connections between each generator and one of the compartments, a scrubber, connections between said scrubber and each of the compartments of the hydrocarbon-chamber, an exhauster which is connected at one end to the scrubber and at the other end to each of the generators, and valves for controlling the several connections, substantially as and for the purpose set forth.

408,885. GRAIN-BINDER. CHRISTIAN H. SALSMAN, Chicago, Ill. Filed June 12, 1886. Serial No. 205,668. (No model.)

Claim.—1. The depressed knife-arm extending through the breast-plate, in combination with the breast-plate, constructed as described, and the knotter O brought down to the breast-plate, whereby the knot is formed nearer to the bundle and the cord shortened, substantially as described.

2. The combination of the knotter-frame, the spring *f*, the swinging knife-arm L, and the knotter O, whereby an intermitting pressure is applied to the pin *g* of the knotter, substantially as specified.

3. The knife-arm L, having notch *c*, for passage of the knotter-bill, side operating-arm L′, projections or plates M N, and knife *l*, in combination with the cam H H′, knotter-bill, and knotter-stand D, substantially as shown and described.

4. The arm L, having the notch or opening *c*, in combination with the knotter-bill, substantially as specified.

408,886. NUT-LOCK. ALLAN T. SAMPSON, Philadelphia, Pa. Filed Aug. 27, 1888. Serial No. 283,911. (No model.)

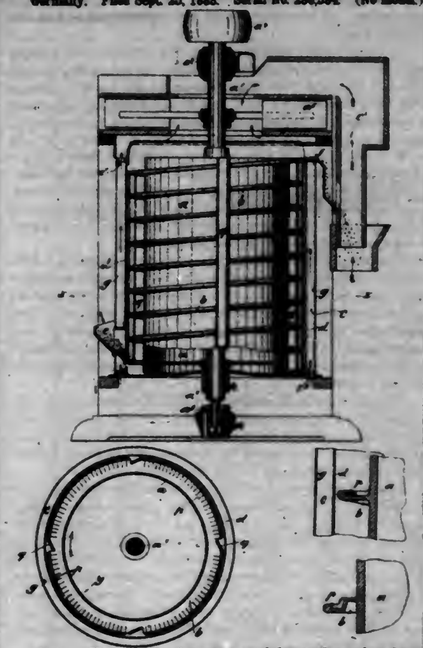
Claim.—The improved single nut-lock bar herein described, formed with two independent springs, one in the eye-coil embracing the bolt and one in a bow-arm extending over and outside of the end of the eye-locking point, bringing both locking-points of the separate springs in opposite contiguous relation, one projecting outwardly beyond the other, and the bow-spring part terminating in the non-spring arm *a*, whereby the two independent locking-spring parts *d b*′ are caused to act upon the inner face of the nut in the way shown and described.

408,887. MILK-CAN. MAX SENWARD, Alexandria, Va. Filed Jan. 29, 1889. Serial No. 297,960. (No model.)

Claim.—The combination, with the can having the supports G, the handle H, pivoted to the said supports, and the locking-flange R, of the cover comprising the concavo-convex portion having the vertical peripheral flange *a* to fit in the neck of the can, the upper portion, *b*, having the vertical annular rim *c*, the annulus *d* at the lower edge of said rim and forming a groove to receive the upper edge of the neck of the can, and in the inner side of which groove the upper edge of said flange *a* is secured, the bar J, extending across the center of the cover and having its ends secured inside of the annulus to the grooved annulus *d*, the catches N, secured to and projecting from opposite sides of the cover and adapted to engage under the ends of the handle H, and the locking-flange P, secured to and projecting from the cover, adapted to register with the locking-flange R of the can when the handle ends are engaged by the catches, the said locking-flange P having the downturned stop Q, adapted to engage the flange P, for the purpose set forth, substantially as described.

408,888. CARRIAGE-CURTAIN FASTENER. SAMUEL P. SCOTT, Hillsborough, Ohio, assignor to the Star Manufacturing Company, same place. Filed Feb. 12, 1889. Serial No. 299,580. (No model.)

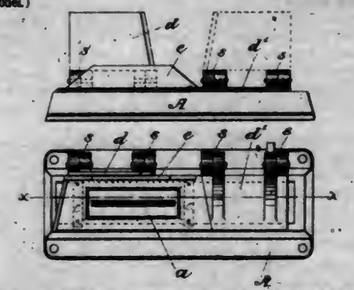
Claim.—1. The combination of the base and the head having a central bore with a sleeve secured in the bore of the head and projecting therefrom and having notches in its inner end, the stem secured to said base and passing through said sleeve, having lugs on its upper end engaging the notches of the latter, and the coiled spring interposed between the bore and head, all substantially as and for the purpose set forth.



2. The combination of the base and the head, each having a central bore, substantially as described, the tubular sleeve secured in the bore of the head and having one end projecting therefrom, with the stem secured to said base and passing through said sleeve and adjustably engaging the inner end thereof, and the coiled spring placed on said stem between the base and the sleeve and entering an enlargement of the bore of the sleeve, substantially as described.

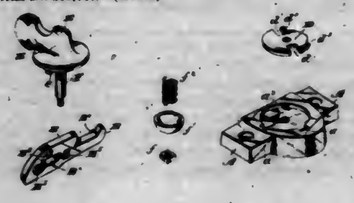
3. The combination of the base having a central bore, enlarged as described, and a head having a chamber, with a tubular sleeve having a notched end seated in the chamber of the head and having a projecting end adapted to enter the enlargement of the base-bore, the stem secured to said base and passing through said sleeve, having lugs on its end within the head to engage the notches of the sleeve, and the spring interposed between the sleeve and base, substantially as set forth.

4. The combination of the base, the head having a central bore, and the stem secured to said base, having lugs on its outer end, with the sleeve C, having notches in one of its ends and an enlarged bore at its other end, and a coiled spring partly entering the enlarged bore of the sleeve and the bore of the base, all substantially as set forth.



5. The combination of the base having a central bore enlarged at its outer end and a head having a chamber with a stem having lugs on its outer end, a sleeve, C, slipped on said stem and secured in the chamber of head A, but projecting therefrom, said sleeve having notches in its inner end to engage the lugs of the stem and an enlarged bore at its outer end, and a coiled spring on said stem between the sleeve and base, all substantially as and for the purpose described.

408,889. GRAIN-SCOURER. HEINRICH SECK, Dresden, Saxony, Germany. Filed Sept. 25, 1888. Serial No. 286,384. (No model.)



Claim.—The combination of an upright perforated casing, a revolving cylinder having a helical rib on its periphery, and vertical blades secured to the rib in a position oblique to the cylinder-surface and in the direction of revolution of said cylinder and leaving spaces between them and the surface of the cylinder, substantially as described.

408,890. BELT-HOLE COVER. WILLIAM E. SHARPLES, Fall River, Mass., assignor of one-half to the Geo. W. Stafford Manufacturing Company, Providence, R. I. Filed Nov. 17, 1888. Serial No. 291,171. (No model.)

Claim.—A belt-hole cover consisting of a bed-plate, A, having an opening provided with two covers, *d d*′, hinged to said bed-plate, and a belt-guide, *b*, arranged to slide in said opening, provided with vertical flange *c*, to automatically raise one cover and lower the other cover when moved in either direction, substantially as and for the purpose set forth.

408,891. SASH-FASTENER. THOMAS E. SMITH, Washington, D. C., assignor to Hobart B. Ives & Co., New Haven, Conn. Filed Feb. 3, 1888. Serial No. 262,840. (Model.)

Claim.—1. In a sash-fastener, in combination with a suitable base, the rotary piece thereon forming a turn-table, and the latch having a sliding connection with the piece, substantially as and for the purpose specified.

2. In a sash-fastener, in combination with a suitable base, a swinging and reciprocating latch engaging locking devices on the base and latch to lock the latter when it is reciprocated, and a rotary piece on the base connected with the latch by a sliding connection adapted to allow reciprocation of the latch, substantially as and for the purpose shown.

3. In a sash-fastener, in combination with the base having a latch-locking notch and a curved latch-guiding surface, the latch having a projection to engage the latch-guiding surface and the locking-notch on the base, and a rotary piece provided with suitable guides to confine the latch to reciprocation with reference to the rotary piece, substantially as and for the purpose set forth.

4. In a sash-fastener, in combination with the base having a locking-notch and a curved guiding-surface, the latch having a projection to engage the guiding-surface and locking-notch, a rotary piece on the base having a sliding connection with the latch adapted to allow reciprocation of the latch, but to cause the piece and latch to swing or rotate together, a rotary knob or handle, and a cam slot-and-pin connection between such knob and the latch, substantially as and for the purpose described.

5. In a sash-fastener, in combination with the base having a locking-notch and a curved latch-guiding surface, the latch having a guiding and locking projection and the longitudinal slot, the rotary piece having a radial slot for engaging the projection on the latch, and the pivot-pin, substantially as and for the purpose specified.

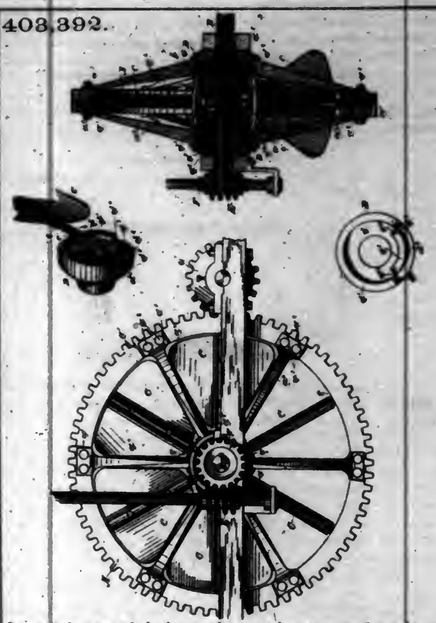
6. In combination with the swinging and reciprocating latch provided with the two lugs, the base provided with a curved guiding-surface and a locking-notch to engage one of the lugs on the latch, and a rotary piece on the base provided with the radial slots to engage the two latch-lugs, substantially as and for the purpose set forth.

7. In combination with the swinging and reciprocating latch provided with the two lugs, the base provided with curved guiding-surfaces and locking-notches to engage both of the lugs, and the rotary piece on the base provided with radial slots to engage the lugs, substantially as and for the purpose described.

8. In combination with the swinging and reciprocating latch having the two guiding and locking lugs, the base having the curved guiding-surfaces and locking-notches for engaging the latch-lugs, and the rotary piece on the base provided with opposite radial slots and suitable stop devices to limit the rotation of such piece as it is turned in one direction to bring one of its radial slots opposite one of the locking-notches in the base and in the other direction to bring its other slot around to the other locking-notch, substantially as and for the purpose specified.

9. In combination with the base provided with a circular recess and the two locking-notches, the rotary piece in the recess provided with a radial slot, the latch provided with a longitudinal slot and with a projection engaging the slot in the rotary piece, the pivot-pin passing through the longitudinal slot in the latch, and stops to limit the rotation of the rotary piece, substantially as and for the purpose shown.

10. In combination with the base having the recess with curved walls and the locking notches or offsets from the recess, the rotary piece in the recess provided with the opposite radial notches, suitable stops for limiting the rotation of the piece as it is turned one way or the other to bring its notches in line with one or the other offset or notch in the base, the latch having the two lugs, a rotary knob or handle, and a slot-and-pin connection between the latch and such knob or handle, substantially as and for the purpose described.



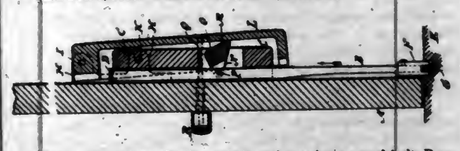
11. In a sash-fastener, in combination with a suitable keeper, the latch adapted to be moved longitudinally to fasten the sashes together, having a cam-surface to engage the keeper, so as to force the sashes carrying, respectively, the keeper and latch up and down in opposite directions as the latch is drawn into its fastening position, substantially as and for the purpose described.

12. In a sash-fastener, in combination with the hooked latch having a cam projection on its upper side, the keeper having the upright portion to be engaged by the latch-hook, and an arm or projection to be engaged by the cam projection as the latch is moved to cause the hook to engage the keeper, substantially as and for the purpose specified.

403,392. FEATHERING PADDLE-WHEEL. HENRY F. W. SOMST, San Francisco, Cal. Filed Oct. 20, 1888. Serial No. 288,692. (No model.)

Claim.—1. In a paddle-wheel, a rotary frame and wings or blades in radial planes thereof and axially pivoted, said wings or blades having each a stem provided with two lugs, one being above and at right angles to the other, in combination with separated disks between which the stems are mounted, said disks having a rim-piece or flange cut away at corresponding opposing portions and having shoulders

403,392.



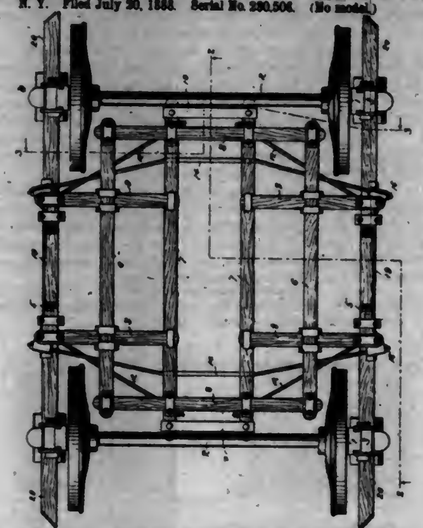
for engaging one of the lugs, and a second segment or flange having shoulders engaging the other lug, whereby the wings are turned, substantially as herein described.

2. In a paddle-wheel, a rotary frame having axially pivoted wings or blades in radial planes thereof, each blade having two lugs, one set at right angles to the other, in combination with a shaft about which the frame rotates, said shaft having a pinion engaged by an operating-worm, whereby the shaft is rotated, separated disks on the shaft having each two independent flanges with shoulders engaged, and the independent lugs on the stems of the wings, whereby said wings are axially moved and the periods of their movement varied, substantially as herein described.

3. In a paddle-wheel, the rotary frame having axially-pivoted wings or blades in radial planes thereof, each wing or blade having a stem provided on its inner end with lugs or projections, one above the other and at right angles with each other, in combination with the separated disks between which the stems travel and are guided, said disks having recessed faces, and independent flanges having cam-shoulders, against which the lugs or projections of the stems come in contact at different periods, whereby the blades or wings are turned from a position in line with the wheel's rotation to a position at right angles thereto and back again, substantially as herein described.

4. In a paddle-wheel, a rotary frame having axially-pivoted blades or wings in radial planes thereof, each blade or wing having a stem with lugs or projections at right angles, as described, in combination with the separated disks between which the stems travel, said disks having recessed faces with flanges cut away to form cam-shoulders, which engage one series of lugs, and short flanges below the cut-away portions for engaging the lugs of the other series, substantially as and for the purpose herein described.

403,393. DOOR-CHECK. HARRY STANTOCOURT, Elizabeth, N. J. Filed Feb. 9, 1889. Serial No. 299,304. (No model.)



Claim.—1. A door-check consisting of a spring-pressed bolt, B, a block or guide, C, a bell-crank lever, M N, pivoted on and carried by the block or guide, and a pivoted push-plate, I, having a recess in which the lever-carrying block or guide is arranged, said push-plate being adapted to press directly against the bell-crank lever, substantially as described.

2. A door-check consisting of a spring-pressed bolt, B, a pivoted bell-crank lever, M N, connected with the bolt, a pivoted push-plate,

I, at one side of of the door, adapted to press on the bell-crank lever to release the bolt, and a pull-handle, R, arranged at the opposite side of the door and having connection through the door with the push-plate to operate the latter, whereby the door may be released from either side, substantially as described.

403,394. CABLE-CAR TRUCK. JOHN STEPHENSON, New York, N. Y. Filed July 20, 1888. Serial No. 280,506. (No model.)

Claim.—1. A car-truck frame constructed with the following elements adapted to suspension beneath the car-axle boxes, to wit: two sills, two sub-sills, two cheek-sills, two end cross-bars, and four central cross-bars, substantially as and for the purpose described.

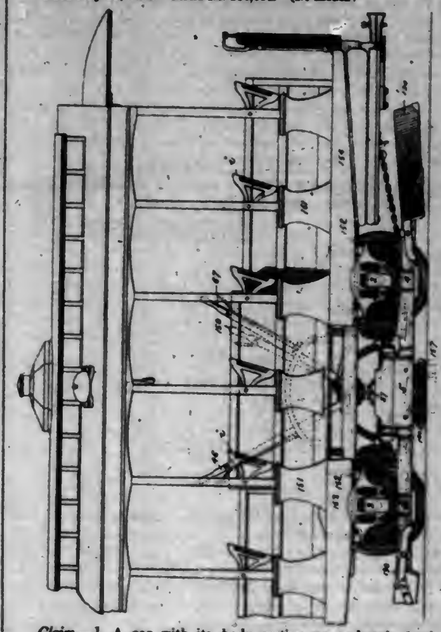
2. A car having a truck-frame with its sills outside of the wheels, the sills being rigidly connected to integral limbs pendent from the bottom of the axle-box shell, the pendent limbs being adapted to transmit to the car-body the motive power which impels the car, substantially as described.

3. A car-truck having its two sills suspended from pendent limbs of the axle-box shell, two sub-sills inside the wheels and parallel to the sills, and two cheek-sills, also parallel, but located nearer the center line of the truck, two end cross-bars framed on the ends of the sub-sills and cheek-sills, and, with the cheek-sills, constituting the four walls of a well adapted to receive and permit the motion of the grip, substantially as and for the purpose described.

4. A car-truck with its sills outside the wheels and its central structure upheld by supporting-rods having their ends carried by the sills and the central parts of the rods deflected to pass under the ends of the sub-sills and cheek-sills, substantially as and for the purpose described.

5. A car-truck with its sills outside the wheels and the central part of the truck structure supported at its ends by deflected supporting-rods having their ends in sockets carried by the sills, substantially as shown and described.

6. A car-truck frame with sills, sub-sills, cheek-sills, and cross-bars preserved in rectangular form by racking-stays extending across the angles and through the sills and cheek-sills and adapted to prevent distortion of the truck-frame, substantially as and for the purpose described.



7. A car-truck with two wheels on each axle and with its sills and sub-sills connected by cross-bars between the wheel-faces and adapted to receive the wheel brake-shoe bar, with its shoe capable of being moved horizontally to and from the wheel, substantially as and for the purpose described.

8. A car-truck with two wheels on each axle, the sills outside and the sub-sills inside the wheels and the ends of the sub-sills within the extremes of the wheels, and the cross-rails between the wheel-faces connecting sills and sub-sills, the latter carrying the heads of the shoe sliding bars, with their shoes adapted to move horizontally to and from the wheels, all substantially as and for the purpose described.

9. A car-truck carried entirely by its sills attached to pendants integral to the axle-box shells, and the sub-sills supported by cross-rails carried by the sills between the wheel-faces, the combination being adapted to the mechanism of the wheel-brake rock-shafts, articulated connecting-rods, shoe sliding bars, and brake-shoes moving horizontally to and from the wheels, substantially as and for the purpose described.

10. A car-truck with its sills beneath the axle-journals and secured to the box-shell pendants by clips surrounding the pendent limbs and the sill ends, the shanks of the clips extending below the sills and through coupling-plates, with screw-nuts beneath the coupling-plates, which are flanged to protect the screw-nuts, substantially as and for the purpose described.

403,395. CABLE-GRIP CAR. JOHN STEPHENSON, New York, N. Y. Filed July 23, 1888. Serial No. 280,631. (No model.)

Claim.—1. A car with its body resting on pedestals, having spring-bearing saddles supporting the car-body and astride axle-boxes, from whose shells pendants carry the truck, substantially as and for the purpose described.

2. A car with a truck suspended from the limbs of axle-box shells with swing (link) motion and the car-body resting on cushioned pedestals with springs intervening between the pedestals and the saddles of the axle-boxes, substantially as and for the purpose described.

3. A car with truck having its axles journaled outside the wheels and the truck pendent from limbs integral with the axle-box shells, the car-body resting on cushions upon the pedestals, substantially as and for the purpose described.

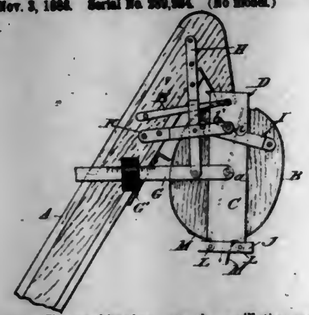
4. An open summer-car with its body-sills strengthened with side metal plates in lieu of truss-work beneath the sills and a truck suspended near its four corners by pendants integral with the axle-box shells, substantially as and for the purpose described.

5. A car with its body cushioned on pedestals, with axle-boxes having saddles whose pedals are capable of a swinging motion, carrying springs upholding the car-body, the shells of the axle-boxes terminating downward in pendants, adapted to sustain the car-truck with its appendages, substantially as and for the purpose described.

6. The combination, with a truck-frame carrying the grip mechanism and the wheel-brake and track-brake mechanism, of the car with its floor structure adapted to support transverse benches each side of an aisle expanding in the middle to form a well for the location and operation of the handles of the grip, wheel-brake and track-brake mechanism of these three parts now named, all being located on the truck, with exception of the union rock-shafts with their articulated rod-connection, and the handles which project into the well, substantially as described.

7. A car with its truck secured to integral limbs pendent from the bottoms of axle-box shells on axle-journals outside the car-wheels, the truck carrying the cable-grip, substantially as described.

8. A car with its truck dependent from the limbs integral with the axle-box shells on axle-journals outside the wheels, and in conjunction with the car-body carrying the operating mechanism of the wheel-brakes, substantially as described.



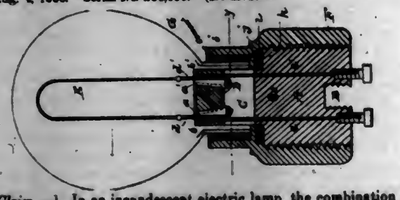
9. A car with its truck dependent from limbs integral with the axle-box shells on journals outside the car-wheels, in conjunction with the car-body carrying the operating mechanism of the track-brake, substantially as described.

10. A car with its truck secured to integral limbs pendent from the bottom of axle-box shells on axle-journals outside the car-wheels, the truck-sills' ends extending endward and carrying under the car-body a track-guard adapted to rise and fall without human agencies, as circumstances require, substantially as described.

11. A cable car with its truck borne by the four axle-journals outside the wheels, on which axle-journals are axle-boxes having at the bottoms of their shells rigid pendent limbs to which the sills of the car-truck are inflexibly secured, the truck having at its middle a well containing an opening for a grip-carrier, and at each side of the well an opening, each of which is adapted for the location of a wheel-brake and a track-brake, substantially as described.

12. A cable car with its body strengthened by metal plates on the outer sides of the body-sills to which the plates are secured, adapted to stiffen the body sufficient to dispense with truss-bracing beneath the body-sills, substantially as described.

403,396. GRAIN-METER. ARCHIBALD STEWART, Keota, Iowa. Filed Nov. 3, 1888. Serial No. 289,804. (No model.)



Claim.—1. The combination, with the oscillating grain-box and the elevator having a feed-spout, of the supporting-frame for said box, having at its upper end a hopper located directly beneath the feed-spout and directly above the oscillating box and provided at its lower end with means for attaching a grain-box thereto, the horizontal arms movably connected to the elevator and to the box-frame, and the scale-beams, all substantially as described.

2. In a grain-meter, the combination of the frame C, the hopper D, secured within the upper end thereof, the feed-spout of the elevator, the oscillating grain-box pivoted in said frame and having a vertical partition, B', and automatically-operating doors M M, and the scale-beams, substantially as described.

3. The combination of the oscillating grain-box having the vertical partition and the bottom covers, M M, the supporting-frame in which said box is pivotally hung having at its lower end rollers L L, the feed-spout of the elevator, the scale-beams connected to the pivots of the grain-box and pivotally attached to rigid arms on the elevator, the pivotal arms attached to the upper end of the frame C, and also to the elevator, and the rigid horizontal arms secured to the elevator and carrying small rollers adapted to enter notched straps on the sides of the grain-box, substantially as described.

4. In a grain-meter, the combination of the feed-spout, the supporting-frame, the hopper in the upper end of said frame beneath the feed-spout, the oscillating grain-box pivoted in the frame and having a vertical partition, B', and the gravity-doors M M, adapted to be closed by riding upon rollers L L on the supporting-frame, and the rectangular frame J, secured to the lower end of frame C, substantially as described.

403,397. INCANDESCENT LAMP. JAMES STEWART, New York, N. Y., assignor of one-half to Edmund C. Stanton, same place. Filed Aug. 4, 1888. Serial No. 281,959. (No model.)

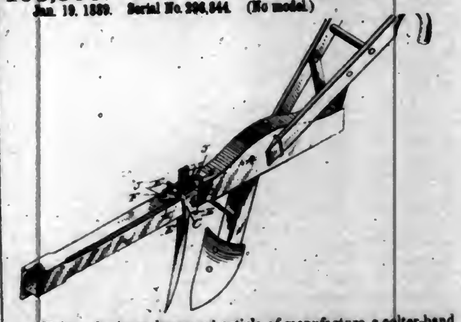
Claim.—1. In an incandescent electric lamp, the combination of the conductors *c c'*, the standard C, provided with the ledges *b b'*, the jaws *a a'*, and the wedge D, inserted between the jaws and adapted to clamp the wires *d d'* of the carbon filament in contact with the wires *c c'* of the lamp-base A, substantially as specified.

2. In an incandescent electric lamp, the solid base-piece A, having a passage, *c*, extending through it from end to end and enlarged and screw-threaded, as at *f*, a recess, B, in the bottom of the base-piece, a passage, *h*, leading from the upper end of the recess into the enlarged passage *f*, and the screw *g*, entering the passage *f* and adapted to close the passages *c* and *h*, substantially as set forth.

3. In an incandescent electric lamp, the combination, with the lamp-base, its movable wire-clamping jaws and their opposing fixed jaws or ledges, of a wedge for forcing both jaws toward said fixed jaws or ledges, whereby the two filament-supporting wires may be firmly clamped in their operative position, substantially as set forth.

4. The combination, with the lamp-globe G, provided with the lugs *n*, formed in the material of the globe, of the socket *i*, having right-angled recesses *m*, substantially as specified.

5. In an incandescent lamp, the combination of the chambered base-piece A, provided with the conductors *c c'*, and standard C, having ledges *b b'*, the pivoted jaws *a a'*, the wedge D, the wires *d d'*, and carbon filament E, connected with the said wires, the collar F, provided with the socket *i*, and the lamp-globe G, having its neck inserted in the socket *i*, substantially as specified.



408,398. BOX-FASTENER. JOHN A. STRONG, Cain, Kans. Filed Feb. 12, 1889. Serial No. 299,599. (No model.)

Claim.—1. In a box-fastening, the combination of the piece *b*, having slots, secured at one end of the box, and the piece *c*, having a central cut, and an ear, *f*, connecting the adjoining ends of said piece, and the spring-catch J, having an inwardly-standing latch-head moving in the cut of piece *c*, with a cover having lugs at one end engaging the slots of piece *b*, and a notch at its other end to engage catch J, all substantially as and for the purpose described.

2. The combination of the box, the castings B C, secured to the ends thereof, having pieces *b* and *c*, respectively, at their upper sides, piece *b* being slotted, as described, and piece *c* cut away at its center and its adjoining ends connected by an ear, *f*, and the spring-catch J, playing through said cut in piece *c*, with the cover having a transverse strip at one end provided with projecting lugs engaging the slots in piece *b*, and having a notch and strip at its other end to engage catch J, substantially as and for the purpose specified.

408,399. COLTER-BAND. ALONZO J. TATUM, Finch, Ark. Filed Jan. 19, 1889. Serial No. 296,644. (No model.)

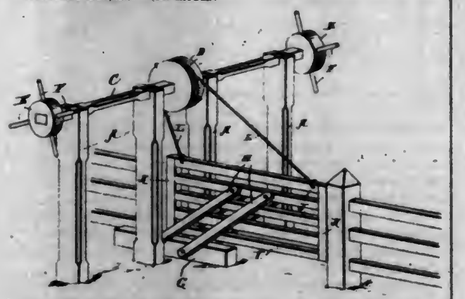
Claim.—1. As an improved article of manufacture, a colter-band having the upper portion thereof provided with laterally-extending perforated flanges, its upper and under portions each provided with longitudinal slots, and vertically-extending lugs, said lugs being provided with screw-threaded holes, and having its sides provided with screw-threaded holes, substantially as set forth.

2. The combination, with the beam of a plow provided with a series of longitudinal slots, of the colter-band having its upper and under portions each provided with a series of longitudinal slots registering with the slots in the beam, said upper portion being also provided with laterally-extending perforated flanges, upwardly-extending lugs provided with screw-threaded holes therein, the colter or cutter, and the set-screws, substantially as set forth.

3. The combination, with the beam of a plow provided with a series of longitudinal slots, of the colter-band having the upper portion thereof provided with laterally-extending perforated flanges, and also having its upper and under portions each provided with longitudinal slots and vertically-extending perforated lugs, the colter or cutter, and the set-screws and bolts, substantially as set forth.

4. The combination, with the beam of a plow provided with a series of longitudinal slots, of the colter-band having the upper portion thereof, provided with laterally-extending perforated flanges, its upper and under portions each provided with longitudinal slots and vertically-extending lugs, said lugs having screw-threaded holes, and having its sides provided with screw-threaded holes, the colter or cutter, and the set-screws and bolts, substantially as set forth.

408,400. LAMP. LEVI H. THOMAS, Chicago, Ill. Filed Jan. 19, 1889. Serial No. 296,823. (No model.)

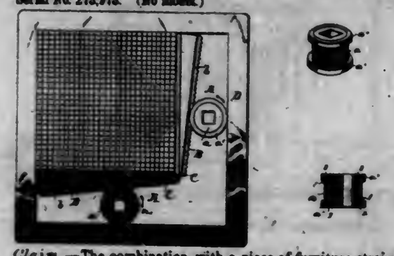


Claim.—1. As a new article of manufacture, the herein-described body, bowl, or fount, consisting in the combination, with a paper cylinder, of a paper head and a paper bottom grooved to receive the end of the cylinder and extended to serve as a support or base for the bowl or body, substantially as described.

2. In a lamp, the combination, with a cylindrical paper bowl or body formed of paper rolled upon itself, of a solid paper disk forming the head and a solid paper disk forming the bottom, said disks being grooved to receive the ends of the cylinder, and the bottom disk being extended to serve as a supporting-base for the lamp-body, substantially as described.

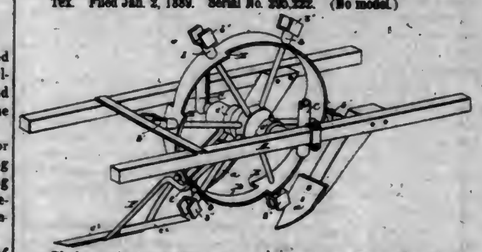
3. In a lamp, the combination of the cylindrical body formed of paper rolled upon itself, a solid paper head, a solid paper bottom, said head and bottom being grooved to receive the ends of the paper cylinder, and said bottom being extended to serve as a supporting-base for the lamp-body, and a metallic collar secured to the paper head for the attachment of the burner, substantially as described.

4. In a paper lamp, the combination, with the solid paper head of the lamp-body, of the metallic collar D, for the attachment of the burner, having an inturned screw-threaded flange, *d*, a shoulder, *e*, adapted to rest on the upper surface of the head, and with a crimped shoulder, *f*, on its lower edge, that presses into and grasps the paper material of the head, substantially as described.



403,401. GATE. CHARLES TIBBS, Vandalia, Ill. Filed Mar. 5, 1889. Serial No. 301,981. (No model.)

Claim.—1. The combination of the swinging levers, the gate supported thereby, the pulley arranged above the gate, means for operating said pulley, and the cables having their ends secured to the pulley at diametrically-opposite points, extending over the pulley in opposite directions, and secured to the opposite upper corners of the gate, as set forth.

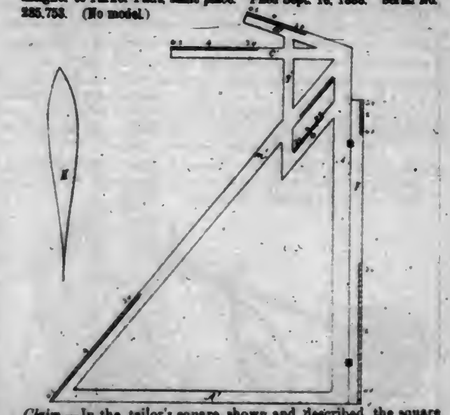


2. The combination of the transverse sill, the swinging levers pivoted at their lower ends to the said sill, the gate pivoted to the upper ends of the said levers, the rotary shaft, the grooved pulley secured on said shaft, and the cables secured to the opposite upper corners of the gate and extending to and over the pulley and secured thereto, as set forth.

408,402. PRINTER'S QUOIN. SAMUEL D. WEBB and SULLIVAN S. SWETT, Washington, D. C., assignors, by direct and mesne assignments, to said Swett and Thomas A. Mitchell, same place. Filed May 16, 1888. Serial No. 273,973. (No model.)

Claim.—The combination, with a piece of furniture straight on one side and having an inclined toothed rib on the opposite side, of a quoin consisting of a toothed cylinder having an opening for the reception of a key and two rollers of slightly greater diameter than the cylinder, one of said rollers being loosely attached to each end of the cylinder, substantially as described, and for the purposes set forth.

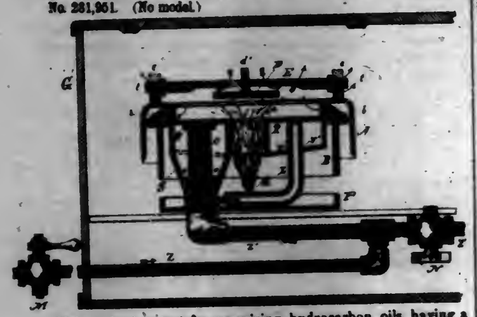
403,403. COTTON-CHOPPER. AMASA O. WOODBURY, Pennington, Tex. Filed Jan. 2, 1889. Serial No. 295,222. (No model.)



Claim.—1. As an improvement in cotton-choppers, the wheel having the cotton-fenders, and the overlapping hoes having their bars operated by said wheel, substantially as set forth.

2. The combination, with the frame and axle, of the axle-supporting boxes or tubes C, the blocks D, the springs *d*, and the adjusting-screws *d'*, whereby the axle-wheel is journaled in a yielding bearing, substantially as shown and described.

3. The combination, in a cotton-chopper, of the wheel having the series of arms, the V-shaped fenders secured thereto, the rim having offsets and tapering side edges, the hoe-bars having rollers, and overlapping hoes at their outer ends, substantially as set forth.



403,404. TAILOR'S SQUARE. SILAS W. YATES, Wilmington, Ill., assignor to Parker Faut, same place. Filed Sept. 18, 1888. Serial No. 285,753. (No model.)

Claim.—In the tailor's square shown and described, the square

A A', having the scale-brace *n'*, scale-blades *a'*, *c'*, and *e*, brace *g'*, and folding-leaf scale-rule F, all combined and arranged to operate substantially as and for the purpose set forth.

408,405. OIL-BURNING STOVE OR FURNACE. CHARLES M. YOUNG and PIERRE L. GIBBS, Clinton, Iowa. Filed Aug. 4, 1888. Serial No. 281,961. (No model.)

Claim.—1. A retort for vaporizing hydrocarbon oils, having a central opening or flame-passage and provided with a depending pocket to form an oil-reservoir, in combination with the supply-pipe extending into said pocket, provided with openings near the bottom of the reservoir and from which the oil passes from the pipe to the reservoir, substantially as described.

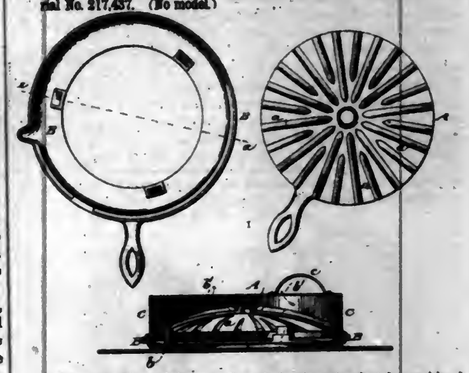
2. In a stove for vaporizing hydrocarbon oils, the combination, with the retort, provided with a central opening or flame-passage and with a depending pocket to form an oil-reservoir, of the delivery-tube connected with the supply-pipe, entering through the bottom of the reservoir and extending nearly to the top of the retort, said pipe provided with lateral openings near the bottom of the pocket for the passage of the oil to the retort, substantially as set forth.

3. In a stove for vaporizing hydrocarbon oils, having a central opening or flame-passage and provided with the depending pocket to form an oil-reservoir, in combination with the supply-pipe extending into the pocket, and provided with the openings near the bottom of the reservoir, through which the oil passes from the pipe to the reservoir, and a pipe extending into the retort, provided with openings near the bottom of the retort for supplying the oil to the lighting-pan through said pipe, substantially as described.

4. In a stove for vaporizing hydrocarbon oils, the combination of the retort having a central opening or passage for the burning vapor, a baffle-plate provided with the notched or serrated edge and the central semicircular openings, and a deflector arranged below the central openings to spread and deflect the flame and to cause a downward current of air through the central opening to mingle with the products of combustion, substantially as described.

5. In a stove for vaporizing hydrocarbon oils, the combination of the retort having the central opening for the passage of the flame, a baffle-plate provided with the notched or serrated edge and the central semicircular openings, deflector arranged below the central openings, and means for adjusting the same to or from the opening in the retort, substantially as set forth.

6. In a stove for vaporizing hydrocarbon oil, the combination of the retort having the central opening for the passage of the flame, a baffle-plate provided with the notched or serrated edge and the central semicircular openings, the jacket provided with the openings, a deflector arranged below the central openings in the baffle-plate, all substantially as set forth, whereby a downward current of air is caused to pass through the central openings in the baffle-plate and mingle with the products of combustion, and an upward current through the openings in the ring to mingle with the products of combustion passing through the notches or serrations in the baffle-plate.

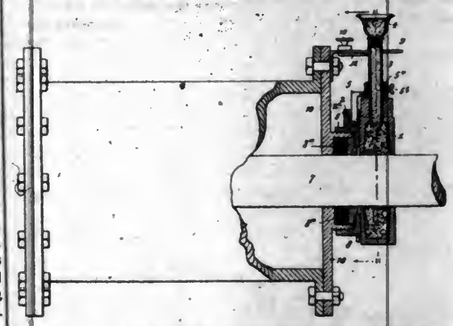


408,406. VELOCIPEDE. FRANCIS M. ABBOTT, Jeffersonville, Ind., assignor of one-half to Charles W. Rodgers, same place. Filed Sept. 29, 1888. Serial No. 286,803. (No model.)

Claim.—1. The combination, with a tricycle, of a buggy-body or carryall having its side walls slotted to receive the axle, and a strap on its dash-board for connecting it with the branches of the backbone, substantially as specified.

2. A buggy-body or carryall attachment having semicircular slots in its side walls which communicate with an upwardly-directed slot, in combination with a cushion in the latter slot, a hinge dash-board, and means for connecting the hinge dash-board to the rearwardly-directed branches of the backbone of a tricycle, substantially as specified.

408,407. BROILER. MICHAEL C. ARMOUR, Chicago, Ill., assignor to George M. Clark & Company, same place. Filed Oct. 26, 1886. Serial No. 217,437. (No model.)



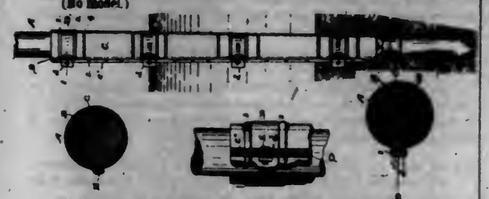
Claim.—1. The solid meat-plate A, having the feet *b*, combined with the trough B, the meat-plate being supported above the trough by the feet, whereby a space, *a'*, is formed, substantially as set forth.

2. The solid convex topped and ribbed meat-plate A, having the feet *b*, combined with the trough B, a space, *a'*, being left between the outer edge of the meat-plate and the trough, substantially as set forth.

3. The combination, with the cover C, of the solid meat-plate A, having the feet *b* and the trough B, supporting said meat-plate, a space, *a'*, being formed between the meat-plate and trough, substantially as set forth.

408,408. COMBINED WRENCH AND PISTON-LUBRICATOR. THOMAS J. BAKER and CHARLES E. BAKER, Findlay, Ohio. Filed Jan. 30, 1889. Serial No. 298,073. (No model.)

Claim.—1. A lubricating device comprising the divided and hinged gland 1, a tube, 3, and a filling-cup, 4, substantially as described.



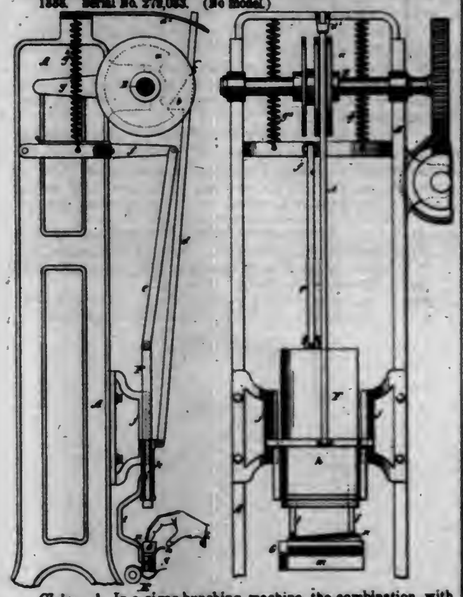
2. The combination of the lubricator having a tube, 3, provided with an arm, 11, the hanger 9, and the slot and set-screw connection between the arm and hanger, substantially as described.

3. The combination of the lubricator having a tube, 3, the stuffing-box follower 8, having notches 2^a, and the arm 5, having sleeve 5^a around the tube and adapted to engage the notches, substantially as described.

4. The combination of the lubricator having a tube, 3, the stuffing-box follower 8, having notches 2^a, and the adjustable arm 5, having sleeve 5^a around the tube, provided with a set-screw, 5^b, substantially as described.

5. The combination of the lubricator having a tube, 3, the stuffing-box follower 8, having notches 2^a, the adjustable arm 5, having sleeve 5^a, and the guide 2, substantially as described.

408,409. TERREDO-PROOF COVERING FOR PILES. GEORGE M. BARCHUSEN, San Francisco, Cal. Filed May 3, 1888. Serial No. 272,703. (No model.)



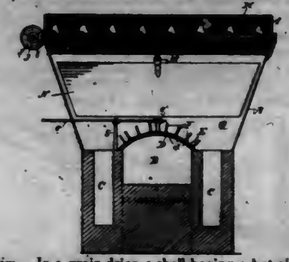
Claim.—1. A protecting-covering for piles and similar structures, consisting of the inner layer or wrapping formed of the hereinbefore-described composition and the outer metal covering inclosing the said composition and secured in position by joints and clamps, substantially as described.

2. A protecting-covering for piles and other similar structures, consisting of the inner covering of composition and the outer inclosing cover and protector of metal, having the beads and secured by joints and clamps, as described.

3. In combination with a pile or similar structure to be protected, the inner covering of composition produced from the hereinbefore-described ingredients, the outer protecting-covering of metal, the clamps, and the ferrule or stop at the bottom, substantially as hereinbefore described.

408,410. CIGAR-BUNCHING MACHINE. NICHOLAS H. BORSFELDT, Brooklyn, and ADOLPH LEWYN, New York, assignors to the National Progress Bunching Machine Company, New York, N. Y. Filed July 5, 1888. Serial No. 279,083. (No model.)

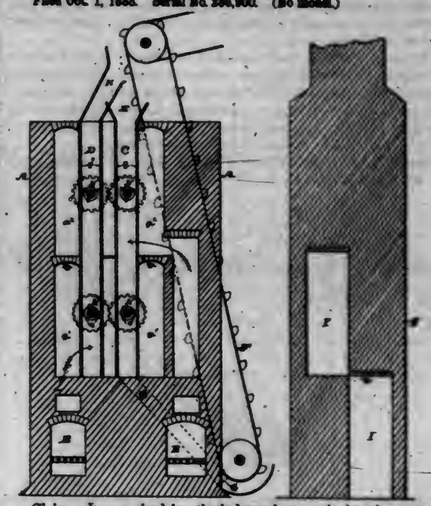
Claim.—1. In a cigar-bunching machine, the combination, with the plunger F, of the reciprocating plunger-guide A, separate filler-receiver *m* at a distance below said guide, and the arms *l*, for supporting the receiver *m*, substantially as described.



2. In a cigar-bunching machine, the combination, with the plunger F, of the reciprocating plunger-guide A, separate filler-receiver *m* at a distance below said guide, flanges *n* on said receiver, and the arms *l*, for supporting the receiver *m*, substantially as described.

3. The combination, with the plunger F, of the reciprocating plunger-guide A, separate filler-receiver *m* at a distance below and in line with said guide, arms *l*, connecting the guide A with the receiver *m*, and the rolling-apron E, substantially as described.

4. A filler-retainer consisting of the connected blades *o* and the flexible strip *p*, connected to said blades and extending between said blades in the form of a pocket, substantially as described.



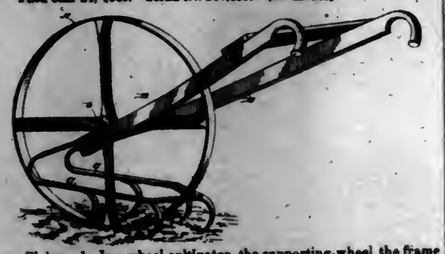
5. The plunger F, guide A, and filler-receiver *m* below said guide, combined with the filler-retainer G, consisting of the connected blades *o* and flexible strip *p* between said blades, substantially as described.

408,411. GRAIN-DRIER. LEWIS BOSLAND, San Francisco, Cal. Filed May 26, 1888. Serial No. 275,504. (No model.)

Claim.—In a grain-drier, a shell having a hot-air chamber and a heating-chamber below, in combination with plates in the hot-air chamber, dividing it into compartments, openings between the heating and hot-air chambers for the passage of heated air to the compartments above, dampers controlling the openings, and adjustable flanges or plates on the upper surface of the dampers, substantially as herein described.

408,412. GRAIN-DRIER. LEWIS BOSLAND, San Francisco, Cal. Filed Oct. 1, 1888. Serial No. 286,900. (No model.)

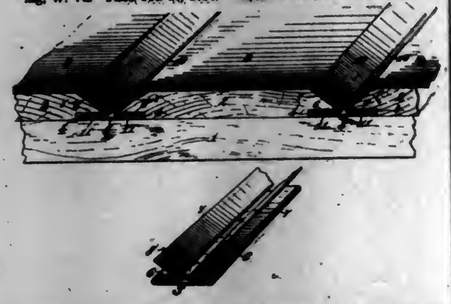
Claim.—In a grain-drier, the independent vertical grain-passages having perforated side walls, in combination with a drying-chamber about the lower portion of the passages and a separate drying-chamber about their upper portion, a fire-chamber communicating with one side of the lower drying-chamber and an exhaust-opening communicating with its other side, a fire-chamber communicating with the opposite side of the upper drying-chamber and an exhaust-opening communicating with its other side, and an elevator or conveyer communicating with the lower end of the passage which is cooler at its bottom than at its top and with the upper end of the other passage, substantially as herein described.



408,413. HAND GARDEN-CULTIVATOR. JAMES W. BOWMAN, College Corner, Ohio. Filed Feb. 12, 1889. Serial No. 299,636. (No model.)

Claim.—A hand garden-cultivator consisting of a handle, the

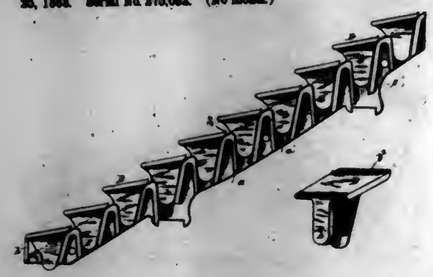
shank B, secured therein and formed with the diverging arms *b*, having eyes *c*, the transverse bar C, the bolts *d*, passed through said eyes and bar, the nuts on said bolts and the teeth having shanks, and the transverse bolts *f*, passed through said shanks, and nuts *g*, by which they are detachably secured to the front face of said bar, substantially as shown and described.



408,414. WHEEL-CULTIVATOR. ROBERT C. BUCKLEY, Peoria, Ill. Filed Jan. 21, 1888. Serial No. 297,055. (No model.)

Claim.—1. In a wheel-cultivator, the supporting-wheel, the frame mounted thereon, and the cultivator-teeth attached to the frame in line with the vertical plane of the axle of the wheel, whereby the weight of the frame and the strain incident to the use of the cultivator-teeth are brought directly on the axle of the wheel, substantially as described.

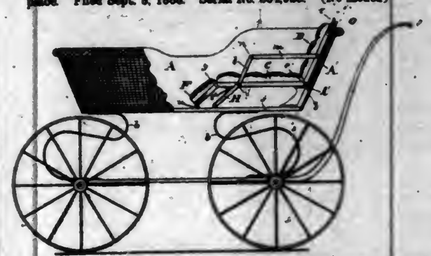
2. In a wheel-cultivator, the wheel, the frame attached thereto, the beams formed at their upper ends into handles and provided on each side of the axle of the wheel with hangers, and the cultivator-teeth attached to the hangers and arranged in vertical plane with the axle of the wheel, substantially as and for the purposes set forth.



408,415. SHEET-METAL ROOFING. FRANK G. CALDWELL, Wheeling, W. Va. Filed Oct. 16, 1888. Serial No. 288,218. (No model.)

Claim.—1. The combination of the independent caps, each composed of a sheet of metal having a head, 5, inwardly-extending top walls, 6, and divergent wings 7, with the sheet-metal roofing-plates having beveled sides 10 and lateral flanges 11, to slide lengthwise into engagement with the top walls and wings of the caps, substantially as described.

2. A roofing consisting of the sheathing-boards having their opposite side edges beveled and rabbeted, the caps each composed of a sheet of metal having a head, inwardly-extending top walls and diverging wings, and the roofing-plates having side bevels and lateral flanges engaging the top walls and wings of the caps, substantially as described.

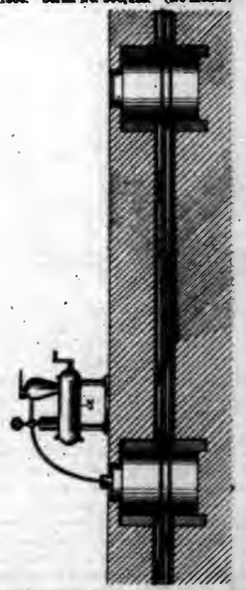


408,416. INCLINED GRATE. HENRY H. CAMPBELL, Cleveland, Ohio, assignor of one-half to Nathan W. Taylor, same place. Filed May 25, 1888. Serial No. 275,062. (No model.)

Claim.—1. The combination, with inclined grate-sections having pockets, of a series of independently-removable shelves connected with each section and held in the sockets solely by gravity, the shelves of a series overlapping each other lengthwise of the grate-sections, and the shelves of adjacent series overlapping and interlocking each other laterally, with horizontal air-spaces between the different shelves and series of shelves, substantially as set forth.

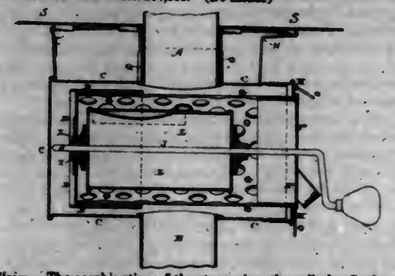
2. The combination of grate-sections A A', having pockets *a'*, with the lower removable shelves B, having depending shanks *b*, fitting in pockets *a'*, and depending flanges *b'*, overlapping the lower ends of said grate-sections A A', substantially as set forth.

408,417. BABY-CARRIAGE. FLORENCE J. D. CHAPPELL, Baltimore, Md., assignor of forty-nine one-hundredths to Riddle & Williams, same place. Filed Sept. 3, 1888. Serial No. 284,925. (No model.)



Claim.—1. A child's carriage having, in combination, a seat, a back, and a leg-board hinged together, two pivoted legs, H, connecting the seat and the bottom of the body, and a stationary standard, *k*, located at the rear, and on top of which the seat may rest.

2. A child's carriage having, in combination, a seat, a back, and a leg-board hinged together, two pivoted legs, H, connecting the seat and the bottom of the body, a stationary standard, *k*, located at the rear, and on top of which the seat may rest, and two bars, *l m*, jointed together, one being also jointed to the seat and the other to the back, for the purpose set forth.



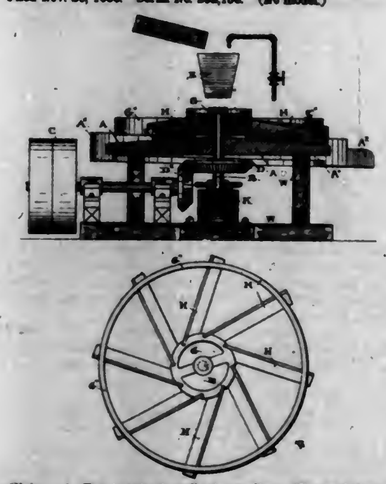
3. A child's carriage having, in combination, a seat, a back, and a leg-board hinged together, two pivoted legs, H, connecting the seat and the bottom of the body, a stationary standard, *k*, located at the rear, and on top of which the seat may rest, a hook, *k'*, on the said standard, and a locking-lever on the back to engage with said hook.

408,418. METHOD OF PROTECTING THE LEAD PIPE OF TELEGRAPH-CABLES FROM CORROSION. ARTHUR R. CLEATE, New York, N. Y., assignor to the Western Electric Company, Chicago, Ill. Filed Feb. 2, 1889. Serial No. 298,445. (No model.)

Claim.—The method of forming a coating of sulphide upon lead pipes, which consists in forcing sulphureted hydrogen into the conduit containing the lead-covered cables, substantially as and for the purpose specified.

408,419. COFFEE-ROASTER. JOHN T. COMB, Cochran, Ga. Filed Jan. 30, 1889. Serial No. 297,986. (No model.)

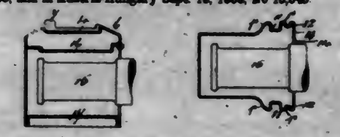
Claim.—The combination of the stove-pipe, the cylinder C, placed at right angles between two of its sections, the support placed inside of the cylinder at its inner end, the perforated cylinder provided with a supporting cap or cover at its outer end and which has its inner end to project into the support, the revolving shaft, the coffee-roaster secured thereto, and the cap or cover for closing the outer end of the perforated cylinder, substantially as shown and described.



408,420. SHINGLE-MACHINE. WILLIAM H. DARNELL, Worthington, Ind. Filed May 26, 1888. Serial No. 275,340. (No model.)

Claim.—1. The movable bar C, having the inclined roughened-faced bed-block D in its side, combined with the guides B, the pressure rollers and springs acting on the journals of the same, and the inclined shaving-knife and the jointing-knife, substantially as described.

2. The bench A, having guides B, and the frame F, the pressure-rollers G in said latter frame, also the shaving and jointing knives E and H, the movable bar C, having the inclined bed-block in its side, the said bar passing between said rollers, the pressure of the same being regulated by springs *g* acting on their journals through blocks *g'* moving in guides *g''*, substantially as described.



408,421. GRINDING-MILL. ESTEBAN DERBEC, San Francisco, Cal. Filed Nov. 28, 1888. Serial No. 292,132. (No model.)

Claim.—1. The herein-described grinding-mill, consisting of the stationary bed having a sloping surface, the surrounding trough, the upright shaft having the grinding-frame mounted on it, the grinding-frame composed of radial arms or plates set at an angle to present acutely-beveled edges to the surface of the bed, and mechanism for rotating said frame, substantially as described.

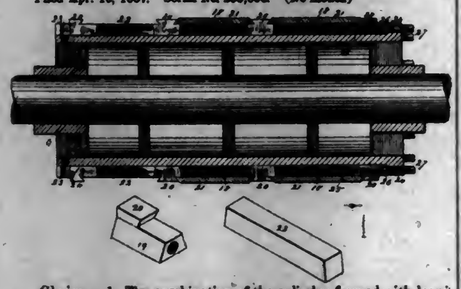
2. In a grinding-mill for ores, the combination, with the sloping surface A, of the shaft, hub G, arms H, having beveled grinding-edges and being set in angular position, and the ring G×, supported by the arms A, as set forth.

408,422. METHOD OF MANUFACTURING AXLE-BOXES FOR RAILWAY-CARRIAGES. JOHN DONNELLY, Parliament Street, and WILLIAM MCLAREN, Moorfields, County of Middlesex, and ARMSTRONG TRASK, Brockley, County of Kent, England. Filed Apr. 24, 1888. Serial No. 271,732. (No model.) Patented in France Apr. 9, 1888, No. 189,849; in Belgium Apr. 10, 1888, No. 81,367; in Italy June 30, 1888, XLVI, 203, and in Austria-Hungary Sept. 16, 1888, No 15,545.

Claim.—1. The herein-described process of manufacturing axle-boxes, which consists in imparting a dished or cupped form to sheet metal and then subjecting the partially-formed box to a succession of drawing operations by sets of dies of decreasing cross-sectional area until the said box is extended in length and reduced in cross-sectional area to approximately the desired form of finished axle-box, substantially as described.

2. The herein-described process of manufacturing axle-boxes, which consists in imparting a dished or capped form with extended side portions to sheet metal by forcing the same over a die-block formed with curved projecting side portions, subjecting the partially-formed box to a succession of drawing operations by sets of dies of decreasing cross-sectional area until the said box is extended in length and reduced in cross-sectional area to approximately the desired form of finished axle-box, and then drawing it over a die-block provided at opposite sides with ribs or projections by means of a bolster of corresponding form, said extended side portions being caused to bend around and enter the space between said ribs or projections and form axle-guard grooves, substantially as herein described.

3. The herein-described process of manufacturing axle-boxes, which consists in imparting a dished or capped form with extended side portions to sheet metal by forcing the same over a die-block formed with curved projecting side portions, subjecting the partially-formed box to a succession of drawing operations by sets of dies of decreasing cross-sectional area until the said box is extended in length and reduced in cross-sectional area to approximately the desired form of finished axle-box, and then drawing it over a die-block provided at opposite sides with three ribs or projections by means of a bolster of corresponding form, said extended side portions being caused to bend around and enter the spaces between said ribs or projections and form external axle-guard grooves and internal dust-guard grooves, substantially as herein described.

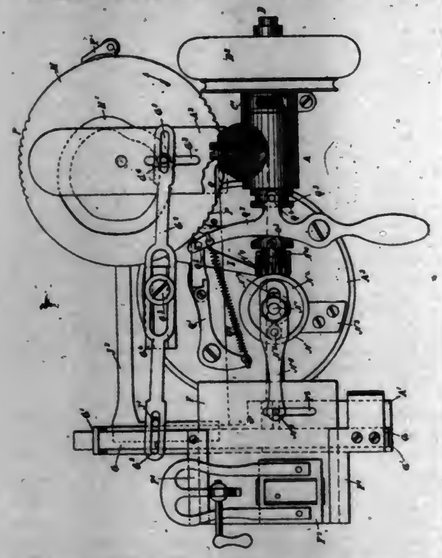


4. The herein-described process of manufacturing axle-boxes, which consists in imparting a dished or capped form with extended side portions to sheet metal by forcing the same over a die-block formed with curved projecting side portions, subjecting the partially-formed box to a succession of drawing operations by sets of dies of decreasing cross-sectional area until the said box is extended in length and reduced in cross-sectional area to approximately the desired form of finished axle-box, compressing the top of said partly-formed box between dies to form a recessed spring-seat, and drawing said box over a die-block provided at opposite sides with ribs or projections by means of a bolster of corresponding form, said extended side portions being caused to bend around and enter the space between said ribs or projections and form axle-guard grooves, substantially as herein described.

5. The herein-described process of manufacturing axle-boxes, which consists in imparting a dished or capped form with extended side portions to sheet metal by forcing the same over a die-block formed with curved projecting side portions, subjecting the partially-formed box to a succession of drawing operations by sets of dies of decreasing cross-sectional area until the said box is extended in length and reduced in cross-sectional area to approximately the desired form of finished axle-box, compressing the top of said partly-formed box between dies to form a recessed spring-seat, and drawing said box over a die-block provided at opposite sides with three ribs or projections by means of a bolster of corresponding form, said extended side portions being caused to bend around and enter the spaces between said ribs or projections and form external axle-guard grooves and internal dust-guard grooves, substantially as herein described.

6. The herein-described process of manufacturing axle-boxes, which consists in imparting a dished or capped form with extended side portions to sheet metal by forcing the same over a die-block formed with curved projecting side portions, subjecting the partially-formed box to a succession of drawing operations by sets of dies of

decreasing cross-sectional area until the said box is extended in length and reduced in cross-sectional area to approximately the desired form of finished axle-box, drawing it over a die-block provided at opposite sides with ribs or projections by means of a bolster of corresponding form, said extended side portions being caused to bend around and enter the space between said ribs or projections and form axle-guard grooves, removing a portion of one side, 13, of said axle-box, and finally securing a bent plate, 16, within the upper part of the same to form both a grease-box and a seat for a liner, brass, or bearing for an axle-journal, substantially as herein described.

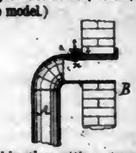


403,423. FORM-CYLINDER FOR PRINTING-MACHINES. JOHN C. FORD, Beverly, Mo., assignor to William Ross & Co., Keokuk, Iowa. Filed Apr. 16, 1887. Serial No. 235,098. (No model.)

Claim.—1. The combination of the cylinder formed with longitudinal undercut channels, the hook-blocks fitting the channels having their bases undercut at the ends, and the furniture-blocks occupying the channels having their ends overcut to fit the ends of the bases.

2. The combination of the printing-forms, the cylinder formed with longitudinal undercut channels extending from one end to near the other end, the hook-blocks fitting the channels, the screw-studs forming abutments at the open ends of the channels, the screws working in end blocks, each screw being formed with a shank having a squared end and a collar.

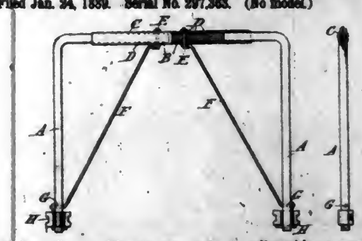
403,424. BUTTON-HOLE SEWING-MACHINE. JOHN S. FRESSE, Brooklyn, N. Y. Filed Mar. 19, 1888. Serial No. 267,730. (No model.)



Claim.—1. In a button-hole sewing-machine, the combination, with the stitch-forming mechanism and cloth-plate, of a feed-bar mounted upon said plate, a feed-wheel having in one face a plain feed-cam, H', connected with the feed-bar, and having in the other face serpentine cam H^2 H^3 and an adjusting-cam, H^3, the former also connected with the feed-bar by means substantially such as herein described, an operating-wheel having a cam, N^4, connected with the cloth-plate, an adjusting-lever, I, connecting the operating-wheel with said adjusting-cam H^3 of the feed-wheel, and a driving-shaft connected with the feed-wheel and operating-wheel, the whole constructed and arranged substantially as herein described, for the purpose set forth.

2. In a button-hole sewing-machine, the combination, with the cloth-clamp and stitch-forming mechanism, of a feed-bar, a feed-lever, a feed-wheel having a cam for operating the feed-lever, a driving-shaft connected with the feed-wheel for operating the same, a crank-rod having a slot parallel to the feed-bar, a bell-crank having a pivot connecting it to the feed-bar, and two studs fitted, respectively, into a slot at one end of the feed-lever and into said slot of the crank-rod for reciprocating the feed-bar, and a means for reciprocating the crank-rod, substantially as and for the purpose described.

3. In a button-hole sewing-machine, the combination, with the cloth-clamp and stitch-forming mechanism, of a feed-bar, a feed-lever, a crank-rod having a slot parallel to the feed-bar, a bell-crank having a pivot connecting it to the feed-bar, and two studs fitted, respectively, into a slot at one end of a feed-lever and into said slot of the crank-rod for reciprocating the feed-bar, a feed-wheel having a cam for operating the feed-lever, a driving-shaft connected with the feed-wheel for operating the same, and cams in said wheel for reciprocating the crank-rod, substantially as and for the purpose described.



4. In a button-hole sewing-machine, the combination of a feed-wheel having a peripheral notch, a driving-shaft connected with the feed-wheel for operating the same, a loose pulley on said shaft, a clutch adapted to engage said pulley for connecting it with the shaft, a stop-lever having one end arranged in peripheral contact with the feed-wheel and constructed to drop into said notch of the wheel for releasing the driving-shaft from the pulley, a clutch-lever having a stop-pin for engaging said end of the stop-lever, and a spring connecting the stop-lever and clutch-lever, substantially as and for the purpose described.

403,425. STOVE-PIPE LOCK. EDGAR GASS, Macomb, assignor of one-half to Benjamin B. Durfee, Peoria, Ill. Filed Jan. 2, 1889. Serial No. 295,187. (No model.)

Claim.—In combination with a stove-pipe, a locking device consisting of a bar, *c*, having a slot, *a*, cut so as to form the teeth *d*, for the purpose of adjustment, and the inner end being bent up at right angles to form an inside stop, *f*, and the stay-bolt *n*, having thumb-nut *e*, and a toothed wheel, *i*, formed on the head for adjusting the bar *c* and securing it firmly to the stove-pipe, substantially as shown and described.

403,426. CORN-CULTIVATOR. WILLIAM J. GOHN, Oakwood, Ill. Filed Jan. 24, 1889. Serial No. 297,363. (No model.)

Claim.—In a cultivator, the rods A, adjustably secured in the sleeve C, the lower ends of said rods being journaled in the boxes H, which are secured to the beams I, the rods A being adjustably secured by means of the braces F, secured to said rods and the sleeve C, substantially as shown and described.

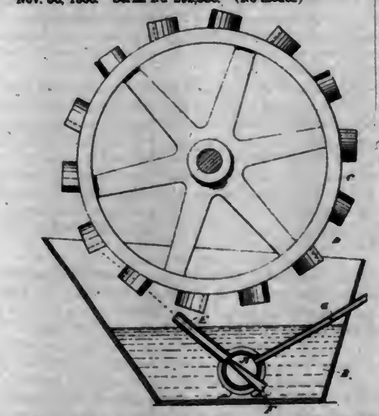
403,427. VEHICLE-COUPLING. SAMUEL H. HAAS, Philadelphia, Pa. Filed June 25, 1888. Serial No. 278,187. (No model.)

Claim.—1. An improved vehicle-coupling consisting of a vertical hooked pin provided with a pivotally-attached latch transverse to the direction of draft, having unequal arms, the longer one preponderating to retain it in horizontal position and curved at the ends, as shown and described, to automatically receive a coupling-link and prevent the disengagement thereof, substantially as set forth.

2. An improved vehicle-coupling consisting of a vertical hooked projection provided with a pivotally-attached latch placed transversely to the line of draft, having arms of unequal length, the longer one preponderating to retain it in horizontal position and curved at the ends, as shown and described, to automatically tilt and pass through a coupling-link and prevent the accidental disengagement thereof, combined with a tilting mechanism arranged to operate said latch from beneath for the purpose of disengaging the link, substantially as set forth.

3. An improved vehicle-coupling consisting of a vertical hooked projection provided with a pivotally-attached latch having arms of unequal length, the longer arm preponderating to retain it in horizontal position and curved at the ends, as shown and described, to automatically pass through a coupling-link and prevent disengagement thereof, combined with a tilting and lifting mechanism arranged to operate said latch and lift the coupling-link, substantially as set forth.

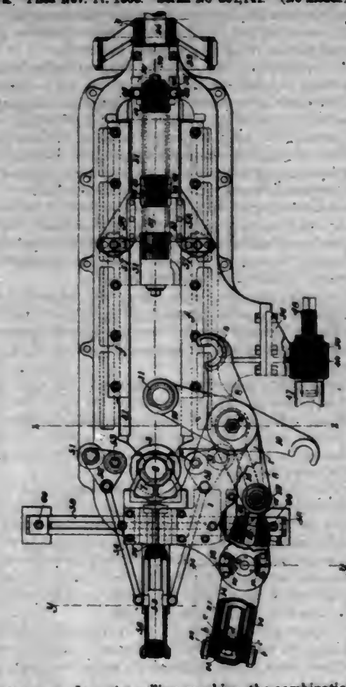
403,428. ARTIFICIAL TOOTH-PLUG. FLORIAN R. HANSEN, Minneapolis, Minn., assignor to Mary Covan Hansen, same place, and Olivia Petrina Hansen, St. Louis, Mo. Filed Mar. 16, 1889. Serial No. 303,542. (No model.)



Claim.—1. As an improved article of manufacture, the connecting-plug for fastening a crown-tooth to the natural tooth-root, consisting of a single piece of metal formed with a screw-threaded part to enter the natural tooth-root, a collar at the base of the threaded part, and a wedge-shaped part to enter the crown-tooth, substantially as described.

2. The crown-tooth connecting-plug, comprised of a threaded part to enter the natural tooth-root, a collar at the base of the threaded part, and a flaring plug to enter the artificial tooth-crown, combined with a disk-plate arranged at the base of the threaded part and seated on the collar, substantially as described.

403,429. PROCESS OF ELECTROPLATING LEAD PIPES. LEONARD D. HOSFORD, Brooklyn, N. Y. Filed Mar. 12, 1888. Serial No. 266,978. (No specimens.)



Claim.—The process of making plumbers' pipes having an exterior coating of a denser and tougher metal, consisting in taking a lead pipe, rendering its exterior surface chemically clean by scouring it, immersing in a solution of caustic alkali and afterward immersing it in a mercury-dip, and subsequently electroplating said pipe in a bath consisting of a solution of the salt of the metal to be deposited.

403,430. STEAM AND WATER MOTOR. CHARLES R. HUNT, Redding, assignor of one-half to Charles K. McElwee, Auburn, Cal. Filed Nov. 30, 1888. Serial No. 292,320. (No model.)

Claim.—The combination of the water-tank, the chamber A, submerged therein, the suction-pipe passing through the chamber and communicating with the contents of the tank, the discharge-nozzle into which the suction-pipe discharges, a steam-jet tube discharging into an annular space between the end of the suction and nozzle, and a rotary wheel having buckets upon its rim into which the jet discharges, said wheel having its lower portion within the tank, whereby the water discharged from the buckets returns to the tank, substantially as herein described.

408,431. TIRE-ROLLING MACHINE. JULIAN KENNEDY, Latrobe, Pa. Filed Nov. 17, 1883. Serial No. 291,141. (No model.)

Claim.—1. In a tire-rolling machine, the combination, with the inner and outer rolls, of a movable carrier by which one neck of the inner roll is supported, a second carrier which engages the roll at the opposite end, said last-named carrier being retractible from the roll to permit placing and removal of the tire, and a power-engine which moves the carriers with the roll for the purpose of reducing the tire, substantially as and for the purposes described.

2. In a tire-rolling machine, the combination, with the inner and outer rolls, of a swinging carrier-lever by which one neck of the inner roll is supported, a second swinging carrier-lever which is adapted to engage and apply pressure to the other neck of the roll, and means for applying pressure to said last-named carrier-lever, substantially as and for the purposes described.

3. In a tire-rolling machine, the combination, with the inner and outer rolls, of a swinging carrier-lever by which one neck of the inner roll is supported, a second swinging carrier-lever which is adapted to engage and apply pressure to the other neck of the roll, and an oscillating hydraulic cylinder whose plunger is connected with said last-named lever, substantially as and for the purposes described.

4. In a tire-rolling machine, the combination, with the inner and outer rolls, of a swinging carrier-lever by which one neck of the inner roll is supported, a second swinging carrier-lever which is adapted to engage and apply pressure to the other neck of the roll, a hydraulic cylinder whose plunger is connected with said last-named lever, and an adjustable stop for limiting the motion of the lever, substantially as and for the purposes described.

5. In a tire-rolling machine, the combination, with the inner and outer formative rolls, of outer guide-rolls, 51, mounted on oscillatory or pivoted frames, and a hydraulic cylinder the plunger of which is connected with both said frames and is adapted to impart simultaneous and equal motion thereto, substantially as and for the purposes described.

6. The combination of the swinging carrier-levers 8 and 10, having a common axis of motion, a pin, 13, on which both said levers have a bearing, and a power-engine—such as a hydraulic motor—which is connected with the pin between the ends of the levers, substantially as and for the purposes described.

7. The combination, with the swinging carrier-levers 8 and 10, of the post 9, which forms their center of motion, a hub or extended bearing on the lever 10, which encircles the post, and mechanism for operating said carrier-levers, substantially as and for the purposes described.

8. The combination of the swinging carrier-levers 8 and 10, hav-

ing a common center of motion, a pin, 13, on which both said levers have a bearing, a power-engine—such as a hydraulic motor—which is connected with the pin between the ends of the levers, and a radius-bar, 15, connecting the pin 13 with the center of motion of the levers, substantially as and for the purposes described.

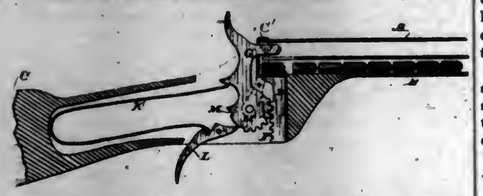
9. The combination of the roll, the swinging carrier-lever 10, having a bearing in which the lower neck of the roll is removably supported, the upper carrier-lever, 8, which engages and supports the said roll laterally, a power-engine—such as a hydraulic cylinder—and its plunger, and a pin by which the plunger of the said cylinder is connected with the carrier-lever 8, and which is situated relatively to the lever 10, so as to engage and move the same forward, together with the lever 8, substantially as and for the purposes described.

10. In a tire-rolling machine, edging-rolls—such as the rolls 26 and 27—and their shafts, in combination with oscillatory bearings which support one of said shafts at a point remote from its roll, and vertically-movable bearings which support the same adjacent to the roll, substantially as and for the purposes described.

11. A tire-rolling machine having edging-rolls, the shaft of one of which is supported at a point remote from the roll in vertically-adjustable oscillatory bearings and has vertically-movable and oscillatory bearings adjacent to the roll, substantially as and for the purposes described.

12. A tire-rolling machine having edging-rolls, the shaft of one of which is supported at a point remote from the roll in oscillatory bearings and has vertically-movable bearings adjacent to the roll, and a motive cylinder having a plunger connected with the vertically-movable bearings by a rounded connection or joint, substantially as and for the purposes described.

13. In a tire-rolling machine, edging-rolls—such as the rolls 26 and 27—and their shafts, in combination with oscillatory bearings which support one of said shafts at a point remote from its roll, vertically-movable bearings which support the same adjacent to the roll, a lever or levers connecting the said oscillatory bearings with the vertically-movable bearings, and a motive cylinder by which the lever or levers are moved to elevate the said movable bearings and the roll, substantially as and for the purposes described.



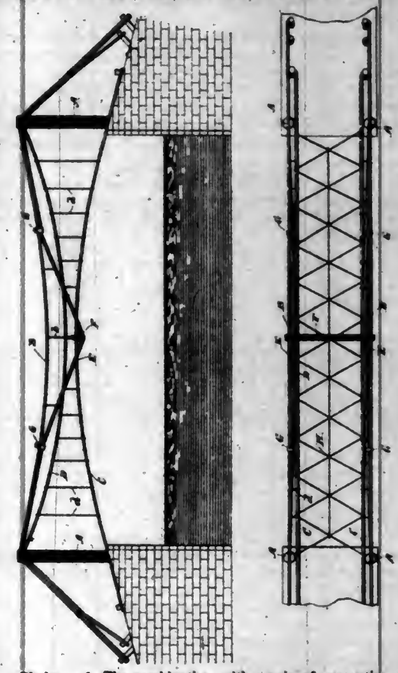
14. The hollow roll 3, one end of which is keyed to its shaft and is held by a shoulder thereon, while the other end is unrestrained and is free to expand when heated, substantially as and for purposes described.

15. In a tire-rolling machine, the combination, with the inner forming-roll having removable bearings to permit placing of the tire-bloom, of a hood or cap adapted to be set on the roll during the placing of the said bloom to protect the journal of the roll from scale, substantially as and for the purposes described.

16. In a tire-rolling machine, a vertical forming-roll having radially and horizontally movable bearings by which it is carried and a power-motor which applies pressure to move said bearings, substantially as and for the purposes described.

17. In a tire-rolling machine, an inner vertical forming-roll having bearings at both ends thereof, the bearings at the upper end being laterally removable to permit placing and withdrawal of the tire, substantially as and for the purposes described.

408,432. SPRING-GUN. EDWARD Y. KNAPP, Blue Lake, Cal. Filed Nov. 10, 1888. Serial No. 290,485. (No model.)



Claim.—1. The parallel barrel and magazine of the gun, the vertically-moving carrier D, having a fixed breech-plate common to both with an aperture in the upper part, in combination with a hammer, the striking part of which enters the aperture, said hammer having the circular tumbler formed upon its lower end and provided with teeth which engage the rack F on the lower rear edge of the carrier, the trigger L, and the spring K, substantially as herein described.

2. The perforated breech-plate C, with the extensions c, fitting the tumbler-shaft, the hammer with the elongated striking-point which passes through the slot in the breech-plate, and the vertically-moving carrier raised and lowered by said hammer and by which the projectile is raised and held so as to be struck by the falling hammer, substantially as herein described.

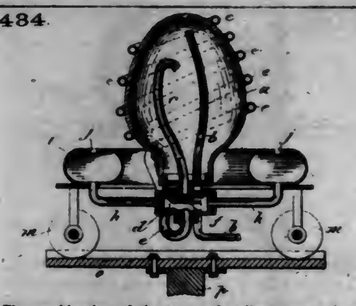
3. The parallel barrel and magazine, the fixed breech-plate common to both and having its upper part slotted or perforated, in combination with a spring-actuated hammer having a point adapted to pass through the aperture in the breech-plate, and a carrier actuated in conjunction with the hammer to raise a projectile from the magazine to a point opposite the barrel, where it is struck and impelled by the falling hammer, substantially as herein described.

408,433. SUSPENSION-BRIDGE. HORACE M. KOHER, Ridgeway, Kans. Filed Jan. 26, 1889. Serial No. 297,720. (No model.)

Claim.—1. The combination, with a pair of supporting-cables and a pair of stringers, of truss-cables extending from the supporting-cables on opposite sides of the middle obliquely downward to the stringers, and means for connecting the trusses with the stringers, substantially as set forth.

2. The combination, with a pair of supporting-cables and a pair of stringers, of truss-cables extending from the supporting-cables obliquely downward toward the stringers, and a girder located between the truss-cables and the stringers, forming a lock between the two, substantially as set forth.

3. The combination, with a pair of supporting-cables and a pair of stringers, of truss-cables extending from the supporting-cables obliquely downward to the stringers, and sliding clamps engaging the supporting-cables and their corresponding truss-cables, whereby the tension of the cables may be regulated, substantially as set forth.



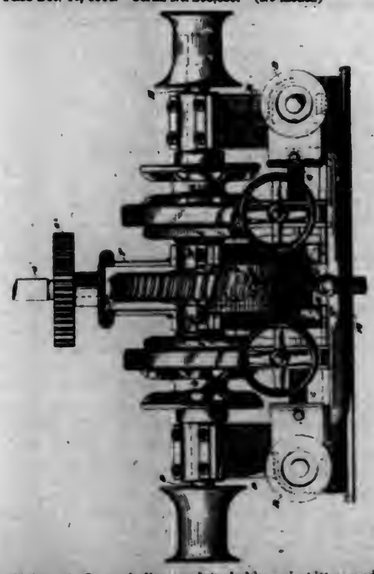
4. The combination, with a pair of supporting-cables, a pair of stringers, and a pair of intermediate supporting-cables, of hangers supporting the stringers from the intermediate cables in arch form, and truss-cables leading from the supporting-cables to the stringers at the crown of the arch, substantially as set forth.

408,434. APPARATUS FOR MAKING AND BURNING GASEOUS FUEL. JOSEPH LOCKE, Glenwood, and SOLON O. RICHARDSON, Jr., Wakefield, Mass., assignors of one-half to said Richardson, and R. D. Libby, Toledo, Ohio. Filed Apr. 2, 1888. Serial No. 269,233. (No model.)

Claim.—1. In an apparatus for making and burning gaseous fuel, the combination of a retort, an oil-supply pipe entering the interior of the retort, a gas-outlet pipe extending from the retort, a steam-pipe surrounding said retort and arranged to be heated for the decomposition of steam therein, and a burner receiving the gases from said pipes and having orifices for the combustion of the gases, as set forth.

2. In an apparatus for making and burning gaseous fuel, the combination of a retort, an oil or gas supply pipe entering the retort, a gas-outlet pipe extending from the retort, a steam-pipe surrounding said retort and arranged to be heated for the decomposition of steam therein, a mixing-chamber communicating with the gas-outlet and steam pipes, and a burner communicating with the mixing-chamber and surrounding the retort, as set forth.

408,434.



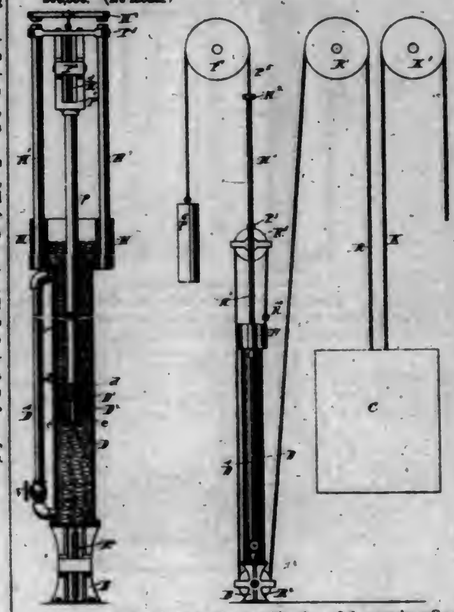
3. The combination of the retort, the oil or gas supply pipe entering said retort and extended to near the upper end thereof, the steam-supply pipe coiled upon the retort, the gas-outlet pipe extending from the interior of said retort, and the burner surrounding the retort and communicating with the gas-outlet and steam pipes, as set forth.

4. The combination of the retort, the oil or gas supply pipe entering said retort, the steam-supply pipe coiled upon the retort, the gas-outlet pipe extending from the retort, the mixing-chamber beneath said retort receiving the gas-outlet pipe at one side and the steam-pipe at the other side and having the interposed baffle-plate, and the burner surrounding the retort and communicating with the mixing-chamber, as set forth.

5. The combination of the retort, the oil-supply pipe entering the retort, the steam-supply pipe coiled upon the retort, a steam-regulator, *y*, in said pipe, the gas-outlet pipe extending from the interior of said retort, the burner surrounding the retort, and the mixing-chamber disposed beneath said retort and having the gas-outlet and steam pipes entering at opposite sides thereof, as set forth.

6. In an apparatus for making and burning gaseous fuel, the combination of a retort, an oil-supply pipe entering the retort, a branch, *b'*, adapted to admit gas from an outside source to said pipe, said pipe and branch being provided with valves whereby either may be shut off, a gas-outlet pipe extending from the retort, a steam-pipe surrounding said retort and arranged to be heated for the decomposition of steam therein, the mixing-chamber beneath said retort, and a burner receiving the gases from said pipes and having orifices for the combustion of the gases, as set forth.

408,435. STEAM AND CAPSTAN WINDLASS. WALTER MILLER, Cleveland, Ohio, assignor to the Globe Iron Works Company, same place. Filed Dec. 17, 1888. Serial No. 293,835. (No model.)

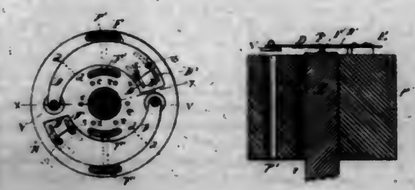


Claim.—1. In a windlass, a detachable main bitt or pedestal, F, in two vertical and integral portions provided with horizontal bearings F' and F², vertical bearings F³ and O, and detachable guard F⁴, in combination with stationary bed-plate A and shafts G, E, K, and O', substantially as described.

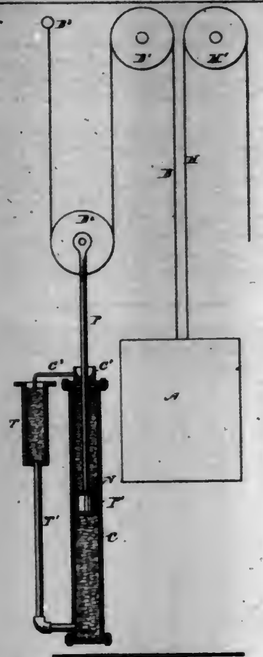
2. In a windlass, a detachable main bitt or pedestal, as F, in two equal vertical portions, connected and integral at their upper edges to form a bearing, O, in combination with an inclosed worm-wheel, N, and worm M, detachable guard F⁴, and bed-plate A, substantially as described.

3. In a windlass, a wild-cat loose on the windlass-shaft, provided with an overhanging flange and lugs on the interior side of said flange, a driving head or disk adjacent to the vertical face of the wild-cat and keyed to the shaft, provided with radial guides and slots, and an exterior disk loosely journaled upon the hub of the interior disk and having slots arranged spirally to the axis of the disk, in combination with dogs adapted to slide in the guides of the interior disk and bolts integral with the dogs passing through the radial slots in the interior disk into the spiral slots of the exterior or inclosing disk, substantially as described.

408,436. FLUID SPEED-REGULATOR FOR ELEVATORS. WILLIAM E. HENDERSON, Cambridge, Mass. Filed Feb. 5, 1889. Serial No. 298,589. (No model.)

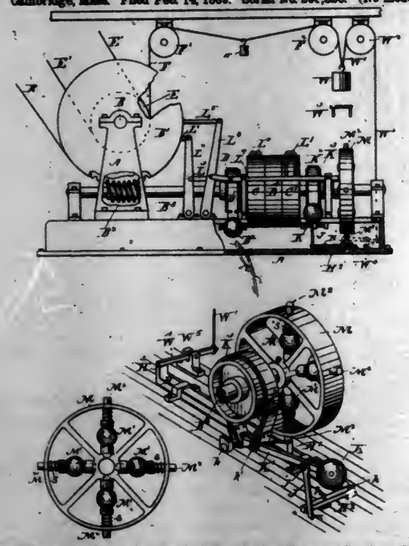


Claim.—In an elevator, the combination of the carriage C, retarding-rope R, piston D, having at the top of its rod P a pulley, R⁴, adapted to receive the retarding-rope R, and valve D⁴, with the cylinder D and retracting-weight P⁵, substantially as and for the purpose set forth.



408,437. FLUID SPEED-REGULATOR FOR ELEVATORS. WILLIAM E. HENDERSON, Cambridge, Mass. Filed Feb. 4, 1889. Serial No. 298,560. (No model.)

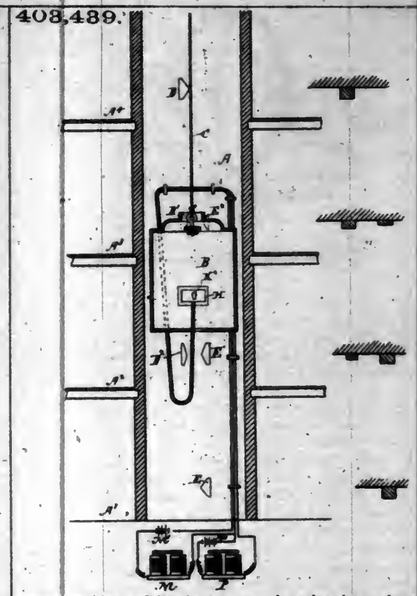
Claim.—1. In a speed-retarding device, the combination of the cylinder C, piston-rod P, piston P', and valve V with the pipe T and reservoir T, having free communication with the lower part of the cylinder C, substantially as and for the purpose set forth.



2. In a fluid speed-retarding device, the combination of the piston P' and valve V with the retractor-spring plate D and the fulcrum-piece F, adapted to adjust the tension of the retractor-spring, substantially as and for the purpose set forth.

408,487.

408,438. ELEVATOR SAFETY-BRAKE. WILLIAM E. NICKERSON, Cambridge, Mass. Filed Feb. 14, 1889. Serial No. 299,820. (No model.)



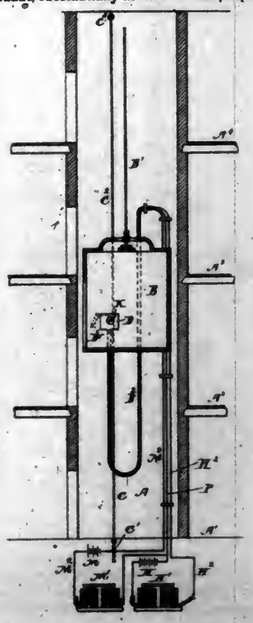
Claim.—1. In an elevator hoisting device, the combination of the hand-rope wheel E, the rope F, and weight W with the rope W', lever W^4, sliding rod H, having a stud, H', and the wheel M, having the slidable arms M^3, substantially as and for the purpose set forth.

2. In an elevator hoisting device, the combination of the shaft B^2, brake K^2 K^3, lever K', and post J with the lever H^3, sliding rod H, having a stud, H', and the wheel M, having slidable arms M^3, all operating substantially as and for the purpose set forth.

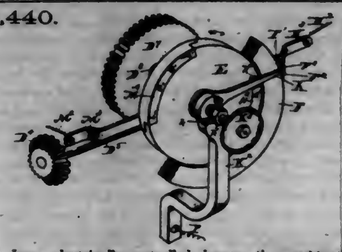
408,489. ELECTRIC CONTROLLING DEVICE FOR ELEVATOR-CARRIAGES. WILLIAM E. NICKERSON, Cambridge, Mass. Filed Mar. 5, 1889. Serial No. 301,573. (No model.)

Claim.—1. In an electrically-controlled elevator, the combination of series of fixed cam-pieces of varying projections with electrical

408,489.



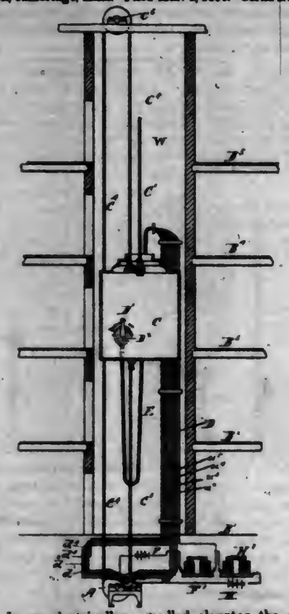
contact making and breaking levers adapted to be set by movable switch-blocks for automatic action, and movable switch-blocks, substantially as and for the purpose set forth.



2. In an electrically-controlled elevator, the combination of the cam-pieces D D' D^2 and E E' E^2 and the levers N and L with the switch-blocks D^2 and E^2, substantially as and for the purpose set forth.

408,440. ELECTRIC CONTROLLING DEVICE FOR ELEVATORS. WILLIAM E. NICKERSON, Cambridge, Mass. Filed Mar. 7, 1889. Serial No. 302,248. (No model.)

Claim.—1. In an electrically-controlled elevator, the combination of contact-plates within the carriage, connected to electric devices and adapted to move in relation to an index the same as the carriage moves in relation to the floors, with an index-electrode adapted to be set by the attendant, substantially as and for the purpose set forth.

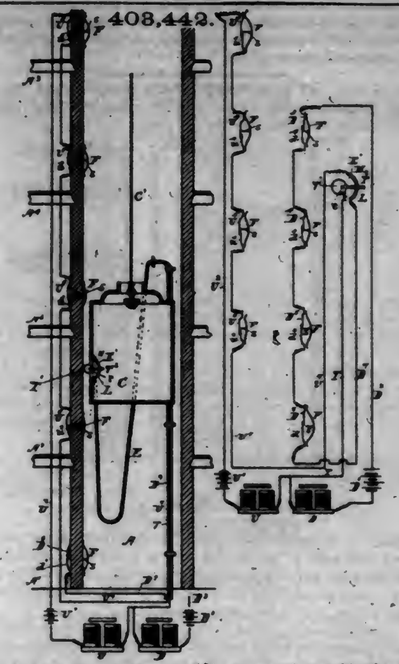


408,440.

2. In an electrically-controlled elevator, the combination of the ropes C and C^3, index-drum D', a transmitting mechanism, and the contact-plate block E and contact-plates M^4 H^4 with the index F and index-electrode K, all electrically connected, substantially as and for the purpose set forth.

408,441. ELECTRICALLY-CONTROLLED ELEVATOR. WILLIAM E. NICKERSON, Cambridge, Mass. Filed Mar. 8, 1889. Serial No. 302,454. (No model.)

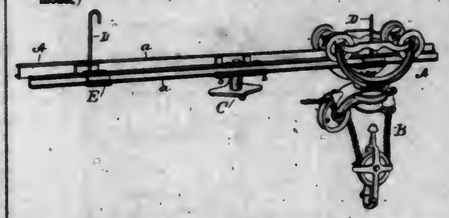
Claim.—1. In an electrically-controlled elevator, the combination of a contact-plate block arranged to move in unison with the movement of the elevator-carriage and having contact-plates each connected to one pole of an electric device, and having resting upon it electric contact-points, each of which is connected electrically to switch-posts in the elevator-carriage, as described, with an index-electrode electrically connected with both electric devices and adapted to be set by the attendant, all substantially as and for the purpose set forth.



2. In an electrically-controlled elevator, the combination of the carriage C, ropes C^3 C^4, index-drum A, transmitting mechanism, and contact-plate block A^9, having contact-plates Z and U, with the contact spring-points l^2 l^3 l^4 l^5 and c' c^2 c^3 c^4 and contact-posts +2 +3 +4 +5 and −1 −2 −3 −4, index-electrode D', the electrical circuits, and devices, substantially as and for the purpose set forth.

408,442. ELECTRIC CONTROLLING MECHANISM FOR ELEVATORS. WILLIAM E. NICKERSON, Cambridge, Mass. Filed Mar. 9, 1889. Serial No. 302,709. (No model.)

Claim.—1. In an electrically-controlled elevator, the combination of a fixed automatically-operated circuit-breaker with an adjustable cam, an index-electrode, and connecting-circuits and electric devices, substantially as and for the purpose set forth.



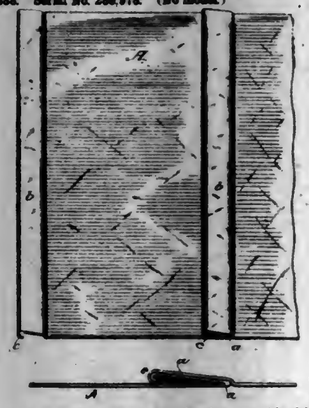
2. In an electrically-controlled elevator, the combination of a series of fixed circuit-breakers in the well-room, one for each floor, with an elevator-carriage having an adjustable cam adapted to operate the circuit-breakers, an index-electrode, and connecting-circuits and electric devices, substantially as and for the purpose set forth.

408,442.

3. In an electrically-controlled elevator, the combination of a series of circuit-breakers adapted for each floor by having different degrees of projections, as described, with an adjustable contact-breaker in the elevator-carriage operating in connection with circuits and electric devices, substantially as and for the purpose set forth.

408,448. TRACK FOR HAY-CARRIERS. CHARLES R. PATRIC and RICHARD H. ROGERS, Springfield, Ohio, assignors to the Superior Drill Company, same place. Filed Dec. 17, 1888. Serial No. 293,890. (No model.)

Claim.—1. The combination, with the rails a, formed of channel-iron, having the top and bottom flanges on the outside thereof, of a U-shaped clamping or supporting piece having projecting arms the ends of which are formed to fit between the flanges on the said rails, and an inner spreading-piece between said rails to force the same against the projecting arms of said clamping or supporting piece, substantially as specified.

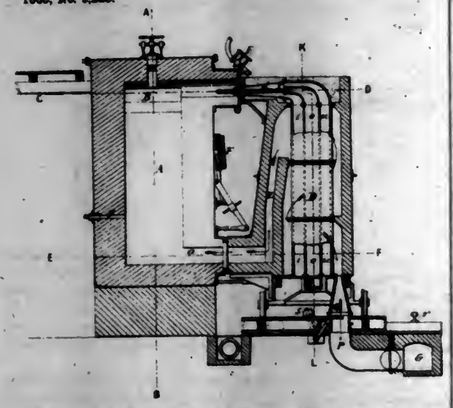


2. The combination, with the rails a, each provided with a lower projecting flange on the outside thereof, of an outer U-shaped clamping or supporting piece, the arms of which are adapted to rest against the outside of said rails, said projecting arms being grooved or formed to receive the lower flange of said rails and support the same, as described, and an inner U-shaped spreading-piece between said rails, substantially as specified.

3. The combination, with a track, as described, composed of channeled rails, of a stop mechanism having a top plate with hook-shaped flanges to engage the lower portion of said rails, a spreader between said rails to force the same in said hook-shaped top plate, and means for securing said flanges against longitudinal movement on the said rails, substantially as specified.

4. The combination, with a track composed of channeled rails connected together, as described, of a stop device secured to said channel-rails by hook-shaped flanges on a top plate adapted to engage with the lower part of said rails, spreaders between said rails,

set-screws passing through said top plate and adapted to impinge against said rails, and means for connecting said spreaders to said top plate, substantially as specified.



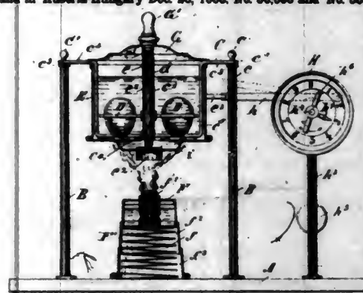
408,444. METALLIC ROOFING-PLATE. GEORGE PATTEN, Clarksville, assignor to himself, and Moultrie Patten, Nashville, Tenn. Filed Oct. 2, 1888. Serial No. 286,973. (No model.)

Claim.—1. A metallic roofing-plate having one side folded back to form a nailing-flange and the free edge of said fold turned under between the plate and fold, forming a core whose convex surface is adapted to engage and hold the hooked edge of an adjacent plate and form a joint, substantially as set forth.

2. A metallic roofing-plate having an underturned hook on one side and the other side folded back and turned under and resting near or upon the upper surface of the plate, so as to form with the hooked edge of an adjacent plate the joint connecting them, substantially as described.

408,445. APPARATUS FOR MAKING CHLORINE. ALFRED R. PECHINEY, Saltodres, Gard, France, assignor to the Weldon's Chlorine Processes Company, (Limited,) Westminster, England. Filed May 21, 1888. Serial No. 274,580. (No model.) Patented in England Aug. 1, 1885, No. 9,235.

Claim.—1. In an apparatus for heating solid bodies out of contact with products of combustion of the fuel employed, the combination of the furnace proper having entrance and discharge openings, a movable burner removably connected with the entrance-opening, the wheels on which the burner is mounted, and a wheeled truck on which the burner is supported moving toward and from the furnace, substantially as set forth.



2. In an apparatus for heating solid bodies out of contact with the products of combustion of the fuel employed, the combination of a furnace proper, a movable burner, and connections for leading the heated air and gas or the products of combustion from the burner to the furnace proper and back to the burner, substantially as described.

3. In an apparatus for heating solid bodies out of contact with the products of combustion of the fuel employed, the combination of a furnace proper, consisting of one or more narrow working-chambers having thick walls, the said chambers (when the apparatus contains more than one of them) not communicating with one another, but all communicating with a common combustion-chamber, a movable burner for heating the narrow chambers, and connections for leading the heated air and gas or the products of combustion from the burner to the furnace proper and back to the burner, substantially as described.

4. The combination of the furnace having thick walls and narrow passages or compartments connected at one end with a common supply-chamber and having a discharge-opening at the opposite end, doors for closing said openings, a burner communicating with the entrance and discharge openings and mounted on movable supports, whereby it may be withdrawn from the furnace, the gas-supply pipe, detachable connections between the gas-supply pipe and the burner, the air-pipe, and detachable connections between the air-pipe and the burner, substantially as set forth.

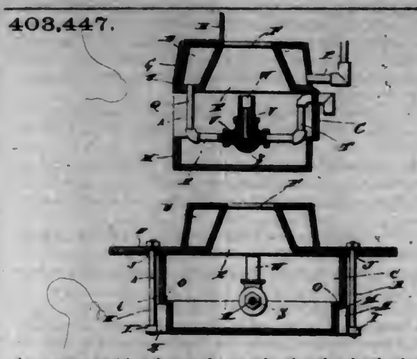
5. The combination of the furnace having thick walls and divided into a series of narrow compartments communicating at one end with a common supply-chamber and at the opposite end with an exit-opening, the burner movable toward and from the furnace and parallel therewith and divided into a series of compartments, the air-openings through which air is supplied to some of the compartments, a gas-pipe, connections between the gas-pipe and the burner, the flue, and connections between the burner and the flue for carrying off the products of combustion after their passage through the furnace, substantially as set forth.

408,446. EGG-BOILER. RUDOLF REITHOFFER, Rudolfsheim, near Vienna, Austria-Hungary. Filed Oct. 5, 1888. Serial No. 287,574. (No model.) Patented in Germany Aug. 3, 1888, No. 46,796; in France Aug. 3, 1888, No. 192,209; in Sweden Aug. 3, 1888, No. 1,717; in Norway Aug. 4, 1888, No. 1,012; in Italy Sept. 30, 1888, XXII, 23,936, XLVII, 218, and in Austria-Hungary Dec. 20, 1888, No. 36,066 and No. 55,722.

Claim.—1. An egg-boiler composed, essentially, of socketed supports, an egg-carrier provided with arms terminating in an eye, and locking-pins adapted to pass through said eye and fitting into the sockets of the supports, in combination with a boiler adapted to move in the plane of the carrier, said carrier being constructed to fit into said boiler, substantially as and for the purposes specified.

2. In an egg-boiler, the combination, with a revoluble boiler having a simultaneous vertical and rotary motion on its support, and a stationary egg-carrier constructed to fit into said boiler, of a locking device to lock said boiler against rotation and vertical motion, substantially as and for the purposes specified.

3. In an egg-boiler, the combination, with a revoluble and vertically-movable boiler provided with a radial stop-arm and a stationary egg-carrier constructed to fit into and arranged in the plane of motion of said boiler, of a locking-lever adapted to engage the stop-arm of the boiler, and a timed releasing mechanism to break the engagement between the arm and lever, substantially as and for the purposes specified.

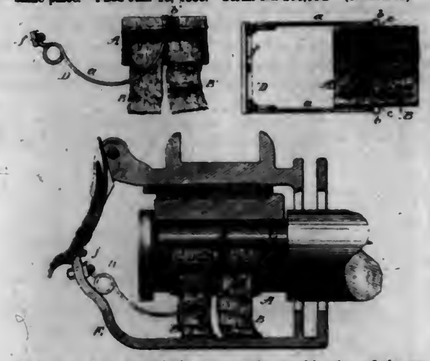


4. In an egg-boiler, the combination, with a movable boiler and a stationary egg-carrier constructed to fit within said boiler, of means for imparting a vertical and rotary motion to said boiler, consisting of a stationary helically-slotted tube and a support for the boiler fitting into said tube, said support being provided with a radial pin extending into the helical slot of said tube, substantially as and for the purposes specified.

5. The combination, with the stationary egg-carrier, consisting of the supporting-yoke C, sleeve c^2 thereof, carrier-tube d, and carrier D, connected therewith, and the spirally-slotted tube c', of the boiler E, and the spindle e, secured to the bottom of the boiler and projecting axially therethrough and through the tube c', and the guide-pin e', secured to said spindle and projecting into the spiral slot of the tube c', substantially as and for the purposes specified.

408,447. OIL AND GAS BURNER. RANSOM H. SARGENT, Titusville, Pa., assignor of one-fourth to James L. Dunn, same place. Filed Aug. 15, 1888. Serial No. 282,773. (No model.)

Claim.—1. The herein-described casing for hydrocarbon-burners,



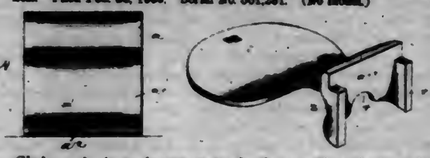
408,447.

the same comprising the annular superheating-chamber having laterally outward-extending base provided with downwardly-extending flanges formed integrally with said chamber, the bottom box having vertical sides and laterally outward-extending legs to support the flanges of the superheating-chamber at a distance beyond the walls of said bottom for the passage of air in a direct upward direction between said walls and flanges, and the connecting-bolts, in combination with the steam and oil pipes, the chamber having a diaphragm or partition forming separate compartments with which said steam and oil pipes are connected, the tube extending upwardly from the oil-compartment, and the nipple secured to the diaphragm connected with the steam-compartment and extending within the tube, substantially as and for the purpose herein set forth.

2. In a hydrocarbon-burner, the combination, with the superheating-chamber provided with a bracket or keeper on its front side, of an inverted-L-shaped shield or deflector having a shank, whereby it is mounted detachably in said keeper or bracket, so as to be conveniently accessible, as herein described, and for the purpose set forth.

408,448. CAR-AXLE LUBRICATOR. THEODORE SAUNDERS, Danbury, Conn., assignor to the Saunders Car Axle Lubricator Company, same place. Filed Jan. 10, 1888. Serial No. 296,014. (No model.)

Claim.—1. In a car-axle lubricator, the combination of the suspended lubricating-pad, the wicks pendent therefrom, and a pair of independently-resilient side supports, to which the ends of said pad are centrally pivoted, said pad being suspended between said supports, substantially as described.



2. The combination, substantially as hereinbefore described, of a bracket having two independently-resilient arms and adapted to be mounted upon the front end of a car-axle journal-box and to project inwardly therefrom, and a lubricating-pad which is suspended between said arms and provided with pendent wicks, and is pivotally connected at its end to said two arms for maintaining it in position for contact with an axle-journal.

3. The combination, substantially as hereinbefore described, of a car-axle box, a suspended lubricating-pad having pendent wicks, and a pad-supporting bracket which is mounted upon and extends inwardly from the front end of said box, and which at its inner end has two arms, upon and between which said pad is suspended and to which the ends of the pad are separately pivoted.

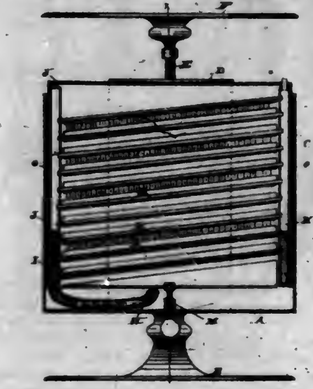
408,449. COMPOSITION FOR PRESERVING WOOD. HILYARD STOKES, Beverly, N. J., assignor to Franklin S. Hovey, same place. Filed Feb. 9, 1888. Serial No. 263,239. (No specimens.)

Claim.—The herein-described composition of matter for preserving wood and rendering other materials water-proof, consisting of crude petroleum-oil, rosin-oil, oil of tar, and fine salt, combined in substantially the proportions set forth.

408,450. ART OF FORMING RAIL-BRACES. JOHAN A. TRAWEL, Chicago, Ill., assignor to the McGuire Manufacturing Company, of Illinois. Filed Feb. 20, 1889. Serial No. 301,291. (No model.)

Claim.—1. As an improvement in the art of producing rail-braces, notching the end portions of the web in a blank such as set forth and turning down the ends 2 of the base of the notched blank, for the purpose described.

2. Notching the end portions of the web of a blank such as set forth, flattening out the tread a of said blank, turning down the end portions, 2, of the base thereof, and subjecting the same to dishing-dies, substantially as described.



408,451. ELECTRIC BATTERY. JOHN A. BARRETT, Brooklyn, N. Y., assignor to the John A. Barrett Battery Company, Baltimore. Filed Feb. 8, 1888. Serial No. 263,353. (No model.)

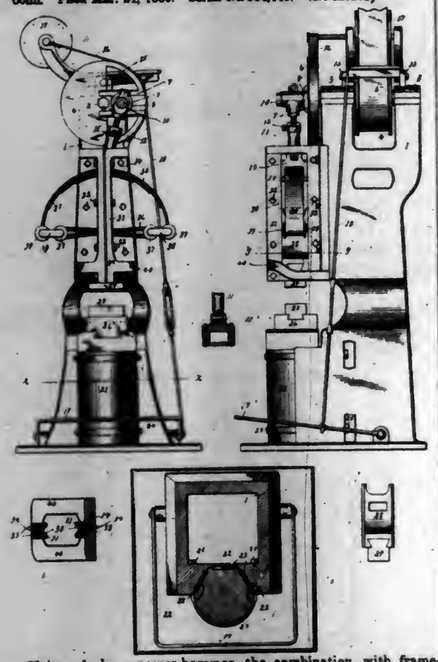
Claim.—1. In a chloride-of-silver battery, the combination, with a mass of fused chloride of silver having a conductor-wire embedded therein, of a conductor applied to the surface of such mass and electrically connected with the embedded conductor.

2. The combination, with the battery-wire B and a mass of fused chloride of silver in which said wire is embedded, of an external conductor applied to the surface of the mass of chloride and connected with the embedded conductor, as and for the purpose described.

408,452. HYDROSTATIC WEIGHING-SCALE. FRANK BAXTER, Olds, Cal., assignor of one-half to W. S. Vanderburg, Marshfield, Oreg. Filed Dec. 22, 1888. Serial No. 294,407. (No model.)

Claim.—1. A weighing-scale having a float-chamber, a float disposed so as to rise and fall in said chamber and having a scale-pan supported upon it, in combination with an indicating dial or scale, said scale consisting of the inclined tubes, the lower one of which is connected with the float-chamber, the ends of all the tubes being so connected that the liquid may flow from one to another until it reaches the level of the surface within the float-chamber, substantially as described.

2. A weighing-scale comprising a float-chamber containing liquid, a float suspended therein and carrying a scale-pan, and an indicating dial or scale consisting of vertical tubes, one of which is connected with a float-chamber, and a series of inclined tubes extending between the vertical tubes, so that the upper end of each of the inclined tubes is on a level with the lower end of the succeeding tube above.



said tubes being subdivided and marked to indicate fractions of the unit, substantially as herein described.

3. The float-chamber, the vertically-moving float suspended therein and supporting the scale-pan, in combination with the indicating dial or scale consisting of a series of inclined tubes having their ends connected with approximately vertical tubes, one of which is connected with the float-chamber, the vertical distance between the inclined tubes representing the unit of weight, and a series of subdivisions marked from end to end of the inclined tubes indicating the fractional subdivisions of the unit, substantially as described.

4. The float-chamber, the vertically-moving float suspended therein and carrying the scale-pan, in combination with the dial or scale consisting of the inclined subdivided tubes having their ends connected with approximately vertical tubes, the lower end of one of which is connected with the float-chamber and the upper end of the other provided with an opening for the free passage of air, together with the regulating or adjusting screw, whereby the level of the liquid may be changed in the dial-tube, substantially as herein described.

5. In a weighing-scale, a float-chamber, a vertically-moving float suspended therein and carrying a scale-pan, in combination with a dial having vertical tubes at its ends connected with the float-chamber, and inclined connecting-tubes extending between them, said dial and tubes being vertically adjustable with relation to the float-chamber, substantially as herein described.

403,453. POWER-HAMMER. RUSSELL A. BELDEN, New Haven, Conn. Filed Mar. 21, 1889. Serial No. 304,115. (No model.)

Claim.—1. In a power-hammer, the combination, with frame-work and a ram, of an anvil-block wholly independent from the frame-work and made polygonal upon its inner side, corresponding mortises in the face of the frame-work and the anvil-block, blocks of wood in said mortises, and means—for example, metallic straps—whereby the anvil-block is held in position without transmitting the jar of the blows to the frame-work.

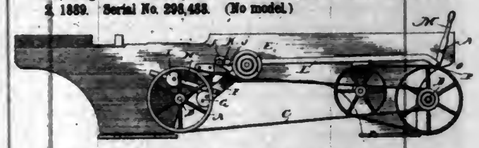
2. In a power-hammer, the combination, with the frame-work and ram, of ways cast in two parts, 31, strips of wood between said parts, and bolts connecting said parts to each other and to the frame-work.

3. In a power-hammer, the combination, with the frame-work and ram, of ways cast in two parts, having bars 33 of steel cast therein, strips of wood, 34, between said parts, and bolts securing them together and to the frame-work.

4. In a power-hammer, the combination, with the frame-work and ram, of ways cast in two parts, and strips 34 between said parts, the lower ends of both parts being curved upward, so that the view of the anvil is unobstructed in use.

5. In a power-hammer, the combination, with the ram, a crank-disk, crank-pin, and connecting-rod, of a slide to which the connecting-rod is hinged, a bow-spring carried by the slide, and straps which pass through the ram and are connected to the opposite ends of the spring, so that in use the shock of the blows of the ram is not transmitted to any other part.

6. In a power-hammer, a ram, a slide carrying a bow-spring, and a strap passing through the ram and connected to the ends of the spring.

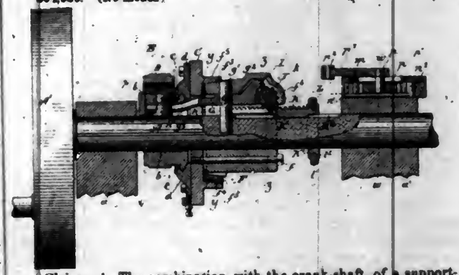


7. In a power-hammer, a slide carrying a bow-spring, a ram, a strap passing through the ram and connected to the ends of the spring, and inner and outer ways by which the ram and slide are supported.

8. In a power-hammer, a ram, a slide carrying a bow-spring, a connecting-rod hinged to the slide, whereby movement is imparted, and a strap passing through the ram and connected to the ends of the spring.

9. The combination, with a slide carrying a bow-spring, of a ram, a strap connected to the ram and to the opposite ends of the spring, two-part ways in which said slide and ram are guided, and strips 34 between the parts of the ways, as and for the purpose set forth.

10. In a power-hammer, the combination, with an anvil-block polygonal upon its inner side, and frame-work corresponding with said block, of corresponding mortises in said block and frame-work and blocks of wood in said mortises, which take up the shock of the blows of the hammer.



403,454. BELT-TIGHTENER. EDWIN BENJAMIN, South Evanston, Ill., assignor to the Benjamin Machine Company, of Illinois. Filed Feb. 2, 1889. Serial No. 298,453. (No model.)

Claim.—1. The combination, in a belt-tightener, of a pivoted arm carrying the tightener-pulley and means for shifting said tightener, consisting of a hand-lever and a connecting-rod from said hand-lever, the latter connected to the tightener-pulley arm by a stud adjustable in a series of holes arranged circumferentially with reference to the pivot of said arm, as set forth.

2. The combination of arm F, tightener-pulley E, rod L, connected to the arm F and lever M, the latter being pivoted to the frame, and the stop O, which arrests the movement of the lever M after the pivotal point P has reached a straight line joining the points K and N.

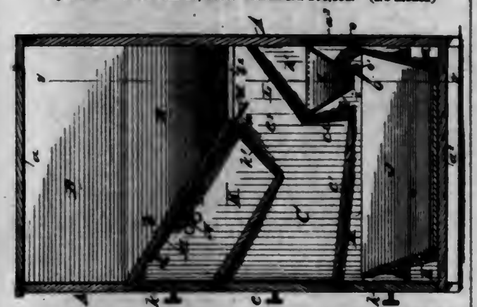
403,455. VALVE-GEAR. EDGAR M. BIRDSALL, Buffalo, N. Y., assignor to Mary Birdsall, same place. Filed Dec. 29, 1888. Serial No. 294,929. (No model.)

Claim.—1. The combination, with the crank-shaft, of a supporting-disk secured to said shaft, an eccentric capable of movement on said support, a shifting-lever pivoted to said shaft, whereby said eccentric is shifted, and a worm whereby said shifting-lever is actuated, substantially as set forth.

2. The combination, with the shaft A, the support C, secured thereto, and an eccentric capable of movement on said support, of a shifting-lever connected with said eccentric, a worm provided with gear-teeth whereby said shifting-lever is actuated, and a gear-rack whereby said worm is rotated, substantially as set forth.

3. The combination, with the shaft A, the support C, secured thereto, and the eccentric B, capable of movement on said support, of a movable block, H, seated in said eccentric, a shifting-lever movably attached to said block and provided with a gear-segment, a worm engaging with said gear-segment, and a longitudinally-movable rack-bar whereby said worm is rotated, substantially as set forth.

4. The combination, with the shaft A, the support C, secured thereto, and an eccentric capable of movement on said support, of a shifting-lever connected with said eccentric and provided with a gear-segment, a longitudinally-movable rack-bar, and a pinion provided with several rows of teeth arranged in line with each other lengthwise of the pinion and extending spirally around the same, substantially as set forth.



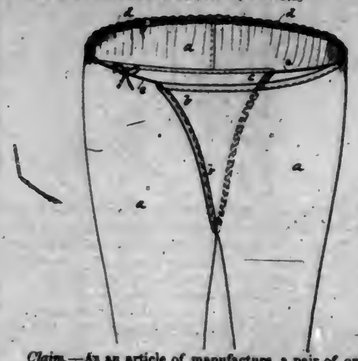
5. The combination, with the shaft A, the support C, and the eccentric B, arranged movably on said support, of a casing, F, surrounding the shaft, a pin, *g*, whereby said support and casing are secured to said shaft, a shifting-lever, G, pivoted to said pin, connected at one end to said eccentric and provided at its opposite end with a gear-segment, a combined worm and gear pinion, J, arranged in the casing F and engaging with said gear-segment, and a gear-rack, whereby said worm-pinion is rotated, substantially as set forth.

6. The combination, with the shaft A, the support C, and the eccentric B, capable of movement on said support, of a tapering socket, f^4, formed on said support, a casing, F, having beveled faces f^5 engaging in said socket, screw-bolts *f*, whereby said beveled faces are forced into said socket and said casing is secured to said support, a pin, *g*, whereby said casing is secured to said shaft, a worm-pinion, J, mounted in said casing, a shifting-lever, G, pivoted to said pin and engaging with said eccentric and with said worm-pinion, and a gear-rack, K, engaging with said worm-pinion, substantially as set forth.

7. The combination, with the shaft A, the disk C, and the eccentric B, supported on said disk and capable of movement thereon, of a casing, F, composed of sections f' f^3, surrounding said shaft and provided with inclined faces, a tapering socket formed on said disk and engaging over said inclined faces, screw-bolts *f*, whereby the inclined ends of said sections are forced into said socket and against each other, a transverse screw, f^6, connecting the outer ends of said sections, a worm-pinion, J, mounted on the screw f^6 within the casing F, a shifting-lever, G, engaging with said eccentric and provided with a gear-segment engaging with said worm, and a gear-rack, K, whereby said worm is rotated, substantially as set forth.

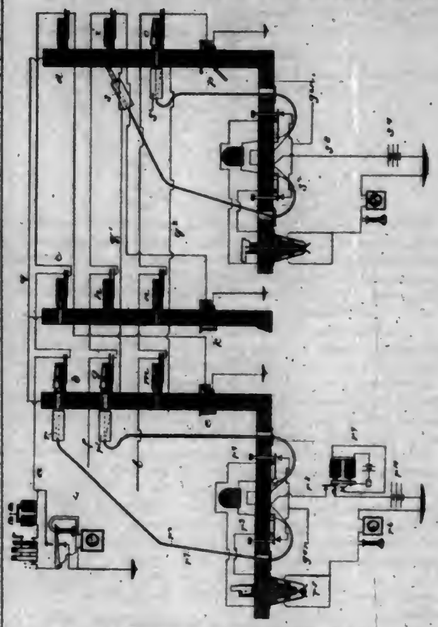
8. In a valve-gear, the combination, with the shaft A and the disk C, of the eccentric B, capable of movement on said disk, the eccentric-shifting mechanism mounted on said shaft and rotating therewith, a stationary rack-bar, m, a movable rack-bar, L, connected with the eccentric-shifting mechanism, a gear-wheel, *n*, meshing with the rack-bars *m* and L, and mechanism whereby said gear-wheel is rotated, substantially as set forth.

403,456. COAL AND WOOD CABINET. HENRY BRANDT, Brooklyn, N. Y. Filed Jan. 19, 1889. Serial No. 296,832. (No model.)



Claim.—1. In a cabinet, the combination, with a coal-bin, a communicating coal-delivery chamber, and a dust outlet at or below the passage between said bin and chamber, of an inclined grating or screen forming the floor of said passage and a self-closing valve fitted at the outlet for the dust below the screen, substantially as shown and described, whereby a dust-receiving pan or vessel placed below the dust-outlet will open the valve for discharge of dust into the vessel and the valve will close to retain the dust when the vessel is withdrawn, as herein set forth.

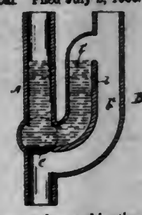
2. In a cabinet, the combination with a coal-bin, a communicating coal-delivery chamber, and a lower dust pan or vessel compartment, of an inclined grating or screen forming the floor to the passage between the coal-bin and coal-delivery chamber, a chute fitted below this screen, and a self-closing valve fitted to the chute-outlet and normally retaining the dust in the chute and adapted to be opened by a pan or vessel placed in the lower compartment, substantially as described, for the purposes set forth.



3. In a cabinet, the combination of a coal-bin, B, a coal-delivery chamber, C, a passage, c^3, connecting the bin and chamber, a dust-vessel compartment, H, below said chamber, an inclined screen, I, forming the floor of the passage c^3, a chute, I, below the screen, and a self-closing valve, O *o*, at the chute-outlet, substantially as herein set forth.

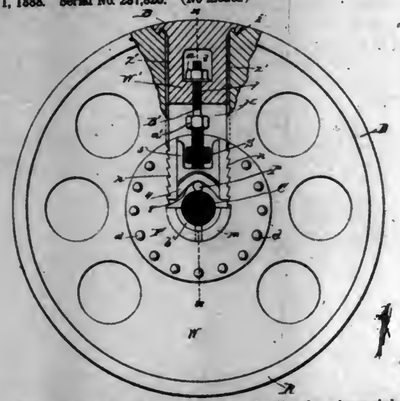
403,457. OVERALLS, &c. JUSTUS H. BROWN, Pittsburg, Pa. Filed Dec. 3, 1887. Serial No. 256,953. (No model.)

Claim.—As an article of manufacture, a pair of overalls having the overlapping flaps *b c* and a continuous elastic band extending around the waist of the garment along the edge of one flap to the crotch, and thence along the edge of the other flap back to the waist, substantially as herein shown and described, for the purpose set forth.



403,458. MULTIPLE-SWITCH-BOARD-TESTING APPARATUS. JOHN J. CARTY, New York, N. Y., assignor to the Western Electric Company, Chicago, Ill. Filed Feb. 2, 1889. Serial No. 298,448. (No model.)

Claim.—1. The combination, with telephone-lines connected each with a different switch on each of two or more switch-boards, of pairs of cords and plugs at each of said switch-boards, the tips of each pair being connected together and the sleeves of each pair being connected through a characteristic current-producing device, whereby it may be determined at one board whether any line wanted or called for is in use at any other of the boards, the particular board at which the connection is made being indicated by the characteristic tone, substantially as and for the purpose specified.

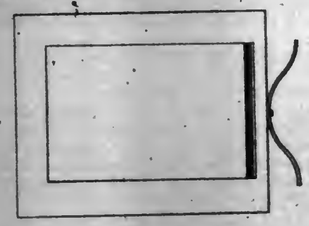


2. A pair of loop-plugs, the tips of said plugs being connected together by a strand of a pair of cords, the sleeves of said plugs being connected together by another strand which is connected through a rheotome, r^2, to ground, in combination with an operator's telephone, telephone-lines, and switching apparatus, substantially as described.

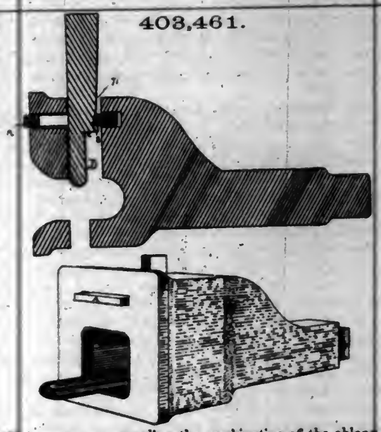
408,459. SEWER-TRAP. ABRAM E. COHN and GEORGE A. MERRILL, San Francisco, Cal. Filed July 2, 1888. Serial No. 278,818. (No model.)

Claim.—In a sewer-trap, the combination, with a soil-pipe, A, and a double-membered branch pipe having the passage b' and b^2 and the dam b between them, of a three-way valve, C, mounted in the soil-pipe at the mouth of branch b', and having passage-ways through it of equal capacity with said pipe A and passage b', as set forth.

408,460. DRIVE-PULLEY. GEORGE C. COWLES, East Saginaw, Mich., assignor of one-half to Edward Germain, same place. Filed Oct. 11, 1888. Serial No. 287,825. (No model.)



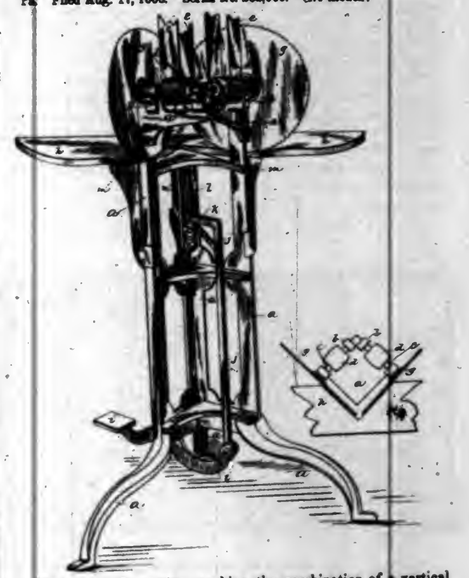
Claim.—1. A pulley having an opening leading from its periphery to its center, which opening is adapted to receive removable parts, the C-shaped and toothed flange-plates having the journal-bearing formed integral therewith, the yoke, the toothed locking-heads, the coupling-head, the detachable section B, and bolt coupling said section to the coupling-head.



2. In a removable and self-gripping pulley, the main portion having an opening leading from the periphery to its center, the web W, having the grooves z', the toothed flange-plates F, having the journal-box m, the wood bushing therein, the yoke, the corrugated roller, the toothed locking-heads, the coupling-head, the section B, having the tongues f' attached thereto, and the bolt and nut coupling the part B to the coupling-head, as and for the purposes specified.

3. The herein-described pulley, comprising the following elements: the main portion having the central web, W, provided with the channels z' therein and the transverse grooves s' in the rim, the flange-plates having the toothed faces n and journal-box m, the wood bushing, the metal yoke S', the roller p, the locking-heads having the toothed faces n', the coupling-heads S, the section B, having the lips z and the tongues f', and the bolt B', adapted to pass through the web of the section B and having a nut at its upper end, the lower end of said bolt engaging with the coupling-head, substantially as and for the purposes specified.

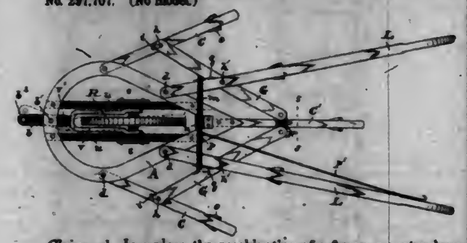
408,461. CAR-COUPLING. MICHAEL D. COX, Knoxville, assignor of one-half to J. R. McCallum, Knox County, Tenn. Filed Mar. 3, 1889. Serial No. 302,560. (No model.)



408,461.

Claim.—In a car-coupling, the combination of the oblong frame provided with the spring and the pin provided with the shoulder and the notch B, all substantially as described.

408,462. MITER-MACHINE. BENNINGTON V. CROWE, Pittsburg, Pa. Filed Aug. 17, 1888. Serial No. 282,969. (No model.)

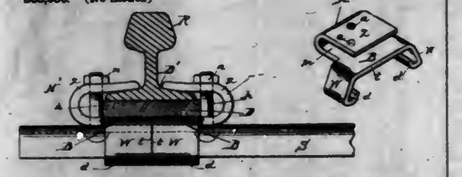


Claim.—1. In a miter-machine, the combination of a vertical triangular frame, the rotary shafts journaled in suitable fixed bearings and arranged at an angle to each other, the saws carried by said shafts, the vertically-movable table arranged in a horizontal position beneath said saws and having a V-shaped slot riding against the legs of the vertical frame, and a treadle connected by an intermediate rod with said table for moving the latter vertically, substantially as and for the purpose described.

2. In a miter-machine, the combination of a vertical triangular frame having a longitudinal slot, l, formed in one of the legs thereof, the inclined rotary shafts carrying the saws, the horizontal gravity-table arranged on the frame below the saws and having a V-shaped recess in one side thereof, the depending arms fixed to the table and having the guide-plates which slide on the legs of the vertical frame, a horizontal arm, k, working in the slot l and secured to one of said depending arms, and a treadle connected by an intermediate rod with said horizontal arm, substantially as and for the purpose described.

3. In a miter-machine, the combination of a vertical triangular frame, the inclined rotary arbors or shafts journaled thereon and carrying the saws, a horizontal gravity-table having a V-shaped slot in one side thereof and fitted close against the legs of said frame, the depending arms m, fixed to the table and carrying the clamping-plates which engage and slide on the legs of said frame, and a treadle for elevating the table, substantially as and for the purpose described.

408,468. CULTIVATING-PLOW. MILTON DAY, Berrett, assignor of one-half to Frank Brown, Baltimore, Md. Filed Jan. 26, 1889. Serial No. 297,707. (No model.)

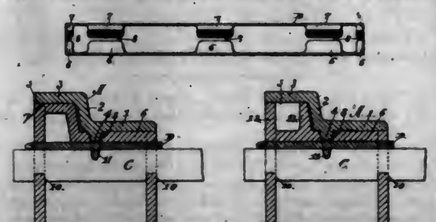


Claim.—1. In a plow, the combination of a frame, a center drag-bar rigidly attached to the frame, a drag-bar at each side pivoted to the frame, a slide-head movable on the center bar, a link-bar at each side connecting the drag-bar with the said slide-head, and two handles, each pivoted to the frame and also to the link-bars at each side.

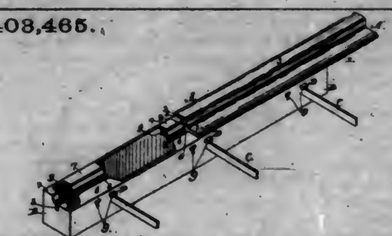
2. In a plow, the combination of a frame, one or more drag-bars at each side of the frame and pivoted thereto, two link-bars, one at each side of the frame and each connecting the said pivoted drag-bars at its side, two handles pivoted to the frame and connected with the drag-bars and slide by means of link-bars, and an adjustment holding device to retain the parts where they may be set, substantially as described.

3. In a plow, the combination of a frame, shaft bearing-plates vertically adjustable on the frame, a wheel whose shaft is mounted in said adjustable plates, one or more drag-bars at each side of the frame and pivoted thereto, two link-bars, one at each side of the frame and each connecting the said pivoted drag-bars at its side, and two handles, each pivoted to the frame and also to the link-bars which connect the pivoted drag-bars with the slide on the rigid drag-bar.

4. In a plow, the combination of a frame, a draft-clevis pivoted intermediate of its ends at the forward part of the frame, shaft bearing-plates having a horizontal slot, a wheel whose shaft ends occupy the said slots, and a draw-yoke whose two arms are connected with the wheel-shaft and the front end of the yoke jointed to the inner end of the pivoted clevis.



408,464. RAILWAY. ELIJAH J. DEVERS, Conwater, assignor to William W. Petherick, Detroit, Mich. Filed Aug. 25, 1888. Serial No. 283,333. (No model.)

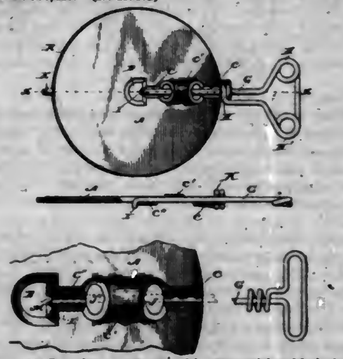


Claim.—In combination with the metal tie having the wings f, the two-part metal chair, each part having the curved wings with hooked ends and the clamping-lip Z, the rail, the wooden agent located between the rail and the chair, and the bolts passing through the tie and the lips of the chair, having nuts on their upper ends, substantially as and for the purposes specified.

408,465. CONSTRUCTION OF RAILWAY-TRACKS. THOMAS H. GIBSON, Albany, N. Y. Filed Dec. 17, 1888. Serial No. 293,795. (No model.)

Claim.—In a railway-track, the combination of a track-rail having a longitudinal rabbet formed under its head and a longitudinal rib pendent from its lower face, and a metallic stringer having two series of seats formed on its upper face—those at one side of said stringer being higher than the series at the opposite side—the higher seats forming a support for the rabbeted edge of said track-rail, said stringer also having a longitudinal slot through its upper face for receiving the pendent rib of said track-rail, as and for the purpose herein specified.

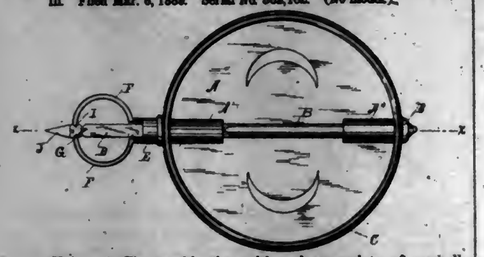
408,465.



408,466. BOTTLE-STOPPER. STERLING GLOVER, Buffalo, N. Y., assignor of one-half to Frank H. Meyer, same place. Filed Jan. 25, 1889. Serial No. 297,554. (No model.)

Claim.—In a bottle, the combination, with the neck provided with inwardly-projecting ledges upon its inner wall, such ledges being centrally recessed upon their under surfaces, of the stopper having a shank and projecting lugs, all operating substantially as shown and described.

408,467. DAMPER. WILLIAM A. HAHN, Freeport, Ill., assignor to the Warner Manufacturing Company, of Illinois. Filed Feb. 19, 1889. Serial No. 300,419. (No model.)

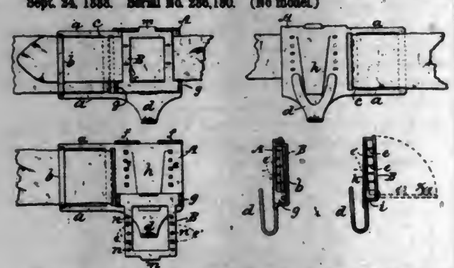


Claim.—1. In a damper, the combination, with a blade having a recess for the bent end of a handle shaft or spindle, of a handle-shaft having at its inner end a lateral bend lying in said recess and having its outer end bent upon itself, forming a spring pressing the edge of the blade, whereby the force of the spring tending to withdraw the shaft longitudinally presses the bent end into the recess and maintains the engagement of the handle with the blade.

2. The combination, with a blade having a radial passage into which a handle-shaft may be thrust and at the inner end of the passage a recess adapted to receive the laterally-bent end of such shaft, of a handle-shaft provided at its inner end with a bend or hook and having its outer end returned upon itself in the form of a spring pressing the edge of the blade, substantially as set forth.

3. The combination, with the blade having the groove, the bridges spanning the same, the openings, and the recess for the hooked end of the handle-shaft, of the handle-shaft having the hooked inner end lying in said recess and the integrally-formed spring pressing the edge of the blade, substantially as set forth.

4. The combination, with the blade A, having the opening D, with inclined walls recessed at M, the radial groove spanned by the bridges C C C', and the openings J J', of the handle-shaft G, lying in said groove, and having at its inner end the bend or hook I and at its outer end the integrally-formed spring-handle terminating in a coil about the shaft in close proximity to the edge of the blade, substantially as set forth.

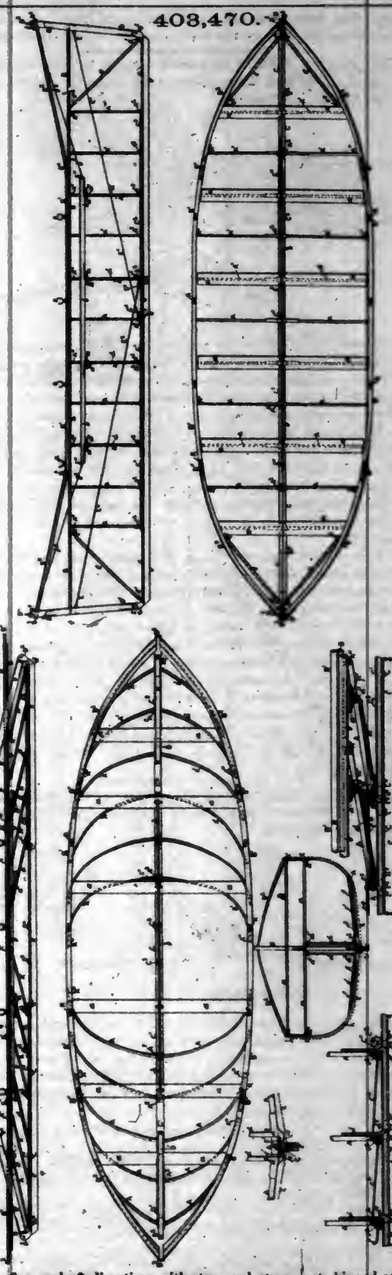


403,468. STOVE-PIPE DAMPER. WILLIAM A. HANCK, Freeport, Ill. Filed Mar. 6, 1889. Serial No. 302,102. (No model.)

Claim.—1. The combination, with a damper-plate, of a spindle projecting therefrom and provided with V-shaped notches upon its opposite sides, the handle sliding upon said spindle, and the opposite spring-catches pressing upon the outer incline of said notches, substantially as and for the purpose set forth.

2. The combination of the damper-plate, the squared projecting spindle rotating therewith and having the pyramidal point and the notches upon its opposite faces, the sleeve adapted to slide upon said spindle, and the outwardly-bent springs formed integrally with the sleeve and having their free ends in engagement, respectively, with said notches, substantially as and for the purpose set forth.

403,469. BUCKLE. JOHN H. HARRELL, Washington, D. C. Filed Sept. 24, 1888. Serial No. 286,180. (No model.)



Claim.—1. In a fastening device, a plate having teeth projecting from its face and provided with a bifurcated hook extending from its lower end, said hook being adapted to be inserted under the edge of a collar and connect with a collar-button, in combination with another plate provided with teeth on its inner face and hinged at its lower end to the aforesaid plate, substantially as and for the purposes described.

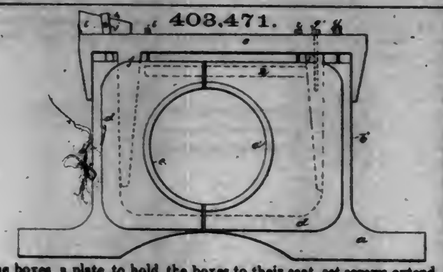
2. The combination, with the plate A, provided with a spring, *h*, a hook, *d*, arms *a*, and bars *b* and *c*, of the plate B, which is hinged to plate A and is provided with a projection, *i*, which is pressed by the said spring, substantially as and for the purposes described.

3. The fastening device constructed from pieces of sheet metal which are stamped, cut, and bent into the required forms, and consisting of the plate A, provided with a spring, *h*, a hook, *d*, arms *a*, bars *b* and *c*, and points *e*, and the plate B, provided with points *e* and a projection, *i*, the two parts being hinged together and constructed substantially as and for the purposes described.

403,470. COLLAPSIBLE BOAT. CHARLES HENDERSON, Glasgow, Scotland. Filed Oct. 1, 1888. Serial No. 286,835. (No model.) Patented in England Aug. 12, 1887, No. 11,059; in Germany July 10, 1888; in France July 13, 1888, No. 191,806, and in Italy July 16, 1888, No. 216.

Claim.—1. A collapsible boat having its ribs jointed at their upper ends to the gunwales and fitted at their lower ends to slide and swivel on or over the keelson in a fore-and-aft direction, so that they fold down vertically to a nearly-horizontal position close over the keelson, substantially as herein set forth.

2. A collapsible boat having its ribs pivoted to fold down vertically in a fore-and-aft direction with the gunwale and thwarts close over the keelson, substantially as set forth.



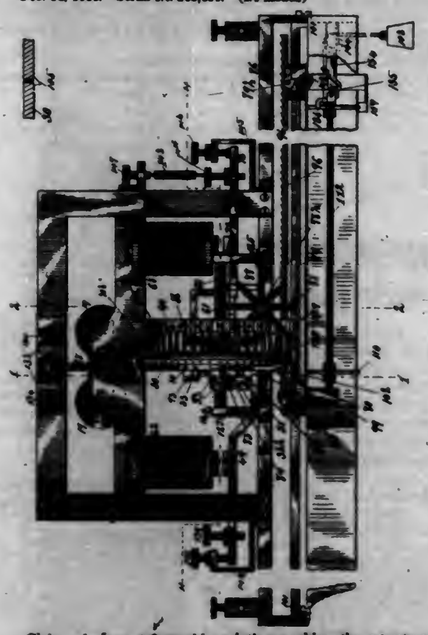
3. A collapsible boat having its ribs folding down vertically in a fore-and-aft direction and thwarts pivoted to the ribs to maintain a horizontal position in folding, substantially as described.

4. In collapsible boats, ribs having their lower parts fitted to slide and swivel on and over the keelson in a fore-and-aft direction, a longitudinal center stringer to which the thwarts are attached, and braces from the ends of the stringer to the stem and stern posts, respectively, to raise the boat to a vertical position, substantially as described.

5. A collapsible boat having ribs pivoted to fold down vertically in a fore-and-aft direction, with stem and stern posts hinged at their lower ends, as and for the purposes set forth.

403,471. PILLOW-BLOCK. SAMUEL M. HERBER, Lincoln, Ill., assignor to Theodore R. Peiler, same place. Filed Sept. 24, 1888. Serial No. 286,262. (No model.)

Claim.—1. The combination of a pillow-block having the vertical jaws forming a seat between them, the vertically-divided box located in said seat and consisting of a pair of similar box-sections adjustable toward each other, a vertically-adjustable cap-plate, wedge-shaped keys carried by the same and located between said jaws and the boxes, a plate to hold the boxes to their seat, set-screws extending through the cap-plate, a set-screw for adjustably securing one end of the cap to one of said jaws, a loop extending from the opposite jaw through the cap, and a wedge upon the cap extending through the loop, for the purpose described.



2. The combination of the pillow-block having vertical jaws forming a seat between them, the vertically-divided box located in said seat and consisting of a pair of similar box-sections adjustable toward each other and having flanges fitting upon the exterior of the jaws of the block and having their adjoining edges provided with recesses and intermeshing overlapping projections, whereby a continuous bearing is formed and the boxes can be adjusted to snugly fit the shaft, and a cap-plate secured to said jaws in vertical adjustment and provided with wedge-shaped keys fitting between the jaws and boxes to adjust the same, substantially as described.

3. A journal box or bearing comprising two sections surrounding and forming the bearing for and adjustable toward each other to snugly fit the shaft, and having their adjoining edges provided with corresponding series of recesses and intermeshing projections, whereby a continuous bearing is formed around the shaft and over the joints between the box-sections, substantially as described.

4. A journal-box comprising two similar sections forming the bearing for the shaft and joined together to form a continuous bearing by having their adjoining edges provided with series of recesses and corresponding snugly-fitting intermeshing and overlapping projections, substantially as described.

403,472. PRINTING TELEGRAPHY. ERROY P. HOTCHKISS, Oak Park, Ill., assignor of one-fourth to Carlos J. Ward, same place. Filed Feb. 11, 1888. Serial No. 263,999. (No model.)

Claim.—1. In a telegraphic printing-machine, the adjustment-post 40, in combination with the adjustment-posts 42½ and 64, the lever-escapement 39, the set-screws 17 and 62, and the retracting-spring 15, substantially as and for the purposes specified.

2. In a telegraphic printing-machine, the post 67, in combination with the adjustment-post 64, the magnets 68, the electrical connection 67½, the local battery 47, the wire 41, the lever-escapement 39, the armature 14, the spring 15, and the insulated set-screw 62, substantially as and for the purposes specified.

3. In a telegraphic printing-machine, the wire 18, in combination with the set-screw 17, the magnets 19, the local battery 23, the binding-post 25, the armature 14, the wire 18, the set-screw 58, the armature 55, the wire 61, the positive magnet 10 of the polarized relay, and the neutral relay 4, substantially as and for the purposes specified.

4. In a telegraphic printing-machine, the wire 41, in combination with the lever-escapement 39, the local battery 47, the magnets 42, the adjustment-post 42½, the wire 60, the insulated adjustment-post 59, the armature 55, the wire 61, the local battery 23, the wire 18, the binding-post 25, the armature 14, the negative magnet 8 of the polarized relay, and the neutral relay 4, substantially as and for the purposes specified.

5. In a telegraphic printing-machine, the ratchet-wheel 30, slotted at the point 92 and having forty-eight teeth equally distant from each other, which engage with the spring-pawls 29 and 33, in combination with the pawls 35 and the wheel 30½, bearing on its periphery forty-six type-characters for printing, said wheels revolving on the shaft 127, fixed in the vertical frame 75, substantially as and for the purposes specified.

6. In a telegraphic printing-machine, the type-wheel 30½, in combination with the coiled spring 86, attached to the shaft 127, the ring ratchet-wheel 90, and the ratchet-wheel 30, substantially as and for the purposes specified.

7. In a telegraphic printing-machine, the ring ratchet-wheel 90, having forty-eight teeth corresponding to those of wheel 30 and which engage with the pawl 89, in combination with the three slotted lugs 158 and the wheel 30½, substantially as and for the purposes specified.

8. In a telegraphic printing-machine, the ratchet-wheel 32½, having eight teeth, in combination with the spring 83, attached to the shaft 127, and with the ratchet-wheel 32, having eight corresponding teeth which engage with the pawl 35, said wheels revolving on shaft 127, substantially as and for the purposes specified.

9. In a telegraphic printing-machine, the combination of armature 28, magnet 19, pawl 31, spring 34, and the ratchet-wheel 30, engaging with the pawl 29, which revolves said wheel one tooth at a time, said wheel bearing on its side the pawl 35, engaging with ratchet-wheel 32, connected with ratchet-wheel 32½, which revolves wheel 30 eight teeth at a time, as hereinbefore shown.

10. In a telegraphic printing-machine, the lever 50, in combination with the armature 49, the lug 132, extending from the frame 75, the spring-pawl 51, engaging with the pin 53 on wheel 32½, and the retracting-spring 52, substantially as and for the purposes specified.

11. In a telegraphic printing-machine, the stop-arm 102, normally resting across the ratchet-bar 96, having a depending branch, 114, the arm continuing upward as a bent lever around the wheel 32 and above the projection 109 on the pawl 31, bent near its upper end at right angles twice and terminating in a wedge-shaped projection extending horizontally over pawl 31, said arm 102 being slotted, and in combination with the frame 75 at the point 148, substantially as and for the purposes specified.

12. In a telegraphic printing-machine, the armature 73, pivoted at the point 74 to the frame 75, and attracted by the magnets 68 68 when a local current of electricity is passing through them, in combination with the cross-bar 82, pivoted at one end to the hooked spring-pawl 77, which engages with the ratchet-wheel 78, and at the other end to the link-bar 88, substantially as and for the purposes specified.

13. In a telegraphic printing-machine, the stub-shaft 78½, having bearings in the frame 75, in combination with the ratchet-wheel 78 and the spoke-wheel 81, which impinges upon the type-bearing plates 129, substantially as and for the purposes specified.

14. In a telegraphic printing-machine, the sleeved lever 88½ upon the stub-shaft 78½, in combination with the link-bar 88 and the hooked pawl 89, engaging with the teeth of the wheel 90, and having on it a wedge-shaped projection corresponding to and in contact with the like projection on the bar 91, fastened to the horizontal frame 76, substantially as and for the purposes specified.

15. In a telegraphic printing-machine, the lugs 99, slotted on their inner faces to receive the sides of the sheet of paper to be printed on and apertured to pass over the bar 100, supported by the screws 101, passing into it through the frame 76, in combination with the ratchet-bar 96 and the socket-sleeves 152, which receive the screws 151, substantially as and for the purposes specified.

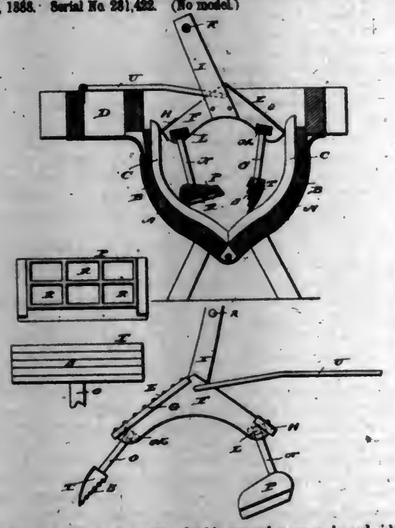
16. In a telegraphic printing-machine, substantially as described, the combination of the magnet 42, armature 49, lever 50 and its vertical arm 54, pawl 31, arm 107 and its projection 108, arm 102, ratchet-bar 96, lugs 99, weight 103, pawl 95, and wheels 78, as and for the purposes stated.

17. In a telegraphic printing-machine, the ratchet-wheel 78, in

combination with the pawl 95 and the stub-shaft 78¼, and engaging with the pawl 77, substantially as and for the purposes specified.

18. In a telegraphic printing-machine, the combination of the armature 73, pivoted to the frame 75 below the magnets 68 68, the lever 82, resting on said armature, the pawl 84, pivoted to said lever and engaging with ratchet-wheel 78, pivoted on stub-shaft 88¼, the pawl 95, pivoted on the sleeve 78¼ of wheel 78 and engaging with the ratchet-bar 96, the stub-shaft 88¼, pivoted to link-arm 88 and to pawl 89, the ratchet-ring 90, loosely secured by screws passing through its slots 158 to wheel 30¼, and the pin 93, rigidly secured to said wheel and passing through slot 92 in wheel 30 directly beneath the upper arm of pawl 35, substantially as and for the purposes specified.

19. In a telegraphic printing-machine, the stub-shaft 88¼, in combination with the link-arm 88, the ratchet-wheel 78, and the spring-pawl 89, which engages with the ratchet-wheel 90, substantially as and for the purposes specified.

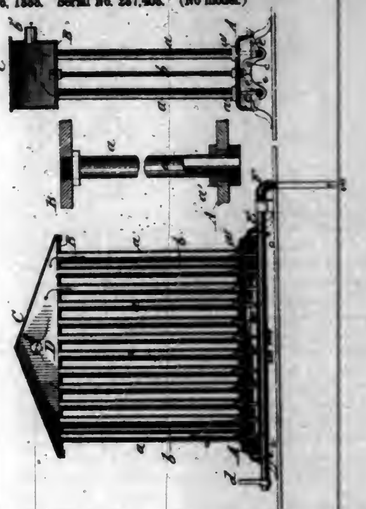


20. In a telegraphic printing-machine, the shaft 112, in combination with the lugs 99, the spur-wheels 110, the weight 103, and the pivoted lever 135, substantially as and for the purposes specified.

21. In a telegraphic printing-machine, the pivoted lever 135, bearing the wedge-shaped piece 142 at one of its ends, which piece slides up on a corresponding wedge-shaped piece, 154, fastened to the frame 76, in combination at above end with the spring-pawl 136, engaging with the teeth of one of the spur-wheels 110, and at the other end in combination with the spiral spring 137, fastened to the lug 99, substantially as and for the purpose specified.

22. In a telegraphic printing-machine, the spring 159, secured at one end to the bottom of that lug 99 which is nearest to the weight 103, in combination with a small lug notched in its upper face to receive a tooth of wheel 110, said notch being made shallow and spring elastic enough to permit the said wheel to revolve, as shown.

23. In the paper-carriage of a telegraphic printing-machine, the lever 135, pivoted on the shaft 112 near one of the lugs 99, carrying fixed to it at one end the spring-pawl 136 in contact with a tooth of wheel 110, and carrying the beveled piece 142 at this end to slide up on the beveled end of arm 154, fixed rigidly to the frame 76, thus partly revolving the wheel 110 on the return of the paper-carriage after the printing of a line and automatically moving the paper forward for the printing of a new line, substantially as shown.



403,473. WASHING-MACHINE. William C. Huffman, Albany, Ind., assignor of one-half to James M. Leavell, same place. Filed July 30, 1888. Serial No. 281,422. (No model.)

Claim.—1. The body having double-curved or ogee-shaped sides, said sides having a lining of slats, the guide-strips C, secured to the slats, and the receptacle D, formed from a continuation of the upper portion of two of the walls and having a communication with the suds-box, in combination with a reciprocating rubber, substantially as specified.

2. The combination, with the tub or suds-box, of the reciprocating frame E, journaled on the bail U, the frame being of angular form and having the shield G, the bars L M, pivoted to the reciprocating frame, the arm N, depending from the arm L and having the counter-head secured to its lower end, and the clothes-turning head S, secured to the lower end of the arm O, substantially as specified.

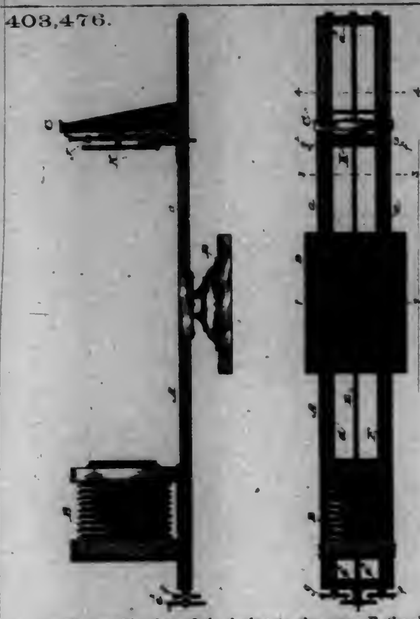
403,474. HEATING APPARATUS. Jonathan Johnson, Lowell, Mass., assignor to himself and Edmund H. Packer, same place. Filed Oct. 6, 1888. Serial No. 287,408. (No model.)

Claim.—1. As an improvement in heating apparatus, the combination of a suitable base, the rows of vertical radiating-pipes open at both ends, the chamber into which the upper ends of the radiating-pipes open, and the rotating fuel-supply pipes provided with a burner for each radiating-pipe placed horizontally within the base and adapted to be rotated upon its axis to carry the burners away from beneath the open lower ends of the radiating-pipes, substantially as and for the purpose set forth.

2. As an improvement in heating apparatus, the combination, with the base, the radiating-pipes supported thereon, and the horizontally-placed fuel-supply pipes rotating upon their axes and provided with a burner for each radiating-pipe, of the supports c c, secured within and to the base, forming bearings upon which the supply-pipes are rotated by means of suitable handles attached to the pipe, substantially as specified.

403,475. COTTON-SPRINKLER. William Kister, Weimar, Tex. Filed Aug. 24, 1888. Serial No. 283,670. (No model.)

Claim.—The combination of the L-shaped nozzle, having the longer arm, C, and the shorter arm, D, the spring-valve secured to the side of the arm D and projecting over the end thereof, and provided with a boss, G, on its upper side, the L-shaped bracket H, secured to the side of the arm D and having one end projecting over the spring-valve and provided with a screw-threaded opening, I, and the thumb-screw J, inserted through and playing in said opening and having its end swiveled in the boss G of the spring-valve, as specified.



403,476. PHOTOGRAPHIC APPARATUS. Henry Kuhn, St. Louis, assignor to Henry A. Hyatt, Kirkwood, Mo. Filed June 15, 1888. Serial No. 277,160. (No model.)

Claim.—1. The combination of the bed-plate, the camera, the screw E, the easel, the picture-holder on said easel, the shaft G, and connections between said shaft and said picture-holder for raising or lowering the latter as said shaft is turned, substantially as set forth.

2. The combination of the bed-plate, the screw E, the nut made to open, as described, and the easel, substantially as described.

3. The combination of the bed-plate, the screw E, the shaft G, the bell-crank g^2 g^3, the pinion g', the handle g, the pin k, the easel, and the frame J, substantially as described.

403,476.

4. The combination of the bed-plate, the screw E, the shaft F, the pinion f', the handle f, the arm f^2, the bar M, the frame J, and the easel, substantially as described.

5. The combination of the bed-plate, the camera, the easel, the vertically-adjustable frame J, devices for raising and lowering it, and the holder K, attached to said frame, substantially as described.

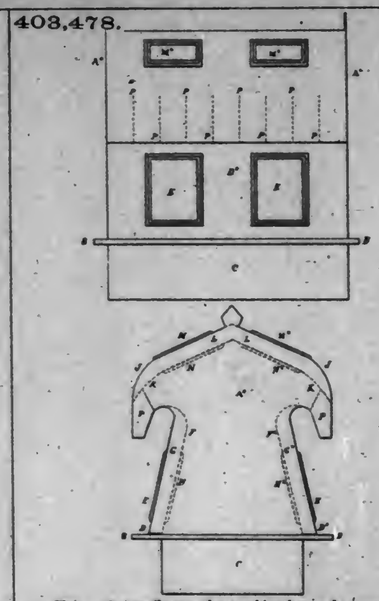
6. The combination of the bed-plate, the screw E, the shaft F, the pinion f', the handle f, the arm f^2, the easel, the frame J, the holder K, and the bars M N, substantially as described.

7. In combination with the base, bed-plate, and camera, an easel adjustable longitudinally on said bed-plate and a picture-holder on said easel adjustable laterally, substantially as set forth.

8. In combination with the base, bed-plate, and camera, an easel provided with a frame which is adjustable vertically and laterally and a picture-holder moving with said frame, substantially as set forth.

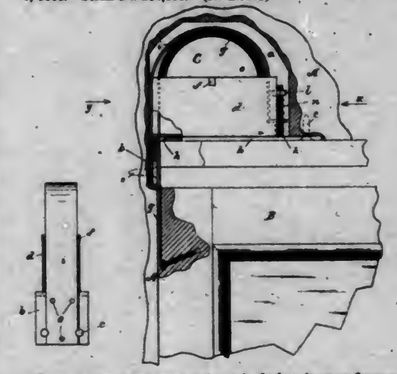
9. The combination of the bed-plate, the camera, the easel, a frame adjustable vertically and laterally upon said easel, and means, substantially as described, for operating said frame from a position in the vicinity of the camera, substantially as set forth.

10. The combination of the bed-plate, the screw E, the shafts F G, the handles e f g, the pinions f' g', the arms f^2 g^2 g^3, the easel, the frame J, the holder K, and the bars M N, substantially as described.



403,477. BUTTON. Russell H. Lewis, Providence, R. I., assignor to Albert Eddy, same place. Filed Feb. 7, 1889. Serial No. 299,964. (No model.)

Claim.—1. A button or stud provided with the post 5, having the arms 11 11 and the slot 12 at its free end, combined with a shoe provided with the spring-plate 7, the spring-finger 13, formed integral with the spring-plate 7, and the notches 14 15, formed in the finger 13, constructed to pivotally connect the post to the shoe and hold the shoe parallel with and at right angle to the shoe, as described.

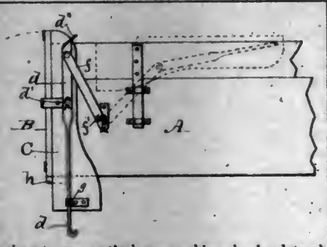


2. The combination, with the head of the button 4 and the post 5, bent at right angle at a point on the inner line of the shoe and bent in the reverse direction near its end, the arms 11, and slot 12, of the shoe 6, provided with the spring-plate 7, having the spring-tongue formed integral therewith, and the notches 14 15, constructed to secure the shoe to the post, as described.

403,478. VENTILATOR. Benjamin Merian, Boston, Mass. Filed Feb. 1, 1888. Serial No. 262,688. (Model.)

Claim.—In ventilators, the combination and arrangement of the ventilator herein described, consisting of the walls A^5 A^x D D^x and the roof J J, of any desired shape in horizontal section, and bearing one or more side pipes curved downward and with tunnel-shaped ends, with the dead-air chambers L L and G G^x, the ventilator and the inner walls making the said chambers being provided, respectively, with windows placed opposite each other, all substantially as described and shown.

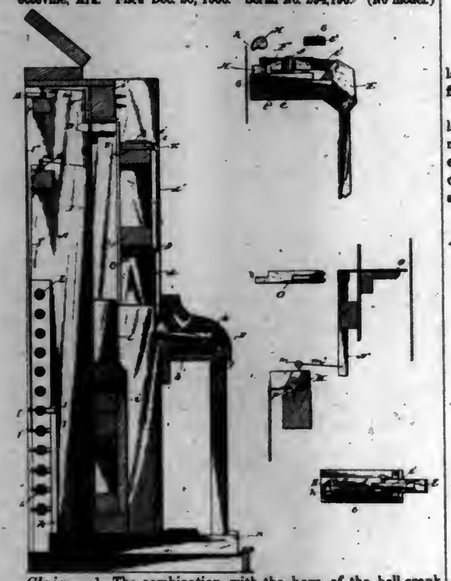
403,479. SASH-BALANCE. James McArthur, Rochester, N. Y., assignor to the Pullman Sash Balance Company, same place. Filed Oct. 6, 1888. Serial No. 287,360. (No model.)



Claim.—A sash-balance having a bed-plate bent to form an angle, in combination with a frame secured to the bed-plate, an actuating-drum held by the frame, a suspending-band on the drum, a curved elastic friction strap or brake secured rigidly to the bed-plate in position to in part encircle the drum, and an adjusting-screw for the brake, provided with a spring and retaining-nut, substantially as and for the purpose set forth.

403,480. END-GATE FOR WAGONS. James A. McClellan, Prairie City, Iowa, assignor of two-thirds to C. W. Friedrich and J. F. Vangilder, same place. Filed Dec. 17, 1888. Serial No. 293,901. (No model.)

Claim.—1. The lever d, having a stop or lateral projection, d', at its end, and the bar f, having a lateral bend, f', in combination with a wagon end-gate having fixed clasps or hooks g, and a wagon-box having a fixed cross-piece, h, substantially as shown and described, for the purposes stated.



2. A wagon end-gate having wings projecting at right angles from its ends, levers having stop devices on their ends pivoted to said wings,

408,480.

hooks fixed to the wings to engage the levers, and bars having lateral bends pivoted under the stop devices on the ends of the levers and to the sides of the wagon-box, arranged and combined to operate in the manner set forth, for the purposes specified.

408,481. MUSICAL INSTRUMENT. EDWIN R. MORGROS, Fayetteville, Ark. Filed Dec. 20, 1888. Serial No. 294,196. (No model.)

Claim.—1. The combination, with the keys, of the bell-crank levers, the sliding head-blocks having elongated slots formed therein to one side of the centers thereof, the pickers connected with the head-blocks and secured to slides below the same, rods connecting the respective levers and keys, and the wires, substantially as described.

2. The combination, with the casing, the wires, and keys, of the bell-crank levers mounted near the upper end of the casing, rods connecting the same with the keys, the head-blocks F, connected with the levers, the slides G, on which the head-blocks are mounted, the guide-strips c^3, the pickers H, mounted loosely on the slides and having an eccentric connection with the head-blocks, and springs for forcing the slides back, substantially as described.

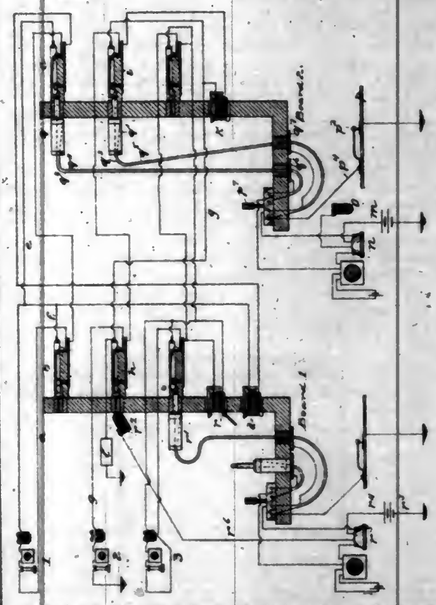
3. The combination, with the casing, the pedals, and keys, of rods attached to the keys, bell-crank levers connected with the rods, slides connected with the levers, pickers on the slides, head-blocks for rotating the pickers, a series of oscillating shafts connected with the pedals, a series of rocking levers located above and connected with the shafts, levers having connections with said rocking levers, frets on said levers, and springs for forcing the frets and pickers out, substantially as described.

4. The combination, with the casing and wires, of the keys, the rods d, the arms D, the rods d', the levers E, the head-blocks F, connected therewith, the slides G, the guides c^3, the pickers H, mounted on the slides and eccentrically connected with the head-blocks, said pickers being constructed with a rounded inner end and a finger, as A, and springs for drawing the slides back, substantially as described.

5. The combination, with the keys and wires, of pickers operated by the keys, consisting of a circular disk having a finger extending out therefrom and having a central and an eccentric opening therein, a slide for moving the picker forward and back, and a head-block for oscillating the same, substantially as described.

6. The combination, with the casing of a musical instrument, of a series of pedals, a series of oscillating shafts connected with the pedals, a series of rocking levers mounted on a cross-piece, a connecting rod or cord between the same and the shafts, a lever having connection with said rocking lever, and frets on said lever, substantially as and for the purpose specified.

7. The combination, with the keys and the rods connected therewith, of the bell-crank lever, a slide having an elongated slot therein on one side the center thereof, a finger on the slide and opening in the said finger, a connecting-link between the bell-crank lever and the slide, a slide below said other slide, a picker on said lower slide having a connection with the upper slide, and the strings or wires, substantially as described.



408,482. INSULATING TUBULAR IRON POSTS. WILLIAM H. O'BRIEN, Elgin, Ill., assignor to the Star Iron Tower Company, Fort Wayne, Ind. Filed Dec. 3, 1888. Serial No. 292,927. (No model.)

Claim.—1. The insulator for tubular posts, consisting of the insulator-block having oppositely-turned ends and intermediate annular flange, and the cup-shaped rain-guard, substantially as specified.

2. The combination, with the tubular post-sections, of the insulator-block having turned ends formed into said sections and an annular flange separating the same, and the inverted-cup-shaped guard engaging the lower end of the upper section and extending below and clear of the flange and the end of the lower section, substantially as specified.

408,483. TESTING APPARATUS FOR MULTIPLE SWITCH-BOARDS. JOSEPH J. O'CONNELL, Chicago, Ill., assignor to the Western Electric Company, same place. Filed Oct. 22, 1888. Serial No. 288,819. (No model.)

Claim.—1. The combination, with telephone-lines, each connected with a different switch on each of two or more multiple switch-boards, of loop-plugs and cords for connecting the lines together on the different boards and in connection with each pair of cords a branch circuit to ground through a variable resistance and a ground-circuit, including a battery and a telephone or indicating device, and means for connecting said ground-circuit at any of the boards with the test-frame of any spring-jack switch thereon, whereby it may be determined at any given board whether a line wanted or called for is connected or in use at any other of the boards.

2. In a telephone-exchange, the combination, with two metallic circuit telephone-lines, each connected with a different switch on each of two or more multiple switch-boards and looped together upon one of the boards to form a complete metallic circuit, of a branch circuit to ground, containing a vibrating contact at the board where the lines are connected together and at one of the other boards a ground-circuit, and means for connecting said ground-circuit with the switch or test-piece of either of said united metallic circuits, whereby on observing or listening at the indicating apparatus included in said circuit when connection is made with the switch or test-piece of either line it may be determined whether either of said metallic circuits is connected or in use at another switch-board.

3. The combination, with a pair of loop-plugs and flexible cords connected therewith, of two telephone-lines looped together through said cords at one of two or more multiple switch-boards, branch connections through high resistance, say two thousand ohms, from each of said strands to ground, a vibrating contact being provided in each of said branches, and testing apparatus consisting of a ground-circuit, including a battery and telephone, and means for connecting said circuit to the switch of either of said lines at another board, whereby, when connection is made with either of said switches, a buzz will be heard in the telephone, while the different sides of said united metallic circuit will be balanced with respect to induced currents.

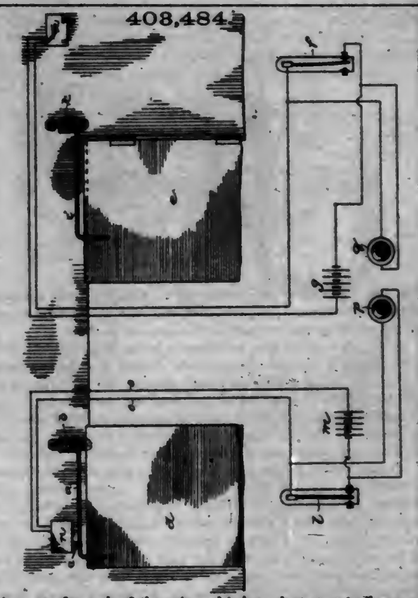
4. A testing apparatus consisting of a normally-open ground branch, m, including a battery and an extra winding upon the coil of a telephone, n, and a movable terminal connection, o, in combination with the different switches or terminals of telephone-lines upon a multiple switch-board, whereby connection may be made with any one of said switches or the test-piece of any of said switches, substantially as and for the purpose specified.

5. The combination, with the pivoted lever p^2, of insulated contact-springs on opposite sides thereof, between which the shank of said lever is adapted to be vibrated, the telephone n, provided with an extra winding connected between said springs, and the springs p^{10} p^{11} outside of the free ends of said springs p^3 p^3, against which springs p^{10} p^{11} the springs p^6 p^7 are adapted to be forced, respectively, to bring the telephone into circuit, substantially as and for the purpose specified.

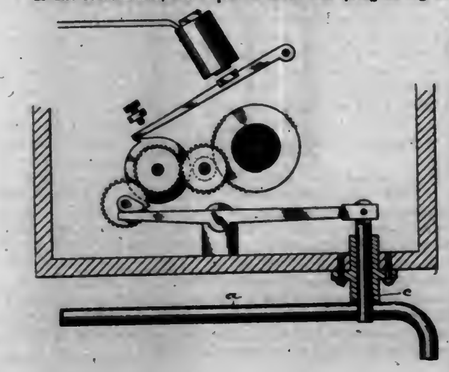
6. The combination, with the strands of a pair of flexible cords provided with terminal loop-plugs, of a ground-circuit, including a vibrator, p^3, and branches p^4 and p^5, connected with said ground-circuit, and each including high resistance and extending each to a different one of said strands, and telephone-lines looped together by said loop-plugs, substantially as and for the purpose specified.

7. The combination, with the lever t', pivoted as shown, of the insulated springs or contacts forming the connections, respectively, of strands q^4 q^6 and q^5 q^7 of the flexible cords, the loop-plugs of said cords inserted in the switches of two telephone-lines to connect said telephone-lines together, and a generator, t, with its contacts near said springs, whereby on moving said lever t' current from said generator may be sent over the said lines, substantially as described.

8. The board or support p and means p' for keeping said board in vibration, in combination with contact p^3, connected to the united circuit of two telephone-lines, substantially as and for the purpose specified.

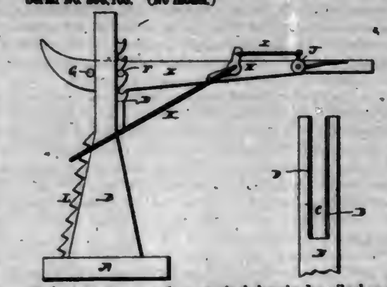


408,484. THERMOSTATIC DOOR-CLOSER. WILLIAM R. PATTERSON, Chicago, Ill., assignor to the Western Electric Company, same place. Filed Feb. 7, 1888. Serial No. 263,084. (No model.)



Claim.—1. The combination, with a pair of doors, of spring-closing devices, one for each door, and electrical apparatus adapted to be operated to close the doors by releasing the said springs in a particular sequence when the temperature rises above certain predetermined limits, substantially as and for the purpose specified.

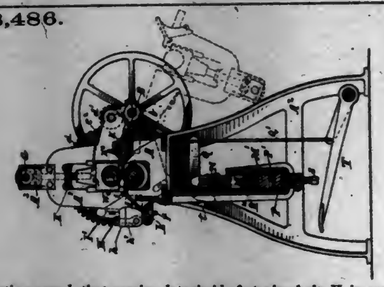
2. The combination, with a pair of doors and spring-closing devices, one for each of the pair, and independent electrically-operated releasing bolts and circuits containing thermostats adjusted to different temperatures and adapted to operate respectively to withdraw the bolts in a particular sequence, substantially as and for the purpose specified.



3. The combination, with a door, of a spring device adjusted to close the same when released, of an electric circuit containing a thermostat and electro-magnetic releasing mechanism, whereby on the temperature rising to close the thermostat the door is closed, substantially as and for the purpose specified.

408,484.

408,485. WAGON-JACK. GEORGE W. PATTON, Wartenburg, Mo., assignor of one-half to William H. Lee, same place. Filed Jan. 31, 1889. Serial No. 298,163. (No model.)



Claim.—The improved wagon-jack herein described and shown, consisting of a standard, B, having a slot, C, in its upper end, the rack-bars D, secured to the side walls of said slot and projecting rearward therefrom, the operating-lever E, having its end passed through the slot C and provided with the transverse pins F G, the pin F engaging the rack-bars D D, and pin G bearing against the front side of the standard, the rack-bar L, arranged in front of the lower portion of the standard, the angle-lever H, pivoted to one side of the operating-lever E, the locking-lever J, also pivoted to the side of the lever E, the link I, connecting the levers H J, and the bail K, secured to the angle-lever H, passing around the standard and engaging the rack-bar L, as specified.

408,486. LEATHER-SPLITTING MACHINE. HENRY C. PEASE, Worcester, Mass., assignor of one-half to Lester J. Pease, same place. Filed Oct. 27, 1888. Serial No. 289,250. (No model.)

Claim.—1. In a leather-splitting machine, the bed-frame A, formed in one casting, with bearings a, for the operating-shaft, as shown, the top housings, A', supported on said bed-frame and separable therefrom at the plane of the knife-seat, said housings having hinges f, that work on the operating-shaft as an axis, and forwardly-

408,486.

projecting ears A, that receive detachable fastening-bolts H, in combination with the operating-shaft, knife, feed and gage rolls, and roll-gearing, all substantially as and for the purpose set forth.

2. In a leather-splitting machine, the housings A', separable from the bed-frame in line with the knife and hinged at *f* upon the operating-shaft B to swing over backward, carrying the gage-roll, its adjustable journal-boxes and adjusting-screws, and the arch-girt A^2, rigidly connecting the tops of said housings one with the other above the rolls, as shown, with the screw-adjusting shaft G, having its bearings within said girt, all combined substantially as shown and described.

3. In a leather-splitting machine, the swinging levers L, disposed transversely to the axis of the feed-roll and having their rear ends fulcrumed upon the knife-bed frame, their forward ends being upwardly and downwardly movable, and the feed-roll journal-boxes supported by center pivots between upwardly-projecting ears fixed upon said levers, in combination with the gage-roll, knife, knife-bed, and feed-roll, and the spring and yielding connections that exert lifting action on said levers, substantially as and for the purposes set forth.

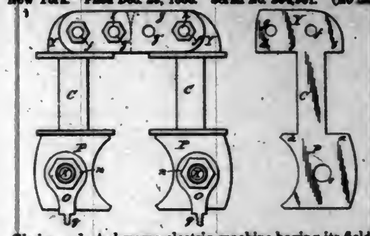
4. The combination, with the gage-roll D, feed-roll C, bed-frame A, and knife K, of the feed-roll journal-boxes C', supported on the screw-points or centering-pivots J to have swinging action in a plane coincident with the roll-axis, and the box-supporting levers carrying said pivots fulcrumed, as described, to have swinging action in a plane perpendicular to the roll-axis, the yielding supporting-connections, and the half-elliptic or bow spring for sustaining said levers, substantially as set forth.

5. In a machine for the purpose specified, the combination of the gage-roll D, the yielding feed-roll C, the swinging arms or levers L, fulcrumed at their rear on the frame, the feed-roll journal-boxes C', supported on said arms, the links N', pressure-bar N, and spring M, all substantially as set forth.

6. In a machine for the purpose specified, the combination, with the gage-roll, knife, yielding feed-roll, and swinging levers whereon the feed-roll journal-boxes are pivotally supported, of the adjustable stop-screws J', fitted in the forward ends of said levers, and lugs A^3 on the frame, against which said screws engage, as set forth.

7. In a machine for the purpose specified, the combination, with the knife, gage-roll, feed-roll, feed-roll journal-boxes, and yielding journal-box supporters, of a connecting-bar extending across the machine beneath the roll and joining said supporters, a half-elliptic or flat-leaf bow-spring centrally mounted on a rocking support and having its respective ends resting against the respective ends of said bar for giving upward pressure on said journal-box supporters and feed-roll, and means, substantially as described, for increasing or diminishing the tension of said springs, as set forth.

8. The combination, substantially as described, of the roll D, yielding roll C, its pivotally-supported journal-boxes C', the pointed screws or pivoting-studs J, the hanger-levers L, having ears *l*, carrying said studs, the fulcrum-pivots L', the adjusting stop-screws J', and lugs A^3, the link N', link-connecting bar N, and flat-leaf bow-spring M, centrally supported on its hanger, with its respective ends engaging the respective ends of said bar for giving upward pressure on said journal-supporting levers, as set forth.



9. In a machine for the purpose specified, the combination, substantially as described, of the spring M, its supporting-hanger A^4, having the retaining-jaw, the grooved bearing-block P and spring-supporting rocker M', the cylinder or bar P', fitted between said bearing-block and rocker, and the adjusting-screw S, as set forth.

10. In a machine for the purpose specified, in combination with the rolls C and D, the inclined apron I, having the upwardly-projecting wrinkle-breaker lip *i*, substantially as set forth.

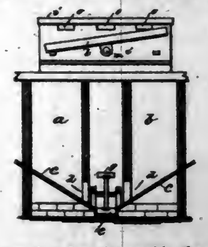
11. In a machine for the purpose specified, the combination, with the feed-roll, its journal-supports and presser mechanism, comprising the bar N and spring M, of the lever Q, fulcrumed on the frame and bearing on said lever in opposition to said spring, the connecting-rod Q', attached to the arm of said lever, and treadle mechanism for actuating said rod, all substantially as and for the purpose set forth.

12. In a machine for the purpose specified, the guard-rod W, located near and forward of the feed-roll D, and extending across the machine, with its ends supported on the housing-frames, in combination with the rolls D and C and feed-apron I, substantially as set forth.

408,487. DYNAMO-ELECTRIC MACHINE. FRANK A. PERRET, Brooklyn, N. Y., assignor to the Elektron Manufacturing Company, of New York. Filed Dec. 29, 1888. Serial No. 294,961. (No model.)

Claim.—1. A dynamo-electric machine having its field-magnet built up in layers of thin plates of sheet-iron in planes at right angles to the armature-shaft, each layer composed of at least two portions connected in closed magnetic circuit at the yoke, in combination with one or more clamping-bolts, one of which serves as a pivot upon which the respective portions of the magnet can be swung apart for winding.

2. In a dynamo-electric machine, a field-magnet built up in layers of thin plates of sheet-iron, each plate constituting in one piece a pole-piece, a core, and part of the yoke, and pierced with bolt-holes, in combination with bolts passing through all the layers and holding them in rigid relation together.



3. In a dynamo-electric machine, a field-magnet built up in layers of thin plates of sheet-iron, each plate constituting in one piece a pole-piece, a core, and part of the yoke, and pierced with bolt-holes, in combination with supplementary yoke-plates, also pierced with bolt-holes and interleaved with the other plates, and bolts passing through all the plates and holding them in rigid relation together.

4. In a dynamo-electric machine, a field-magnet built up in layers composed of thin plates of sheet-iron in planes at right angles to the armature-shaft, each plate having in one piece a pole-piece, a core, and part of the yoke, each plate on one limb being magnetically connected at the yoke to a corresponding plate on the other limb by bolts parallel with the armature-shaft, and all the plates forming one pole of the machine being secured together by bolts passing through their polar portions.

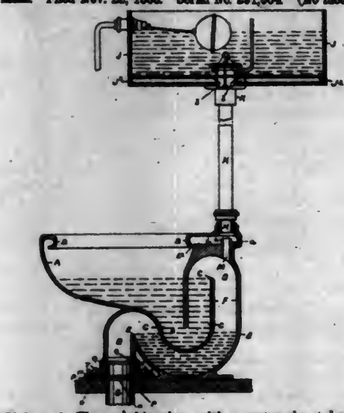
5. In a dynamo-electric machine having its pole-piece laminated and perforated with bolt-holes, the bolts or rods K, provided with nuts *n*, for compressing the pole-plates together, and having shoulders *m*, in combination with the armature-hangers H and nuts *s*, whereby the rods K serve to hang the armature in true alignment and prevent individual motion of the plates.

6. In a dynamo-electric machine having its pole-pieces laminated and perforated with bolt-holes, the bolts or rods K, provided with nuts *n*, for compressing the pole-pieces, and having shoulders *m*, in combination with the hangers H and one or more standards, O, secured between the nuts *n* and said pole-pieces.

408,488. ORE-WASHER. WILLIAM W. ROSENSTEIN, Pittsburg, Pa. Filed May 9, 1888. Serial No. 273,347. (No model.)

Claim.—In a coal-washer, the combination, with a bin divided longitudinally into compartments, of a horizontal washer, *i*, located immediately above said bin, transversely across the same, and having a series of overflow-openings, *o*, and a horizontally-inclined trough pivoted centrally to the side wall of the washer at a point immediately below the series of overflow-openings *o*, said trough being of a length less than the width of the bin, and arranged to receive the entire contents of the washer that escape through the openings *o* thereof, and adapted to direct the same into either compartment of the bin, substantially as and for the purpose described.

408,489. STOVE-PIPE DAMPER. SILAS C. SCHOFIELD, Prescott, Ill., assignor to Frederic Bartlett, same place. Filed Feb. 1, 1888. Serial No. 262,290. (No model.)

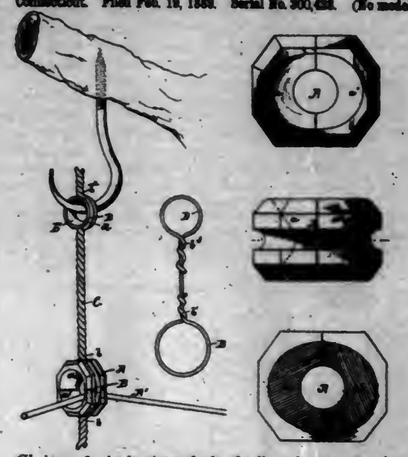


Claim.—1. The combination, with a damper, of a hollow handle having in both the part normally without and the part normally within the pipe-openings communicating with the interior of the handle, for the purpose set forth.

2. The combination, with a damper having at one side a bead or lug raised above the plane of its surface, of a split handle adapted to clasp the side of the damper and provided upon one of the clasping-surfaces with a recess adapted to receive said bead, substantially as set forth.

3. The combination, with a damper, of a split handle clasping the edge or side of the damper and a sliding collar placed upon said handle and adapted to prevent the separation of its parts, substantially as set forth.

4. The combination of the damper having the bead and the ribs raised above its surface, the divided and grooved handle clasping the side of the damper between said lugs and over said bead, the collar sliding upon the handle, and a spring coiled about the handle and pressing the collar toward the damper, substantially as and for the purpose set forth.

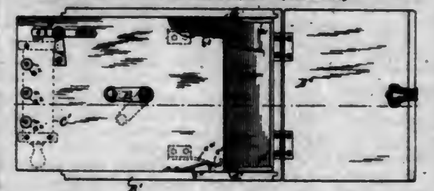


408,490. SIPHON WATER-CLOSET. WILLIAM SCOTT, Medford, Mass. Filed Nov. 22, 1888. Serial No. 291,604. (No model.)

Claim.—1. The combination, with a water closet bowl adapted to be flushed and having two water-traps with a column of air between located in the discharge-passage of the bowl and making a siphon, a single water-supply pipe leading to the flushing means of the bowl, and an opening and closing valve to open and close said water-pipe, of two separate waterways or passages leading from and both always in open communication with said water-pipe and one in communication with the flushing means of the bowl and the other directly with the air-column between the water-traps, and of an area less than the area of the water-pipe, whereby, with said valve opened, the water from the water-pipe is delivered simultaneously through one of said water-ways to the flushing means, and through the other of said water-ways to the air-column between the water-traps, and with said valve closed substantially only to the flushing means, substantially as and for the purposes described.

2. The combination, with a water-closet bowl adapted to be flushed and having two water-traps, with a column of air between, located in the discharge-passage of the bowl and making a siphon, a single water-supply pipe leading to the flushing means of the bowl, and an opening and closing valve to open and close said water-pipe, of two separate water ways or passages, L M, leading from and both always in open communication with said water-pipe, and one, L, in communication with the flushing means of the bowl, and the other, M, directly with the air-column between the water-traps and having a projection of its walls *a* into and across the water-way L, whereby, with said valve opened, the water from the water-pipe is delivered simultaneously through one, L, of said water-ways to the flushing means, and through the other, M, of said water-ways to the air-column between the water-traps, and with said valve closed substantially to the flushing means, substantially as described, and for the purposes specified.

408,491. INSULATING DEVICE FOR LINE-WIRES. THOMAS J. SMITH, Brooklyn, N. Y., assignor to the E. S. Greeley & Company, of Connecticut. Filed Feb. 19, 1888. Serial No. 300,428. (No model.)



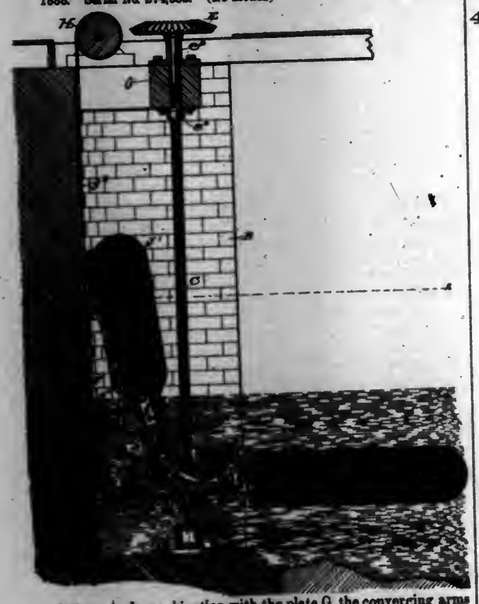
Claim.—1. An insulator device for line-wires, composed of the sectional insulator-ring A and the stem C, provided at one end with the band B, serving to encircle and hold together the sections of said ring, and at the opposite end with the closed or continuous eye D, serving to suspend the united parts, substantially as and for the purpose set forth.

2. An insulator device for line-wires, composed of a sectional insulator-ring, A, a band, B, consisting of a wire or wires encircling and holding said ring-sections united and twisted together beyond said sections, as set forth, and a stem, C, consisting of the same wire or wires as the said band and having integral therewith the eye D at the free end thereof, substantially as and for the purpose specified.

3. A sectional insulator-ring having upon the divisional faces of each section, respectively, a boss, a^3, and a corresponding depression, a^3, said boss and depression being similarly located on said respective faces of the section, whereby the sections may be used interchangeably in constituting an insulator-ring, substantially as and for the purpose set forth.

408,492. ELECTRO-MEDICAL APPARATUS. THOMAS J. SMITH, Brooklyn, N. Y., assignor to the E. S. Greeley & Company, of Connecticut. Filed Feb. 19, 1889. Serial No. 300,429. (No model.)

Claim.—1. In an electro-medical apparatus, the combination of the inclosing-case containing the battery or cell and provided with contact-points *d* and d', an insulating-base, C, carrying a magneto-coil, C', and contact-points c^3 and c^4, in electrical connection therewith and adapted to slide in ways in said case and to project therefrom, with electrical connection established with the battery through said contact-points, and a gate, B^4, adapted to close the side of the case through which said base projects, and in closing to swing to and impinge upon said base, substantially as and for the purpose set forth.



2. In an electro-medical apparatus, the combination of the case B, containing the battery or cell A and having the contact-points *d* and d' on the case-walls, the ways b^4 in said walls above said contact-points, the base C, adapted to slide in said ways and to project beyond the case, the stop device c' c^5, to limit the outward movement of said sliding base, the coil C' and its graduator C^3, carried on the projected end of said base, the contact-points c^3 and c^4 on said base and in electrical connection with said coil and adapted to engage the

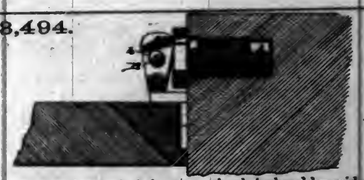
contact-points on the case when said base is slid outward, together with the gate B^4, adapted to close the case where the said base projects and to swing to and impinge upon the projected end of said base in closing, substantially as and for the purpose described.

3. In an electro-medical apparatus, the combination, with the walls of the inclosing-case, of the partition *b*, extending laterally of the interior of the case and terminating vertically below the top of the case, and the sliding cover *b'*, working in ways in the case-wall and closing over the upper edge of said partition, together with the lid B^4, whereby a chamber, B', is constituted in the case adapted to inclose and shelter the battery-cell, and a chamber at one side and above said cell-chamber is constituted for the remaining operative and detachable parts of the apparatus, substantially as set forth.

4. In an electro-medical apparatus, the sliding base C, carrying the magneto-coil C' and contact-points c^3 and c^4, adapted to engage and disengage contact-points of the battery inclosed in the case in which said base slides, in combination with a circuit-breaker, E, placed in a circuit-wire between one of the contact-points on the base and the magneto-coil, substantially as and for the purpose set forth.

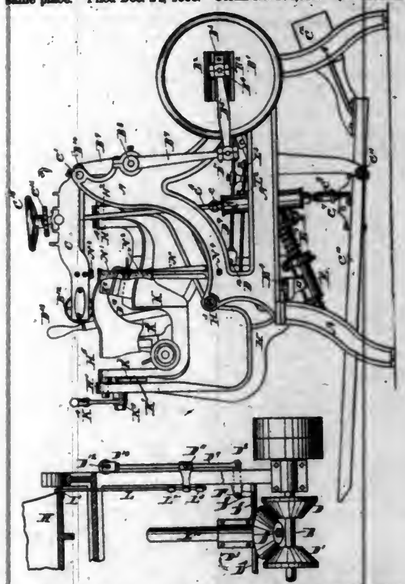
408,493. CURRENT-WHEEL. JOHN STRASSER, Manchester, Mo., assignor of one-half to De Witt C. Taylor, same place. Filed May 23, 1888. Serial No. 274,832. (No model.)

Claim.—1. In combination with the plate G, the converging arms g^2, extending therefrom, the hub g^4, attached to the outer ends of said arms, the arms g^5, extending outward divergently from said hub, the curved lifting-bar g^6, extending upward and backward from these outer arms, the brace-rod g^7, connecting the plate G with said lifting-bar, the shaft C, extending through said hub, and a series of feathering-paddles turning with said shaft and having their bars in contact with said lifting-bar, substantially as set forth.



2. A shaft, C, in combination with a wheel, I, fast thereon, paddle-bars pivoted to said wheel, and a relatively-stationary lifting-bar inclined upwardly and rearwardly for causing the paddles to feather by its contact with said paddle-bars, the said wheel consisting of a base, a central boss, *i*, pairs of apertured lugs *i'*, to which said blades are pivoted, and curved bars i^3, arranged in pairs—one on each side of each paddle-bar—and extending from the top of said boss to the base of the wheel, and springs i^3, attached to said wheel, for the purpose set forth.

3. In combination with an upwardly and rearwardly inclined lifting-bar and curved bars arranged in pairs in vertical planes, a rotary wheel to which said curved bars are attached, and a series of paddle-bars pivoted to said wheel, each of said paddle-bars being arranged between a pair of said curved bars and provided with anti-friction rollers which are in contact with said lifting-bar and curved bars, for the purpose set forth.



408,494. SPRING-HINGE. SUMNER P. STRESTER, Greenfield, Mass. Filed Dec. 8, 1888. Serial No. 293,012. (No model.)

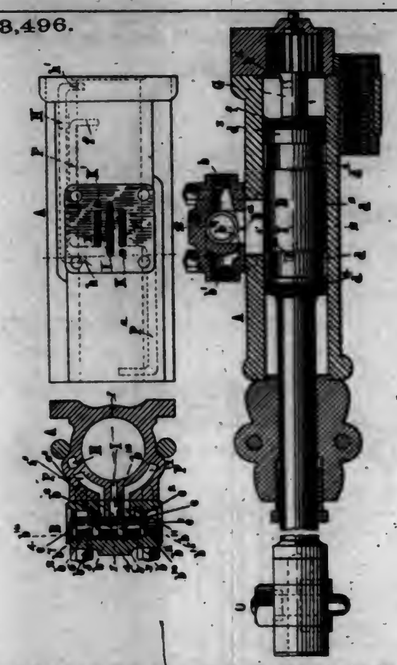
Claim.—1. The screen door or blind hinge comprising the hollow screw, a spring-encircled arm or shank inclosed by said screw, a pintle secured thereon, and the leaf having a cam or eccentric arm or shank fitting upon the pintle and bearing against the head or outer end of the screw, substantially as and for the purpose set forth.

2. The screen door or blind hinge comprising the hollow screw having an angular aperture in its head or outer end, an arm cylindrical for the greater portion of its length and provided with an angular portion fitting said aperture of the screw-head, a pintle secured thereon at the outer end, a disk thereon at its inner end, a spring encircling said pintle arm or shank and bearing against said disk and against the inner portion of the hollow screw, and the leaf having an apertured cam or eccentric-arm fitting upon said pintle and resting against the screw-head, substantially as specified.

408,495. SOLE-LEVELING MACHINE. FREDERICK S. STROUD, East Bridgewater, Mass., assignor to the Carver Cotton Gin Company, same place. Filed Dec. 24, 1888. Serial No. 294,524. (No model.)

Claim.—1. In a shoe-sole-leveling machine, the combination of a jack for holding the shoe and adapted to oscillate in a path the line of which lies in a circular arc coinciding practically with the arc of the sole of the shoe, with a leveling-roller, B^{12}, frame C, and adjustable head-block N^7, substantially as described, and for the purpose set forth.

2. In a shoe-sole-leveling machine, the combination of the oscillating frame H H' H^3, oscillating nut E^3, screw-shaft E^7 E^{14}, and sliding housing D^3, with the friction-cone D^2, adapted to be actuated by the driving friction-cones D D', substantially as described, and for the purpose set forth.



3. In a sole-leveling machine, the combination of the shaft E^7 E^{10}, sliding housing D^3, link D^5, bent lever D^6, and shipping-rod D^9, with the hand-lever D^{10}, spring-plate M, and spring M', all operating together substantially as described, and for the purpose set forth.

408,496. ROCK-DRILL. ABRAHAM J. STEPHEN, Iron Mountain, Mo. Filed Nov. 27, 1888. Serial No. 292,021. (No model.)

Claim.—1. A steam rock-drill or analogous machine having a cylinder, A, provided with a cushioning steam-passage, in addition to the passages which lead from the valve-chamber to the cylinder and used for supplying the steam to the cylinder for driving the piston, said cushioning steam-passage being independent of said other steam-passages, substantially as described.

2. The combination of the valve-chamber, the cylinder, the passages F F, the port I, the passage H, and the piston having the two recesses *d d'*, substantially as described.

408,496.

3. The combination of the cylinder A, having the cushioning steam-passage H, as described, and the piston having the two recesses *d d'*, substantially as and for the purpose described.

4. The combination of the valve-chamber, the port I, the cushioning steam-passage H, as described, and the piston having the two recesses *d d'*, substantially as described.

5. The combination of the cylinder and the piston, said cylinder having the port I, and the passages K K', and said piston having the recesses *d* and *d'*, substantially as and for the purpose described.

6. The combination of the cylinder, the valve-chamber, the valve, and the piston, said cylinder having the port I, said valve-chamber having the valve-seat and the spaces b^{13} b^{10}, said valve having the disks c' c^4, said piston having the recesses *d d'*, and said cylinder and valve-chamber together having the ports K K', substantially as described.

7. The combination of the valve-chamber, the valve-seat, the spaces b^{13} b^{10}, the recesses b^7 b^{11} b^{12} b^{14}, the outlet b', and the valve having the end disks, c' c^4, substantially as and for the purpose described.

8. The combination of the valve-chamber, the valve-seat, and the valve, said chamber having the inlet *b*, the exhaust-outlet b', the live-steam outlet b^{13}, the recesses and spaces b^7 b^9 b^{10} b^{11} b^{12} b^{14} b^{15} b^{16}, and said valve consisting of the stem and the four disks, substantially as described.

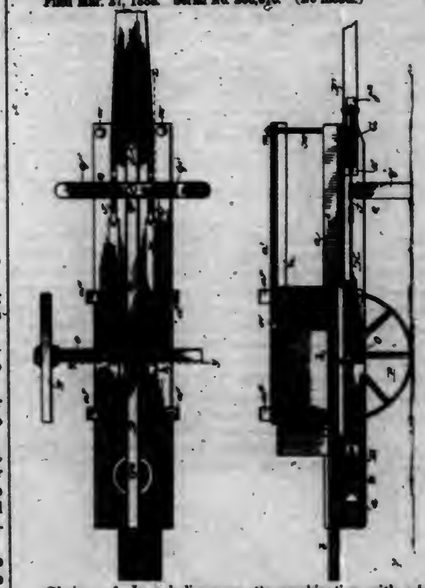
9. The combination of the valve-chamber having the bridges b^8 b^9 b^{15} b^{16}, with the longitudinally-moving valve having the stem and the disk c^3 c^4, the steam-inlet *b*, and the passages F F', substantially as described.

10. The combination of the valve-chamber having the recesses b^7 b^9 b^{10} b^{11} b^{12} b^{14}, the bridges b^8 b^9, and the outlet b', with the longitudinally-moving triple-spool valve, and the ports F F', substantially as described.

11. The combination of the valve-chamber having the spaces and recesses b^7 b^9 b^{10} b^{11} b^{12} b^{14} b^{15} b^{16}, the bridges b^8 b^9, the outlet b', with the longitudinally-moving triple-spool valve, and the ports F F', substantially as described.

408,497. THILL FOR VEHICLES. EDWARD WARREN, Ligonier, Ind. Filed Aug. 20, 1884. Renewed Oct. 20, 1886. Again renewed Nov. 5, 1888. Serial No. 290,043. (No model.)

Claim.—1. As an improvement in thills or shafts for carriages and wagons, a downwardly and rearwardly curved rear cross-bar, curved in a plane with the curved heels or extensions of the thills proper, and adapted to be connected at its lowest middle part to the axle-tree, substantially as set forth.



408,497.

2. The combination of the shafts A A, and rearwardly-curved rear cross-bar, B, having the middle part, B', of its lowermost end in a line with the ends of the curved heels A' A', substantially as set forth.

3. The combination of the shafts A A, rearwardly-curved rear cross-bar, B, having the middle part of its lowermost end in a line with the ends of the heels A' A', and the re-enforcing webs *a a*, substantially as set forth.

408,498. BALING-PRESS. VIRGIL L. WILLIAMS, Cartersville, Ga. Filed Mar. 27, 1888. Serial No. 268,610. (No model.)

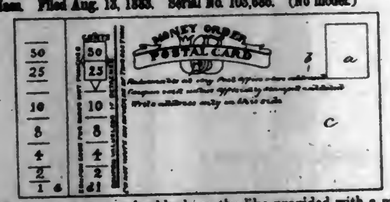
Claim.—1. In a baling-press, the combination, with a baling-chamber, of a two-part hollow plunger, an operating-lever, and a strip-and-chain connection between the plunger and said lever, substantially as set forth.

2. In a baling-press, the combination, with a baling-chamber, of a two-part hollow plunger, substantially as set forth.

3. In a baling-press, the combination, with the baling-chamber, of a two-part plunger, an operating-lever, and strips and chains connecting the same with said plunger through slots in the baling-chamber, substantially as set forth.

4. In a baling-press, the combination, with a baling-chamber, of a plunger, a lever at one end of said chamber, a sheave at the opposite end, strips connected with the plunger, a chain passing around said sheave and connecting the corresponding ends of the strips, and a chain or chains connecting the opposite ends of said strips with the lever, substantially as set forth.

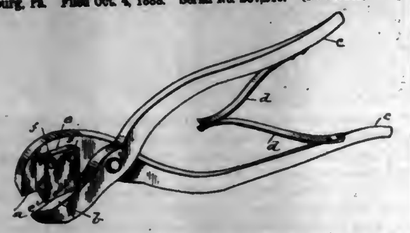
5. In a baling-press, the combination, with a baling-chamber, of a plunger, a lever at one end of said baling-chamber provided with a series of perforations, and a chain-and-strip connection between said plunger and lever, said perforations being adapted for adjusting the chain-and-strip connection, substantially as set forth.



6. In a baling-press, the combination of a baling-chamber, a sheave pivoted at one end thereof, a lever pivoted at the opposite end and having a sheave mounted in a recessed end thereof, strips connected with a plunger through slots in the baling-chamber, chains connecting said strips and lever, and a chain passing around the sheave at the opposite end of the chamber and connected at each end to the corresponding free ends of the strips, substantially as set forth.

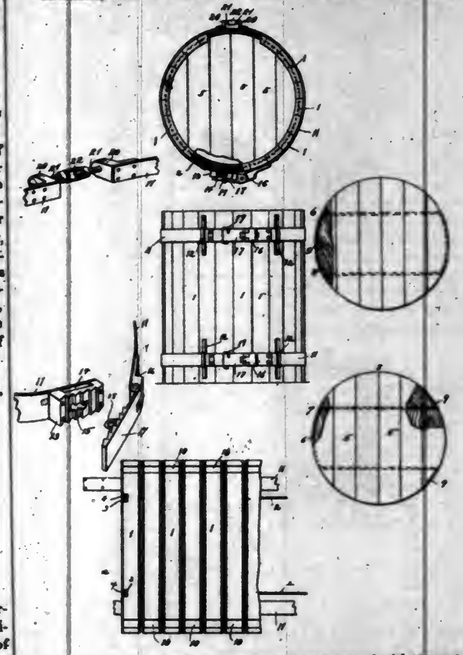
7. In a baling-press, a baling-chamber having slots in the bottom thereof, a plunger located therein, operating strips and chains connected with said plunger through the slots, a transverse slot in the top of the chamber adapted for the insertion of an end piece for the bale, clamping bolts and nuts at the front end, an axle and carrying-wheels mounted at one end, and a support or rest at the other end, substantially as set forth.

8. In a baling-press, a two-part plunger rectangular in cross-section, said parts being adapted to operate alternately to press the same bale, substantially as set forth.



9. In a baling-press, the combination, with a baling-chamber, of a two-part tubiform plunger, a lever pivoted at the forward under side of the baling-chamber, recessed at its pivoted end and a sheave pivoted therein, a sheave pivoted at the opposite end of said chamber, longitudinal stripe connected with the sections of the plunger through longitudinal slots in the bottom of the baling-chamber, chains connected to the forward ends of the stripe, short strips pivoted to the free ends of said chains and having eyes or perforations in their other ends for securing said strips to the lever by a bolt passing through the same and one of a series of perforations in the lever, and a chain passing around the sheave at the opposite end of the baling-chamber and having its ends connected with the free ends of the longitudinal stripe, substantially as set forth.

408,499. MONEY-ORDER BLANK. JOHN J. WILLIAMSON, Boston, Mass. Filed Aug. 13, 1883. Serial No. 103,686. (No model.)



Claim.—A money-order blank or the like provided with a margin, upon which is printed a column of figures representing denominations of the currency of the country, as described, the additions of which figures will make the maximum amount for which the order may be drawn, which amount corresponds to a denomination of said currency, and the addition of selections from which, left uncanceled, will make a sum of lesser denomination of said currency, whereby the preparation of the order for the amount desired will be ready and instantaneous, like making change in the accustomed manner, and of the common standard of currency of the country, and the amount for which the order is given will be immediately recognizable.

408,500. FRUIT-GATHERER. WAYNE J. WIDENBOTH, Wilkinsburg, Pa. Filed Oct. 4, 1888. Serial No. 287,219. (No model.)

Claim.—The herein-described fruit-gatherer, consisting of the shear-blades *a b*, pivoted laterally together, the blade *b* having the broad flat edge adjoining the cutting-edge of the blade *a*, and a rubber block, *c*, detachably secured by transverse screws *f* to the lateral face of the blade *a* contiguous to the blade *b*, and arranged in line with the latter blade, said rubber block having one of its edges *c'* beveled, as described, and projecting beyond the cutting-edge of the blade *a*, to which said block is attached, whereby the beveled edge *c'* of the rubber block is adapted to close upon the stem of the fruit and grip the stem between itself and the broad edge of the blade *b*, substantially as and for the purpose described.

408,501. COLLAPSIBLE SHIPPING-CASK. JOHN H. MITCHELL, Bloomfield, Iowa. Filed Aug. 25, 1888. Serial No. 283,754. (No model.)

Claim.—1. A collapsible shipping-cask constructed with staves 1, having grooves 10, adjacent to their ends, and wires 2, extending through the staves and secured in recesses 4 in the end staves, heads 8, consisting of stripe 5, connected together by a U-shaped wire, 6, extending through the stripe 5, and having its ends secured in the edge of the head, the heads 8, resting in the grooves 10 of the staves, metallic bands 11, inclosing staves 1 and secured thereto by clamps 12, with a serrated metallic block, 13, having vertical slot 14 and lateral slot 15, opening thereinto, secured to one end of bands 11, and a metallic block, 16, secured to the other end of the bands 11, with serrated plate 17, pivoted thereto, engaging block 13, and having lateral staple 18, projecting through slot 15 into slot 14, and wire 19, passing through slot 14 and staple 18, with its ends bent over plate 17, substantially as described.

2. The head 8, consisting of stripe 5, connected together by U-shaped wire 6, extending through stripe 5, and having its folded end resting against one edge of head 8, and its ends bent against the opposite edge, substantially as described.

3. The band 11, having at one end metallic serrated block 13, with vertical slot 14 and lateral slot 15, opening into the same, and at the other end metallic block 16, with serrated plate 17, having staple 18, and pivoted block 16, substantially as described.

4. The band 11, having at one end metallic serrated block 13, with vertical slot 14 and lateral slot 15, opening into the same, and at the other end metallic block 16, with serrated plate 17, having staple 18, and pivoted to block 16, and joined between its ends by the lugs 20, having screw-threaded projections 21, with turn-buckle 22, substantially as described.

5. The staves 1, with grooves 10, adjacent to their ends, and wires 2, extending through staves 1 and secured in recesses 4 in the end staves, and metallic bands 11, secured to staves 1, with serrated metallic block 13 at one end having vertical slot 14 and lateral slot 15, opening thereinto, and the block 16 at the other end, with serrated plate 17, having staple 18 and pivoted to block 16, substantially as described.

DECISIONS
OF THE
COMMISSIONER OF PATENTS
AND OF
UNITED STATES COURTS IN PATENT CASES.

DECISIONS OF THE U. S. COURTS.

Supreme Court of the United States.

PETERS *v.* HANSON *et al.*

Decided March 5, 1889.

1. PETERS—VEHICLE-DASHES.

Claims 1, 2, and 3 of Letters Patent No. 213,529, granted March 25, 1879, to George M. Peters, for an improvement in vehicle-dashes, cover merely applications of old devices to new uses, not involving invention.

2. SAME—SAME.

There was no invention in providing a bearing-surface (covered by claim 4) upon the frame of the dash, to which the foot of the brace was to be attached to support the brace and dash, either by an increase in the quantity of metal or otherwise, so as to strengthen the proper part, in a proper way, for its proper duty.

3. PETERS—VEHICLE-DASH FRAMES.

Reissue Letters Patent No. 9,891, granted October 11, 1881, to George M. Peters, for an improvement in vehicle-dash frames, does not involve invention. The process was old in the state of the art of working metals.

APPEAL from the Circuit Court of the United States for the District of Indiana.

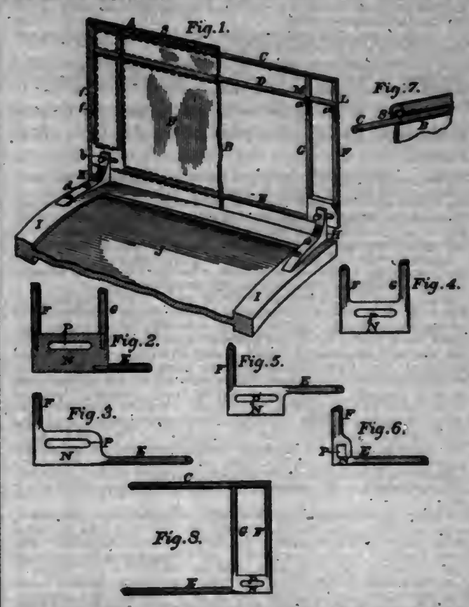
Mr. William Hubbell Fisher and *Mr. Benjamin Butterworth* for the appellant.

Mr. Arthur Stem for the appellees.

Mr. Justice BLATCHFORD delivered the opinion of the Court.

This is a suit in equity, brought by George M. Peters, in the Circuit Court of the United States for the District of Indiana, against Julius A. Hanson and Cortland C. Van Camp, for the alleged infringement of two Letters Patent granted to George M. Peters, the plaintiff, namely, Letters Patent No. 213,529, granted March 25, 1879, for an improvement in vehicle-dashes, on an application filed June 19, 1875, and Reissued Letters Patent No. 9,891, for improvements in vehicle-dash frames, granted October 11, 1881, on the surrender of original Letters Patent No. 224,792, granted February 24, 1880, on an application filed May 5, 1879, the reissue having been applied for June 15, 1881.

The answer sets up as to both patents want of novelty and patentability, non-infringement, and the invalidity of the reissue, because it has been expanded beyond the invention disclosed in the original patent, and contains new matter not found in that patent, and is for a different invention.



There was a replication to the answer, proofs were taken, and the circuit court dismissed the bill. The plaintiff has appealed from the decree. We are not furnished with any opinion given by the circuit court stating the ground for its action, but it said, in the brief for the appellant, that the ground was that the inventions were not patentable.

So much of the specification of No. 213,529 as is material, and the drawings referred to in it, are as follows:

My invention relates, * * * secondly, to the attachment of the dash to the vehicle; and this part of my invention renders the dash capable of attachment to vehicles of different widths, so that it can be sold as an article of manufacture, for application to the vehicle by the purchaser. These features of my invention render the construction easy, expeditious, and economical.

Another feature of my invention consists in such a novel construction of the dash as that there shall be at the part of the frame thereof to which the laterally-adjustable foot is to be attached a proper bearing-surface for the support and bracing of the dash.

In the accompanying drawings, which form a part of this specification, Figure 1 is a perspective view of sufficient of a vehicle to illustrate my invention; Fig. 2, a sectional detached view; Figs. 3, 4, 5, 6, 8, detached views illustrating modifications; and Fig. 7, a detached perspective view.

One mode of making the dash-frame is shown in the drawings, in which G F are parallel uprights at each end, C D E parallel cross-rods, and M L short continuations of the rods G F. * * *

In order to connect the frame to the vehicle, and further to permit a frame to be applied to vehicles of different sizes, I construct the frame and the foot H so that, by a lateral adjustment in relation to each other, the desired connection to bodies of different widths may be effected. The frames may be varied in construction to effect this result. Thus in Figs. 1 and 2 the frame has a wide bearing-piece, N, of any desired length, with a slot to receive the fastenings of the foot or attachment H, by which the dash and the body of the vehicle are connected adjustably, so that within the limits of the adjustment the foot secured to the dash may find its bearings on bodies of various widths.

The foot may be of any desired shape, being shown with two

branches, *b d*, one bolted or otherwise secured to the dash and the other to the body I of the vehicle.

By the above-described means the dashes may be furnished to the trade as independent articles of manufacture, as the foot may be fitted to vehicles in the process of construction or afterward, and the dash secured without altering or moving it. For the like reason, the feet adapted to the vehicles and dashes may be sold separately. * * *

The bearing N for the attachment or foot may be within the frame, as shown in Figs. 1, 2, 3, 4, and 8, or it may be in an extension outside of the frame, the result being the same—*i. e.*, the frame being adapted to be secured without change to bodies of different widths. This bearing portion N may be secured permanently or detachably to the frame-bars. Thus in Figs. 1 and 2 it is provided with sockets for the reception of studs at the ends of the bars. In any case it affords a strong and rigid connection between the foot and the frame, so that the latter cannot be bent over under anything less than destructive pressure. This is especially the case when both uprights, F and G, are secured to the bearing-piece N, whether within or without the frame proper; but when within the frame and extending up between the uprights it stiffens and braces the latter.

The adjustment of the dash and foot is not necessarily limited to the mode described. For instance, it may be effected by means of a series of holes, affording a means of adjusting the foot at different points. When the foot is not required, the dash may be connected directly to the body with like advantage, as the points of connection may be varied to suit bodies of different widths.

The feature of lateral adjustability set forth therein is applicable to dashes and feet, or equivalent laterally-adjustable attachments, other than those particularly herein described.

There are eight claims in the patent, the first four of which alone are alleged to have been infringed, namely:

Without confining myself to any special mode of connecting the foot and dash adjustably, I claim—

1. The combination of a dash and laterally-adjustable attachments, whereby the same may be connected to vehicles of different widths, substantially as set forth.

2. A dash or dash-frame having slots or openings, whereby attachments may be made at different points, substantially as and for the purposes set forth.

3. A dash provided with bearings having slots or openings, substantially as and for the purpose specified.

4. A dash-frame provided with bearings, arranged to strengthen the frame in those parts whereby the dash is to be connected to the laterally-adjustable feet or to the vehicle.

So much of the specification of Reissue No. 9,891 as is material, and the drawings referred to in it, are as follows:

One object of my invention is a novel construction of the dash-frame, whereby the latter is rendered light and strong, can be manufactured with little expense, and whereby the various portions of the frame are cheaply, readily, and firmly secured together, and also whereby the dash is cheaply, quickly, and firmly connected to a permanent or detachable portion of the vehicle.

Another object of my invention is a formation of a dash-foot for connecting a dash to a vehicle, whereby the foot is at once strong and light and can be cheaply manufactured.

Referring to the drawings forming part of this specification, Figure 1, A, B, C, and D represent a dash-frame constructed in accordance with my improvements, a section through the channeled lower rail of dash, and a sectional and perspective view of my special form of bar. Fig. 2, E and F are a perspective and sectional view of a modification of the mode of attaching the bar to the lower rail of the dash, where said lower rail is channeled on only one side; and G is a perspective view, showing a portion of the lower rail channeled only on one side and a channeled foot of my invention attached thereto, showing manner of attaching the foot to the lower rail by a T-headed bolt. Fig. 3, H I, Fig. 4, J K, and Fig. 5, L M, are sectional views, showing different modes of attaching the foot to the lower rail of the dash. Fig. 6 is a perspective view, showing how the extension *c'* of the upper bar may be riveted to the thin web or channeled portion of the lower rail.

A', Fig. 1, represents the lower rail of a dash-frame, channeled, as shown at B. This rail is provided at either end with the slot *a* or the holes *a'*, for attaching the feet to the dash-frame. The lower ends of the upright bars of the frame are split, and each half provided with a T-head. (Shown at D, Fig. 1.) These T-heads are made of the same width as the channel in the lower rail, into which they fit. The two halves of this split end are separated from each other to admit the lower rail between them. The upper ends of the upright bars are provided with notches *d*, for the reception of the upper rail of the dash-frame. * * *

By constructing dash-frames in the manner described much of the expense incurred in the ordinary mode of manufacture is saved. The lower rail is made broad and flat, so that the slot *a* or holes *a'* can be made therein and leave a strong bearing for the attachment of the feet. * * *

The wide vertical flat faces of the lower rail afford a desirable bearing for the dash-foot or vehicle-body (as the rail can be readily perforated for bolts or rivets, and the thick edges left above and below the perforations are first-rate bearings for said foot or body,) and possess great advantages over the customary convex or oval rails, the central portion of which, being thick, renders them hard to punch, and the edges afford no flat surface for said foot or body to press against. The rail therefore, when more or less flat on one or both sides, becomes a modification of the forms of rail shown herein and possesses some of their advantages.

Irrespective of the comparative advantages derived from the bearings being flat over being otherwise shaped, the following among other advantages obtains—viz., that the web allows the rail or bar to be readily and quickly perforated, the thick parts, however shaped, connecting said web serving as supports or bearings for the attachment of the foot or other portion of the vehicle to which the dash is connected.

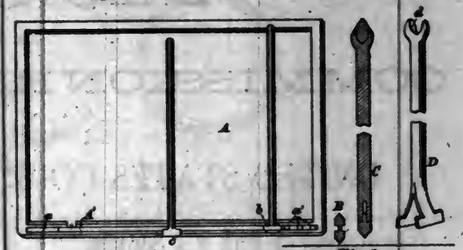


Fig. 1.

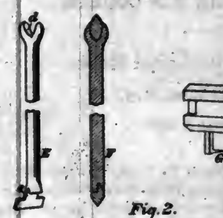

Fig. 2.

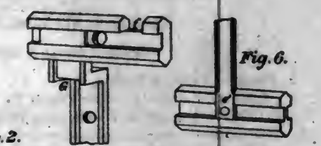

Fig. 6.

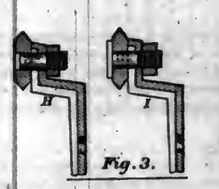

Fig. 3.

Fig. 4.

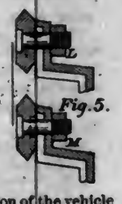

Fig. 5.

G, Fig. 2, is a perspective view of the under side of my channeled or concave foot. * * *

The foot may be channeled or concaved on the opposite side to that shown and described herein, or on both sides, these forms of construction being both obvious equivalents of the one shown and described.

The depth and the length of the channel or concavity in the dash rail or foot may be varied to suit the requirements of the manufacturer.

Another advantage of that portion of my invention which relates to channeling or recessing the foot is that the same may be readily cast of malleable iron, the channeling obviating the injurious effects arising from the presence of shrunken corners in thick malleable-iron castings. The channeling or recessing of the foot enables the latter to be made light and thin and to be better annealed.

There are thirteen claims in the reissue, but only claims 1, 2, 3, and 11 are alleged to have been infringed. Those claims are as follows:

1. A vehicle-dash whose lower bar is provided exteriorly with a channel or recess, the metal on either side of the channel or recess affording a bearing for the dash-foot or other portion of the vehicle to which the dash is connected, for the purposes specified.

2. A dash whose lower rail is composed near or at the ends of two thick portions united by an easily-perforated web, for the purposes specified.

3. A dash provided with a rail having vertically-flat sides, one or both of said sides being exteriorly channeled, substantially as and for the purposes specified.

11. The foot channeled on either or both sides, substantially as and for the purposes specified.

We will first consider claims 1, 2, 3, and 4 of No. 213,529. Claims 1, 2, and 3 relate to the means of adjusting laterally the feet of a dash. Formerly, the feet which connected the dash to the body were welded to the frame of the dash and made solid with it. When a manufacturer made both the dash and the body, he welded the feet of the dash to the frame at such points as were proper for the particular body for which the dash was designed. In the course of business, it came to pass that dashes were made by other persons than the manufacturer of the carriage, who either made

his carriage-body or bought it from some person other than the manufacturer of the dash. Under such a course of business, if the feet of the dash were welded to and made solid with the dash-frame, they might not fit the various sizes of carriage-bodies. Hence arose the idea of making the feet separate and not welding them to the dash, but attaching them thereto by a bolt and nut at the proper point. As the dash is covered with patent-leather, it is not convenient to bore through its iron frame after that frame is covered and in the hands of the carriage-maker. Therefore, a hole was bored in the lower rail of the frame of the dash, before it was covered, to receive the bolt by which the foot was to be attached to the frame. But, as vehicles varied in width and shape, it was necessary to place the feet sometimes nearer together, and sometimes farther apart from each other. Therefore, two holes, one on each side, in the frame of the dash, for receiving each a bolt, would not always be in the most convenient places. So it became obvious that it would be proper to make two holes, or even more, on each side, so that if one hole did not come at the right point, another would. Carrying out the same idea, it would be obvious that the bits of metal left laterally between the holes might be cut away, and thus a slot be made, or a long hole instead of two or more round ones, admitting of the more perfect adjustment of the place of attachment of the feet to the frame of the dash. It certainly required no invention to put two holes or a slot in the rail of a dash, instead of one hole, for the purpose indicated.

The use of a bolt passing through a hole and secured by a nut, to fasten one article of iron to another, was a well-known device; and so was the use for the same purpose of a slot which admitted of the adjustability or change of position of the bolt. The specification of the patent states that "the adjustment of the dash and foot is not necessarily limited to the mode described," but that "it may be effected by means of a series of holes, affording a means of adjusting the foot at different points."

The testimony of Mr. Wood, an expert for the defendants, on the subject of the state of the art in that regard, is as follows:

Q. 21. State whether or not there is anything novel in mechanics in the use of slots for the purpose of adjustment. A. 21. No; there is nothing novel about adjustable slots, elongated slots, or holes bored extra large for that purpose.

Q. 22. State, if you know, how long and in what manner and for what purposes adjustment has been accomplished by means of slots. A. 22. Well, any kind of mechanical work that has to be put together so as to be adjusted or duplicated in case of breakage—as, for instance, railroad-iron. The butt-ends are held together by bolts passing through elongated slots, so that the expansion and contraction of the rail will admit of self-adjustment; in fact, slots were a well-known mechanical principle, which has been used from a mouse-trap to a locomotive, you might say.

Q. 23. In the ordinary railroad-iron is or is not the T-rail channeled? A. 23. Yes, sir; T-channeled.

Q. 24. Are or are not the slots of which you speak as provided for adjustment made in the web of the rail? A. 24. They are.

Q. 25. Name some of the familiar uses in mechanics of slots for the purposes of adjustment, and describe the manner of their use. A. 25. They are so generally used in the construction of everything that is made of iron, or that iron is used in the construction of, that it would be almost impossible to pick out anything they were not used in for the purpose of adjustment.

Q. 26. Well, can't you name some of the familiar uses? A. 26. Bridge-work, jail-work, vehicles, dashes, tops.

Q. 27. Is it or is it not universally used on gages for lathes, sewing-machines, grain-drills, and all classes of machinery where the feed mechanism is made adjustable? A. 27. Yes, sir.

Q. 28. How long has it been so used? A. 28. Used, as I know of, for the last twenty-five years.

So, also, Mr. Brackett, another expert for the defendants, says:

Q. 11. Where it is desirable or necessary in mechanics to provide for adjustment of parts attached to one another, what is the most common form or manner of securing adjustability? A. 11. Where two pieces are bolted together the general form is by an oval or slotted hole. We have always used such a connection wherever it is possible, in frame structures or sliding parts, where difference in length or position is required.

Q. 12. Can you name a few of the applications of this slot for the purpose of adjustment, in your own business and outside of it? A. 12. We use it in all bearing-plates where bridges are anchored to the masonry, and where rollers are placed under one end, to allow for contraction and expansion. It is also used for roof-truss bearing-plates, to allow the roof to change its position on the wall, and for the fastening of columns to continuous girders, where the change of temperature changes the position of the girders or the columns. It is also in common use in such work as slide-gages, where the adjustment of the gage is required. It is used on an iron-planer, where the difference of the length of the parts is required at different times. It is also used on the ordinary carpenter's plane, to adjust the position of the knives. It is used on a rotary wood-planer for the same purpose, and, in fact, there is hardly an adjustable part of a machine where two pieces come in close contact but that it is the most common mode of adjustment, and I consider it as one of the commonest principles of mechanics, and one that has been used, that I know of, for fifteen years, and was an old principle at that time.

Q. 13. Would any ordinarily-skilled mechanic who had occasion to provide for the adjustment to different positions of the parts of any machine or device be able to apply this principle without suggestion or invention? A. 13. He could, for the reason that this would be the first manner in which he would try to make the connection, when, if it did not work, he would look for some other manner to make connection, for the reason that this is one of the simplest and easiest methods for connecting and allowing adjustment where both parts, when two pieces are used, are made of iron.

There is no contradiction of this testimony, and in view of it the improvements covered by claims 1, 2, and 3 of No. 213,529 are merely applications of old devices to new uses, not involving invention. (*Penn. Railroad* v. *Locomotive Truck Co.*, 110 U. S., 490, and cases there cited.)

In regard to claim 4 of that patent, the invention is stated in the specification to be the putting, at the part of the frame to which the foot is to be attached, a proper bearing-surface to support the brace and dash. Claim 4 states that the bearing is arranged to strengthen the frame in that part by which the dash is to be connected to the foot of the vehicle. There was no invention in providing such bearing, either by an increase in the quantity of metal or otherwise, so as to strengthen the proper part, in a proper way, for its proper duty.

As to Reissue No. 9,891, claims 1, 2, and 3 relate to channeling or recessing the rail or bar, so that the metal on each side of the channel or recess will be thicker than the metal at the channel or recess, the necessary effect of such arrangement being that the metal on each side of the channel or recess will be thick enough to form a bearing, and the metal in the channel or recess will be capable of being easily perforated. The channeling or recessing of the foot, covered by claim 11, involves the same idea, and the specification states that thereby the foot may be cast of malleable iron, and may be made light and thin, and be better annealed.

The idea of using iron with channels or recesses in it, to produce any result due to the existence of such channels or recesses, was old in the state of the art of working in metals. Mr. Wood testifies as follows:

Q. 3. State whether you are familiar with any uses to which channeled iron is applicable; if so, what uses, and the purpose and manner, and for how long you have known them. A. 3. Channeled iron, you might say, has been generally used in many different kinds of work and ways ever since I have been in the business. I first used it about twenty years ago in putting up hand-rails and stairs.

Q. 4. How long was it used for stairs and why? How did you apply it? A. 4. We used it for a hand-rail on the top of the rods which came from the steps, about three feet. We punched holes in the web of the iron—in the face of the iron—and riveted the vertical rods over, which left nice, smooth flanges to stiffen the rail and strengthen it, and was at the same time light and answered the purpose of a solid bar of iron with much less work.

Q. 5. Can you name other uses to which channeled iron has been

applied? A. 5. Yes; I fitted up a large lot of iron for Wood Brothers & Co., of Bridgeport, Connecticut, in 1870, for their landaus, carriages which they were making, which they used—this channel-iron—for dropping the tops and for holding the tops up in a position in different ways. These irons were fitted up with poles, with slots in them, for adjustable purposes. I bought the iron from a hardware store, as it was common stock or general stock. We had no trouble to obtain different sizes for the purpose. Since then I have seen it used in a great many different ways and for a great many different purposes; for instance, fire-proof buildings. The girders and beams, the lathe, and roofing are all made of channeled iron. The bridges, railroad-iron, gears of vehicles, jail-work, vault-work, safes, fire and burglar proof safes, fences, agricultural implements—in fact, it is used for a great variety of work which I can't call to mind just now.

Q. 6. For how long has it been so used? A. 6. Ever since I have been in the business.

Q. 7. What was the shape of the channeled iron you used in 1870 for the carriages made at Bridgeport? A. 7. The web of the iron was about two and one-half inches on the face; flanges about a half-inch deep. The web was about three-sixteenths of an inch deep.

Q. 8. What part of the iron was perforated with slots for adjustment purposes? A. 8. The web.

Q. 9. Did you buy it already channeled? A. 9. Yes, sir.

Q. 10. State whether or not you are familiar with the use of channeled iron for the purpose of feet, for any purpose. A. 10. Yes; the feet of desks, stoves, machinery of different kinds, vehicles.

Q. 13. Is channeled iron commonly used in carriage-work; and, if so, for what purpose? A. 13. Well, channeled iron has been used for years; dash-feet, dashes, tops, the bows on the tops, and for the tire on wheels.

Q. 14. For how long a time have you known it to be used for these purposes? A. 14. Twenty years.

Q. 15. What is the object in using channeled iron instead of solid bars? A. 15. Well, it's for the purpose of securing stiffness, lightness, and it is easy to work. It is easier to punch a hole through a light web than through a solid bar. It is economy to use it.

Q. 16. Can you state any use to which channeled iron could be applied in mechanics where its use would be novel or would constitute an invention? A. 16. I don't know of any.

Q. 17. Has or has not channeled iron been used in mechanics wherever it was desirable to combine lightness and strength? A. 17. Yes; we generally use it wherever we want to make that combination.

Q. 18. For how long has its use in that way been common and familiar? A. 18. Ever since I have been in the business.

Q. 19. State whether or not iron dealers keep in stock constantly various forms of channeled iron. A. 19. We never had any trouble to obtain channeled iron from most any of the stores.

Q. 20. How many various forms is it kept in in stock? A. 20. Well, I could not say as to that. A great many forms—for bridge purposes, house-building, jail-work, safe-work, vehicle-work; it is generally kept constantly on hand. Parties who generally use large lots of it for building, bridge purposes, and other purposes, make contracts for large lots of it and have it rolled to order, and get it cheaper that way.

Mr. Brackett testifies as follows:

Q. 4. State whether or not channeled iron is a common form for mechanical uses; and, if so, some of the uses to which it is put. A. 4. It has been commonly used in all frame structures where stiffness and lightness are desired. I have known of its use since 1862, when I first took an active part in manufacturing. We use it in bridges, roof-trusses, machine-frames, floor-beams, joists, tramways—in fact, hardly a frame structure but what it is used more or less. Then other classes of manufactories use it in numerous places, such as fence-pickets, bottom rail of fences, in stove manufacturing, furniture manufacturing, sewing-machine manufacturing, and in fact I hardly think there is any class of iron structures where lightness is required but that it could be used to advantage.

Q. 5. How long have you known of these uses you have referred to? A. 5. Fifteen years or more.

Q. 6. Should it be desirable to combine lightness and strength in the construction of vehicles or any parts of them, would it require any invention or would it be novel to apply channeled iron for that purpose? A. 6. No, sir; I think not, as channeled iron is in almost as common use as bar-iron, and hardly any framed work is made where stiffness and lightness are required but that it is used, because it is the stiffest form in which iron can be used in carrying a load between two points, either suspended or in the form of a —, and wherever a compressible strain occurs, or cross-strain, or any other strain than a purely tension strain, it is the cheapest iron to use, and it is in common use under such circumstances.

Q. 7. What other advantages or advantage, if any, is obtained by the use of channeled iron which is also old and familiar? A. 7. Wherever two members running either at an angle or in the same direction, its greatest convenience is in the easy manner and strength with which such attachments and connections can be made, on account of the thinness of its web, it being readily drilled or punched, requiring a great deal less labor and expense than flat bar-iron, and on this account it is in general use throughout the United States for the last fifteen to twenty years, that I know of.

Q. 8. Can you give any instances in which channeled iron has been used as supports—that is, legs or feet, prior to 1875?

[Witness here asks whether counsel means channeled on one side or both.]

Q. Either. A. 8. Sewing-machine legs, stove-legs, school-desk legs, steam-heater legs; that's all I think of just now.

Q. 9. Do you know of any use of iron for feet or supports where these supports are not made channeled, as a rule? A. 9. No, sir; I do not, and, as a question of economy of material, it should be done in every instance where practicable.

This testimony is uncontradicted, and in view of it the improvements covered by claims 1, 2, 3, and 11 of Reissue No. 9,891 amount only to applications of old devices to new uses, not involving invention.

The decree of the circuit court is affirmed.

Supreme Court of the United States.

PETERS *v.* THE ACTIVE MANUFACTURING COMPANY.

Decided March 5, 1889.

1. PETERS—TOOLS FOR ATTACHING SHEET-METAL MOLDINGS.
Claims 1 and 2 of Letters Patent No. 178,463, granted June 6, 1876, to George M. Peters, for an improvement in tools for attaching sheet-metal moldings, *Held* to be anticipated by a machine used by Joseph P. Noyes, Binghamton, N. Y., as early as September, 1867.

2. SAME—SAME—INFRINGEMENT.
Claim 3 not infringed by defendant's apparatus, in which no washers are used for adjustment.

APPEAL from the Circuit Court of the United States for the Southern District of Ohio.

Mr. William Hubbell Fisher and *Mr. Benjamin Butterworth* for the appellant.

Mr. Arthur Stem for the appellee.

Mr. Justice BLATCHFORD delivered the opinion of the Court.

This is a suit in equity, brought in the Circuit Court of the United States for the Southern District of Ohio, in January, 1882, by George M. Peters against The Active Manufacturing Company, for the alleged infringement of Letters Patent No. 178,463, granted June 6, 1876, to the plaintiff, George M. Peters, for an improvement in tools for attaching sheet-metal moldings, on an application filed March 7, 1876.

The specification, drawings, and claims of the patent are as follows:

My invention comprises a peculiarly-constructed sheath or holder, wherewith the ornamental molding on the top of carriage-dashes may be applied in the most expeditious manner, and without bending or buckling, or otherwise injuring or marring either said molding or its supporting dash-board.

In its preferred form, said sheath consists of a two-part holder or receiver connected together with bolts and washers, and provided with a longitudinal groove or channel of such size and shape as to readily inclose the molding that is to be applied to the upper edge of the dash; a key or other suitable stop being fitted within the sheath to prevent the molding slipping through said longitudinal groove when the device is in use.

The sheath is rendered capable of carrying moldings of various lengths and sizes by an arrangement of adjusting devices whose details of construction will be hereinafter more fully explained.

In the accompanying drawing, forming part of this specification, Figure 1 is a perspective view of a two-part sheath in an inverted position, the middle portion and rear end of the device being broken away. Fig. 2 is a perspective view of the molding detached from sheath. Fig. 3 is a plan showing the molding located within the sheath. Fig. 4 is a longitudinal section through the rear end of the sheath, with a screw-stop for the molding to bear against. Fig. 5 is a transverse section at the line *x x*, showing the molding incased within the sheath; and Figs. 6 and 7 represent modifications of the holder.

A and B represent two metallic bars of any appropriate size, and having their lower outer edges slightly beveled off at *a* and *b*. These bars are maintained in a parallel position with reference to each other by means of bolts or screws C and washers or fillings D. Instead of washers and bolts or screws C, the bars may be maintained in parallel position, and separated or brought nearer together by means of right-and-left screws, the right-hand thread of said screw engaging a female screw in one bar, and the left-hand thread engaging a female screw in the other.

The bar A has a longitudinal groove, E, formed along its inner surface and near the lower edge of said bar. E′ is a precisely similar groove made in the other bar, B, and when the two members A B of the sheath are joined together the grooves E E′ form a channel that is approximately circular in its transverse section. F represents a hook, shackle, or link, pivoted to the front end of the sheath, and guttered at *f*, to avoid contact with the upper edge of the dash.

The bars are furnished with undercut notches *g g′* to receive a detachable key, G, which latter serves as a stop or abutment for the rear end of the molding to rest against. A series of similar notches may be made in the bars A B at such distances from the front end of the sheath as will correspond with the various lengths of moldings; or, if preferred, the notches and key may be dispensed with, and a screw, H, may be arranged for the molding to bear against, as seen in Fig. 4. This screw may be adjusted out or in to agree with the length of molding.

The advancing end of the sheath is rounded off at I, so as not

Fig. 1.

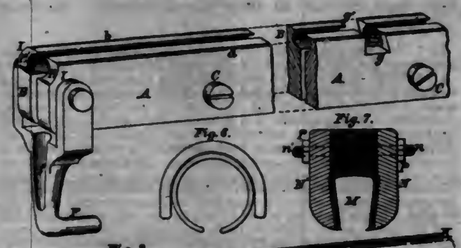

Fig. 6.

Fig. 7.

Fig. 2.

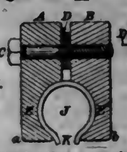

Fig. 3.

Fig. 4.

Fig. 5.

to tear up the leather coverings of the dash while the molding is being applied. The molding consists of a sheet-metal tube, J, having a longitudinal slot or parting, K, and a flaring or trumpet-mouthed end, L. This trumpet-mouth is located at the forward end of the molding.

As represented in Fig. 7, the sides of the molding M are straight, and have an outward flare, the top of said molding being somewhat crowning. This illustration shows a three-part sheath, the two outer bars N N′ being secured to the central member O by right-and-left-hand screws *n n′* and nuts P. Fig. 6 represents the sheath as made of a single piece of metal or other suitable material.

Previous to using the sheath the key G is first inserted in the notches *g g′* at such a distance from the end I as will correspond with the length of molding J, which latter is then slid into the groove E E′, the rear end of said molding being brought in contact with the vertical edge of said key. When thus located within the sheath the flaring mouth L of the molding has a slight projection beyond the chamfered end I of the bars A B, as represented in Fig. 3. The carriage-dash is then held perfectly rigid, and the upper margins of the coverings of the same are inserted in the flaring end L of the molding, after which any suitable power is applied to the hook F to draw the sheath along the top of said margins or projections. As the sheath advances the flaring mouth serves to conduct the leather margins into the slot K of the molding, and as the grooves E E′ prevent any radial distention of the tube J, it is evident that the molding is caused to embrace said margins in the most uniform and secure manner. After the molding has traversed the entire length of the dash the sheath can then be retracted, thereby leaving the tube J in its proper position upon the dash, the flaring end L being either filed off or else disposed of in any other suitable manner. During the progress of the sheath along the top of dash the molding is impelled forward by the key G, and consequently no strain whatever is brought to bear upon the flaring end L of the tube.

As a considerable degree of force is required to anchor the molding J securely to the leathern margins, it is evident that the driving action of key G would have a tendency to buckle said tube; but this defect is obviated by making the channel of the sheath of such capacity as to allow a pretty snug fit of the molding within it.

When a longer molding is to be applied to a dash, the key G is driven out and inserted in another set of notches nearer the rear end of the sheath; or the same results may be effected by causing the molding to abut against the end of screw H, the latter being adjusted either out or in, so as to agree with the length of molding that the sheath is to carry. The width of channel E E′ may be increased, to receive a molding of greater diameter, by removing washers or filling and inserting thicker ones in their place, or by turning the right-and-left-hand screws, where the latter are employed.

It is preferred to make the sheath of two pieces, on account of the facility of grooving them; but it is evident the holder may be made of a greater or less number, if desired. (See Figs. 6 and 7.)

It is also preferred to have the sheath embrace the molding as completely as possible, so as to bring the lower edges of the bars A B near the parting K, and thereby prevent any spreading of the tube at said slot; but if the tube is sufficiently stiff to prevent such spreading, the sheath need not surround the molding so completely. This modified form of sheath is shown in Fig. 6.

Furthermore, the sheath may be composed of wood lined with a metallic bushing. It is evident that this form of sheath may be advantageously employed for attaching sheet-metal moldings or tubes to various articles; and I reserve the right to use it for any and every purpose that it is capable of.

What I claim as new, and desire to secure by Letters Patent, is—

1. A sheath for applying metallic moldings, said sheath being furnished with a stop for advancing the molding, all substantially as and for the purpose specified.

2. The within-described sheath for applying metallic moldings, said sheath being furnished with recesses *f′ g′* and a key, G, or their equivalent stops, as and for the purpose explained.

3. A sheath composed of two grooved bars A E B E′, bolts or screws C, and washers D, whereby the sheath is rendered capable of adjustment to contain moldings of different diameters, as herein set forth.

4. The combination of bars A E B E′ and guttered hook or shackle F *f*, for the object stated.

Infringement is alleged of claims 1, 2, and 3.

The defenses insisted upon are want of invention, want of novelty, and non-infringement of claim 3.

The substance of the invention set forth in the specification is the use of a sheath or holder or receiver, having in it a longitudinal groove or channel, in which is placed the molding that is to be applied to the upper edge of the dash-board, the sheath or holder, when pulled, drawing with it the molding over the upper edge of the dash-board, and the key or stop being fitted within the sheath or holder, to prevent the molding from slipping through the groove. One useful effect of the sheath is to support the molding laterally, and prevent it from bending or buckling, or injuring the dash-board. Claim 1 covers the use of a sheath furnished with a stop, which operates to prevent the further advancing of the molding when it reaches the stop. Claim 2 covers the use of a sheath with a stop formed by means of notches or recesses, and a detachable key to be inserted in the notches. Claim 3 covers a sheath composed of two grooved bars, parallel to each other, and having bolts or screws connecting them, and washers between them, so as to render the apparatus capable of being adjusted to contain moldings of different diameters.

The circuit court entered a decree dismissing the bill, from which the plaintiff has appealed. The opinion of that court, reported in 21 Fed. Rep., 319, says in regard to claims 1 and 2:

The respondent's evidence establishes that, as early as September, 1867, Joseph P. Noyes, a manufacturer of combs at Binghamton, New York, used a machine for putting moldings on combs, in which the molding was held in a sheath fitting it closely, and having an extension enough smaller to fit the comb. In this extension there was a sliding follower fitted to abut against the end of the comb. At the extreme opposite end of the larger part of the sheath there was a slot across the sheath, containing a key or stop to prevent the sliding of the molding. The follower was attached to a slide and lever, so that when a molding was laid in the larger part of the sheath and the comb in the smaller part, the comb, being prevented from bending by the walls of the sheath, could be forced into the molding by the action of the slide and lever upon the follower, the molding being prevented from bending by the walls of the part of the sheath within which it was placed. This machine was in use more than three years before the date of the complainant's invention. That this was a comparatively small machine and used only for applying moldings to combs, is not material. (*Planing Machine v. Keith*, 101 U. S., 490.) Nor is it material that the groove or gutter was so open in cross-section that the molding could be dropped into it. Fig. 6 of the drawings accompanying the Letters Patent issued to complainant shows a sheath of like shape, and is referred to in the specifications as a modified form of the sheath patented, and the claim is so broad as to cover any sheath, of any material, shape, or size, for applying moldings to any article. There is nothing more in the sheath patented to the complainant than an adaptation of the sheath used at Binghamton to the application of moldings to carriage dash-boards—an adaptation which would have occurred to a skilled mechanic without the exercise of the inventive faculty. Had the complainant's invention been first in time

and patented, the Binghamton sheath would have been an infringement; and, conversely, had the Binghamton sheath been patented, the complainant's would have been an infringement. That which infringes, if later, would anticipate, if earlier.

We concur in these views.

The affirmative evidence on the part of the defendant, in regard to the Noyes apparatus, consists of the testimony of Noyes and Yingling, their testimony having been taken in August, 1882. Noyes testified that he had been engaged in making combs, at Binghamton, Broome county, New York, since 1860, and had, since 1864, made combs with metallic moldings for stiffening the backs. He produced one of such combs, marked A, and one of such moldings, marked B. He further testified as follows:

Q. 6. State whether or not you have ever used any machinery for putting these moldings on combs. A. I have.

Q. 7. Can you describe any of the machines used by you for putting moldings on combs? A. Yes. I have one machine in which the molding is held in a groove, which fits it closely, and the same groove has an extension enough smaller to fit the comb closely, and in this extension there slides a follower, which is fitted to abut against the end of the comb. At the extreme opposite end of the larger part of the groove there is a slot across the groove, containing a key or stop to prevent the molding sliding through the groove. The follower before mentioned is attached to a suitable slide and lever, so that when a molding is laid in the larger part of the groove, and the comb in the smaller part, the comb, being prevented from bending by the walls of the groove, can be forced tightly into the molding, by the action of the follower and its connected parts, the molding being, at the same time, prevented from bending by the walls of the larger part of the groove.

Q. 8. Can you produce a drawing illustrating the machine above described and its operation? A. I here produce a drawing which illustrates said machine. In this drawing, Figure 1, A represents the main body of the machine. In the part A is the groove C and its smaller extension D, in which are placed the molding and the comb, as described in my previous answer. O represents the slot in which is placed the key, marked Fig. 2. E, Fig. 1, represents the follower B, the slide of which the follower forms a part; L, K, M, and H the lever and connecting parts by which E and B is operated. Fig. 3 shows an end view of the slide and follower.

Q. 9. Into which of the grooves do you place the metallic molding? A. Into the groove C.

Q. 10. And into which the comb? A. Into the groove D.

Q. 11. In use, the key or stop, Fig. 2, is placed in the slot O to prevent the metallic molding sliding, is it not? A. It is.

Q. 12. State whether the groove C in the sheath A effectually prevents the metallic molding from bending as it is forced over the back of the comb. A. It does.

Q. 13. State how long you have used the above-described machine for putting metallic moldings on combs in the manner described. A. Since September, 1867.

Q. 14. Can you fix the date by any positive evidence besides your memory? A. I can. I have referred to the time-book of the men who made the machines, and find the machine to have been finished at the dated named, and remember that it was put into immediate use.

Q. 15. Has it been used ever since? A. It has been in continued use ever since without any alteration.

Q. 16. Have you ever made any effort to keep its use a secret, or has it always been open to the inspection of any person who might come into your shop? A. I have made no effort to keep it secret, but the shop has always been open to visitors, and any one could see the machine who cared to look at it.

The drawing so produced, marked C, shows a machine substantially like that of the plaintiff.

Yingling testified that he was, at the time of testifying, in the employ of Noyes, and, since 1868, or for about fourteen years, had used a machine like that shown by the drawing C, above referred to, for puting metallic moldings upon combs.

Noyes had stated, on cross-examination, in answer to a question as to who made the machine he had described as made in 1867, that William Knopp and his son were in his (Noyes's) employ as machinists at that time, and worked some on it; that his time-book, kept at that time, which he had consulted, contained a record of the fact that Knopp and his son so worked on the machine; and that the machine was built during the first week in September, 1867. In rebuttal, the plaintiff examined as witnesses William Knopp and three persons named Newman, Coyle, and McAuley.

Knopp testified that he was employed in Noyes's comb factory from 1865 to 1869, and was familiar with the kind of machinery manufactured by them during that time, for use in their comb-factory. He then proceeded:

Q. 5. In September, 1867, or at any other time, did you make machinery for putting metallic backs on combs? A. I did.

Q. 6. Without going into detail as to the kind you did make, I will ask you whether, in September, 1867, you made, or helped to make, a machine for putting moldings on the backs of combs, where the molding is held in a groove which fits it closely, and the same groove has an extension enough smaller to fit the comb closely, and in this extension there slides a "follower," which is fitted to butt against the end of the comb. At the extreme opposite end of the groove there is a slot across the groove, containing a key or stop, to prevent the molding from sliding through the groove. The follower is attached to a suitable slide or lever, so that, when a molding is laid in the larger part of the groove, and the comb in the smaller part, the comb is prevented from bending by the walls of the groove, and can be forced tightly into the molding, by the action of the follower and of the connecting parts? A. I do not remember that I made anything of that kind.

Q. 7. Did you at any other time make such a machine? A. I don't remember that I did.

Q. 8. Please examine the comb I now hand you, and state whether Noyes Bros. & Co., at that time when you worked for them, and since, manufactured a comb with metallic back similar to this one, and, if so, state how said metallic back was put on the comb? (Comb marked Exhibit A shown witness and offered in evidence by solicitor for complainant.) A. They manufactured a comb in general appearance similar. The metallic back was put on and fastened to the comb by compression. The back was compressed in a vise to make it fit in a groove in the comb tightly. The molding was placed on the comb by hand, and then put in a vise, and the molding pressed up tightly against the comb.

Q. 9. Do you remember working on or making machinery for compressing the molding on the comb, as above described? A. I do.

Q. 10. Is the mode above described the only way Noyes Bros. & Co. put metallic moldings on that kind of a comb? A. It is.

Q. 11. You was familiar at that time with the mode employed by them for putting moldings on combs, was you? A. I was.

This testimony of Knopp is very inconclusive. He merely testifies, thirteen years after he had left Noyes's establishment, that he does not remember that he made, fifteen years before the time when he was testifying, a machine like that described in question 6 put to him. The drawing produced by Noyes was not shown to Knopp.

The testimony of Newman, Coyle, and McAuley amounts to nothing. Although they were employed in the comb-factory of Noyes at the time they gave their testimony, in December, 1882, and had been employed there, Newman from 1862, Coyle for 14 or 15 years, and McAuley for about thirty years, neither of them was shown the comb A, nor the molding B, nor the drawing C, above mentioned, nor was a distinct question put to either of them as to the use of a machine like that described in question 6 put to the witness Knopp.

The only difference between Noyes's device and that of the plaintiff is, that in Noyes's the stop holds the molding stationary while the comb is forced into the molding by the action of the follower. But its action is substantially the same as that of the stop in the plaintiff's patent, which prevents the molding from slipping through the groove.

The case falls within the principle applied in *Pennsylvania Railroad* v. *Locomotive Truck Co.*, (110 U. S., 490,) and cases there cited.

As to the third claim, it is not infringed, because, in the defendant's apparatus, no washers are used for adjustment.

The decree of the circuit court is affirmed.

Attorneys.

DEPARTMENT OF THE INTERIOR,
Washington, D. C., May 10, 1889.

SIR: I am directed by the Secretary of the Interior to inform you that the order of the Department, dated February 12, 1885, disbarring John McLean, of Crookston, Minn., from practice before the Department of the Interior and the Bureaus thereof, has this day been rescinded.

Very respectfully,

E. M. DAWSON,
Acting Chief Clerk.

The Commissioner of Patents.

Fraudulent Practices by Attorneys.

DEPARTMENT OF THE INTERIOR,
UNITED STATES PATENT OFFICE,
Washington, D. C., April 18, 1888.

The attention of this Office having frequently been called to circulars and communications of persons pretending to have access to the records of this Bureau, and claiming to possess information of the pendency of applications for patents, notice is hereby given the public that all such persons in so advertising themselves are acting under false representations and are guilty of unprofessional conduct, and should not be entitled to credit.

The Office has also received information that certain attorneys disbarred from practice under section 487 of the Revised Statutes are continuing to prosecute applications for patents under the names of other persons.

Hereafter a list will be published in the OFFICIAL GAZETTE containing the names and addresses of all such persons, and the public warned against employing them or intrusting applications or interests to their charge.

BENTON J. HALL, *Commissioner.*

The Office has information that *Isaac S. McGiehan, No. 158 Broadway, New York*, a disbarred attorney, has been practicing under the name of *Alexander Melhado*.

Issue of May 21, 1889.

"The representation of a winged head and the word 'CYCLONE.'"

16,599.—GRANULAR EFFERVESCENT SALT.—*Isaac E. Emerson*, Baltimore, Md. Application filed April 8, 1889. Used since January 15, 1889.
"The word 'BROMO-SELTZER.'"

16,600.—TROUSERS, OVERALLS, AND COATS.—*Erlanger Brothers*, Baltimore, Md., and New York, N. Y. Application filed February 20, 1889. Used since March 23, 1888.
"The words 'TWO FOR ONE,' in combination with the numerals '2 4 1.'"

16,601.—COFFEE SUBSTITUTE.—*George Floto's Sons*, Brooklyn, N. Y. Application filed April 10, 1889. Used since April 23, 1883.
"The picture of a city with an eagle above it and the words 'AUGUST KOENIG'S.'"

16,602.—COMPLEXION-POWDERS.—*Gale & Blocki*, Chicago, Ill. Application filed March 26, 1889. Used since December, 1880.
"The word 'EDELWEISS.'"

16,603.—SAUCES AND CONDIMENTS.—*Patrick F. Gillespie*, Chicago, Ill. Application filed March 28, 1889. Used since November 1, 1888.
"The representation of a shield and the letters 'L. J. C.,' together with the words 'P. F. GILLESPIE' and the words 'CHICAGO' and 'ILLINOIS' on either side of the shield."

16,604.—CERAMIC COLORS.—*Hancock & Son*, London, England. Application filed January 25, 1889. Used since July 1, 1868.
"A cross-band, two circles arranged behind the band, and the representation of a crown in the same."

16,605.—SOAP.—*Robert F. S. Heath*, Camden, N. J. Application filed March 25, 1889. Used since January 1, 1889.
"The word 'SOCIETY-SOAP.'"

16,606.—VARNISHES, PAINTS, OILS, AND JAPANS.—*William Hadwin Houghton*, Long Island City, N. Y. Application filed February 24, 1888. Used since September 1, 1887.
"The letters 'H H' or a monogram of the letters 'H H.'"

16,607.—CEREAL PRODUCTS, SUCH AS FLOUR AND MEAL.—*Henry Ferdinand Ihlee*, Battersea, county of Surrey, England. Application filed September 6, 1888. Used since June 20, 1888.
"The words 'FRAME FOOD.'"

16,608.—PILE-SALVE.—*John F. Joyce*, De Soto, Mo. Application filed February 11, 1889. Used since January 1, 1889.
"The words 'LOCOMOTIVE ENGINEER, JOYCE'S PILE DRIVER SALVE,' arranged about the cut or representation of a pile-driver."

16,609.—SOCKS AND STOCKINGS.—*August Kitz*, New York, N. Y. Application filed March 27, 1889. Used since December, 1888.
"A lozenge-shaped figure and the words 'COAL BLACK WARRANTED NOT TO CROCK' arranged parallel to its four sides."

16,610.—SOCKS AND STOCKINGS.—*August Kitz*, New York, N. Y. Application filed March 27, 1889. Used since December, 1888.
"The capital letters 'W. M. W. & Co.' and the words 'ANTI-CROCK DYE.'"

16,611.—PERFUMES.—*Herman Loeb & Co.*, New York, N. Y. Application filed March 25, 1889. Used since September 1, 1888.
"The words 'THE ARMANT PERFUMES,' printed over the vignette of a lion's head and a scroll."

16,612.—SEMI-SOLID MEDICINAL COMPOUND IN THE FORM OF PILLS.—*Elias Edwin Matthews*, Indianapolis, Ind. Application filed February 28, 1889. Used since January 15, 1889.
"The words 'PERUVIAN BEANS.'"

16,613.—CEMENT.—*McLean & Company*, (*Limited.*) London, England. Application filed January 6, 1888. Used since 1880.
"The word 'CORONET.'"

16,614.—CANNED OYSTERS, FRUITS, AND VEGETABLES.—*C. H. Pearson & Co.*, Baltimore, Md. Application filed January 27, 1888. Used since January, 1887.
"The word 'PEERLESS.'"

16,615.—WATCH-CASES.—*Philadelphia Watch Case Co.*, Philadelphia, Pa. Application filed March 9, 1889. Used since February 1, 1889.
"The word 'PHŒNIX' in combination with the word 'PHILADA.' and the words 'WATCH C. CO.'"

16,616.—WATCH-CASES.—*Philadelphia Watch Case Co.*, Philadelphia, Pa. Application filed March 9, 1889. Used since March 6, 1889.
"The word 'UNIQUE' in combination with the word 'PHILADA.' and the words 'WATCH C. CO.'"

16,617.—WATCH-CASES.—*Philadelphia Watch Case Co.*, Philadelphia, Pa. Application filed March 9, 1889. Used since February 1, 1889.
"The word 'IDEAL' in combination with the word 'PHILADA.' and the words 'WATCH C. CO.'"

16,618.—WATCH-CASES.—*Philadelphia Watch Case Co.*, Philadelphia, Pa. Application filed March 9, 1889. Used since January 1, 1888.
"A central wheel with a wing attached to each end of the hub thereof."

16,619.—HALF-TONE ENGRAVED RELIEF-PLATES FOR ILLUSTRATIVE PURPOSES.—*Purton, Stearns & McIntyre*, Philadelphia, Pa. Application filed February 26, 1889. Used since September 1, 1888.
"The word 'ELECTRO-TINT.'"

16,620.—FILTERS MADE ACCORDING TO THE PASTEUR SYSTEM.—*Société Anonyme du Filtre Chamberland, Système Pasteur*, Paris, France. Application filed May 28, 1888. Used since August, 1886.
"The representation of two dolphins resting on their mouths and supporting between their tails a filtering-bottle."

16,621.—PAILS, TUBS, AND ANALOGOUS WOODEN WARE.—*Two Rivers Manufacturing Company*, Two Rivers and Milwaukee, Wis. Application filed March 29, 1889. Used since March, 1871.
"The word 'DOWEL.'"

16,622.—PAINT PREPARED FOR IMMEDIATE USE.—*The Wadsworth Paint and Oil Manufacturing Company*, Brooklyn, N. Y. Application filed March 28, 1889. Used since September 15, 1888.
"The word 'ELECTRIC' and the representation of an incandescent light."

16,623.—PATENT FLOUR.—*William Henry Weiss*, San Antonio, Tex. Application filed December 3, 1888. Used since January 1, 1888.
"A large fancifully red-bordered black circle on a lemon-colored background and an inner representation of concentric circles containing the representation of the head of a lion in appropriate coloring."

16,624.—REED-ORGANS.—*The Wilcox & White Organ Company*, Meriden, Conn. Application filed March 25, 1889. Used since November 1, 1888.
"The word 'SYMPHONIA.'"

16,625.—REED-ORGANS.—*The Wilcox & White Organ Company*, Meriden, Conn. Application filed March 25, 1889. Used since November 1, 1888.
"The words 'PNEUMATIC SYMPHONY.'"

16,626.—REMEDY FOR NERVE, BRAIN, AND STOMACH DISORDERS.—*Williamson, Ingram & Griggs*, Detroit, Mich. Application filed March 27, 1889. Used since January 1, 1889.
"The words 'BROMO SEIDLITZ.'"

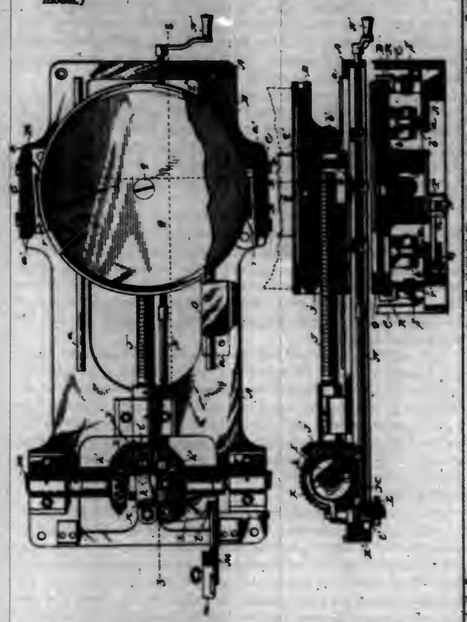
16,627.—TEA.—*Thomas Wood*, Boston, Mass. Application filed February 23, 1889. Used since December 1, 1888.
"The words 'MAY QUEEN.'"

16,628.—COPPER PAINT.—*Charles A. Woolsey*, Jersey City, N. J. Application filed March 13, 1889. Used since December, 1884.
"The representation of a Nereid on a sea-horse, with the words 'CHAS. A. WOOLSEY'S COPPER BEST PAINT.'"

LABELS.

5,908.—Title: "BLAIR'S STENOGRAPHIC GOLD FOUNTAIN PEN."—*John Blair*, New York, N. Y. Application filed April 24, 1889.

5,909.—Title: "CAN'T RUST 'EM." (FOR DRESS STAYS.)—*M. Cohn & Co.*, New York, N. Y. Application filed April 6, 1889.



5,910.—Title: "SYPHILIS & GONORRHŒA PREVENTIVE."—*Green Berry Harris*, Mooreville, Tex. Application filed April 19, 1889.

5,911.—Title: "MAY'S MEXICAN FRUIT SHERBET."—*Eugene May*, New Orleans, La. Application filed April 26, 1889.

PATENTS

GRANTED MAY 21, 1889.

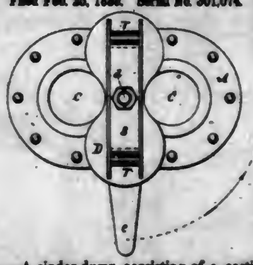
408,502. MOTOR FOR CULINARY BEATERS, MIXERS, &c. EDWIN BAILEY, Philadelphia, Pa., assignor to the Keystone Manufacturing Company, same place. Filed May 11, 1888. Serial No. 273,615. (No model.)

Claim.—1. The combination, with the bed, the table, means for reciprocating the table on the bed, and the shipper-lever, of the tappet-rod having a right and a left thread, journaled in the said bed and adapted to have a longitudinal and a rotary movement, the inner end of the rod being in connection with the shipper-lever, the tappets mounted on the said rod and moved to and from each other by rotating the rod, and means, as the crank N', for rotating the said tappet-rod, substantially as and for the purpose specified.

2. The combination of the bed, the table Q, having a stop, P, the feed-screw, means for rotating the feed-screw alternately in opposite directions, the shipper-lever, the arm L, connected with the shipper-lever, having the opening *l* in its end, the stud K', pivoted to the arm L, the tappet-rod journaled at one end in the stud K' and at its other end in the bed and having a right and a left thread, the tappets mounted on the threaded portions of the tappet-rod and having extensions, the guide-plate O, and the weighted lever M, having its end fitted in the opening *l* in the arm L, substantially as described.

3. The combination of the bed and the reciprocating table having a stop, of the tappet-rod journaled in the bed and having a right and a left screw-thread thereon, the tappets mounted on the threaded portions of the said rod and having extensions, and the plate O, forming a guide between it and the bed for the said extensions, substantially as described, for the purpose specified.

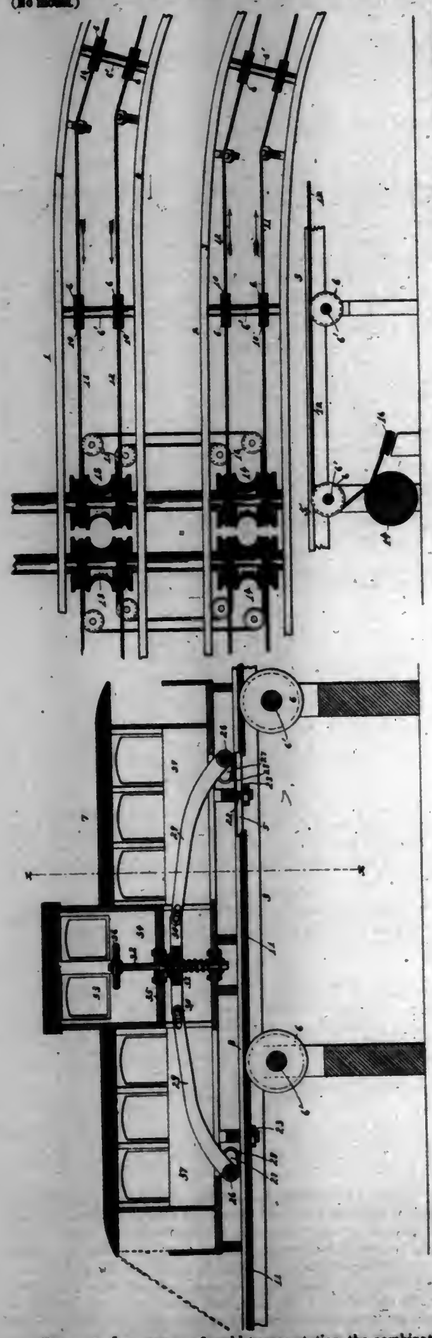
4. In a motor for mixers, beaters, &c., the combination of the reciprocating table, the turn-table carried by the said reciprocating table and having teeth about its periphery, and the two diametrically-opposite pawls, each having two heads which alternately engage with the turn-table to produce a continuous rotatory movement of the same simultaneously with its reciprocating movement, the head of one pawl engaging with the said teeth the moment the other head of the same pawl is disengaged, substantially as set forth.



5. The herein-described machine for mixers, beaters, &c., composed of the bed A, having the standards C, the vertical shaft *e*, journaled in the cross-piece uniting the ends of the standards and provided with the beaters at its lower end, the shaft H, gearing connecting the shaft H with the said shaft *e*, the pinions A' and A^3 on the shaft H, the double clutch-sleeve I, for keying one or the other of the pinions A' and A^3 on the shaft H, the screw J, having pinion *j* on its outer end, which is in mesh with pinions A' and A^3, the rotatable and endwise-movable rod N, having a right and a left screw-thread thereon, the tappets mounted on the threaded portions of the rod N, the shipper-lever K, connected with the rod N, the weighted arm M, the table B, engaged by the screw J and having a stop to engage with the said tappets, the turn-table Q, having ratchet-teeth on its periphery, and the pawls R R, for engaging with and rotating said turn-table during its reciprocating movements, substantially as set forth, and for the purpose described.

408,503. PACKING-CASE. GEORGE W. BAKER, Brooklyn, N. Y. Filed Mar. 9, 1889. Serial No. 302,668. (No model.)

Claim.—The combination, in a packing-case, of a removable cover, corner-bracing pieces fastened to the case and extending above its upper edge, hooks E, staples G, hasps H, resting close to the hooks when both are in closed position, and locking devices K for the hasps, substantially as set forth.



408,504. DOOR FOR CINDER-BOXES. JOSHUA B. BAKER, Springfield, Ill. Filed Feb. 25, 1889. Serial No. 301,074. (No model.)

Claim.—A cinder-dump consisting of a casting secured to the bottom of the smoke-box, and having two circular and funnel-shaped outlets closed and opened by a door centrally pivoted upon a stud rigidly secured in the partition between the outlets, said door being adapted to swing round in the plane in which the edges of the discharge-orifices lie, so as to close or open said orifices, and a spring pivotally secured upon the same stud as the door and adapted to sustain the latter against the edges or faces of the two outlets or dis-

charge-orifices by lock-nuts upon the stud upon which the spring is pivoted, all of said parts constructed, combined, and adapted to operate substantially as and for the purpose set forth.

403,505. SYSTEM OF RAPID TRANSPORTATION. CHARLES H. BARROWS, Willimantic, Conn. Filed Feb. 20, 1888. Serial No. 300,546. (No model.)

Claim.—1. In a system of rapid transportation, the combination of a track, a series of driving-rolls spaced at suitable intervals along the track and each having an annular groove in its periphery, a wheelless car carrying longitudinal runners which rest on the rolls to support the car solely by the rolls and adapted to be moved by frictional contact with said rolls, and the running power-cables passing through the annular grooves in said driving-rolls and arranged between the rolls and the runners when the latter rest on said rolls, substantially as and for the purpose described.

2. In a system of rapid transportation, the combination of a track, a series of positively-rotated driving-rolls spaced at suitable intervals along the track between the side girders thereof, a wheelless car, the longitudinal runners carried by the car and resting on the rolls to support the car on the rolls out of contact with the track, and friction devices carried by the car and arranged to engage the side girders of the track, substantially as and for the purpose described.

3. In a system of rapid transportation, the combination of a track, a series of positively-rotated driving-rolls spaced at suitable intervals on the track, and a car resting on and supported by the driving-rolls independently of the track and carrying devices which engage the track to prevent lateral and vertical displacement of the car, substantially as and for the purpose described.

4. In a system of rapid transportation, the combination of a track, a series of spaced driving-rolls, the running power-cables passing over said rolls to rotate the same, and a car having longitudinal runners or bars which engage with said driving-rolls by frictional contact only, substantially as and for the purpose described.

5. In a system of rapid transportation, the combination of a track, a series of spaced driving-rolls, the running power-cables, a car having the longitudinal runners or bars fixed to its lower side and resting on the driving-rolls and cables by gravity to move the same along the track independently of the latter and solely by frictional contact between said runners, the driving-rolls, and the cables, substantially as described.

6. In a system of rapid transportation, the combination of a track, the positively-rotated driving-rollers arranged between the sides of said track, the running power-cables spaced laterally of each other and passing over said driving-rolls, a car having frictional rollers adapted to engage the track, and the longitudinal runners or bars fixed to the car, on the lower side thereof, and adapted to be moved by frictional contact with the driving-rolls, substantially as and for the purpose described.

7. In a system of rapid transportation, the combination of a track, the positively-rotated driving-rolls, a car supported by the driving-rolls and capable of a limited vertical movement, substantially as described, the longitudinal runner-bars fixed to the car and adapted to have engagement with said driving-rolls, mechanism carried by the car for lifting the same vertically and disengaging the longitudinal runners from the driving-rolls, and devices on the car adapted to be forcibly pressed against the track when the car is elevated, substantially as described.

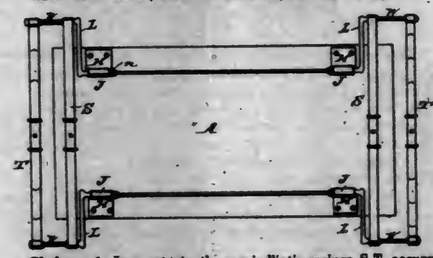
8. In a system of rapid transportation, the combination of a track, a series of positively-rotated driving-rolls spaced at suitable intervals along the track between the side girders thereof, the running power-cables passing over said rolls, a wheelless car, the longitudinal runners fixed to the bottom of the car and arranged to have contact with the driving-rolls and the power-cables, and friction-rollers carried by the car and arranged to have contact with the side girders of the track below an overhanging ledge on said girders, substantially as described.

9. In a system of rapid transportation, the combination of a track, the positively-rotated driving-rolls, a car having longitudinal runners adapted to rest on said driving-rolls, and friction-rollers carried by the car and arranged to be moved vertically by mechanism, substantially as described, to depress said rollers upon the track and elevate and support the car on the track out of contact with the driving-rolls, substantially as and for the purpose described.

10. In a system of rapid transportation, the two adjoining tracks, the driving-rolls arranged between the side girders of the track, the rotary power-drums, each arranged below one of the tracks and the driving-rolls thereof and driven in opposite directions, and a continuous endless cable passing over said driving-rolls, arranged around said drums and passing laterally from one track to the other, substantially as and for the purpose described.

11. In a system of rapid transportation, the two adjoining tracks, the driving-rolls arranged between the side girders of the tracks, the power-drums, each arranged below one of the tracks and rotated positively in opposite directions, a pair of endless cables arranged over the driving-rolls and around said drums and passing laterally from the drum of one track to the drum of the adjoining track, and guide-rollers intermediate of the drums and located laterally thereof, as and for the purpose described.

12. In a system of rapid transportation, the two adjoining tracks, the driving-rolls supported between the same, the rotary power-drums 13 14, located at suitable intervals along the length of the track and arranged laterally with respect to each other, the endless power-cables passing over the driving-rolls and laterally of the tracks from the power-drum 13 of one track to the power-drum 14 of the adjoining track, substantially as and for the purpose described.



13. In a system of rapid transportation, the combination, with a track and a car-propelling mechanism, of a wheelless car, the rock-shafts journaled on the car and carrying friction-rollers arranged to engage the side girders of said track, and a cross-head connected with said rock-shafts to simultaneously move the latter and force the rollers thereof into engagement with the track when said cross-head is moved vertically in one direction, substantially as and for the purpose described.

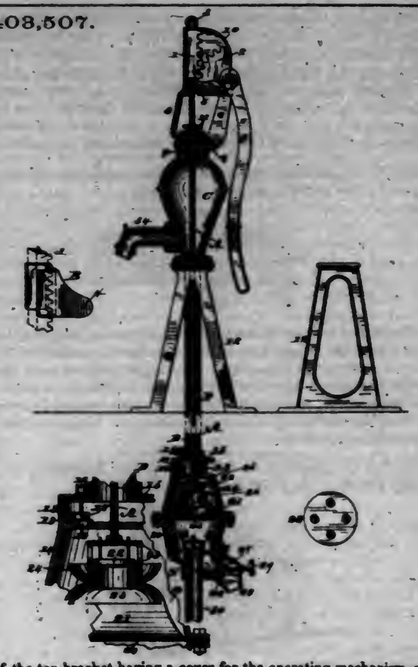
14. In a system of rapid transportation, the combination, with a track and a car-propelling mechanism, of a car, the rock-shafts journaled in the car near the ends thereof and having arms which carry the friction-rollers, a vertical screw-shaft, a cross-head fitted thereon, and levers intermediate of said cross-head and the rock-shafts, substantially as and for the purpose described.

15. In a system of rapid transportation, a car having a longitudinal frame, the horizontal parallel runners fixed to said frame longitudinally thereof, rock-shafts journaled in said frame above the runners and having angular arms which carry friction-rollers, in combination with a track, the car-propelling mechanism, and mechanism carried by the car for simultaneously operating the rock-shafts to depress the rollers thereof into engagement with the track or withdraw said rollers from the same, as and for the purpose described.

16. In a system of rapid transportation, a car having a vertical central apartment provided with a look-out-chamber and the end passenger-apartments, the rock-shafts journaled in the car and carrying friction-rollers, a vertically-movable cross-head and a screw-shaft located in the central apartment, and the longitudinal levers arranged between the seats in the passenger-apartment and connected at their ends to the rock-shafts and the cross-head, substantially as and for the purpose described.

403,506. VEHICLE-SPRING. CHARLES A. BESLER, Cincinnati, Ohio. Filed Mar. 16, 1889. Serial No. 303,906. (No model.)

Claim.—1. In a vehicle, the semi-elliptic springs S T, occupying relatively-reversed positions, one being attached to the head-block, the other to the under side of the body, in combination with loops L, one end supporting extremity of springs, which are separated from one another by washer W, the other end being swiveled into a hinged and barreled coupling underneath the vehicle-body, substantially as shown and described, and for the purposes noted.



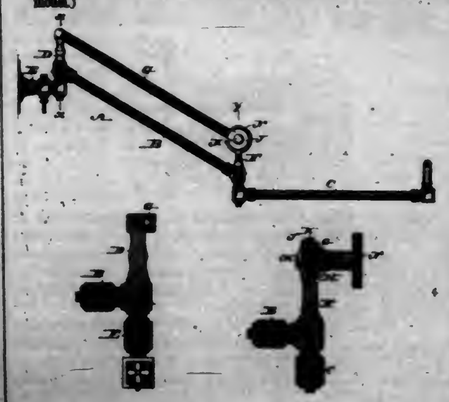
2. The body A and loops L on each corner thereof, said loops being loosely connected to a hinged and barreled coupling, in combination with two semi-elliptic springs occupying relatively-reversed positions, and in such shape fastened, respectively, to the head-block or axle-bed and vehicle-body, their extremities being mounted on the outer loop-stem and separated from one another by washer W, substantially as shown and described, and for the purposes specified.

3. In a vehicle, the body A, loops L, properly shackled to body and supporting spring portions S T, and washer W, the said loops extending the length of the vehicle-body, with barreled couplings I J, connected by an elongated link, L', through the instrumentality of which the springs can be elongated or contracted, substantially as shown and described.

403,507. PUMP. PETER J. BOSS, Belleville, Ill. Filed July 13, 1888. Serial No. 279,857. (No model.)

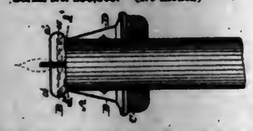
Claim.—1. In a pump, the combination of the pump-chamber, the perforated cap above the inlet thereof, the lower or foot valve arranged in said cap, the outlet having a hinged valve or cover, the screw for closing said valve-cover, the diaphragm in the pump-chamber carrying the perforated cap, the valve therein, and the plunger-rod having its lower end screwed into the cap and adapted to be screwed down on the valve, arranged and operating substantially in the manner and for the purpose described.

2. In a pump, the combination, with the pump-chamber having the diaphragm therein, the valve carried by said diaphragm, the perforated cap in which said valve is arranged, the piston-rod having its lower end connected to said cap, the supply-pipe, and air-chamber,



of the top bracket having a cover for the operating mechanism, and an annulus or collar embracing the top of the air-chamber, whereby said bracket may be rotated on the air-chamber to place the operating mechanism in a convenient position and may cause the plunger-rod to close the valve of the diaphragm or adjust the play of the same as desired, substantially as and for the purpose described.

3. In a pump, the pump-chamber provided with a foot-valve above the inlet thereof, having its lower wall inclined and an outlet at the termination of said wall, a hinged valve controlling said outlet, a screw for regulating the play of the valve or for closing the same on its seat, a diaphragm in the pump-chamber, a perforated cap carried by said diaphragm, a valve arranged in and guided by said cap, and a plunger-rod having its lower end adjustable in said cap, whereby the play of the valve may be regulated or the same closed on its seat, substantially in the manner and for the purpose described.



4. A pump having a chamber with a foot-valve controlling its inlet-passage, a hinged valve controlling its outlet-passage, a spout surrounding its outlet-passage and having a screw regulating the play of the said hinged valve, and a diaphragm in said chamber with operating-stem, said parts being combined substantially as and for the purpose set forth.

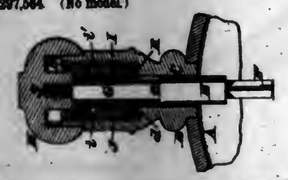
403,508. GAS OR LAMP BRACKET. WILLIAM BORNE and JULIUS BORNE, Philadelphia, Pa. Filed May 15, 1888. Serial No. 273,963. (No model.)

Claim.—The improved lamp or gas bracket herein described, consisting of a branch with a horizontal opening in the same, the vertical post D, rotatably connected with said branch, the vertical posts F, with serrated disk J at its upper end, the pipe B, pivoted to said posts, and the bar G, having the serrated disk H at one end and pivotally connected to said posts, the packing K between the disks J and H, the screw-bolt M and nut N, and the pipe C, rotatable on the lower end of the post F, said parts being combined substantially as described.

408,509. CANDLE-GUARD. HUBERT BOVÉ, Philadelphia, Pa. Filed Apr. 6, 1887. Serial No. 233,866. (No model.)

Claim.—An improved candle-guard consisting of a perforated conical body with weighted base and outwardly-dish-shaped rim B, with an inwardly-overhanging lip, *a'*, extending inwardly as far as the top edge of the body A, and adapted to retain within the chamber the melted material, as described, the said rim being connected to the body at the inwardly-projecting neck A', said parts being combined substantially as described.

408,510. BRIDLE-BIT. ZACHARY T. BOWLES, Hillsborough, Tex. Filed Sept. 20, 1888. Serial No. 285,969. (No model.)

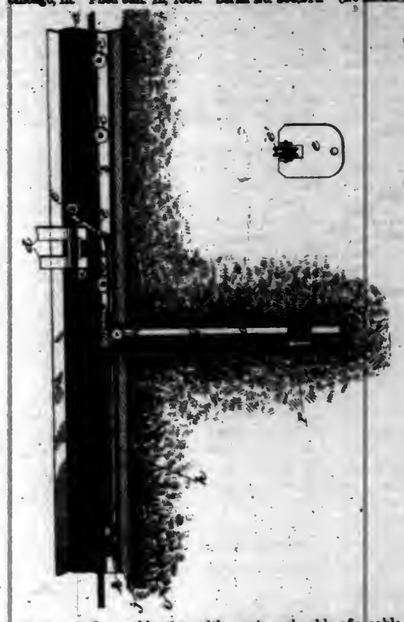


Claim.—1. In a bridle-bit, the combination, with the bit-bar, of the angle-levers swiveled on the said bar and having limited rotation thereon, the curb-chain connecting the upper arms of the said levers, and the reins connected to the lower arms of the same, substantially as specified.

2. In a bridle-bit, the combination of the bit A, having the loops B B attached to its ends, the angle-levers mounted on the bit-bar and comprising the arms E E, provided with sockets *e e*, and the arms F F, connected by the curb-chain G, and the loops or rings H H, provided with shanks mounted in the sockets *e e*, substantially as specified.

3. In a bridle-bit, the combination, with a bit-bar, A, provided with the loops B B, of the angle-levers D D, mounted on the said bar and having their corresponding arms respectively connected by the curb-chain and provided with rein loops or rings H H, and the studs or pins L on the levers engaging the loops B, substantially as specified.

4. In a bridle-bit, the combination, with the bit-bar, having loops B B attached thereto, of the levers mounted loosely on the said bar and provided with sockets *e e*, and the rings or loops H H, provided with shanks mounted in the said sockets, whereby the rings are adjustable, substantially as specified.



408,511. WATCH-CASE PENDANT. WILLIAM W. BRADLEY, Newport, Ky., assignor to John C. Dueber, same place. Filed Jan. 25, 1889. Serial No. 297,544. (No model.)

Claim.—1. A chambered watch-case pendant provided with an ungrooved longitudinally-shiftable push pin or stem, in combination with a clutch fitted within said chamber and grasping an ungrooved stem, so as to revolve in unison therewith, a keeper that prevents longitudinal sliding of said clutch, and a stop that limits the outward pull of said stem, substantially as described.

2. A watch-case pendant, as B, having a screw-threaded chamber, D, and bearing *b*, in combination with the longitudinally-shiftable push-pin E *e* G, clutch J *j* K, and a tubular keeper or nut, I, that engages with said chamber and holds said clutch against said bearing *d*, as herein described.

408,512. CABLE-RAILWAY MECHANISM. THOMAS BRADWELL, Chicago, Ill. Filed Jan. 12, 1889. Serial No. 296,214. (No model.)

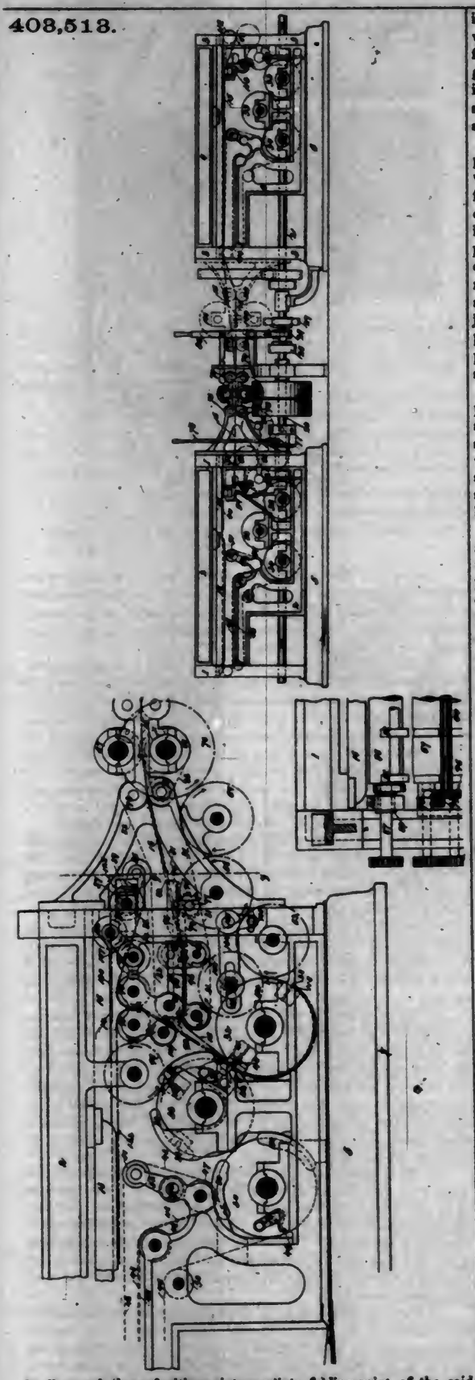
Claim.—1. In combination with a grip and cable of a cable railway, a stop, *e*, attached to an elastic resisting mechanism, whereby a grip carrying a cable may be stopped, substantially as specified.

2. In combination with a grip and cable of a cable railway, a stop, *e*, attached to the piston of an air-cylinder wherein the air is caused to form an elastic resisting medium, whereby a grip carrying a cable may be stopped, substantially as specified.

3. In combination with a grip and cable of a cable railway, a stop, *e*, attached to an elastic resisting mechanism, whereby a grip carrying a cable may be stopped, and mechanism, as set forth, whereby said parts may be returned to their starting-points automatically, substantially as specified.

4. In combination with a grip and cable of a cable railway, a stop, *e*, attached to the piston of an air-cylinder wherein the air is caused to form an elastic resisting medium, whereby a grip carrying a cable may be stopped, and a weight by means of which said parts may be caused to return to their starting-points automatically, substantially as specified.

5. In combination with a grip and cable of a cable-railway, a stop, *e*, provided with a pulley, *d*, and said stop attached to an elastic resisting mechanism, whereby a grip carrying a cable may be stopped, substantially as specified.



6. In combination with a grip and cable of a cable railway, a stop, *e*, provided with a pulley, *d*, and said stop attached to a piston of an air-cylinder wherein the air is caused to form an elastic resisting medium, whereby a grip carrying a cable may be stopped, substantially as specified.

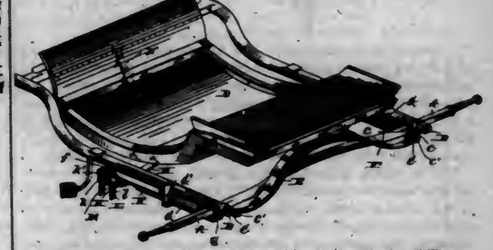
7. In combination with a grip and cable of a cable railway, a stop, *e*, provided with a pulley, *d*, and said stop attached to a piston of an air-cylinder wherein the air is caused to form an elastic resisting medium, whereby a grip carrying a cable may be stopped, and a weight whereby said parts may automatically be returned to their starting-points, substantially as specified.

408,518. ROTARY PRINTING-MACHINE. JOHN BROWN, Plainfield, N. J. Filed May 12, 1888. Serial No. 273,708. (No model.)

Claim.—1. In a cutting or breaking and folding mechanism for printing-presses, the combination of the cutting-cylinders adapted to transversely cut a printed web in given lengths subsequent to its delivery from a press printing at a given surface speed, separate perforating-cylinders adapted to transversely perforate a printed supplement-web in half said given lengths subsequent to its delivery from a separate press printing at half the said surface speed, and parting-rolls succeeding said perforating-cylinders in the line of feed of the supplement-web, having the said given surface speed and located at a distance from the said cutting-cylinders, whereby they are adapted to part and accelerate the speed of the supplement-web to tally the

408,518.

leading end thereof with an intermediate folding-point of the said given cut lengths from the press having the aforesaid given surface speed, all substantially as and for the purposes set forth.



2. In a printing and folding mechanism, the combination of the separate co-operative presses, the one having the cutting-cylinders 32 33, adapted to sever its printed web in given lengths, the other having perforating-cylinders 66 67, adapted to partly sever its printed web in half said given lengths, and cutting-cylinders 108 109, adapted for alternative use to sever its printed web in lengths equal to said given lengths, and of the herein-described differential clutch mechanism connecting the two presses, whereby the relative speeds of the same are changed or the two disconnected, as and for the purposes specified.

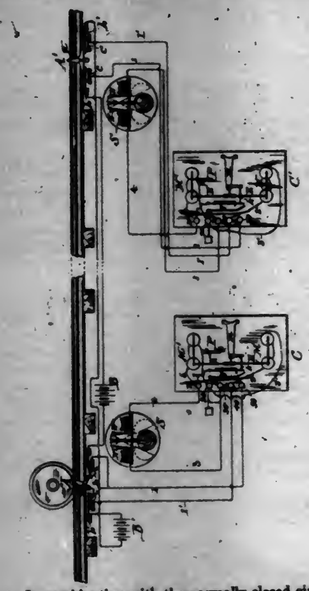
3. In a cutting or breaking and folding mechanism for printing-presses, the combination of the cutting-cylinders adapted to transversely cut a printed web in given lengths subsequent to its delivery from a press printing at a given surface speed, separate perforating-cylinders adapted to transversely perforate a printed supplement-web in half said given lengths subsequent to its delivery from a separate press printing at half the said surface speed, and parting-rolls succeeding said perforating-cylinders in the line of feed of the supplement-web, having the said given surface speed and adjustable at variable distances from the said cutting-cylinders, whereby they are adjusted to part and accelerate the speed of the supplement-web at a period to tally the leading end thereof with an intermediate folding-point of the said given cut lengths from the press having the aforesaid given surface speed.

4. In a cutting or breaking and folding mechanism for printing-presses, the combination, with the diagonal bars 16 18, whereby the subdivisions of a double-width printed web are superimposed, and the superimposing-rolls 90 91, of the adjustable roll 88, adapted to change the length of course of one of said subdivisions, whereby the impressions of the same are registered with the impressions of the other of said divisions and the cutting and folding points thereof registered between the cutting-cylinders, as set forth.

5. In a cutting or breaking and folding mechanism for co-operative printing-presses, the combination, with the diagonal bars 16 18, whereby the subdivisions of a double-width printed web from the first press are superimposed, of the adjustable roll 88, adapted to tally the cutting and folding points of said subdivisions, the low-speeded perforating-cylinders 66 67, for perforating the web of the second press, and the normally-speeded parting-rolls 89 90, adjustable at variable points in the line of paper-feed from the said second press, whereby the leading ends of the sheets severed from said paper-feed will tally with the coincident folding-points in the said subdivisions of the first web, as and for the purposes set forth.

408,514. ROAD-CART. WALTER R. BURNS, Rising Sun, Md. Filed Dec. 7, 1888. Serial No. 292,862. (No model.)

Claim.—1. In a road-cart, the combination, with the thills secured near their rear ends to the axle, of the rear spring connected at its ends to the rear ends of the thills, the side springs arranged under and parallel with the thills, the central spring connected at its extremities to the free front ends of the side springs and vertically adjustable thereon, and the body connected at its center and rear end to the central and rear springs, respectively, substantially as and for the purpose set forth.



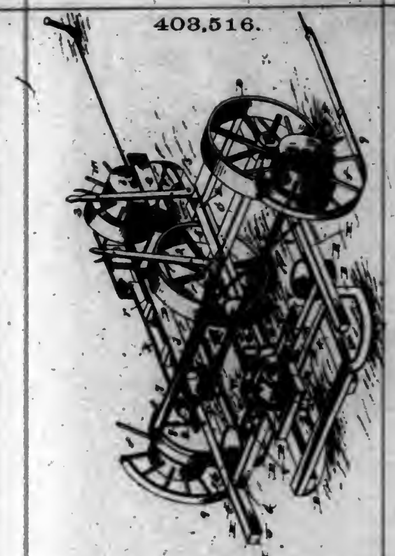
2. In a road-cart, the combination, with the axle, of the thills attached thereto, the side springs, F, attached to the thills, the rear spring, E, connected at its ends to the thills, and the body bearing at its rear end on the rear spring and connected at or about its center just in advance of the seat to the free front ends of the side springs, and the safety-strap connecting the front end of the body to the thills, as set forth.

3. In a road-cart, the combination, with the axle and the thills attached thereto, of the side springs arranged under and parallel with the thills and having free front ends, the clevises attached to the said front ends of the side springs, and the central spring arranged transversely across and secured to the body of the vehicle near the center just in advance of the seat, and provided at its ends with bolts engaging the clevises, and the safety-strap N, connecting the front end of the body to the thills, substantially as specified.

4. In a road-cart, the combination, with the axle and the thills attached thereto, of the side springs arranged under and parallel with the thills and provided at their front ends with loops *f f*, the clevises

provided with apertures, ears arranged on opposite sides of the side springs, and also provided with the depending parallel arms L L, having a series of registering perforations, *l l*, the bolts engaging the loops *f* and apertured ears, the central spring arranged transversely across and secured to the body of the vehicle near the center thereof, just in advance of the seat, and provided at its ends with transverse bolts engaging the registering perforations in the arms L L, substantially as specified.

403,515. RAILWAY-SIGNAL. THOMAS A. CASEY, New York, assignor, by mesne assignments, to William Wallace and George A. Porter, both of Syracuse, N. Y. Filed July 18, 1888. Serial No. 280,242. (No model.)



Claim.—1. In combination with the normally-closed circuit, circuit-breaker, electro-magnetic registering instrument and signal in said circuit, and said registering-instrument actuated by electric impulses produced by intermittent closing of the circuit, as described, a shunt normally open and forming then a more direct connection of the signal with the circuit and closed by the first break of the circuit and before the registering mechanism is actuated, as set forth.

2. In combination with the normally-closed circuit, circuit-breaker, electro-magnetic registering instrument and signal in said circuit, a shunt normally open and forming then a more direct connection of the signal with the circuit, a primary shunt-closing lever operating independently of the registering mechanism and actuated directly by the release of the armatures of the registering-instrument, and a secondary shunt-closing lever operated by the mechanism of the registering-instrument, as set forth.

3. In combination with track-instrument, circuit-breakers, magnets M' M' and signal S in one and the same circuit, armature D, lever E, connected to said armature, pawl *e* on said lever, worm-shaft *d'*, ratchet-wheel I and notched disk *i* on said shaft, notched wheel J, and gear-wheel *n*, operated by said worm-shaft, and the lever *m*, having lugs *m m'*, adapted to engage the notched disk and wheel, the metallic spring-arms *v* and *v'*, connected with the circuit and normally apart from each other, the lever *c*, having the cam *c'* across the free end of the arm *v*, the pins *g g*, projecting from the levers E E and supporting the lever *c*, and the two-armed lever *k*, pivoted to the frame and having one arm connected with the lever *m* and the other arm facing the free end of the spring-arm *v*, substantially as described and shown.

403,516. PLANTER. ALBERT CHARLES, Blue Mound, Kans. Filed Jan. 26, 1888. Serial No. 297,643. (No model.)

Claim.—1. The combination, with a shaft, of a ratchet-wheel secured rigidly thereon, the spike-wheel loosely mounted on the shaft and provided with a cylindrical casing, the series of pawls arranged within the casing and engaging the ratchet-wheel, and the springs bearing on the said pawls, as set forth.

2. The combination of the shaft M, the frame *k*, extending therefrom, the ratchet-wheels rigidly secured on the shaft near the ends of the same, one of said ratchet-wheels being provided with a crown-wheel on its inner face, the spike-wheels loosely mounted on the said shaft and carrying a series of pawls engaging the ratchet-wheels, the shaft *l*, mounted in the rear end of the frame *k*, the ratchet-wheel secured on said shaft and having a crown-wheel on one side, the longitudinal shaft provided at its ends with beveled pinions engaging the crown-wheels, and the spike-wheel on the rear shaft, *l*, carrying a series of pawls engaging the ratchet-wheel thereon, as set forth.

3. The combination, with the main frame and the seed-boxes secured thereon, of the cross-bar secured to the seed-boxes, the forwardly-projecting arms secured to the ends of the cross-bar, the bars K, pivoted to the said arms, the shaft M, geared to the seed-slide, the frame *k*, extending rearwardly from the shaft M, the operating-gearing carried by the said shaft and frame, the lever 3, fulcrumed on the main frame and connected to the rear end of the frame *k*, the lever 2, fulcrumed on the main frame and having a lower arm provided with a cross-bar, and the chains extending between said cross-bar and the bars K, as set forth.
